## SUMMARY

This report details an exploration program conducted in two parts between May and September 1997 on the McPhee property near Castlegar, B.C. Assessment work was filed in August and again in November 1997; this report encompasses both work programs. The program comprised soil sampling, prospecting and mapping over an area some seven kilometres long and three kilometres wide with a goal to delineate a previously identified gold showing and to examine the potential of the remaining claim area.

Geochemical results indicate moderate to low base and precious metal values in soils and generally uneconomic values in rocks. A weak, single station wide, linear gold anomaly some 1200m to 2500m long may be coincident with the regional metamorphic trend within the Elise volcanics. Elevated gold, copper, lead and zinc in soils is also coincident with quartz stockworks in the Bonnington monzonite.

A follow up soil profile sampling program along the linear gold trend may expose pyritic bearing volcanics similar to the original McPhee showing and prospecting of the quartz stockworks in the quartz monzonite is also recommended.

## INTRODUCTION

This report details an exploration program conducted in two parts between May and September 1997 on the McPhee property near Castlegar, B.C. Assessment work was filed in August and again in November 1997; this report encompasses both work programs. The program comprised soil sampling, prospecting and mapping over an area some seven kilometres long and three kilometres wide with a goal to delineate a previously identified gold showing and to examine the potential of the remaining claim area.

## LOCATION AND ACCESS

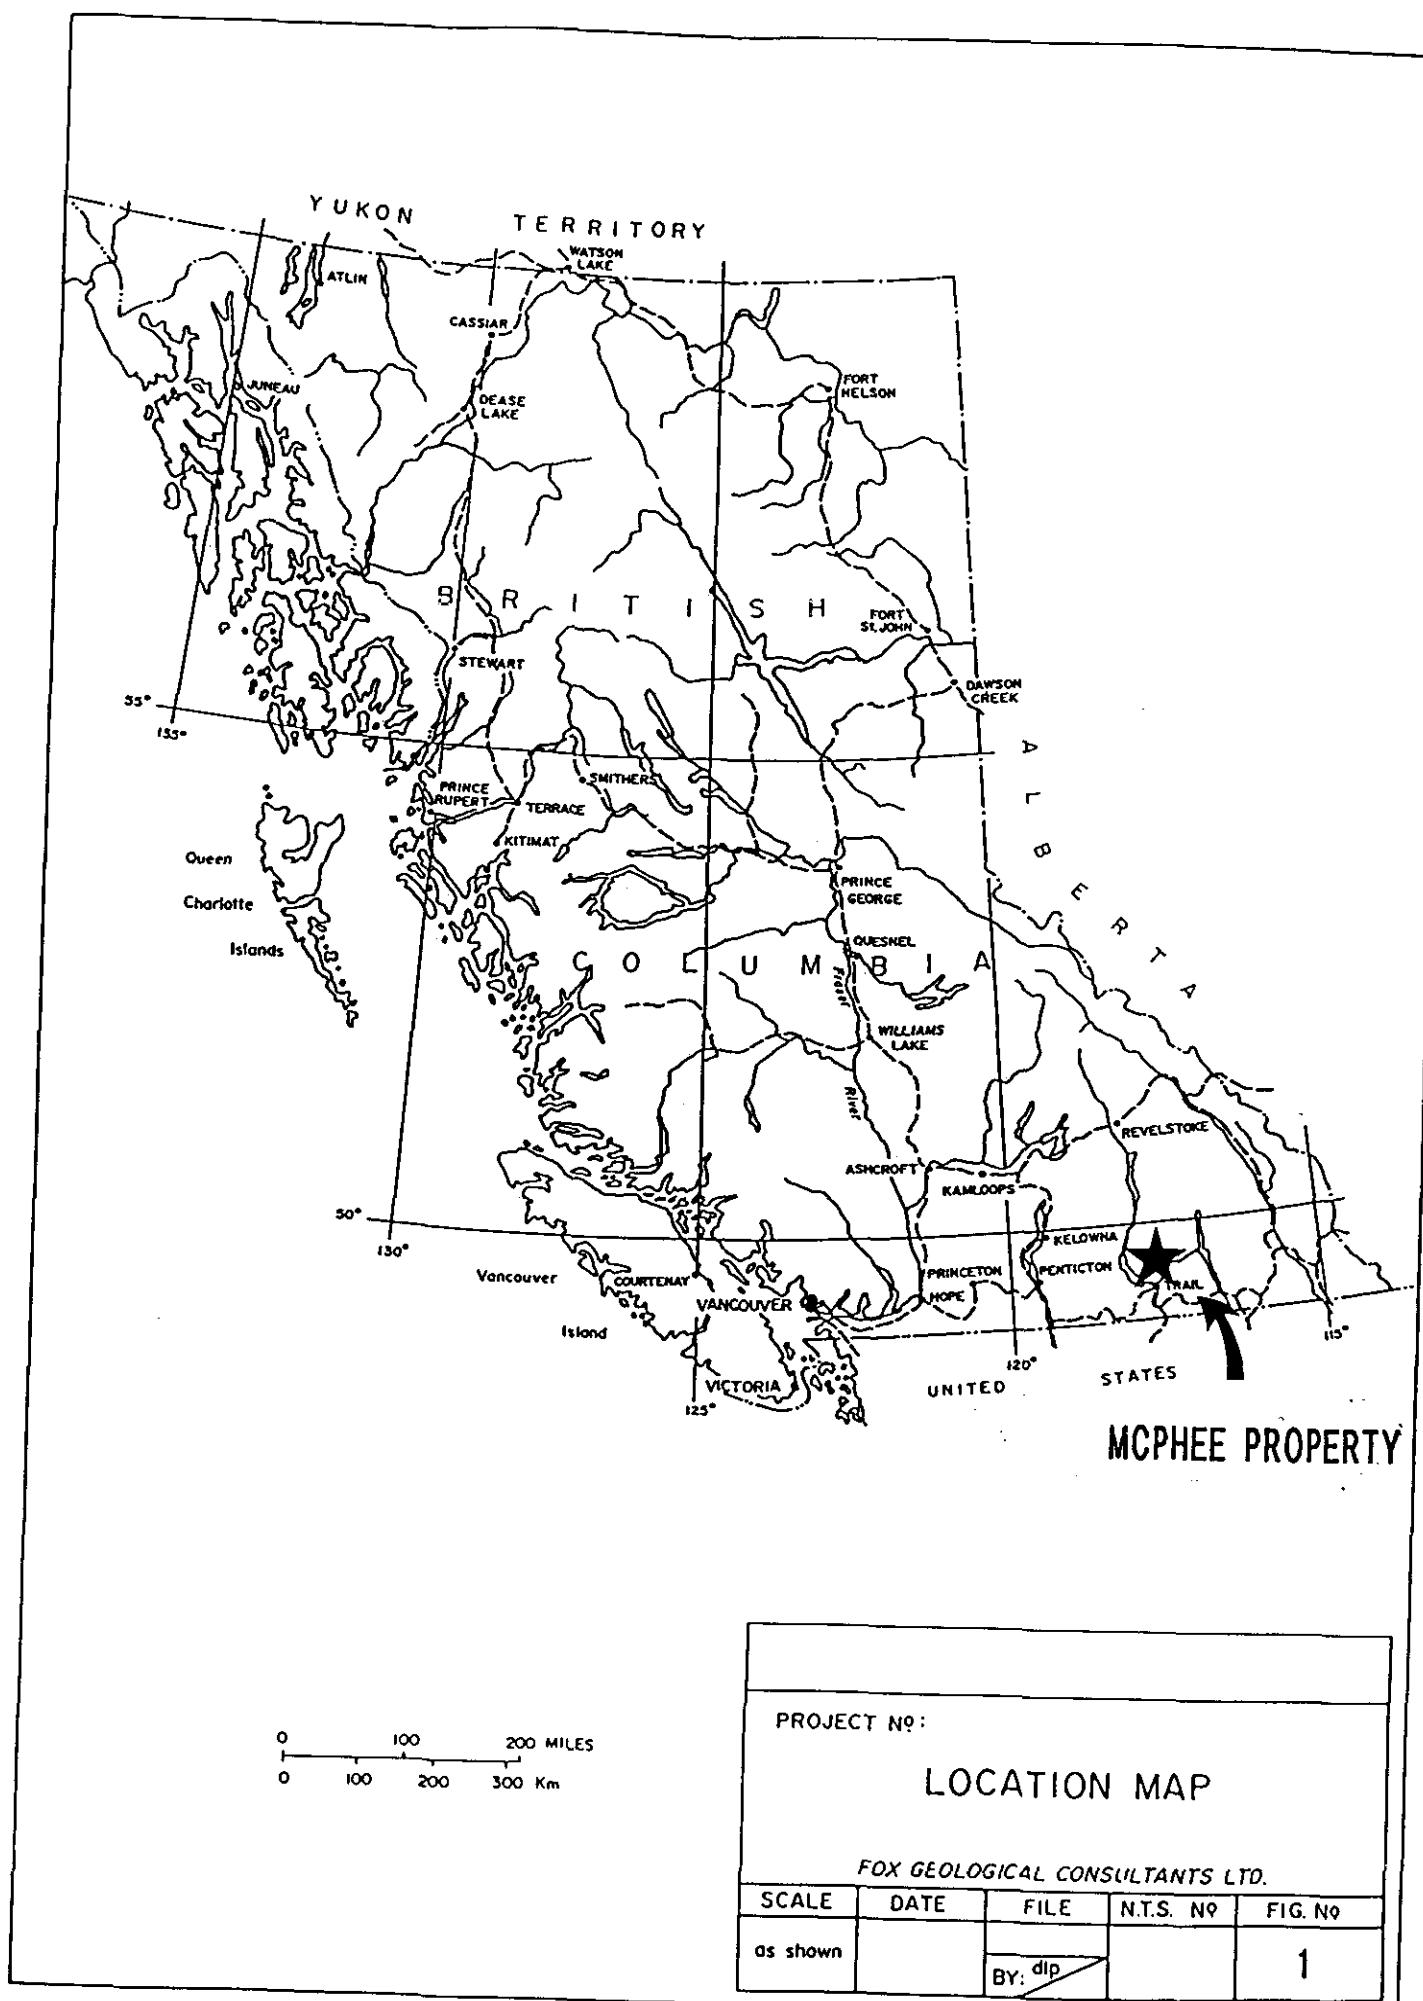

The McPhee property is located approximately 6 kilometers east of Castlegar, British Columbia (Figure 1). The claims are situated on McPhee and Little McPhee Creeks, both north-flowing tributaries of the Kootenay River, and are centered at 49°17' north latitude and 117°32' west longitude. Access is via a six kilometre secondary road that leaves Highway 3 at Bombi Summit, some 15 kilometres east of Castlegar. Logging and powerline roads provide local access to much of the property.

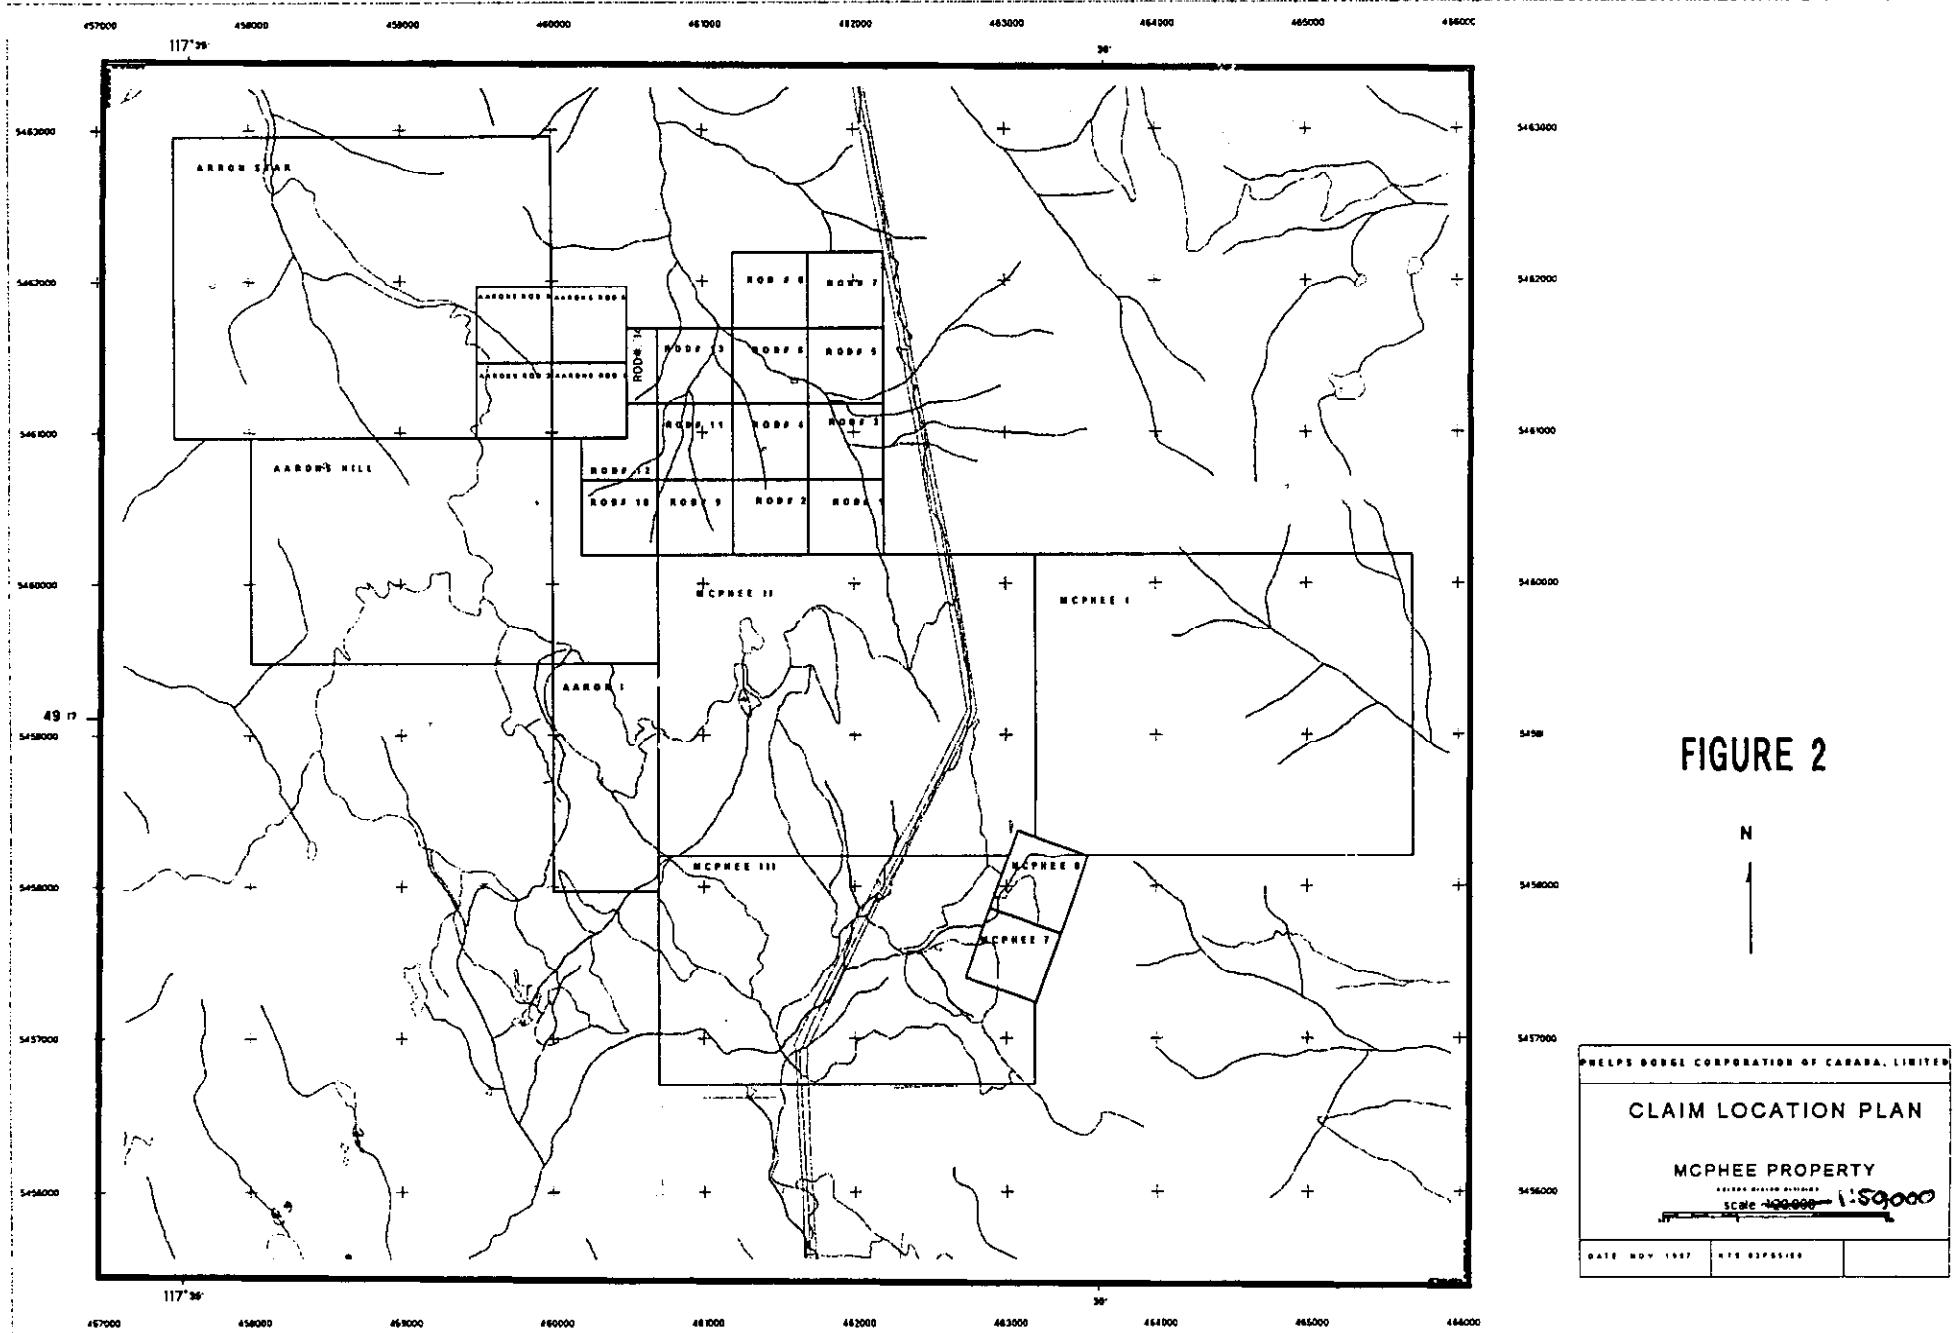

The claims are situated on a large flat ridge which divides the McPhee and Champion Creek drainages. Most of the property has been logged, the rest is covered by mature alpine fir. A large electrical transmission line crosses the central claim area.

## CLAIM INFORMATION

Phelps Dodge Corporation of Canada, Limited optioned the McPhee property from Bruce Doyle in October 1996. At this time the property comprised the Mag 1 & 2, the McPhee #1 to #9, the McPhee I, Aarons Hill, Aaron Star and the Aarons Rod #1 to #4. Upon optioning the property, Phelps Dodge acquired more ground by staking the McPhee II and McPhee III and the Aaron I claims. This created a contiguous block of some 108 units. In June 1997 Doyle staked the Rod #1 to #14 which became part of the option agreement. In August 1997 the Mag 1 and 2 and the McPhee #1 to #6 and McPhee #9 were included into the surrounding claims.

Currently the McPhee property consists of twenty-six claims, totalling 113 units, recorded in the Nelson Mining Division and shown on NTS map sheets 82F/05 and 82F/06 (Figure 2). Claim details set out below are contingent upon this work being accepted for assessment credits.

Rod #13	1	356712	19 June 2000
Rod #14	1	356713	19 June 2000

**HISTORY**

There is no documentation of previous exploration work in the area prior to 1995, although a number of old pits, adits and shafts are present in the western claim area. The nearest documented work is on the Maud S. occurrence (Minfile No.082FSW325), a gold, chalcopyrite and galena siliceous fissure hosted in Bonnington plutonic rocks, 500 metres south of the Aarons Hill claim. Work on the Maud S. probably occurred between 1897 and 1900. There are also rumours of historical placer workings on McPhee and Champion Creeks. Prospecting by Bruce Doyle in 1995 and 1996 identified gold and base metal showings within meta-volcanics in the eastern claim area.

## REGIONAL GEOLOGY

The area immediately west of the town of Castlegar is underlain by the middle Jurassic Bonnington Pluton and by the lower to middle Jurassic Rossland Group. The Rossland Group is comprised of the lower Jurassic Archibald Formation argillite, siltstone, quartzite and minor volcanics overlain by lower Jurassic Elise Formation augite porphyry andesite flows, agglomerates, breccias and tuffs. The lower Jurassic Hall Formation lies conformably on the Elise Formation and is comprised of argillite, siltstone and conglomerate with minor volcanic rocks.

The middle Jurassic Bonnington Pluton is a quartz diorite and is part of the Nelson Intrusive Suite, a magmatic arc emplaced during obduction of Quesnellia over Ancestral North American basement. The Bonnington Pluton is flanked to the south and to the east by Rossland Group rocks. Pendants of metamorphosed Rossland Group within the Pluton were recognized by the GSC prior to 1985, however they were poorly constrained by mapping and were not noted in the eastern McPhee area. Mapping in the late 1980's by the British Columbia Geological Survey Branch largely ignored these metamorphic blocks and were not included in recent maps of the area. Regional Geology is shown in Figure 3.

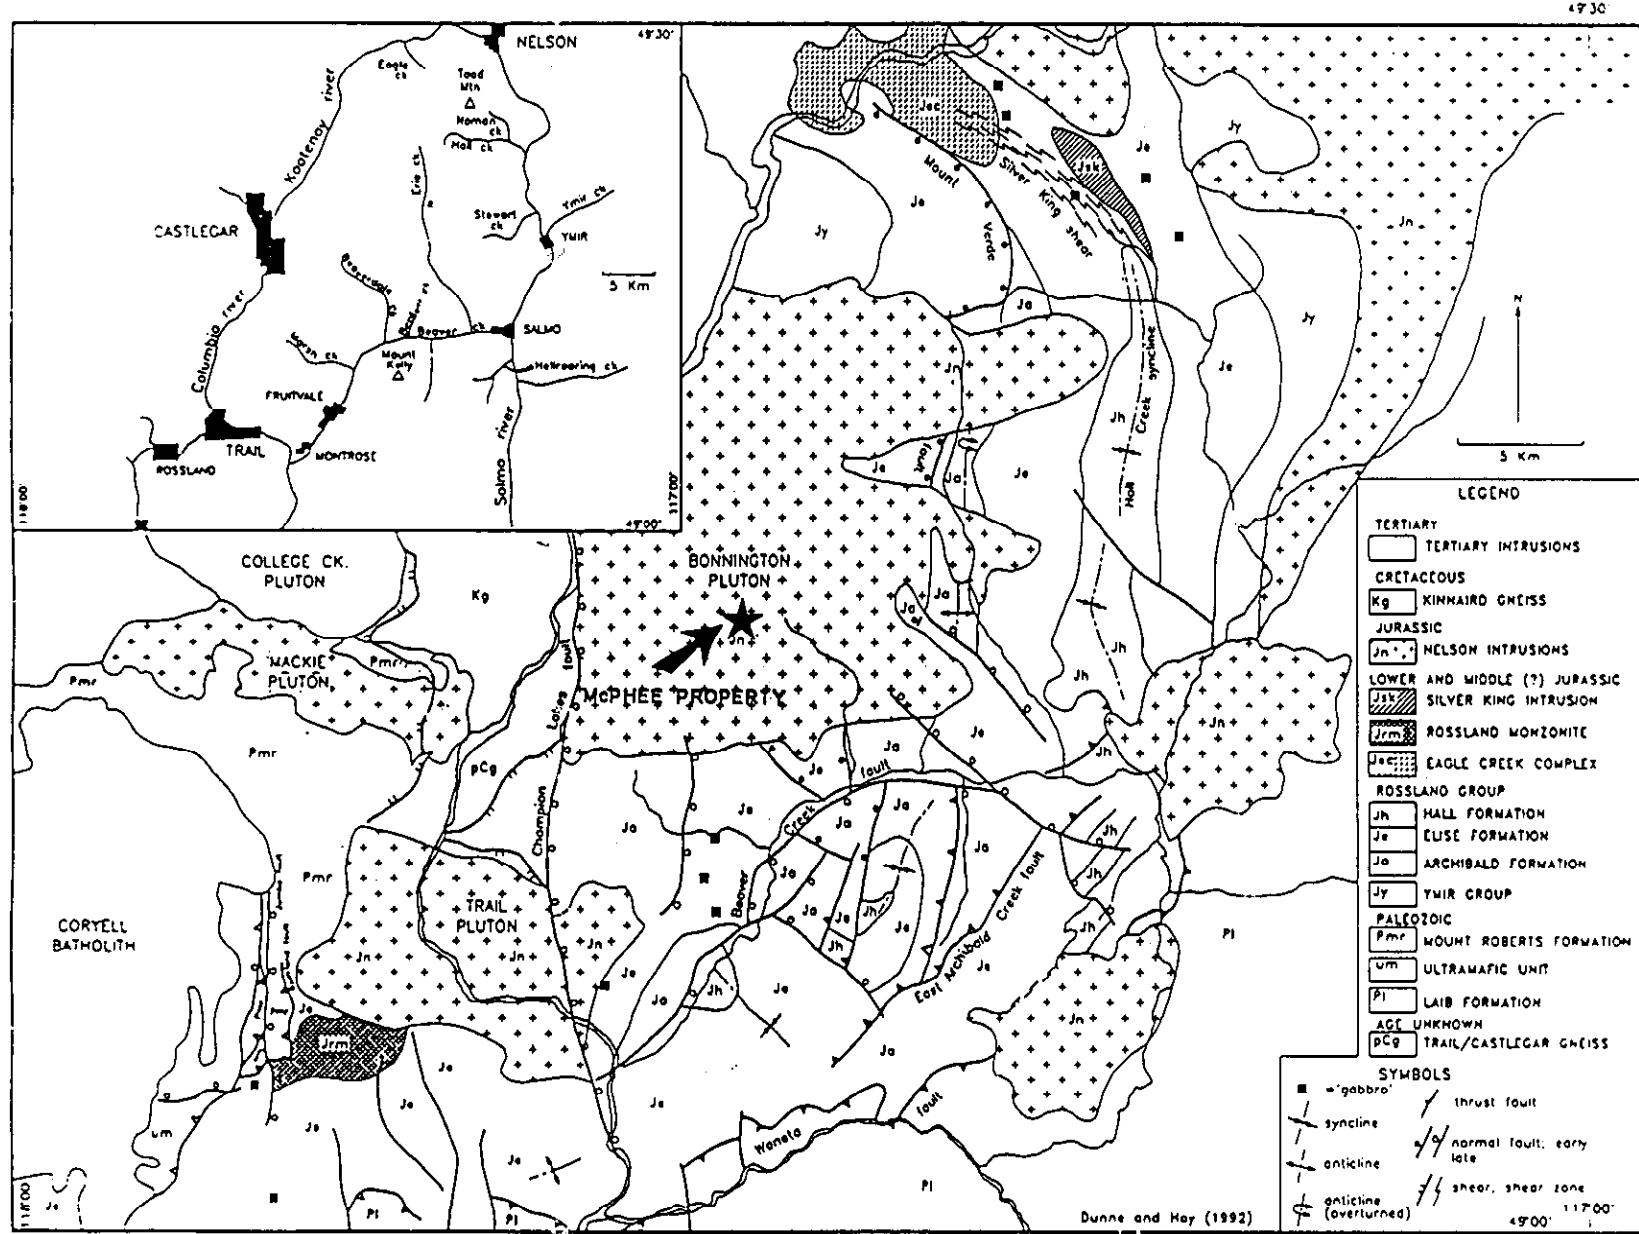

## PROPERTY GEOLOGY

The McPhee property is underlain by two rafts of metasedimentary and metavolcanic rocks, probably the Rossland Group, enclosed by monzonite and hornblende diorite of the Bonnington Pluton, a member of the Nelson intrusions.

## 1997 WORK PROGRAM

Work done on the McPhee property during 1997 consisted of forty man-days of soil sampling and thirty-one man-days of mapping and prospecting. Prospecting and rock sampling was performed in conjunction with 1:20,000 scale mapping and covered an area some seven kilometers long and 3.5 kilometres wide. Soil sampling, on lines 200 metres apart and stations along the lines 50 metres apart, was performed in the central claim area and totalled 35.4 line kilometres. Forty eight rock samples and 720 soil samples collected during the program were described, placed in sample bags, assigned unique numbers and were sent to Acme Analytical Laboratories Ltd. in Vancouver. Samples were analyzed for 35 elements using ICP methods. Analytical procedures are set out in Appendix I of this report.

FIGURE 3 REGIONAL GEOLOGY

## RESULTS

Analytical results from 720 soil samples returned up to 415ppb gold, 40.4ppm arsenic, 254.3ppm copper, 350.5ppm zinc, 404.5ppm lead and 26.7ppm molybdenum. Statistical results for select elements are summarised in Table 1 below. Sample locations are shown in Figure 4 (pocket) and 95<sup>th</sup> percentile threshold maps are shown in Figures 5a to 5i. Soil samples 55149 and 55150 were taken at L78+00E and 104+50N at a depth of 20cm and 70cm respectively following up on sample 61352 which returned 276ppb gold. 55149 returned 58 ppb gold while 55150 returned 415 ppb gold. No bedrock was encountered at this station.

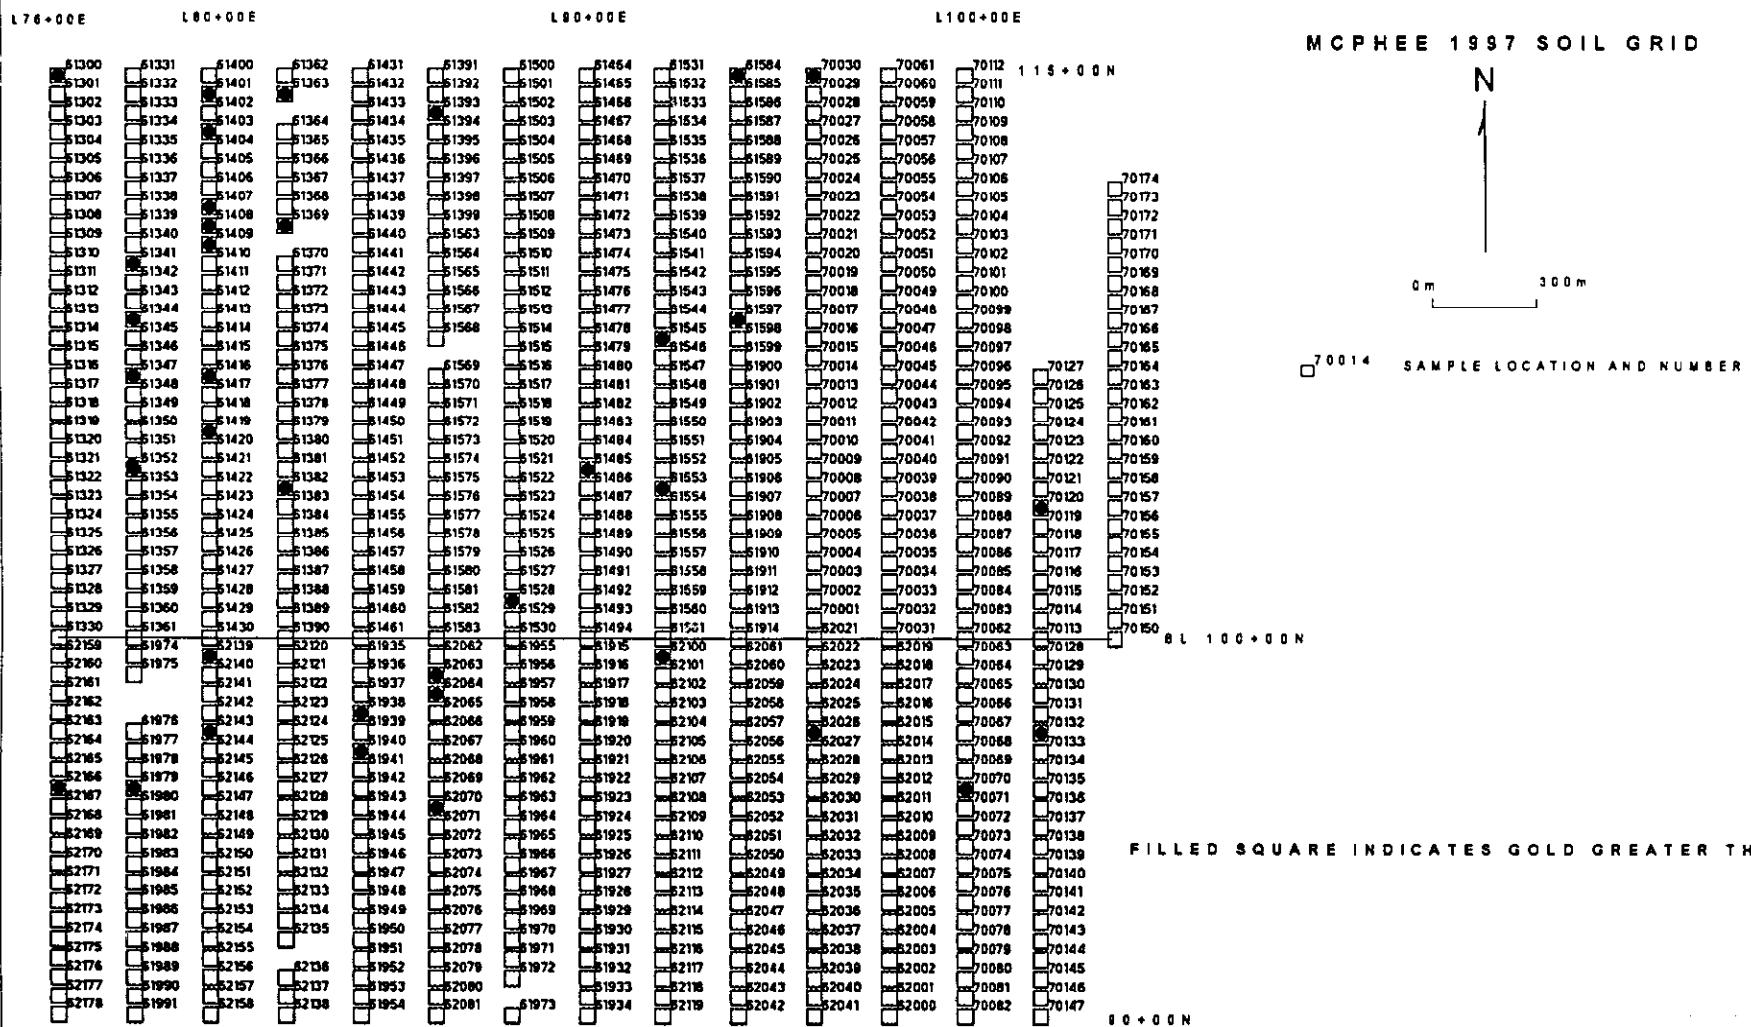

**Table I**

	Count	Maximum	95 <sup>th</sup> percentile	97 <sup>th</sup> percentile	99 <sup>th</sup> percentile
Mo ppm	720	26.7	5	7	13
Cu ppm	720	254.3	57	73	97
Pb ppm	720	404.5	56	70	103
Zn ppm	720	350.5	127	142	169
Ag ppb	720	1400	635	709	873
Ni ppm	720	125	36	44	65
Co ppm	720	51	16	19	25
Au ppb	720	415	35	63	141
As ppm	720	40.4	8	10	14

Analytical results from 48 grab samples returned up to 57ppb gold, 32ppm arsenic, 7426ppm copper, 6944ppm zinc, 2077ppm lead and 1200.4ppm molybdenum. Statistical results for select elements are summarised in Table 2 below. Sample locations are shown in Figure 6 (pocket). Sample 62607, an outcrop of pyritic gneiss, was collected near L93+00E at 91+67N and returned 6944ppm zinc, 2077ppm lead and 241ppm copper. Sample 63701 collected near L84+00E at 105+20N, returned 1200ppm molybdenum from an outcrop of quartz stockwork in monzonite. Sample 61265, a massive sulphide, was collected from an old pit located at the edge of a logging block near the western edge of the Aarons Hill claim block and contains 7426ppm copper.

Geologic mapping at 1:20,000 scale in the central claim area indicates augite porphyry andesite and diorite and monzonite dykes and sills, probably belonging to the Rossland Group Elise Formation, trend north west in a block one kilometre wide and four kilometres long. These Rossland group rocks are enclosed by megacrystic quartz monzonite and hornblende diorite to the north and west, by hornblende monzonite to the south and remains open east of the mapped area. The volcanic rocks are metamorphosed, locally to amphibolite grade, and form a north west trending gneissic zone up to 400 metres wide along the northern boundary. All units show minor displacement along a north trending normal fault in the eastern map area.

Quartz pebble conglomerate probably belonging to the Rossland Group, Hall Formation occurs in the northwest map area. This pendant is terminated by megacrystic quartz monzonite to the south and east but remains open and unmapped to the north and west. The quartz pebble conglomerate appears to be offset some 500 metres along a northwest trending fault. Results of 1:20,000 scale mapping are shown in Figure 7 (pocket).

## **CONCLUSIONS & RECOMMENDATIONS**

Geochemical results indicate moderate to low base and precious metal values in the soils. Gold does not appear to correlate well with arsenic nor antimony however a weak, single station wide, linear gold anomaly some 1200m to 2500m long from L100+00E at station 96+00N to L78+00E at station 104+50N may be coincident with the regional metamorphic trend within the Elise volcanics. Copper, silver, cobalt, nickel and molybdenum in soil also appear to indicate this trend as well as a similar trend from L98+00E at 99+50N to L90+00E 104+50N. Elevated gold in soil is also present in the northwest survey area and is coincident with a quartz stockwork in Bonnington monzonite. The Bonnington quartz monzonite in the eastern mapped area contains elevated copper, lead and zinc in soils, indicated by results from L104+00N. Previous rock sampling and prospecting in this area identified a copper bearing quartz stockwork in the monzonite. Results from rock samples collected during the 1997 program generally returned uneconomic values.

Follow up profile soil sampling on L78+00E at station 104+50N indicates gold values increase with depth. A follow up program of deep sampling along the linear gold trend may expose pyritic bearing volcanics similar to the original McPhee showing which contains up to 1gpt gold and is located nearby to the gold trend. Prospecting of the quartz stockworks in the quartz monzonite is also recommended.

## DISBURSEMENTS

**Disbursements - May 21 to August 9, 1997**

### STATEMENT OF QUALIFICATIONS

I, Greg Kulla of Surrey, British Columbia do hereby certify that:

1. I am a graduate of the University of British Columbia with a Bachelor of Science in Geology granted in 1988
2. I am a Associate of the Geological Association of Canada.
3. I have practised my profession since 1988.
4. I am a consulting geologist with Fox Geological Services Inc.

Respectfully submitted,

---

Greg Kulla B.Sc  
Vancouver, B.C.

## **APPENDIX I**

### **ANALYTICAL METHOD**

#### **ANALYTICAL PROCEDURES**

##### **Rock Samples:**

ICP: A 30 gram sample is digested with 180 millilitres 3-1-2 HCl-HNO<sub>3</sub>-H<sub>2</sub>O at 95° Centigrade for one hour and is diluted to 100 millilitres with water. This leach is partial for Mn, Fe, Sr, Ca, P, La, Cr, Mg, Ba, Ti, B, W and limited for Na, K, Ga and Al. Solution is analysed directly by ICP. Mo, Cu, Pb, Zn, Ag, As, Au, Cd, Sb, Bi, Tl, Hg, Se, Te and Ga are extracted with MIBK-aliquat 336 and analysed by ICP.

Au: Gold is extracted by aqua-regia/MIBK extract, GF/AA finished.

##### **Soil Samples:**

Same as above utilizing a 15 g sample.

**APPENDIX II**

ICP - 15 GRAM SAMPLE IS DIGESTED WITH 90 ML 3-1-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 300 ML WITH WATER. THIS LEACH IS PARTIAL FOR Mn Fe Sr Ca P La Cr Mg Ba Ti B W AND LIMITED FOR Na K Ga AND Al. SOLUTION ANALYSED DIRECTLY BY ICP. MO CU PB ZN AG AS AU CD SB BI TL

MG SE TE AND GA ARE EXTRACTED WITH MIBK-ALIQUAT 336 AND ANALYSED BY ICP. ELEVATED DETECTION LIMITS FOR SAMPLES CONTAIN CU, Pb, ZN, AS>1500 PPM, Fe>20%.

- SAMPLE TYPE: P1 ROCK P2 TO P17 SOIL      AU+ - AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.

Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: JUN 3 1997 DATE REPORT MAILED: Jan 13/97 SIGNED BY: D.TOEY, C.LEONG, J.WANG; CERTIFIED B.C. ASSAYERS
