GEOLOGICAL, GEOPHYSICAL AND GEOCHEMICAL REPORT ON THE DOBBIN CLAIM GROUP, WHITEROCKS MOUNTAIN, KELOWNA, B.C.

Vernon, Nicola, Osoyoos Mining Division

For:
Verdstone Gold Corp., Molycor Gold Corp.,
2A 15782 Marine Dr., White Rock, B.C. V6B 1E4

By

Andris Kikauka, P.Geo.
4-6 4901 East Sooke Rd.,
Sooke, B.C. V0S 1N0

Feb. 28, 2001

TABLE OF CONTENTS AND LIST OF FIGURES

LIST OF FIGURES AND APPENDIX

1.0 INTRODUCTION

This report was prepared at the request of Verdstone Gold Corp./Molycor Gold Corp. to describe and evaluate the results of trenching and magnetometer geophysics carried out on the Alfy 1-5, Pt 1, Cr 1, and My 18 claims (part of the Dobbin claim group), which straddles the edge of the Nicola, Osoyoos and Vernon Mining Divisions. The Dobbin claim group is located 26 km WNW of Kelowna, B.C. and 17 km. NE of the Brenda Cu-Mo Mine.

Field work was undertaken for the purpose of evaluating economic mineral potential of the Dobbin claim group.

Field work was carried out from Sept. 29-Nov.15, 2000 by Andris Kikauka (geologist), Frank Renaudat (geotechnician), and Neill's Mining (drill and blasting contractors) under the supervision of Larry Reaugh and John Fisher. This report is based on published and unpublished information and maps, reports and field notes.

2.0 LOCATION, ACCESS & PHYSIOGRAPHY (FIG. 1,2)

The east portion of the Dobbin claim group is located 26 km WNW of Kelowna, B.C. at the headwaters of Lambly and Powers Creeks which both drains east into Okanagan Lake. The west portion of the claim group is at the headwaters of Alocin Creek, a tributary to the Nicola River (Fig. 1,2).

The claims are located on Map Sheet NTS 92 L/4 W and 82 E/13 W at latitude 50 01' N and longitude 119 46' W.

Road access is via the Bear Creek Main logging road, which originates at the Bear Creek Provincial Park on the west shore of Okanagan Lake. The Bear Creek Main road is followed to signpost km. 17 where a spur road heads west for about 7 km. to Tadpole Lake. At the northeast end of Tadpole Lake, a spur road heads south up a ridge that parallels the east shore of the lake. This road is followed for about 2.5 km. to the Dobbin copper showings.

The property elevation ranges between 1,600-1,900 m. (5,248-6,232 ft.). The area is heavily forested with pine and some spruce in low lying areas. Semi-arid, cool climate conditions prevail. The recommended field season is April-December, because of snowfall accumulations January-March.

3.0 PROPERTY STATUS (FIG. 2)

The property consists of 38 claims owned by Verdstone Gold Corp./Molycor Gold Corp.(Fig.2). Details of the claims are as follows:

CLAIM	RECORD NO.	UNITS	RECORD DATE	EXPIRY DATE
Pt 5	374911	20	March 19, 00	June 8, 01
Pd 1	374905	1	March 17, 00	June 8, 01
Pd 2	374904	1	March 17, 01	June 8, 01
Pd 3	374906	1	March 17, 01	June 8, 01
Cr 1	380642	4	Sept. 14, 01	June 8, 01
Tuff	376021	6	April 27, 01	June 8, 01
Alfy 13	376022	1	April 28, 01	June 8, 01
Alfy 14	376023	1	April 28, 01	June 8, 01
Alfy 15	376024	1	April 28, 01	June 8, 01
Alfy 16	376025	1	April 28, 01	June 8, 01

The claims listed above total 166 units, which are contiguous and have been grouped together to form the Dobbin claim g roup (Mineral Titles event # 3156185). The total area covered by the claims is 4,150 hectares (9.960 acres). A $5,000 bond is posted by Verdstone/Molycor under reclamation permit # MX-4-303 (work approval # KAM 2000-0400408-619).

The writer is not aware of any regulatory problem that would adversely affect mineral exploration and development on the Dobbin claim group, with the exception of the southeast portion of Pt 1 and the southwest portion of Pt 2 claim which border the north end of Cameo (Cameron) Lake (Ministry File # 16210-20/OSLRMP). The LMRP committee (Process Co-ordinator, Steve Carr, Vernon Forest District, 2501 14th Ave, Vernon, BC V1T 8Z1; Tel: 250-558-1700; fax 250-549-5485) has recommended the 500 meter perimeter of Cameo Lake be excluded from mineral tenure. Mr. J. Britton, Regional Mineral Lands Planner has recommended a delay of the establishment of the protected area adjacent to Cameo Lake in order to carry out further property assessment and establish a geological/ecological boundary.

4.0 AREA HISTORY

The Okanagan Batholith is a Middle Jurassic alkaline to calc-alkaline complex that covers a 40 X 30 km area between Summerland and Princeton, B.C. A prolific mining district is related to the margin phases of the Okanagan Batholith intrusive complex which contains the following mineral deposits:

DEPOSIT	TONNAGE	GRADE	TOTAL BASE METAL PRODUCTION	TOTAL PRECIOUS METAL PRODUCTION
Tulameen District, Gold and Platinum Placer Gravels	No records	No records		100,000 ounces Au 20,000 ounces Pt, (Rice, 1947)
Hedley Camp, Nickel Plate, Hedley Mascot	4,020,000 tonnes	0.380 ounces/ton Au	Ore contained variable amounts of copper sulphides averaging less than 0.3 % Cu	1,678,102 ounces Au (Ray, et. al., 1987)
Copper Mountain	32,000,000 tonnes	1.08 % Cu 0.005 ounces/ ton Au	691,200,000 pounds Cu	182,420 ounces Au
Ingerbelle, Similco	141,000,000 tonnes	0.47 % Cu 0.004 ounces/ton Au	1,325,400,000 pounds Cu	564,000 ounces Au
Lodestone Mountain	205,970,000 tonnes	17.56 % Fe, 0.2 % Ti, 3 pounds/metric ton vanadium (Hancock, 1988)		
Apex, Star	181,436 tonnes	34.0 % Fe (Hancock, 1988)		
Axe	115,000,000 tonnes	0.36 % Cu		

Granite Mountain	80,000 tonnes	0.265 ounces/ton Au		
Brenda Mine	159,000,000 tonnes	0.183% Cu, 0.049% Mo	271,983 tonnes Cu, 65,469 tonnes Mo	

Most of the base and precious metal deposits in the Okanagan Batholith area are hosted in Mesozoic and older age rocks. The major deposits, such as Hedley Camp and Copper Mountain deposits were formed during the Early and/or Middle Jurassic, approximately 169-208 Ma. The Brenda Cu-Mo deposit is dated Late Jurassic/Early Cretaceous, approximately 144 Ma.

Copper Mountain/Ingerbelle/Similco is located 11 km southwest of Princeton, B.C. The Copper Mountain/Similco-Ingerbelle Porphyry Cu-Ag-Au deposit has produced 173,000,000 tonnes @ 0.58% Cu and 0.005 opt Au. Copper Mountain is classified as a alkalic volcanic type porphyry copper deposit characterized by subvolcanic stocks, plugs, sills and dyke swarms. The country rock at Copper Mountain consists of steeply dipping easterly striking flows and tuffs of the Nicola Group. This sequence is cut by the Copper Mountain Stock and the Lost Horse Complex alkaline diorite, monzonite, and syenite. Copper-gold mineralization occurs predominantly as chalcopyrite, with or without bornite in veins, both within the Nicola Group volcanics and at the contact with the Copper Mountain Stock and the Lost Horse Intrusive Complex (Stanley, 1993).

The Nickel Plate and Hedley Mascot (owned by Corona Resources) is Canada's largest gold skarn deposit. The deposit is situated 29 kilometers (18 miles) southeast of the New Dot property. Nickel Plate gold skarns are localized adjacent to a series of flat massive porphyritic diorite sills, with minor gabbro phases near the base of the sequence. Pervasive silicification occurs as a blanket-like alteration halo surrounding the gold bearing zones (Ray, et. al., 1987). Production from underground workings total 3,600,000 tonnes of 0.408 opt Au and from Corona Resources open pit, production figures were 8,250,000 tonnes of 0.080 opt Au. At Nickel Plate Mine, auriferous arsenopyrite and bismuth telluride ore occurs at margins of a pyroxene skarn zone between limy silicates rocks and porphyry sills of the Middle Jurassic Hedley Intrusions (Rublee, 86). The Hedley intrusions are mapped as the Stemwinder, Aberdeen, Toronto, Banbury, Pettigrew and Larcan Stocks. The Hedley Intrusion consists of hornblende porphyritic diorite and gabbro, equigranular diorite and gabbro, mafic diorite and gabbro, quartz diorite and rare quartz gabbro. The Hedley Intrusion is mineralized with arsenopyrite, pyrite, pyrrhotite, chalcopyrite, bornite, bismuth and/or tellurium minerals, magnetite, malachite, and scheelite. Assays of 0.5% platinum, occurring as sperrylite ($PtAs_2$), were reported from the residue at plates on the stamp mill at the mine.

Goldcliff Resources Corp reports grades of 0.526 opt Au over unreported widths from pyroxene skarn hosted sulphides on the York Prospect located adjacent to the Nickel Plate property.

The Brenda Cu-Mo porphyry deposit located 22 km. West of Peachland, B.C., milled 177,000,000 tonnes @ 0.17% Cu and 0.043% Mo. Mineralization is confined to an irregular shaped zone about 720 X 360 m to a depth of 300 m (Weeks, 95). Mineralization consists of chalcopyrite, molybdenite, pyrite, magnetite, with trace bornite, specular hematite, sphalerite, galena. Mineralization is confined almost entirely to veins, except in altered dykes and intense hydrothermal alteration which may contain disseminations. The grade of the orebody is a function of the fracture density and the thickness and mineralogy of the filling material.

Fairfield Minerals Ltd. Elk (Siwash North) gold-quartz vein system contains approximately 121,000 tonnes @ 0.740 opt Au and 1.03 opt Ag. Huntington Res Ltd. Brett Bonanza Zone located about 22 km west of Vernon, contains an estimated 12,000 tonnes @ 1.140 opt Au.

The only recorded platinum production in British Columbia is 20,000 ounces of 'white gold' from the placer deposits along the Tulameen River drainage. The headwaters of the Tulameen River are underlain by the Tulameen Complex, a northwest trending elongated ultramafic-gabbroic body that has been emplaced into Upper Triassic Nicola Group metasedimentary and metavolcanic rocks. Ultramafic rocks within the Tulameen intrusive form assymetrically zoned, steeply dipping plugs, enclosed by an older alkalic (potassium rich, silica undersaturated) gabbroic suite (Findlay, 69). The Tulameen intrusive is an 'Alaskan Type Ultramafic Complex' which is interpreted as a crudely zoned dunite core surrounded by shells of olivene pyroxenite and hornblende clinopyroxenite. Assays exceeding 1.0 opt Pt have been obtained from the Grasshopper Mountain area located in the northeast edge of the ultramafic complex. Highest platinum concentrations come from podiform chromitite as well magnetite horizons in hornblende clinopyroxenite (Nixon, 91).

The Tor prospect, located 10 km northwest of Princeton, B.C. contains gold, silver, platinum, palladium, rhodium enriched mineralization hosted in dacitic to basaltic porphyritic flows and agglomerates of the Middle and Upper Cretaceous Spences Bridge Group. Alteration assemblage at the Tor prospect includes minor epidote, carbonate and argillic alteration. This property is held by Noble Metal Group Inc. which have performed diamond drilling and bulk sample testing between 1988 and 1992.

5.0 PROPERTY HISTORY

1929- Copper mineralization is reported in the Dobbin area (E and SE zones adjacent to Whiterocks Mountain). Limited work is documented in the Annual Report of the Minister of Mines, B.C. 1929. A grid is cut near the north end of the property.

1966- Phelps Dodge carried out a reconnaissance stream sediment geochemical survey. A strong Mo anomaly was located directly west of Tadpole Lake. Some follow-up soil sampling was performed.

1967- Texas Gulf Sulfur acquired the property and conducted an extensive Mo soil geochemical survey detects the presence of a 1.4 X 1.2 km. soil anomaly centered NW of Tadpole Lake. The Mo anomaly coincides with a quartz porphyry stock of similar size as the soil survey Mo zone.
1968- Work by I. Greg and G. Shell; 3 diamond drill holes giving the following results:

DRILL HOLE	TOTAL DEPTH	% Cu
#1	43.0 ft.	0.38
#2	26.0 ft.	0.18
#3	112.0 ft.	0.32

Platinum group elements were not analyzed.

1969- Atlas Explorations Ltd. performs trenching, soil geochemistry, IP and magnetometer geophysics. Geological mapping of trenches shows disseminations and clots of chalcopyrite and bornite are associated with above average magnetite and are hosted by mafic units. I.P. survey outlined four N-S elongated, 0.2 X 0.6 km. areas of high chargeability. The fifth anomaly, which coincides with ENE-WSW elongated, 0.3 X 0.4 km. high chargeability coincides with the central Dobbin Cu showings. The magnetometer survey outlines a broad total field increase NE of the central Cu showings, with isolated profile peaks aligned roughly N-S. The main Cu soil anomaly (with 8 samples >1,000 ppm Cu) is centered on the east margin of the central Cu showings. Several smaller anomalies were located N, NE, SW and SE of the central Cu showings. The N and NE soil anomalies are coincident with mag highs. Geoquest Resources drilled a vertical to 400 feet depth in the middle of the central Cu showing which returned 0.3% Cu over the entire length of the hole. Platinum group elements were not analyzed.

1974- Rockel Mines drilled 3 diamond drill holes, a total of 1,195 ft. (deepest hole depth 575 ft.) located near the 1972 hole. The grades were in the range 0.1-0.4% Cu, with intervals up to 147.0 ft.

1977- Cominco acquires the claims and mapping, soil geochemistry and magnetometer geophysics is carried out resulting in a 4.0 X 6.5 km. grid area centered near Tadpole Lake. Soil samples have anomaly thresholds of 100 ppm for Cu and Zn, and 20 ppm for Mo which confirms the presence of an extensive Mo soil anomaly centered at the west edge of Tadpole Lake. The mag survey locates 5 strongly anomalous areas (> 5,000 gammas), one of these anomalies is the central Cu showings. Cominco's drills 2,560 ft. of percussion (9 holes) at the Mo bearing quartz porphyry west of Tadpole Lake, and 590 ft. (2 holes) at the Dobbin Cu located near the central Cu showings and 1 km. NE of the main showing. PDH #DP-78-11 (a vertical hole collared on the west edge of the central Cu showings) intersected 0.18% Cu in the last 20 ft. of the hole (@220-240 ft.). Platinum group elements were analyzed as composite samples (50 foot widths) from the two drill holes and returned values below 100 ppb.

1982- David Mehner publishes the Geology of the Whiterocks Mountain Alkalic Complex, as partial fulfilment of a M.Sc. thesis for the University of Manitoba. Highlights of his work are summarized as follows:

Amphiboles in the mafic units consist of ferrohastingsite and hornblende which replaces aegirine-augite. Epidote usually occurs as fracture coatings and as the groundmass for late stage veins and dykes.
Copper distribution within various rock types is summarized below:

LITHOLOGY	RANGE ppm Cu	MEAN ppm Cu	MEDIAN ppm Cu
Amphibole pyrox.	129- 5,500	853	327
Biotite pyroxenite	6- 357	142	88
Honblendite dykes	70- 400	267	330
Mafic syenite/monz.	56- 173	114	111
Leuc.qtz.monzonite	1- 11	6	5

The amphibole pyroxenite shows varying degrees of deuteric alteration, such as epidote, chlorite, sericite, calcite, hornblende and poikilitic ferrohastingsite.
Sulphides (pyrite and lesser chalcopyrite) are most common in areas with abundant epidote and locally constitute 5% of the rock, but average 1%. Copper mineralization postdates primary pyroxenes, and occurs as disseminations, blebs, clots, stringers and fracture fillings associated with ferrohastingsite replacing partly corroded aegirine-augite.

The mineralization process is a result of magmatic differentiation, i.e. Cu and S are enriched in the melt of a fractionating magma until conditions were suitable for crystallization. The slightly more "evolved" melt was responsible for the formation of ferrohastingsite (after aegirine-augite) and K-spar with which Cu bearing mineral assemblages are associated. K-Ar age dates from a quartz monzonite aplite dyke and 5 quartz monzonite samples from the calc-alkaline portion of the stock gave an age date of 147 Ma (similar age of the emplacement as the Brenda Cu-Mo stock). The alkali complex may be older and shares numerous petrochemical affinities to the Kruger alkali complex which is located east of Hedley, and Copper Mountain, SW of Princeton. Both the Kruger, Copper Mtn., and Whiterocks alkali complex are on the edge of the Okanagan Batholith, and may be the oldest phases of the complex.

1986- Documentation of platinum occurrences in B.C. are summarized by V. Rublee, in Open File 1986-7. In contrast to the more familiar Alpine and Ni-Cu types of P.G.E. deposits which occur in B.C., Rublee lists alkalic hosted P.G.E. occurrences (of which the Dobbin Cu-Pt-Pd showings are classified) as a miscellaneous type, which are associated with copper mineralization in pyroxenite-syenite gangue. One of the better documented occurrences is the Franklin Camp Eocene Coryell augite-syenite stock located at the headwaters of the north fork of the Kettle River. Sperrylite (Pt,As2) is closely associated with sulphides and platinum values are proportional to the primary copper sulphides, mainly chalcopyrite.

1997-Verdstone /Molycor Gold Corp performed core drilling of the Dobbin Central Anomaly Zone. DDH 97-21, a vertical hole collared 105 m west of the discovery trench returned 111 m garding 0.19% Cu, 0.41 g/t Pt, and 0.35 g/t Pd.

Between July 30, 1997 and Sept.3, 1997, twenty drill holes (DDH 97-8 and 97-19 non-existent) were collared from 16 drill sites. BQTW diamond drill core was logged and mineralized sections sampled at 3.0 meter intervals. Split in half with a core splitter, and shipped to Chemex Ltd., N.Vancouver, B.C. for 30 element ICP and based on results a portion of these samples were sent for Au,Pt,Pd assay.

A total of 300 soil samples were taken with a grubhoe from a depth of 20-40 cm. In the 'B' horizon of the soil profile. Samples were placed in marked kraft envelopes, the site was marked with flagging, and samples shipped to Chemex Labs Ltd., N..Vancouver, B.C. for 30 element ICP analysis. Soil sampling results show widespread copper e.g. >5% of samples >500 ppm Cu. The strongest Cu in soil anomaly is within 500 m north and south of the Central Anomaly Zone. There are several broad Cu in soil anomalies 500-1000 m east and west of the Central Anomaly Zone which appear to have hydrothermal breccia and/or vein texture in underlying outcrop.

Two samples from DDH 97-2 @ 23.5 m. and @ 28.0 m. depth were sent to Vancouver Petrographics for prepared and described as polished thin sections

An estimate of copper and platinum/palladium resources is indicated by a total of 20 diamond drill holes. The work program was carried out from June to October, 1997 under the supervision of Andris Kikauka, John Fisher and Larry Reaugh. This report is based on assay information (certified by registered assayers) from Bondar-Clegg and Chemex (N.Vancouver, B.C.) and diamond drill records written by Andris Kikauka..

This resource evaluation is based on the following criteria:

1) Drill sections are inferred to represent 25 X 25 m area of influence

2) Assay blocks were defined to the halfway point to the next and/or previous drill hole

3) Tonnes= area X thickness X specific gravity

4) Specific gravity of pyroxeninite and/or gabbro calculated @ 3.1 tonnes/m^3

5) Low grade material (<0.1% Cu, 0.1 g/t Pt, 0.1 g/t Pd) on the edge of mineralized zones has been cut off to minimize the effect of low grade mineralization

GEOLOGY: The mineralized zone known as the Central Anomaly is based on geological interpretation of data from diamond drill core assays from DDH 97-1,2,3,7,8,16,20,21,22 which are summarized as follows: SECTION L 0+00 N: This section shows the Central Anomaly mineral zone from 0+00 W to 1+05 W and includes DDH 97-1,2,3,7,8,16,20,21.
SECTION L 0+37 N: DDH 97-22 is located on this section and represents the northern continuity of the Central Anomaly zone.

DOBBIN Cu-Pt-Pd RESOURCE EVALUATION

HOLE #	SECTION	AREA (m^2)	WIDTH (m)	TONNES	Kg. Cu	gm. Pt	gm. Pd	gm. Pt+Pd
97-1	L 0+00 N	625	15	29,062.5	56,671.9	7,091.3	4,417.5	11,508.8

TOTAL GEOLOGICAL INDICATED TONNES= 1,503,214.5
@ 0.192 % Cu, 0.237 g/t Pt, 0.196 g/t Pd
GEOLOGICAL INDICATED RESERVE OF 1,503,214.5 TONNES CONTAINING:
2,894,112.7 Kg Cu, 356,289.4 gm Pt, 294,390.9 gm Pd, 650,680.3 gm Pt + Pd

2000- David Makepeace prepares a summary review of the Dobbin property for Verdstone and Molycor Gold Corp. Based on numerous untested hydrothermal breccia zones which are mineralogically similar to the Dobbin Central Zone, Makepeace recommends a 2 phase $1,600,000.00 program of core drilling and geological evaluation.

2000- The Ministry of Energy and Mines (Colin Dunn, Gwendy Hall, & Graham Nixon) performed orientation mapping, soil and vegetation sampling on the Dobbin main zone (0-2 km west of Whiterocks Mountain) and the Roy showing (1-2 km north of Lambly Lake). Vegetation samples consisted of Engelmann Spruce and at a few sites twigs from sub-alpine fir, rhododendron and blueberry were clipped and analyzed (Dunn, 00). The study shows slight enrichment of Br and I in soil samples and subtle enrichments of Bi, Ag, Mo, Cu, Pb, and Cs associated with known Cu-PGE mineralization. Although not presented as a formal conclusion, the data suggests there is a poorly defined correlation of Pt and Pd in soils with significant drill hole intercepts, but Pt appears to correlate better than Pd as a soil pathfinder element . This may in part be due to fact that most Cu-PGE bearing samples from the Dobbin prospect contain Pt/Pd ratios in the range of 1.0-1.4.

2000- Fieldwork by the Ministry of Energy and Mines geologists, Graham Nixon and Brent Carbno on the Whiterocks Alkaline Complex consisted of geological mapping, geochemical rock, soil and plant sampling. The study concludes that the Dobbin is a base and precious metal (Cu+Au+Ag) geological environment associated with alkaline intrusive complexes as well as calc-alkaline intrusions. The Mo-Re (Ag+Cu+Pb+As) bearing sulphide mineral assemblages are relatively rare on the Dobbin, but DDH 97-01 cut molybdenite stringers at 30.0-33.0 m, suggesting a calc-alkaline intrusion is cutting and/or being cut by more abundant alkaline intrusive masses. The study noted that apatite and magnetite are associated with Cu-PGE mineralization in DDH 97-21 (Nixon, 00). The host rock for Cu-PGE mineralization is hornblende clinopyroxene which contains 1-5% epidote and chlorite, trace-0.5% chalcopyrite and bornite, and 1-10% magnetite. The hornblende clinopyroxene is depleted in MgO as well as Ni-Cr. Lithogeochemical assay of sample GNX-60-1 from diamond drill hole 97-21 gave values of 3.32 g/t Pt and 2.65 g/t Pd. The combined 5.97 g/t Pt+Pd is the highest noble element assay taken on the property thus far.

The area 4-6 km south-southeast of Whiterocks Mountain was mapped in the vicinity of the Roy Ti-Fe magnetite occurrence. The Roy showing is about 1,000 m north of Lambly Lake and coincides with a sharp 2,000 gamma total field aeromagnetic positive anomaly (GSC aeromag map, 68).

Based on the association with Cu-PGE mineralization, the hornblende clinopyroxene is postulated to have evolved from sulphide saturated magma. Although complicated and/or enhanced by hydrothermal overprinting, there is a possibility that the Cu-PGE mineralization hosted in hornblende clinopyroxene intrusive is of magmatic origin. Given that there is a genetic link to magmatic segregation and Cu-PGE values, the distribution of Cu-PGE bearing mineralization on the Dobbin prospect is closely related to the following:
1) Lithology: Hornblende clinopyroxene phase and biotite pyroxenite.
2) Stratigraphic controls: Igneous laminations, layering and/or radiating cupola forming large scale patterned features.
3) Structural controls: Fracture density, faults, e.g. pervasive biotite veining which post dates Cu-PGE mineralization, but has Cu-Au mineralization, e.g. Dobbin NE Zone.

6.0 GENERAL GEOLOGY (FIG. 3)

Whiterocks Mountain area lies near the east margin of the Intermontane Belt within Quesnellia terrain (Harper Ranch subterrane). The oldest rocks in the Whiterocks Mountain area are Mississipian Chapperon Group which are cut by ultramafic sills and dykes. Unconformably overlying Chapperon Group are Mississipian-Triassic age Thompson Assemblage which consists of metamorphosed argillite, siltstone, quartzite, conglomerate, limestone, andesite/rhyolite tuff and flows. In the west and northwest portion of the Dobbin claim group, ultramafic bodies within the Chapperon Group, known as the 'Old Dave Intrusions' are probably remnants of an abducted sliver of oceanic crust emplaced within a Paleozoic subduction complex (Nixon, 01).

The Lower Cretaceous/Middle Jurassic (or older ?) Whiterocks Mountain Alkaline Complex occupies an area of about 9 km^2 and the mafic and ultramafic rocks are restricted to the edges of the complex. The 'Central Anomaly Zone' hosts disseminated Cu-Pt-Pd bearing mineral zones which consist of mafic syenite/monzonite, alkali pyroxenite, porphyritic monzonite, and leucocratic quartz monzonite. The alkali complex cuts the Thompson Assemblage sequence of volcanics and sediments. A younger Upper Jurassic/Lower Cretaceous age calc-alkaline complex cuts all of the above. Porphyry Mo mineralization within the calc-alkaline complex (Tadpole Lake) is related to a quartz porphyry stock 3 km. NW of the alkaline complex and is referenced as the Mount Sandberg Pluton (Nixon, 01).

Major mineral deposits within or near the Okanagan Batholith include Copper Mountain Cu-Ag-Au deposit, which is dated Early-Middle Jurassic, Hedley Camp Au Early-Middle Jurassic, Brenda Cu-Mo dates an Early Cretaceous ages of emplacement.

Additional mineral deposit types which occur within the Dobbin claim group include "Chrome Ridge" and "Alocin Chrome" chromite-magnetite pods hosted in serpentinized harrzburgite. There is a NW trending ridge axis north of Cameo Lake and west of Eileen Lake respectively. The Dobbin claim group has several gold bearing quartz veins related to a quartz diorite stock, in the area 500-1200 m west of Tadpole Lake. Two km south of the Dobbin Cu-PGE "Central Zone" there is a Cu sulphide occurrence in metasediments. Another similar Cu-Ag occurrence is noted two km southwest of the "Central Zone". Geological mapping in the area of the 1968 GSC Aeromagnetic positive 2000 nT anomaly 700 m north of Lambly Lake which correlates with the "Roy" Fe-Ti minfile occurrence, has led to the identification of textures and lithology similar to the "Central Zone", i.e. hornblende clinopyroxene bedrock exposed over a 250 X 1200 m area.. This favorable geological environment for Cu-PGE mineralization has led to the acquisition of additional mineral claims covering the Lambly Lake aeromagnetic anomaly. Future detailed geological mapping and sampling is warranted

7.0 2000 WORK PROGRAM

7.1 METHODS AND PROCEDURES

During Sept. 29 to Nov. 15, 2000 a program of trenching, magnetometer geophysics and geological mapping and rock chip, soil and stream sediment sampling were carried out on the Alfy 1-5, My 18 claims, part of the Dobbin claim group. Nine (9) stream sediment samples (DST 1-9) were taken with a shovel and screened through -80 mesh screen. The fines were placed in marked kraft envelopes, dried and shipped to Chemex Labs, N. Vancouver, B.C. for 30 element ICP and Au-Pt-Pd geochemical analysis. Forty seven (47) soil samples were taken on the Chrome Ridge chromite showings on the north end of Pt 1 claim (Fig. 12). All soil samples were taken with a shovel from a depth of 30-50 cm, placed into marked kraft envelopes, dried and shipped to Chemex Labs, N. Vancouver, B.C. for 30 element ICP geochemical analysis. The rock chip samples were taken from outcrop that was drilled to a depth of 1.0-1.5 m and blasted with 60% forcite to expose a narrow channel for sampling and geological mapping. Approximately 100

short trenches were excavated on bedrock and a total of 182 rock chip samples were taken across widths ranging from 0.3-4.0 m, but over 95% of the samples were taken across a 3.0 m width (similar to the 1997 drill core which was consistently sampled at 3.0 m intervals). Total distance of trenching was 540 m from six zones all within the 2 X 2 km area immediately west of Whiterocks Mountain (Fig. 5). All 182 rock samples were sent to Chemex and 18 of the higher grade samples were checked assayed for 30 element ICP and Au-Pt-Pd geochem at Bondar-Clegg, N. Vancouver, B.C. (Appendix B).

Magnetometer grids were surveyed to tie into the existing east-west trending grid lines. A total of 11.52 km line grid was surveyed (Fig. 6-13). All the grid lines between Tadpole Lake and Whiterocks Mountain (Fig. 6-11) run east-west and were surveyed by chain and compass relative to a common N-S trending baseline which originates at the collar of DDH 97-1. All grid lines on Chrome Ridge and Dobbin Chrome, located west of Eileen Lake (Fig. 12 & 13), were surveyed at 055 azimuth with a 145 azimuth baseline. All grid line stations were marked at 25 m intervals with flagging. Magnetometer readings were taken with a Geometrics G-836 Proton Precession Magnetometer. The magnetometer was tuned to the local total field (about 57,000 gammas) and all readings were corrected using looping. All raw data readings were then converted to either positive or negative values using 57,000 gammas as a base value. Thus the data presented in Appendix C is given as values above 57,000 gammas (as a positive integer) and below 57,000 gammas (as a negative integer).

7.2 PROPERTY GEOLOGY (Fig. 5)

The following lithologies were recognized within the Whiterocks Mountain Alkalic Complex:

UPPER JURASSIC-LOWER CRETACEOUS (& OLDER ?)

5b Leucocratic, pophyritic quartz diorite, minor sections containing 0.5-4.0 mm. euhedral to sub-hedral plagioclase phenocrysts, 5-8% biotite, 1-3% horblende, 1-2% chlorite.

5 Leucocratic quartz monzonite, 3-4% biotite, 1-2% hornblende, 1% chlorite, 1% epidote.

5a Porphyritic monzonite, 3-15 cm. microcline phenocrysts, 5% biotite, 3-5% epidote, 2-4% hornblende, 1% chlorite.

4b Biotite pyroxenite, 60% aegirine-augite, 10-15% biotite, 5-10% amphibole, 5-8% magnetite, minor K-spar, carbonate, pyrite, apatite, sphene.

4a Pyroxenite, and porphyritic pyroxenite, 6-10 mm. amphibole phenocrysts, 30-50% aegirine-augite, 30% amphibole, 2% biotite, 3-8% epidote, 5% magnetite, accessory apatite, sphene, minor pyrite.

3 Hornblende gabbro, mafic syenite/monzonite, 30-50% aegirine-augite, 5-40% K-spar, 3% biotite, 1% chlorite, 3% epidote, 10-15% amphibole

UPPER MISSISSIPPIAN TO TRIASSIC THOMPSON ASSEMBLAGE
1 Metasediments and metavolcanics

A compilation of geological data indicates platinum and palladium bearing chalcopyrite and bornite mineralization occurs as disseminations and fracture filling within alkalic clinopyroxene and hornblende gabbro phases of the Jurassic age Whiterocks Mountain Alkalic Complex associated with deuteric (i.e. derived from the primary magma) alteration such as poikilitic amphibole (ferrohastingsite) replacing primary pyroxenes (aegirene-augite) and increased secondary epidote, chlorite, calcite, sericite, garnet and quartz as veinlets, disseminations and fracture coatings. Diamond drill hole data suggests mafic cumulate or marginal phases of Cu-Pt-Pd bearing alkalic pyroxenite and gabbro are localized near the contact of a post-ore, monzonitic microcline porphyry.

The 1997 Verdstone/Molycor core drilling (20 diamond drill holes) in a 150 X 250 m area and outlined the following geological indicated resource evaluation within the Central Anomaly:

Tonnes	% Cu	Kg Cu	g/t Pt	gm Pt	g/t Pd	gm Pd
1,503,214.5	0.192	2,894,112.7	0.237	356,289.4	0.196	294,390.9

The Dobbin Property contains platinum and palladium bearing chalcopyrite, bornite and magnetite mineralization occurring within clinopyroxenite and hornblende gabbro phases of the Jurassic Whiterocks Mountain Alkalic Complex. This type of platinum and palladium deposit (alkaline Cu-Au porphyry affinity) is relatively rare, however geological features of the New Rambler Mine, Medicine Bow Mountains, Wyoming, compare closely with the Dobbin as demonstrated in the following table:

GEOLOGICAL FEATURE	DOBBIN	NEW RAMBLER MINE
Mineralogy of PGE bearing assemblage includes chalcopyrite, bornite, magnetite, malachite, pyrite	x	x
Host rocks are mafic and ultramafic such as pyroxenite and gabbro, gangue minerals include hornblende, epidote, calcite, apatite, garnet	x	x
Strong Bi correlation with increased Cu-PGE values	x	x
Fracture filling and disseminated mineralization present	x	x
Intense brecciation characterizes dilatant zones along multiplane faults	x	x

The main similarities between the Dobbin and New Rambler are mineralogy and evidence of remobilization and redistribution of PGE by deuteric or hydrothermal fluids. Thermochemical temperatures of copper-rich ore, representing the main stage of PGE deposition, suggest deposition of mineral assemblages from New Rambler Mine at 335^0 C (McCallum, 76). The New Rambler and perhaps the Dobbin are relatively rare examples of platinum group element deposit types that have been concentrated by intermediate temperature hydrothermal fluids.

The trenching and mapping program was focused on untested hydrothermal alteration and breccia zones, Cu in soil geochemical anomalies and mag and IP geophysical anomalies along a 1.6 km strike length located north of the Central Anomaly. The secondary areas of interest are located west, south and east of the Central Anomaly where numerous showings occur and several new ones have been found. One of the new showings called the Kenny 2000 breccia zone (Fig. 9) is located 600 m west and 200 m south of the Central Anomaly hub(Fig. 10). The presence of blebs of 1 mm sized chalcopyrite, 3-8% disseminated pyrite with 3-5% magnetite mineralization as well as breccia texture with indurated epidotized wallrock clasts in the Kenny 2000 showing are encouraging because of Cu-PGE values from are similar to those obtained from the Central Anomaly.

7.3 ROCK GEOCHEMISTRY (Fig. 6-11)

The area of detailed mapping and trenching is approximately 4 km^2 (Fig. 5-11). Note that Figure 5 is a 1:7,200 scale showing a compilation of all the zones and Figure 6-11 show the detail mapping at a scale of 1:1,000 as well as gold-platinum-palladium-copper geochemical values from the 182 trench samples taken along a total of 540 m of trenching from 6 main zones (rock chip sample # 599051-599232).

The following summary of significant Cu-PGE values from Fig. 8,9 & 10 highlight the trenched outcrops from year 2000 fieldwork:

Sample #	Zone	Width	Description	g/t Pt	g/t Pd	% Cu
599056	Central Zone SE extension	1.0 m	Biotite pyroxenite, 1% cp., strong malachite	0. 385	0. 748	0. 416
599061	Northeast	3.0 m	Biotite pyroxenite, calcite, magnetite, cp. malachite	0. 015	0. 044	0. 459
599097	Central	3.0 m	Hornblende gabbro, calcite, magnetite, cp., bornite, ep.	0. 625	0. 534,	0. 778
599098	Central	3.0 m	Hornblende gabbro, calcite, magnetite, cp., bornite, ep.	0. 105,	0. 076,	0. 260
599099	Central	3.0 m	Hornblende gabbro, calcite, magnetite, cp., bornite, ep.	0. 110,	0.096,	0. 716
599100	Central	3.0 m	Hornblende gabbro, calcite, magnetite, cp., bornite, ep.	0. 140	0.112,	0. 380
599101	Central	3.0 m	Hornblende gabbro, calcite, magnetite, cp., bornite, ep.	0. 100,	0.0 54	0. 720
599102	Central	3.0 m	Hornblende gabbro, calcite, magnetite, cp., bornite, ep.	0. 195,	0. 158	0. 613
599103	Central	3.0 m	Hornblende gabbro, calcite, magnetite, cp., bornite, ep.	0. 200	0. 182	0. 100
599104	Central	3.0 m	Hornblende gabbro, calcite, magnetite, cp., bornite, ep.	0. 095	0.0 94,	0. 288
599105	Central	3.0 m	Hornblende gabbro, calcite, magnetite, cp., bornite, ep	0. 095	0. 046,	0. 420
599106	Central	3.0 m	Hornblende gabbro, calcite, magnetite, cp., bornite, ep.	0. 215	0. 182,	0. 300
599107	Central	3.0 m	Hornblende gabbro, calcite, magnetite, cp., bornite, ep.	0. 320	0. 360	0. 335
599108	Central	3.0 m	Hornblende gabbro, calcite, magnetite, cp., bornite, ep.	0. 350	0. 260	0. 197
599109	Central	3.0 m	Hornblende gabbro, calcite, magnetite, cp., bornite, ep.	0 .0 95	0. 084	0. 411

Sample #	Zone	Width	Description	g/t Pt	g/t Pd	% Cu
599111	SW ext. Central	3.0 m	Biotite pyroxenite, calcite, magnetite, cp., bornite	0. 145	0. 150	0. 147
599190	SW (Kenny 2000)	3.0 m	Hornblende gabbro, biot.,cal.,py.,ep.,cp. bx	0. 330	0. 202	0. 252
599191	SW (Kenny 2000)	3.0 m	Hornblende gabbro, biot.,cal.,py.,ep.,cp. bx	0. 300	0. 142	0. 185
599196	SW (Kenny 2000)	3.0 m	Hornblende gabbro, biot.,cal.,py.,ep.,cp. bx	0.335	0.282	0.103
599199	SW (Kenny 2000)	3.0 m	Hornblende gabbro, biot.,cal.,py.,ep.,cp. bx	0.320	0.144	0.154

NOTE: Sample 599056 contains 0.264 g/t Au and sample 599061 contains 0.268 g/t Au. All other samples listed average 0.05 g/t Au.

The new showings listed have not been drill tested and are presently being evaluated for potential core drilling sites. The SW Kenny 2000 Zone (Fig. 9) is of particular interest because the zone has been traced for a strike length of over 500 meters with widths of 100 meters. The north end of the Kenny 2000 is a well mineralized breccia pipe with 5-15% sulphides, dense green angular clasts as well as hydrothermal biotite veining and stockwork. Additional sampling of the Kenny 2000 Zone are presently being carried out.

The Chromite-Vanadium showings occur along a northwest trending ridge axis of mafic and ultramafic rocks that coincides with aeromagnetic positive anomalies located in the north end of Pt 1 and the south end of Cr 1 mineral claims (Fig. 2). Detailed soil geochemistry was done (47 samples) on the Chrome Ridge showings on Pt 1 as well as magnetometer surveys (Fig. 12). A magnetometer survey was carried out on the Cr 1 claim on the Alocin Creek chromite showings (Fig. 13). Serpentinized harzburgite in pelitic and volcanic rocks of the Chapperon Group host chromite and magnetite mineralization. Chromite occurs as 1-3 cm lenses and as heavy disseminations with 25-75% chromite in a 20 X 30 cm area. Assays up to 28% chromite were obtained from these lenses (EMPR Assessment Report 6775). Other minerals include altered pyroxene, talc, chlorite, and asbestos. Where shearing or slickensiding is pronounced, lenses of partly developed slip-fibre asbestos and serpentine veinlets have formed. Semi-transparent talc is scattered through most of the ultramafic rock which makes up 10-20% of the Chrome Ridge and Alocin Creek Chromite showings grid area.

7.4 MAGNETOMETER SURVEY (FIG. 6-13)

The magnetometer survey was done over areas of the Dobbin claim group as listed below:

AREA	NUMBER OF GRID LINES	TOTAL METERS SURVEYED	TOTAL NUMBER OF READINGS
FIG. 6 NW ZONE	5	1,250	100
FIG. 7 N CENTRAL ZONE	4	1,200	96
FIG. 8 NE ZONE	4	710	57
FIG. 9 SW ZONE KENNY 2000	6	1,080	87
FIG. 10 CENTRAL ZONE	8	3,100	248
FIG. 11 SE ZONE	4	800	64
FIG. 12 CHROME RIDGE	7	2,275	182
FIG. 13 DOBBIN CHROME CR 1	4	1,100	88

A total of 42 magnetometer survey grid lines give a total of 11.52 km surveyed taking 922 readings. All of the grid lines trend east-west except for the NE trending grid lines on the Chrome Ridge and Dobbin Chrome (Fig. 12 & 13).

A summary of the range of magnetometer total field readings and comments regarding anomalous readings are noted in the following table:

FIG. # and Area Name	Highest Magnetometer Reading	Lowest Magnetometer Reading	Comments
Fig. 6, NW Zone	+9177 (66,177 gammas)	-6650 (50,350 gammas)	This area has the highest range of mag values, but the low reading is a single isolated reading. This area coincides with the major 3,000 gamma GSC airborne mag anomaly and is close to the N Central Zone
Fig. 7, N Central Zone	+8216 (65,216 gammas)	-291 (56,709 gammas)	The N Central zone is an extension of the NW Zone mag anomaly which coincides with the major 3,000 gamma GSC airborne mag anomaly
Fig. 8, NE Zone	+2,710 (59,710 gammas)	-254 (56,746 gammas)	The north end of the NE Zone has some magnetite bearing clinopyroxene with abundant biotite
Fig. 9, SW Zone, Kenny 2000	+5880 (62,880 gammas)	-1413 (55,587 gammas)	Two distinct NNW trending mag high elongate features coincide with abundant biotite veining
Fig. 10, Central Zone	+7906 (64,906 gammas)	-175 (56,825 gammas)	3 distinct zones of >62,000 gammas occur in areas of known Cu-PGE mineralization, i.e. Hub DDH 97-1 and 100 m NE and SW of DDH 97-1
Fig. 11, SE Zone	+2920 (59,920 gammas)	-790 (56,210 gammas)	Mag high coincides with zones of biotite veining
Fig. 12, Chrome Ridge, Pt 1 Claim	+3605 (60,605 gammas)	-6976 (50,024 gammas)	The extremely low readings coincide with magnetite bearing ultramafic rocks and a 2,000 gamma GSC airborne anomaly
Fig. 13, Alocin Chrome, Cr 1 Claim	+1963 (58,963 gammas)	-1110 (55,890 gammas)	The area of known chromite in the trenches does not coincide with any strong mag high or low

7.5 SOIL GEOCHEMISTRY

The Chrome Ridge showing on the north end of Pt 1 claim was sampled along 055 trending grid lines spaced at 50 m. Seven lines were sampled at 25 m intervals for a total of 47 soil samples. Soils range from 21 to 350 ppm Cr and 32 to 838 ppm Ni. There does not appear to be any pattern to distribution of Cr and Ni in soil, but the higher values (e.g. L 1+50 S stn 1+00 E on Fig. 12), occur where apple green coloured serpentine outcrops suggesting this rock unit is nickel chromite enriched.

7.6 STREAM SEDIMENT GEOCHEMISTRY

The 9 samples DST 1-9 were taken 500-1600 m west of Whiterocks Mountain. Samples DST-3, & 7 returned >30 ppb Pt, and DST-9 returned >30 ppb Pd and 554 ppm Cu. Sample DST-9 was taken from a swampy area near surrounded by hummocky topography on L 6+00 S, 4+50 W. Sample DST-9 is located southwest of the Central Zone. Cominco geologists mapped a late stage leucocratic quartz diorite dyke emerging northeasterly from the swampy area where DST-9 was taken, suggesting that the swamp may be a convergent structural feature (i.e. possible convergent fault zone) emerging from this swamp.

8.0 CONCLUSIONS & RECOMMENDATIONS

The Cu-PGE mineralization on the Dobbin Central Zone (Fig. 10) occurs near the vicinity of the grid hub point at DDH 97-1. There is a magnetometer total field increase of >5,000 gammas above background in a 25 X 75 m area, elongated northerly from DDH 97-1 (Fig. 10). This may represent an increased concentration of magnetite peripheral to the known mineralization. The strong magnetic geophysical and coincident Cu/Bi in soil geochemical anomalies occur 100-125 m ENE of DDH 97-1. This area, as well as the 7 others listed below, are worth detailed investigation for extensions and new lenses of Cu-PGE bearing mineralization.

Proposed Work Area, Recommended Type of Work and Figure Number Reference in Brackets	Zone Name Grid Location	Comments
100-125 m ENE of DDH 97-1 , 300-400 m DDH, trenching, (Fig. 10)	Central Anomaly L 1+00 N, 1+00 E to 1+25 E	DDH-97-18 was collared here and missed the ultramafic mass, suggest the collar be moved 50 m uphill and a deeper vertical hole should be collared about 30 m west of the center of the strong magnetometer total field increase.
300-325 m east of DDH 97-1, 300-400 m DDH, trenching (Fig. 10)	Central Anomaly DST-3 stream sediment sample	Taken from very low flow rate, rusty east tributary of Bit Creek near roadcut, geochemical analysis returned 189 ppm Cu and 40 ppb Pt
100-125 southwest of DDH 97-1, 300-400 m DDH, trenching (Fig. 10)	Central Anomaly L 1+00 S, stn1+00 W to 1+25 W	Sample site 599056 should be core drilled to investigate the dimension of this showing which assayed 0.26 g/t Au, 0.39 g/t Pt, 0.75 g/t Pt, and 0.42% Cu across 1.0 m
100-125 southeast of DDH 97-1, 300-400 m DDH, trenching (Fig. 10)	Central Anomaly L 1+00 S, stn 1+00 E to 0+75 E	A 3.0 m sample from here had 0.11 g/t Pt and 0.07 g/t Pd with only 134 ppm Cu.

Proposed Work Area, Recommended Type of Work and Figure Number Reference in Brackets	Zone Name Grid Location	Comments
500-600 m west of DDH 97-1 1,200-1,800 m of core drilling, trenching (Fig. 9)	Kenny 2000 L 0+00 N, and L 1+00 S	Breccia zone, indurated and epidotized angular clasts. 3-8% disseminated pyrite. Magnetometer response shows very NNW 400 m long by 30 m wide linear trend
600-650 m west-southwest of DDH 97-1, 300-400 m core drilling, trenching (Fig. 9)	Kenny 2000 L 3+50 S, stn 5+12 W to 5+50 W	Moderately anomalous Pt-Pd (0.05-0.15 g/t) & strongly anomalous copper (0.1-0.2%) in most samples from a 100 X 400 m area
800-850 m northwest of DDH 97-1, 300-400 m core drilling, trenching (Fig. 6)	NW Zone L 7+00 N, stn 2+00 W to 2+50 W	Coincident mag, IP and Cu in soil anomaly zone. May be related to Kenny 2000 breccia and high pyrite type Cu-PGE mineralization
1200-1250 m east-northeast of DDH 97-1, 300-400 m core drilling, trenching (Fig. 8)	NE Zone L 6+00 N, stn 10+50 E	Cominco's drill hole hit reasobaly good copper. Our best trench from the NE Zone returned 0.27 g/t Au, 0.02 g/t Pt, 0.04 g/t Pd, and 0.46% Cu across 3.0 m
50-150 m northwest of DDH 97-1, 600-900 m core drilling, trenching (Fig. 10)	Central Zone L 0+50 N and L 1+00 N, stn 0+75 W to 1+50 W	This are is in the vicinity of vertical DDH 97-22 which intersected Cu-PGE mineralization from 216.4-312.0 m depth and was collared 82 m west of and 37 m north of DDH 97-1

In addition to the above drill targets, a program of grassroots exploration, (including prospecting, geological mapping, trenching and magnetometer geophysics) is recommended in the area of stream sediment sample DST-9 (L 6+00 S, stn 4+50 W) as well as altered hornblende clinopyroxene located northwest of Lambly Lake (Nixon, 01). Following up GSC airborne magnetic survey anomalies (Map 5207G Shorts Creek 82 L/4 and Map 8522G Peachland 82 E/13) Verdstone/Molycor recently acquired the Fe 1 and Ti 1,2,3,4 mineral claims (43 units) covering the area northwest of Lambly Lake. The GSC airborne magnetic survey shows 3 strong 2,000-3,000 gammas positive peaks on the Dobbin which correlate with magnetite bearing mafic and ultramafic rocks. Magnetometer readings of 4,000-6,000 gamma above background are common in the NW and N Central Zones (Fig. 6 & 7).

The Dobbin property has potential to host a resource of 100,000,000 tonnes @ 0.1-0.3% Cu and 0.4-1.0 g/t Pt+Pd. Recent technological advances in the PLATSOL process (pressure leach and hydrometallurical treatment of base metal sulphide concentrates for the recovery of copper and PGE) enhances the economics of low grade-bulk tonnage ore treatment.

A proposed core drilling program of of the Central Anomaly, SW Kenny 2000, NW, and NE Zones would total about 17,000 feet (5,400 m.). a 1.4 X 0.4 km. area located west of Whiterocks Mountain (Fig. 5). A total of 17 drill holes to a depth of 200-350 meters (656-1,148 feet) are recommended to test 9 targets described in the preceding table. A follow-up phase of core drilling would involve 25-50 meter grid spacing of selected proposed drill holes for detailed geological evaluation.

A proposed Phase 1 budget has been outlined as follows:

PROPOSED BUDGET:		
FIELD CREW- Geologist, 2 geotechnicians, 1 cook X 120 days		$ 69,000.00
FIELD COSTS-	Truck, transportation costs	30,000.00
	Core drilling 17,000 ft. 5,400 m.	540,000.00
	Assays (1,600)	32,000.00
	Equipment and supplies	8,000.00
	Communications	4,000.00
	Food	13,400.00
Management		7,500.00
REPORT		1,800.00
	TOTAL=	$ 705,700.00

Contingent on the results of this diamond drilling program, a follow-up phase of an additional 17,000 feet (5,400 m) of core drilling, as well as bulk sampling, geostatistical evaluation of volume, mass and grade of deposit, and engineering evaluation of ore reserve, cut-off grade, mineralization lost, design dilution, environmental baseline studies, integrated resource management and reclamation plans, etc. would be required to assess the profitability of the Dobbin project. The total cost of phase 1 and 2 would be approximately $2,000,000.00

CERTIFICATE

I, Andris Kikauka, of Vancouver, B.C., hereby certify that;

1. I am a graduate of Brock University, St. Catharines, Ont., with an Honours Bachelor of Science Degree in Geological Sciences, 1980.

2. I am a Fellow in good standing with the Geological Association of Canada.

3. I am registered in the Province of British Columbia as a Professional Geoscientist.

4. I have practised my profession for eighteen years in precious and base metal exploration in the Cordillera of Western Canada and South America, and for three years in uranium exploration in the Canadian Shield.

5. The information, opinions, and recommendations in this report are based on fieldwork carried out in my presence on the subject properties and on published and unpublished literature and maps.

6. I have a direct interest with Verdstone Gold Corp and Molycor Gold Corp & the subject property.

7. This report is intended for the purpose of filing a statement of work and is not intended for purposes of public financing.

Andris Kikauka, P. Geo.,

Feb. 28, 2001

ITEMIZED COST STATEMENT- DOBBIN CLAIM GROUP, Sept. 29-Nov. 15, 2000
VERNON, NICOLA AND OSOYOOS MINING DIVISIONS

FIELD CREW:	
A. Kikauka (Geologist) 43 days	$ 9,675.00
F. Renaudat (Geotechnician) 22 days	3,850.00
FIELD COSTS:	
Mob/demob	2,350.00
Assays 182 rock samples 30 element ICP Au-Pt-Pd geochem	5,460.00
9 silt samples " " " " " " "	270.00
47 soil samples " " " No Au-Pt-Pd	1,034.00
Niell's Mining (546 m length, 1-2 m width and depth)	
of short trenching on Alfy 1-5, My 18 claims (by contract)	37,500.00
Food & Accommodation	3,375.00
Equipment Rental (Drill, compressor, tools, etc.)	1,225.00
Report	575.00
Total =	$ 65,314.00

END OF DATA

DOBBIN Cu-Pt-Pd-Au PROJECT, WHITEROCKS MTN., KELOWNA, B.C.

Sample #	Northing	Easting	Zone Name	Description ppb Au, Pt, Pd, ppm Cu
DST-1	5542320	301200	Central Zone SE extension	Bit Ck silt, low water flow **6, 10, 6, 86**
DST-2	5542490	301320	Central Zone SE extension	East tributary to Bit Ck. silt sample, low water flow **4, 5, 2, 44**
DST-3	5542590	301180	Central Zone SE extension	East tributary to Bit Ck silt sample very rusty, very low water flow **10, 40, 12, 189**
DST-4	5543240	301350	N central	West tributary to Bit Ck, dry creekbed **14, 5, 4, 42**
DST-5	5542090	301890	SE	Dry creekbed below mineralized hornblende gabbro/pyroxenite **4, 5, 6, 129**
DST-6	5543470	301140	N central	Soil sample on massive biotite pyroxenite outcrop **2, 5, 4, 61**
DST-7	5542980	300905	N central	Soil resample of 550 ppm Cu in soil **4, 30, 8, 87**
DST-8	5542500	300360	SW	Soil sample beside mineralized hornblende gabbro outcrop **2, 5, 4, 100**
DST-9	5541900	300635	SW	Soil resample of 521 ppm Cu @ L 6+00 S, stn. 4+50 W **8, 15, 32, 554**
599051	5543100	301980	NE	0.3 m wide, magnetite vein in medium grain hornblende gabbro **26, 10, 16, 246**
599052	5542110	301890	SE	2.0 m Amphibole pyroxenite, minor biotite, trace cp **16, 10, 22, 478**
599053	5543200	300700	NW	2.0 m Hornblende gabbro, 3% diss. py., trace cp **2, 5, 20, 268**
599054	5543070	302030	NE	1.0 m Biotite pyroxenite, breccia texture trace cp., mal. **46, 15, 48, 1165**
599055	5543030	301110	N central	1.0 m Amphibole pyroxenite, trace cp., mal **54, 15, 110, 2170**
599056	5542400	300810	Central Zone SE extension	1.0 m Biotite pyroxenite, 1% cp., strong malachite **264, 385, 748, 4160**
599057	5542180	300205	SW	1.0 m Biotite pyroxenite, cp, mal., breccia texture **14, 25, 54, 2120**
599058	5543050	302015	NE	3.0 m Biotite pyroxenite, trace py., cp. **28, 5, 28, 510**
