1.00 INTRODUCTION

1.10 Location and Access

The Ham mineral claims are located approximately 4 km west of Kimberley, B.C. See the index map (figure 1) for the location of the claim block. The claims are located along Matthew Creek, a tributary of the St. Mary River, in the Fort Steele Mining Division on reference map NTS 82F/09 and centered near 49°40'N latitude, 116°05'W longitude.

The property is accessed from highway 95A south of Kimberley, up the St. Mary River paved road to the unimproved Bootleg Road. Most of the property is crossed by logging roads.

1.20 History

During 1994 a soil sampling program totaling 223 samples generated several lead and zinc anomalies. In 1996 Sedex Mining collected an additional 94 soil samples and drilled a 305.41 metre exploration hole on the best anomaly. Chris McFarlane, a Masters student from the University of Calgary has completed a field mapping program on the high-grade metamorphic rocks around Matthew Creek.

1.30 Physiography

The property is situated west of the Rocky Mountain Trench within the Purcell Mountains. Topography is moderate to steep with glacially rounded ridges. Within the property elevations range from 1000 to 2000 metres.

Vegetation cover varies from immature to mature forests of larch, pine, spruce and fir. Considerable clear-cut logging has occurred on the claim group in the recent past and the logged areas are in various stages of regeneration.

1.40 Property

The Ham claim block consisting of 98 claim units and 6 claims (Figure 2, in Appendix) is a contiguous block of claims owned by Sedex Mining Corp, 1000-675 W. Hastings Street, Vancouver, B.C. Table 1 (in Appendix) is a listing of the individual claims, their tenure numbers and current expiry dates.

1.50 Scope of Present Program

The 1997 program consisted of collecting 105 gravity stations over the claim block to identify the presence of near-surface massive sulphide occurrences.

LOCATION MAP

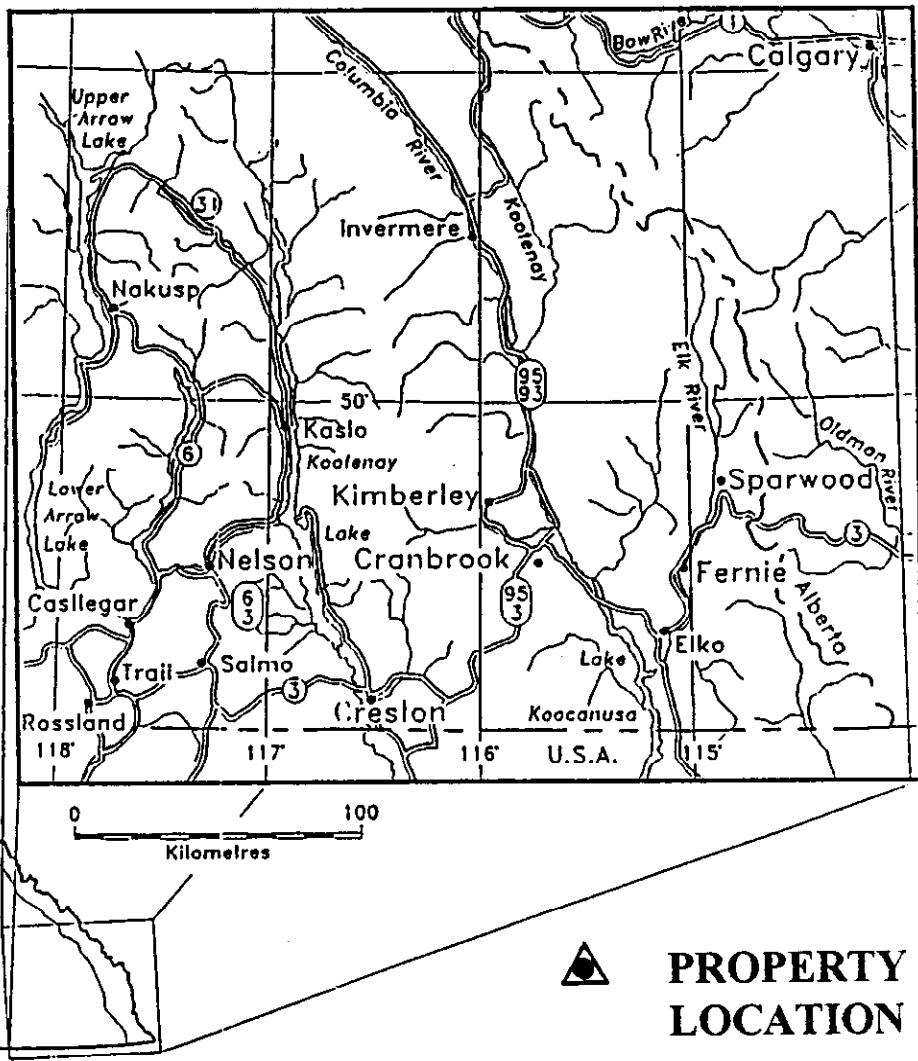

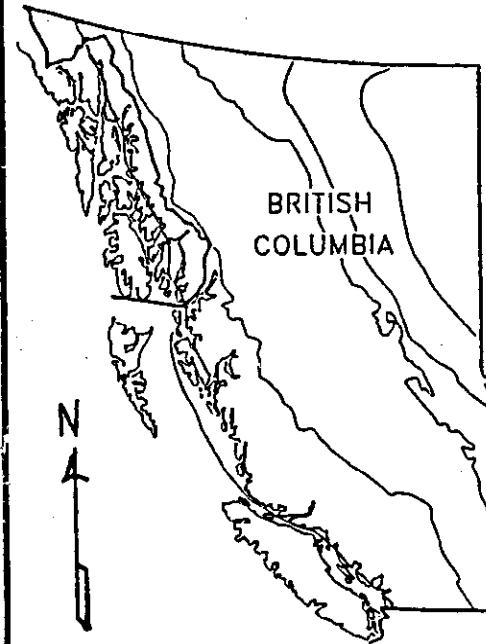

Figure 1.--Location Map.

2.00 GEOLOGY

2.10 Regional Geology

The area of the Ham claim block is underlain by Precambrian Purcell Supergroup rocks of the Aldridge Formation (figure 3). These are fine-grained clastics that include impure quartzites, siltstones and argillites. The rocks have been metamorphosed to lower greenschist facies and have been intruded by a series of mafic sills and dykes.

2.20 Property Geology

On the Ham claim block, Precambrian-age lower Aldridge Formation rocks are generally flat-lying with local dips up to 20°. Outcrops comprise less than 15 percent of the area and are generally restricted to cliff faces and ridge crests. Considerable glacial material covers the slopes and valleys. Some outcrop exists in the stream beds.

3.00 GRAVITY SURVEY

3.10 Introduction

Sedex Mining Corporation contracted Quadra Surveys of Richmond, British Columbia to complete a gravity survey over the claims to detect massive sulphide mineralization. See Quadra Survey's summary report in Appendix (attached) which describes the survey procedure, instrumentation, data reduction and formulae, results & interpretation, and survey precision.

3.20 Survey Boundary

After discussions with Rick Conte, gold commissioner (EI<RCONTE@galaxy.gov.bc.ca), a gravity survey of approximately 1 km beyond the claim boundary was chosen to avoid the "edge-effects" of limiting the gravity data to the area of the claim block. The purpose of this method was to provide better control for detecting gravity anomalies on the extremities of the claim block.

3.30 Example of "Edge-Effect"

Figure 4 is an example of the benefit of including gravity stations approximately 1 km beyond the limits of a claim block.

A theoretical claim block 3 km by 3 km extending from 1000 metres east to 4000 metres east and 1000 metres north to 4000 metres north is shown as the shaded area on figure 4. Gravity values are shown extending from 6 gravity units at 0 metres east, 5000 metres north to 10 gravity units at 4000 metres east, 1000 metres north.

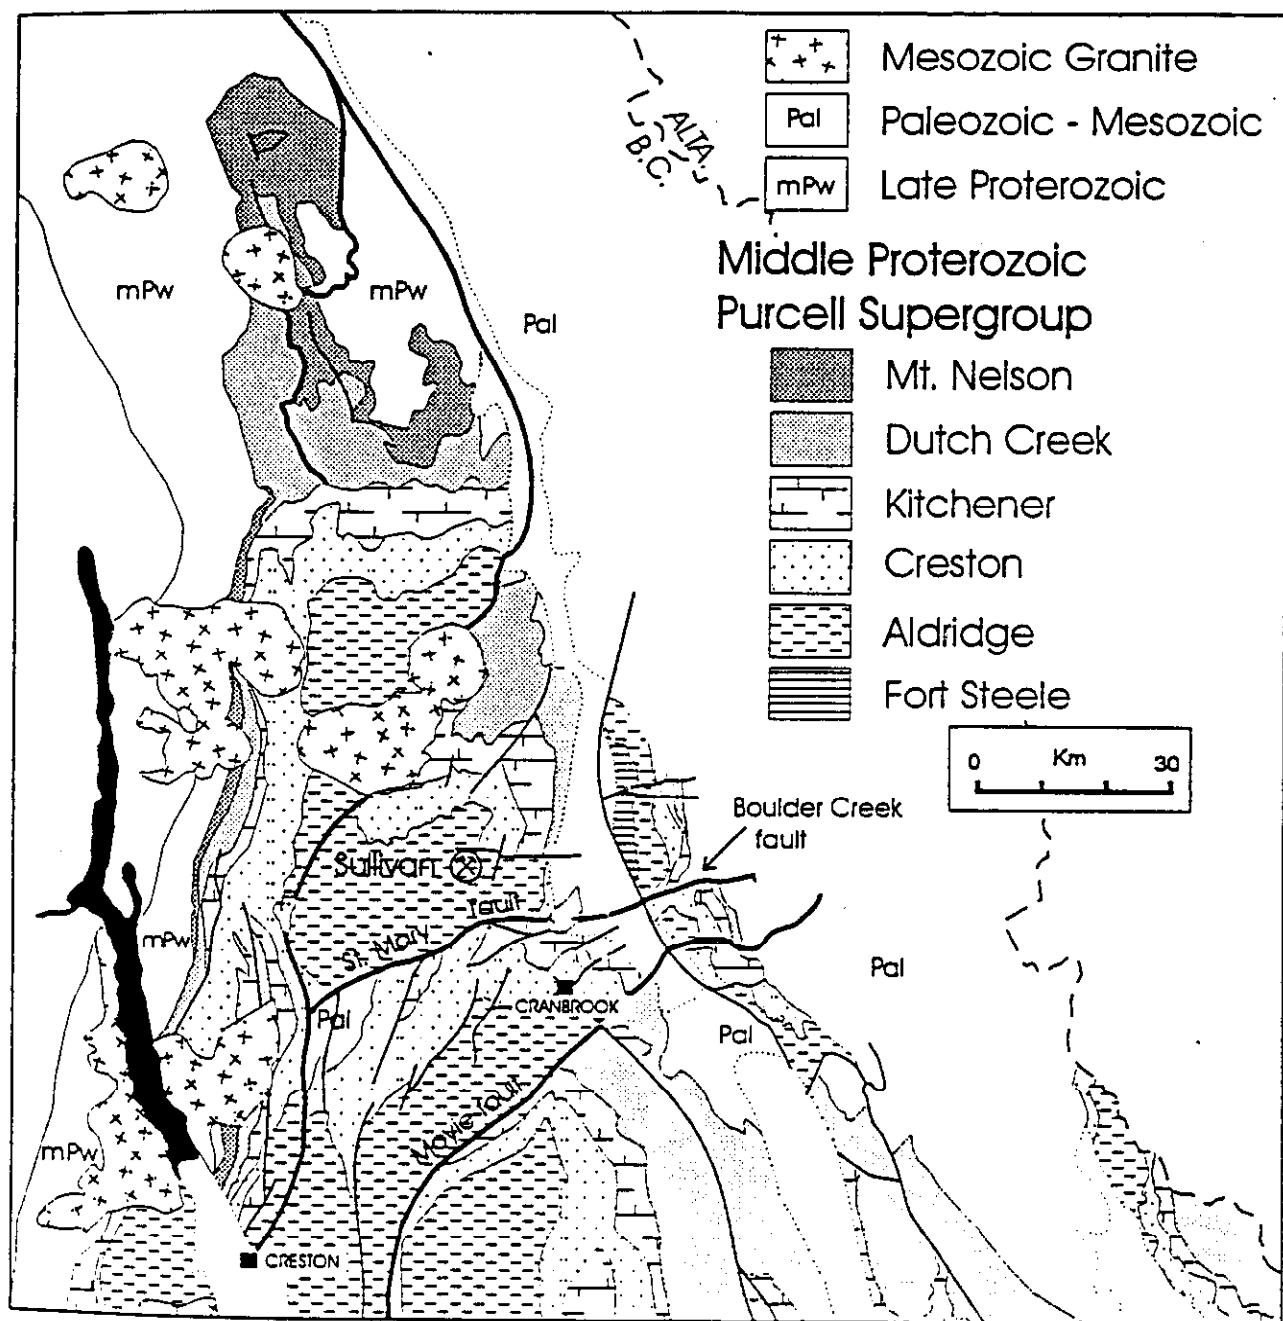

Figure 3.--Regional map of the Purcell Supergroup,
Southeastern British Columbia.

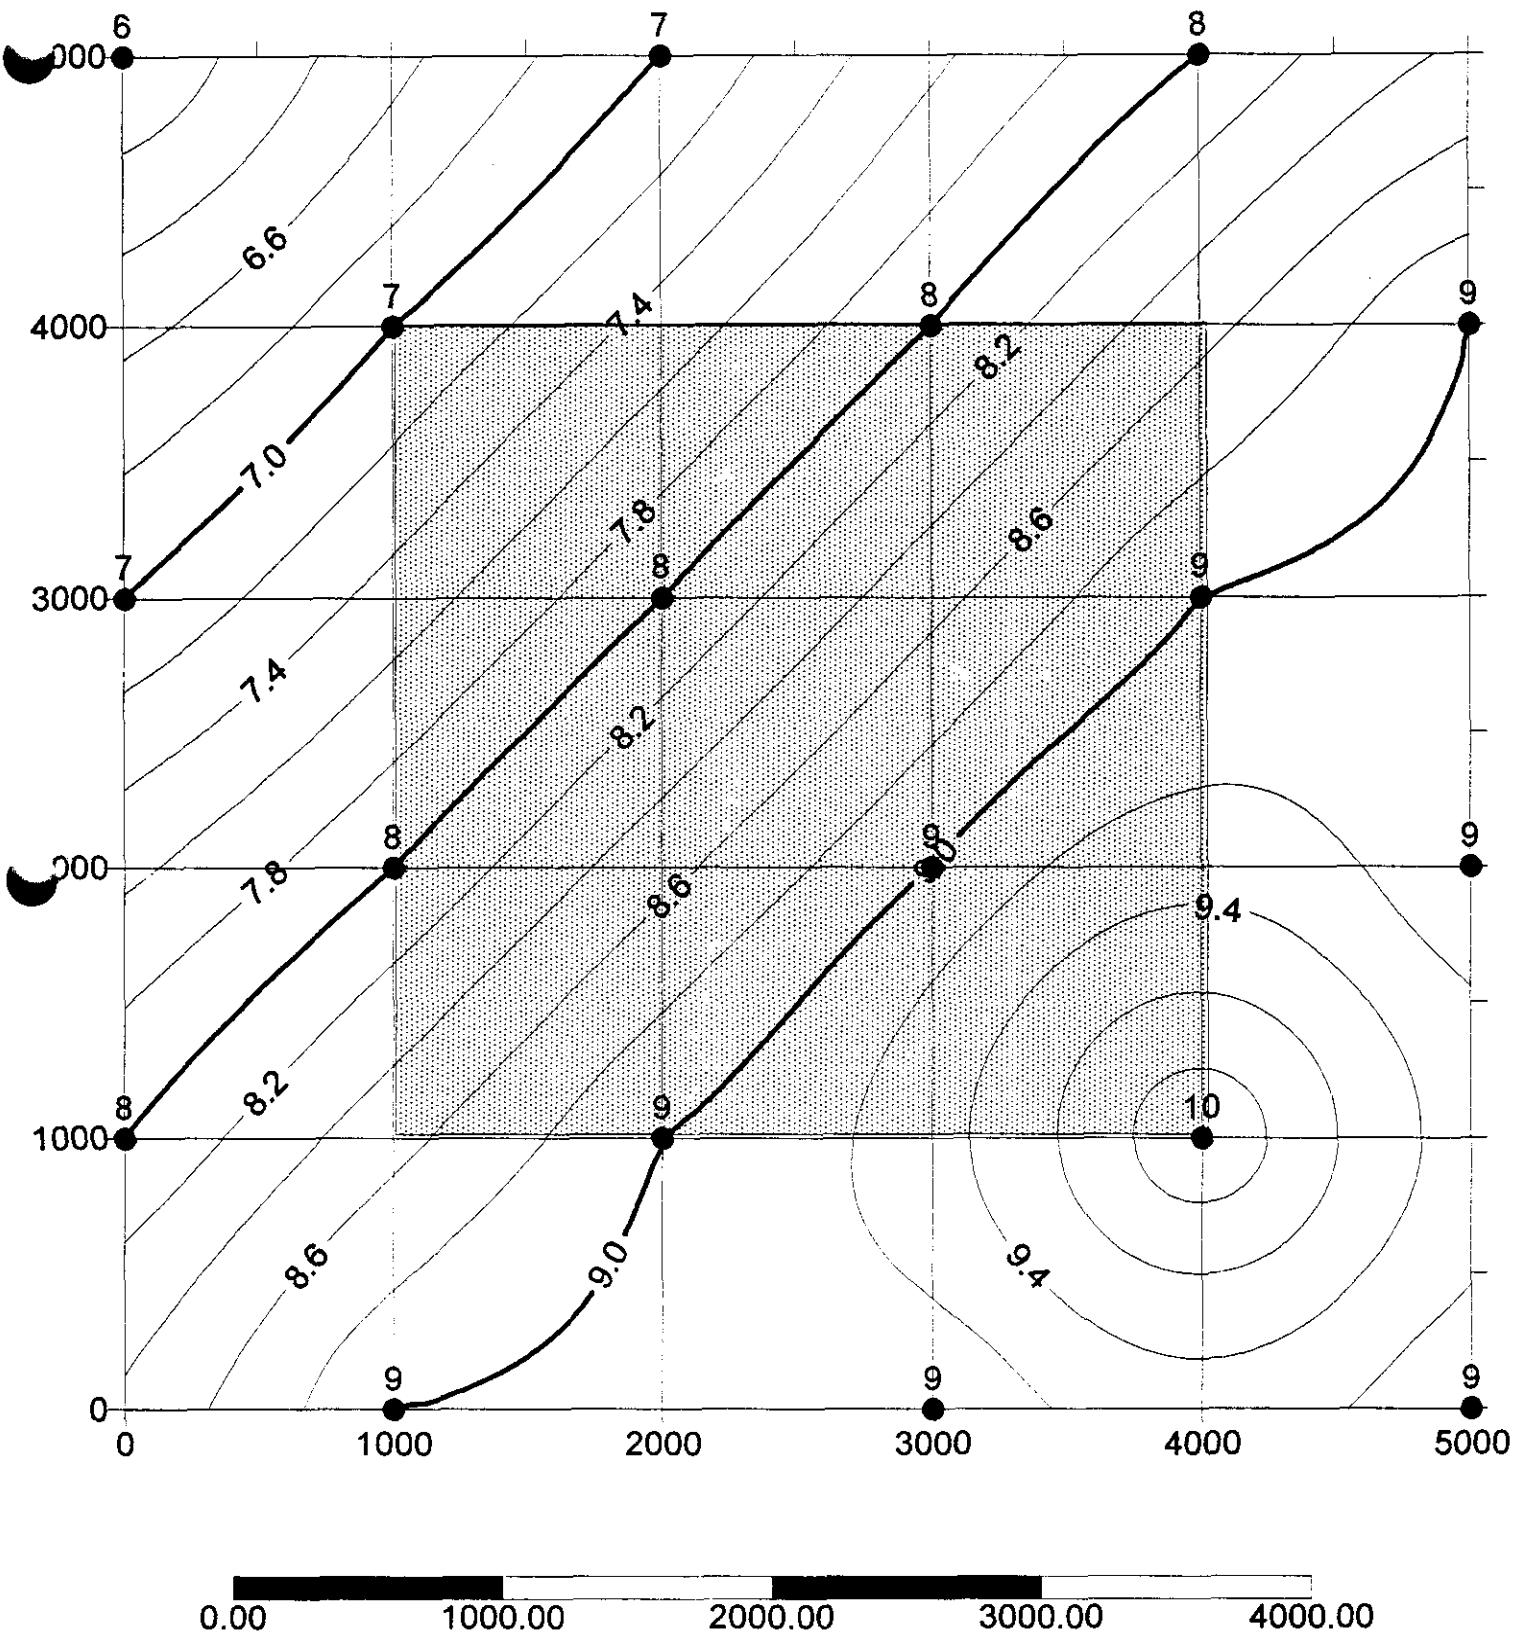

Figure 4.--Example of "Edge-Effect", claim block shaded area.

If only the gravity values on the claim block are considered, an interpretation that the area contains a gentle regional gradient ranging from 7 to 10 gravity units would be made. But, if gravity values approximately 1 km beyond the limits of the claim block are considered, the gravity value at 4000 metres east, 1000 metres north is detected as a significant anomaly.

Therefore, gravity stations approximately 1 km beyond the claim boundary are utilized in the interpretation in this report.

4.00 CONCLUSIONS AND RECOMMENDATIONS

Figure 5 is a contoured plot (Surfer for Windows, www.golden.com) of partial Bouguer gravity values collected by Quadra Surveys. The 1:10,000 scale map shows the location of the claim block and the location of the gravity stations. The -170 mgal contour line outlines an area along the St. Mary River and the southwestern part of the claim block of less dense material believed to be alluvial fill overlying lower Aldridge sediments. The -160 mgal contour line outlines an area east of Matthew Creek and along the northern part of the claim block of more dense material believed to be Moyie intrusives within the lower Aldridge sediments. Through the central part of the claim block a gentle gradient of 10 mgals strikes NW-SE and dips to the SW. This gradient is interpreted as a typical sequence of lower Aldridge sediments with Moyie intrusive. No closed contours indicative of buried massive sulphide material was detected anywhere on the claim block.

No further work is recommended on the claim block.

5.00 STATEMENT OF COSTS

Establish Base Stations, Data Acquisition and Inner Zone Terrain Corrections

(Quadra Surveys operator, report, instrument rentals, 4x4 field vehicle, expenses, computers, lodging plus helper and expenses)

105 stations x \$146/station..... \$15,330

Management and Report Writing

(R.D. Woodfill)

4 days x \$400/day..... \$1,600
AutoCad drafting, Surfer software plots, supplies..... \$435

Sub-Total \$17,365

PAC Withdrawl \$4,650

Total \$22,015

6.00 STATEMENT OF QUALIFICATIONS

I, Robert Woodfill, certify that:

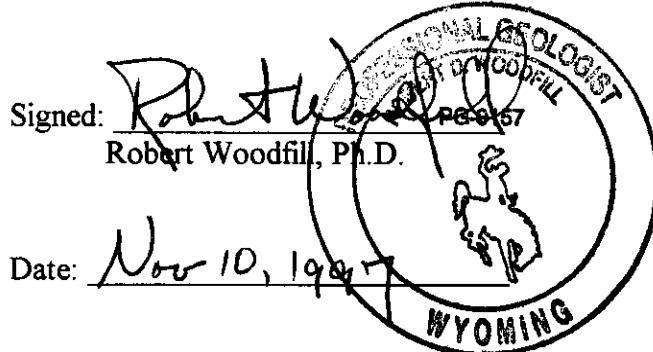

1. I am a Ph.D. graduate of Purdue University in structural geology and an M.S. graduate of the University of Wyoming in geophysics. I am a registered Professional Geologist in the State of Wyoming.
2. I have based this report on work done by myself during 1997 on the claim block.
3. I do not expect to receive any share consideration as a result of writing this report.
4. I have practiced my profession continuously over the last 25 years as an exploration geologist/geophysicist working in the United States, Alaska, Canada, Mexico, Australia and Africa.

	: UTM Zone 11 Northing: 5494000 -5504000
SURVEY PERIOD	: August 11 to August 14, 1997
WRITTEN FOR	: Abitibi Mining Corporation 1000 - 675 West Hastings Street Vancouver, British Columbia, V6C 1S4
WRITTEN BY	: Tam Mitchell, AScT QUADRA SURVEYS 2-8640 Blundell Road Richmond, British Columbia, V6R 1K1
DATED	: September 3, 1997

SUMMARY

A regional gravity survey was conducted in the St Mary's Lake area. The property hosts a geological terrain known to be prospective for sedex type deposits. The purpose of the work was to define possible mineralized zones and geologic structures in the area.

The gravity survey was conducted with 4WD access on existing roads and walking traverse. Gravity measurements were carried out using a Scintrex gravity meter. The station locations were obtained with a real time Trimble double differential GPS survey system. Inclinometer readings were taken at every station to a distance of 170 meters for terrain corrections.

The gravity data were corrected for the various influences to yield partial Bouguer gravity anomaly values listed herein.

INTRODUCTION

At the request of Abitibi Mining Corporation a gravity survey was conducted in the St. Mary's Lake area, West of Cranbrook BC. This report describes the instrumentation, theory, field procedure, data reduction and results of the 4 day survey which commenced August 11 and was completed August 14, 1997.

The survey was conducted by Tam Mitchell, AscT of Richmond, BC with the assistance of Zyoji Jackson of Cranbrook, BC. The crew was based at the Hastings Management field office at 3380 Wilks Road in Cranbrook. The exploration program was carried out under the field supervision of Dr. Robert Woodfill of Abitibi Mining Corporation.

The main purpose of the survey was to identify geologic structures in the area to locate possible zones of sedex type mineralization. Gravity surveying is a very effective tool in locating lead and zinc mineralization, particularly because of the high specific gravity of any sulphide mineralization especially that of lead.

FIGURE: 1

QUADRA SURVEYS

LOCATION and ACCESS

The property is located 30 kilometers to the West-Northwest of Cranbrook approximately defined by UTM Zone 11; Easting: 561000 to 571000 and Northing: 5494000 to 5504000. See figure 1.

Access to the property was on the St Mary's Lake road located on the westerly side of the city of Marysville, near Kimberley.

SURVEY PROCEDURE

All gravity readings were tied to the National Gravity Net by a gravity base station established in a 1996 gravity survey. The base is located at the Cranbrook field office at 3380 Wilks Road and is marked by a steel spike and identified by a wooden stake with an aluminum tag reading: "Gravity Base -101". Geographic coordinates for the station were derived by GPS measurements as $49^{\circ} 32' 48.07384''$ N and $115^{\circ} 48' 44.86830''$ W (see figure 2). The station has a National Gravity Net value of 980688.13 ± 0.02 mgal. Field ties were also made to the nearest field base used for the GPS base station.

All Survey locations were referenced to Canadian Geodetic Control Marker No. 543249 which is a brass tablet marked 897050 (see figure 3). The marker was in good condition and was established with spirit levels and GPS in 1990/91. The marker is located 7.7 km West on St. Mary's Lake Road from Marysville. The marker is 47 m East of a bridge over Mathew Creek and 16 m south of the centerline of the road. The station is further described as follows:

Nad 83 Northing	5497859.405 m	± 0.072 m
Nad 83 Easting	568123.346 m	± 0.072 m
CVD28 Elevation	957.988 m	Method: Spirit Level

Tam Mitchell, AScT, of Richmond BC, with the assistance of Zyoji Jackson of Cranbrook BC acquired the field data. A total of 105 stations were acquired during the 4 days of the survey.

The gravity survey was conducted with 4WD on existing logging roads and by walking on uncut lines.

Inclinometer readings were taken on each gravity station with a Suunto inclinometer to provide inner zone terrain corrections in accordance with the Hammer Chart method. Zone B inclinometer readings were taken at 0, 90, 180 and 270 at a distance of 9.3 meters from the station. Zones C and D were shot at 0, 60, 120, 180, 240, and 300 degrees at distances of 35 and 112 meters respectively. Distances and angles were estimated.

INSTRUMENTATION

GRAVITY

The gravity readings were taken with a Scintrex CG-3 gravity meter (serial no. 10345) manufactured in Concord Ontario. The instrument has a world wide calibration range of over 7,000 mgal and a reading resolution of 0.005 mgal. This instrument features a sensor based on a fused quartz elastic system. The proof mass is balanced by a spring and a relatively small electrostatic restoring force. The position of the mass, which is sensed by a capacitative displacement transducer, is altered by a change in gravity. The inherent strength and elastic properties of the fused quartz together with stop limits around the proof mass permit the instrument to be operated without clamping. Instrument drift is considerably reduced by precise thermostatic control of the unit and software correction for residual effects. The instrument's tilt sensors are analog as well as electronic with a resolution of 1 arc second. Real time corrections for tilt errors can be automatically made for a range of ± 200 arc seconds. The entire gravity sensing mechanism is enclosed in a vacuum chamber to provide isolation from variations in atmospheric pressure. This extremely stable operating environment allows the long term drift of the sensor to be accurately predicted, and real time software correction reduces it to less than 0.02 mGals/day in theory. The unit can also automatically compensate for earth tides. The ETC is generated using the Longman formula (gravimetric factor 1.16).

SURVEYING

Station locations were surveyed using the Trimble Site Surveyor 4400 system with a Pacific Crest radio link. The system used was capable of post-processing rapid static measurements with an accuracy of ± 5 mm +1ppm horizontal and ± 1 cm + 1ppm vertical or real time data acquisition with an accuracy rating of ± 1 cm +2ppm horizontal and ± 2 cm + 2ppm vertical.

The Site Surveyor 4400 is based on Trimble's fourth generation real-time survey technology. Incorporating the latest Trimble real-time GPS engine code and solution algorithms, the system provides very fast on-the-fly (OTF) initializations with the industry's most reliable position results. With this technology, average initialization times are cut in half. With advanced satellite signal acquisition and tracking, the ability to survey near trees is enhanced and downtime due to loss of signal minimized.

DATA REDUCTION and FORMULAE

The gravity data was processed by computer in the following manner:

g_o **Observed Gravity-** field observations corrected for earth tides and long term instrument drift were downloaded from electronic storage in the gravity meter and corrections made for instrument height and residual instrument drift. These values were then tied to the National Gravity Net.

g_{fa} **Free Air Effect-** Correction for relative distances of observation points from the centre of mass(earth). This calculation moves all stations to a common elevation datum and corrects for relative distances in distance from the source mass. The elevation datum used was CGVD 28 mean sea level. The formulae used was:

$$g_{fa} = -0.3086 \text{ mgal/m}$$

g_{bs} **Bouger Slab Effect -** Correction for the relative differences in amounts of surface rock below gravity stations. This calculation requires that a mean density or rock type between the lowest and highest grid elevations be established. All stations are shifted to a common datum as in the free air effect except that the vertical change is through an assumed slab of the derived density. The elevation datum used was CGVD 28 mean sea level.

$$g_{bs} = 2\pi \cdot 0.00667 \cdot \sigma \text{ mgal/m}$$

Where σ = slab density (gm/cc)

g_t **Theoretical Gravity -** Yields correction for change of observed gravity with change in latitude which is due primarily to the rotation of the earth and the difference in earth's radius between the poles and the equator.

$$g_t = g_e (1 + \alpha \sin^2 \theta + \beta \sin^2 2\theta)$$

Where g_e = equatorial gravity = 978,031.85 mgal.

$$\alpha = 0.005278895$$

$$\beta = -0.000023462$$

θ = Latitude

gt **Terrain Correction-** corrections for variations caused by local terrain. The vertical component of the gravitational effect exerted by nearby hills, or not exerted by nearby valleys or gullies, will effect the net reading obtained on any one station. The overall effect on a given line profile or area will be a function of the station spacing relative to the frequency of terrain undulations. Areas were segmented using circular sectors in zones developed by Hammer (1939). Corrections were made for zones B, C, and D (covering an area from 2 to 170 meters from the station).

g_t was calculated from the following expression:

$$g_t = \sum \Phi \tau \sigma [r_o - r_i + (r_i^2 + z^2)^{1/2} - (r_o^2 + z^2)^{1/2}]$$

Where Φ = Sector angle (B = 90°, C & D = 60 °)

τ = gravitational constant = 0.00667

σ = average density (gm/cc)

r_o = outer sector radius (B=16.6, C=53.3, D=170)

r_i = inner sector radius (B=2, C=16.6, D=53.3)

z = elevation difference between sector and station.

g_{faa} **Free Air Anomaly:** is derived from the following formulae:

$$g_{faa} = g_o - (g_i - 0.3086 * E) = \text{Free Air Anomaly}$$

Where g_o = observed gravity

g_i = theoretical gravity

E = CGVD 28 elevation

g_{ba} **Bouguer Anomaly:** was derived from the following formulae:

$$g_{ba} = g_b + g_{faa} + g_t = \text{Bouguer Gravity}$$

Where g_b = Bouguer gravity

g_{faa} = free air anomaly

g_t = terrain corrections

RESULTS & INTERPRETATION

The data was reduced to partial Bouguer gravity anomaly values. Terrain corrections have been applied to 170 meters. A density of 2.67 gm/cc was used throughout the survey. The partial Bouguer Gravity anomaly values spanned a range of 16.81 milligals from a low of -173.34 mgal to a high of -156.53 mgal. The partial Bouguer value was -164.83 ± 4.24 mgal. The survey identified several major and minor geologic trends and areas of interest.

SURVEY PRECISION

GRAVITY

Daily gravity loop ties were made to the base station -101 at the Cranbrook field office as follows:

Date	Loop Tie in mgal	Notes
11-Aug-97	0.05	
12-Aug-97	0.05	
13-Aug-97	0.01	
14-Aug-97	0.11	

Repeat gravity readings were conducted on 7% of the stations as follows:

Station	Repeat Accuracy - mgal
4128	0
4215	0
4303	0.01
4021	0.03
4313	0.03
4130	0.04
4022	0.07

LOCATION

The area has significant geoid undulation, in areas exceeding 3 cm per kilometer. The best geoid correction model available is based on a 10 km square grid, therefore the geoid correction applied in this area is at best approximate. However, the area is quite small so the geoid correction errors are quite insignificant. The CGBM and one GPS control point were used throughout the survey.
