## LIST OF APPENDICES

## 1.0 INTRODUCTION

### 1.1 Location and Access

The Swift Katie group of claims lies approximately 7.0 km southwest of the township of Salmo, B.C. (Figures 1, 2 & 3). The property is accessed from Salmo via 2 km of paved highway - Highway #3 south of the town, and from there along 6.75 km of gravel logging roads which parallel Hellroaring Creek and it's northern tributary. There is good access to most areas of the claim group along logging roads which are generally in fair to good condition.

Most of the southeastern portion of the Swift Katie mineral property is on surface lands owned by Beaumont Timber Company Ltd. (forest plantation). Beaumont's northern boundary is at ~5443775Nm NAD83. North of that line it is Crown Land under timber license to Atco Lumber Ltd. Only the most northerly four holes of the Katie deposit drilling lie outside of Beaumont's surface lands.

### 1.2 Physiography

The Swift Katie group of claims lies within the Omineca belt in the southern Selkirk Mountains.

The Katie area is composed of an oval shaped valley bottom surrounded by ridges to the north, west, south and southeast. The terrain consists of a valley bottom filled with large accumulations of glacial drift circumvallated by gently to moderately rising slopes. Elevations range from 1250m in the valley bottom to 1700m along the ridges. Approximately 50% of the claim group has been clear cut logged and replaced by second growth timber which is in various stages of maturation. Most of the timber in the western part of the Katie deposit area of the claim group has been subjected to a burn in the not too distant past, and there is a profusion of second growth particularly in the central and western portion of the grid.

The Swift area is on a south facing slope at ~1600m elevation at the headwaters of Swift Creek.

### 1.3 Claims and Ownership

The Swift Katie claim group is composed of the following claims:

| Tenure Number | Area (hectares) | Expiry Date |
|---|---|---|
| 321700 | 25.00 | January 15, 2008 |
| 507490 | 1,669.33 | January 15, 2008 |
| 508207 | 2,114.52 | January 15, 2008 |
| 510330 | 253.84 | January 15, 2008 |
| 510347 | 148.08 | January 15, 2008 |
| 529412 | 422.41 | March 4, 2007 |
| 529421 | 528.40 | March 4, 2007 |
| 529422 | 253.55 | March 4, 2007 |
| **Total Area** | **5,415.13** | |

The beneficial owners of the Swift Katie claim group as at the date of this report are: John A. Chapman (33.75%), KGE Management Ltd. (Gerald G. Carlson) (33.75%), Doublestar Resources Ltd. (22.50%) and Ken Murray (10.00%). The claims are registered showing a slightly different ownership as not all Bills of Sale have been activated. On March 30, 2006 the beneficial owners optioned the Swift Katie claim group to the Manex Resource Group of Vancouver, B.C. Figure 2 shows a map of the claims at the Swift Katie Property.

### 1.4 Previous Work

In 1977 a government RGS survey indicated anomalous copper values in silts from Hellroaring Creek. Amoco Canada Petroleum Company Limited followed up with a geochemical survey in 1980 and identified a large (1km by 0.5km) and intense (+100 ppm) copper-in-soils anomaly over what would become the Katie deposit.

From 1984 to 1987 Kidd Creek Mines and Falconbridge Limited conducted mapping, soil sampling and geophysical surveys over the Swift and Gus claims (Swift property) south of and adjacent to the Katie. The Swift property exploration was focused upon VMS Cu/Zn exploration which soon changed to trenching and drilling of gold-in-soils anomalies. The trenching (23 trenches) and core drilling (~892m) resulted in discovery of gold in quartz veins enclosed in a broad (100m wide) zone of carbonate alteration (see "Geology & Exploration of the Rossland Group in the Swift Creek Area", Kathryn Andrew & Trygve Hoy, Exploration in British Columbia 1989). Swift results included 4m grading 54gpmt gold in trench 21 and 10m grading 1.8gpmt gold in core hole 87-6.

In 1985 prospector Ken Murray staked the Katie copper-in-soils anomaly discovered by Amoco and conducted a successful geochemical survey for gold-in-soils, indicating partially coincident anomalous gold-in-soils values compared with Amoco's copper anomaly. In 1988 Balloil Lassiter Petroleum Limited optioned the Katie property and conducted geological and geophysical surveys and a four-hole, 305 meters core drilling program in 1989. In 1990 Yellowjacket Resources Limited acquired Balloil's option

interest in the property and formed a joint venture with Hemlo Gold Mines and Brenda Mines Limited (Noranda subsidiaries). Over the next two years the Katie joint venture conducted geological and geochemical surveys and drilled 34 core holes totaling 8,260 meters. Yellowjacket took over as Operator in 1992 and drilled 18 core holes totaling 4,477 meters. The Katie drilling identified three zones of mineralization referred to as the Main, West and 17. Highlights include 17m of .52% Cu and 1.13g Au (90-09), 133m of .22% Cu and .31 g Au (90-13) and 21 m of .25% Cu and .96 g Au (91-21B).

In 1988 Aerodat Limited flew a 2,660km airborne survey for International Corona Corporation south of the town of Salmo. The survey was conducted over and adjacent to the Swift Katie property and it identified some magnetic and EM anomalies that are significant, especially in the northern extremities of the present Property. No follow-up has been conducted on these anomalies since they were detected (refer to Assessment Report 18990).

The Katie property lapsed and John Chapman and KGE Management Ltd. acquired the property by staking in August 2001. In March 2005 the Swift and Katie properties were combined, for the first time, under common ownership - and became known as the Swift Katie property.

### 1.5 Work Performed

The 2005 program included: (1) drill core sampling and drill core logging in the Swift area, and (2) drill collar locating (GPS), block modeling and resource determination in the Katie area. The Swift area drill core work was on core that was drilled in the 1980s and 1990s and not split, nor sampled, nor logged.

This Report was assembled and edited by John Chapman, PEng. Section 4 was written by David Makepeace, MSc., PEng. Section 5 was written by Paul Gray, PGeo and Gerald Carlson, PEng.

### 1.6 Personnel

Field work was carried out on the Swift Katie claim group by John A. Chapman (BSc., PEng., Mining Engineer), Gerald G. Carlson (PhD., PEng., Geologist), Paul Gray (BSc., PGeo., Geologist) and Ken Murray (Prospector).

## 2.0 GEOLOGY

### 2.1 Regional Geology

The Salmo area is underlain by a series of volcanic and sedimentary rocks belonging to the Lower Jurassic Rossland Group intruded by stocks and plugs of Lower Cretaceous Nelson granodiorite (Figure 4). The Rossland Group is noteworthy as a host unit for a number of mineral occurrences especially in the Rossland Camp. The Rossland Group of rocks is represented by clastic rocks of the Archibald Formation, overlain by a volcanic

**FIGURE 4**
**BY: J.A. CHAPMAN**

sequence of the Elise Formation and finally by clastic rocks of the Hall Formation. The Archibald Formation is composed of argillite and thin intercalated beds of siltstone which grade upward into interbedded siltstone, argillite and minor conglomerate. A protuberant horizon composed of a plagioclase-rich lapilli and crystal tuff also occurs within the upper portion of this formation. The Elise Formation is composed of intermediate tuffs overlain by a sequence of mafic tephra, tuffites, which are composed of mixed pyroclastic and epiclastic fragments, and epiclastic rocks. The Upper Elise consists of heterolithic lapilli stone, lapilli tuff, and pyroclastic breccia (Hoy and Andrew, 1989) . Preponderant in the upper portion of this formation are mafic flows and tuffaceous rocks in sharp contact with the argillites and siltstones of the overlying Hall Formation. The Hall Formation is composed of a black, fissile locally graphitic argillite with minor intercalations of thin beds of siltstone.

### 2.2 Property Geology

Host rocks for the Katie deposit are mafic volcanics and intrusives of the Elise Formation belonging to the Lower Jurassic Rossland Group. The volcanics range in composition from andesite to basalt and include flows, flow breccias and tuffs, as well as syn-volcanic gabbro to monzonite dikes and sills. Mineralization occurs within a classic alkaline copper-gold porphyry-style system, with a potassic core surrounded by a broad propylitic zone. The pervasive potassic alteration includes K-feldspar, plagioclase, quartz, biotite and chlorite and corresponds to the elevated copper and gold values. Sulphide minerals include pyrite and chalcopyrite with minor pyrrhotite, sphalerite, tetrahedrite, bornite and molybdenite. The propylitic zone is characterized by epidote, chlorite, sericite and calcite with pyrite. Two major mineralized zones have been identified, characterized by copper values in excess of 0.2% and gold values in excess of 0.25 gpt. The Main Zone is 70 to 135 meters thick and at least 500 meters long. The 17 Zone is 90 meters thick and at least 300 meters long. Both zones are open along strike and at depth. A second, later style of mineralization cuts the Main Zone and consists of quartz-carbonate-sericite mylonite containing up to 30% sulphides, including pyrite, chalcopyrite, tetrahedrite, molybdentite and arsenopyrite. Gold grades range up to 0.5 gpt with copper typically in the 0.1% to 0.2% range.

Host rocks for the Swift gold showings are foliated and sheared mafic volcanic rocks of the Lower Jurassic Elise Formation. Sheared zones are typified by intense carbonate-sericite-silica alteration exposed on surface and in a number of trenches at the headwaters of Swift Creek.

## 3.0 KATIE DRILL HOLE COLLARS SURVEY & CONVERSION TO NAD83

The Noranda companies and Yellowjack Resources Ltd. surveyed the 58 core drill hole collars using chain and compass. Prior to commencing the Block Model work in 2005 the Operators conducted a field program to survey some of the drill hole collars using GPS. See Appendix II for survey and transformation details. Also included in Appendix II is a complete listing of all drill core sample assays from hole 1 to hole 58, assembled for the first time, and as used as input to the Block Model.

## 4.0 BLOCK MODEL OF KATIE DEPOSIT

### 4.1 Mineral Deposit

### 4.1.1 Data Review, Editing and Digital Compilation

#### 4.1.1.1 Drill Hole Data

There were 57 drill holes within the Swift Katie deposit totalling of 13,974 meters drilled. The following table summarizes the drill collar information obtained from the drill logs.

***Swift-Katie Drill Collar Data***

| Hole Id | UTM, NAD 83 | | Elevation | Azimuth | Dip | Length |

The data was entered into Surpac Minex Group's Vision V 5.1-C mining software package in a "csv" format. This software is a three dimensional graphical database used in the exploration and mining industry. The files included:

1. **Collar.csv** - collar location data (i.e. UTM NAD 83 coordinates, mean sea level elevation, total depth and path-type)
2. **Survey.csv** - down-the-hole survey data (i.e. survey depth, dip, azimuth)
3. **Assay1.csv** - assay data (i.e. sample interval with gold [g/t] and copper [%] values)

There were no down-the-hole surveys available, therefore the survey file contains collar surveys only. There are 5,629 gold and copper assays in the assay file.

#### 4.1.1.2 Other Data

Digital topography was acquired by obtaining the digital TRIM II data from the British Columbia government for the area (82F014). Elevation contours are 20 meters apart. The data was manipulated and cleaned-up in AutoCAD MAP-2005. Separate layers were extracted and exported in 'dxf' format. The files included:

- **SwiftKatieContour1**.dxf - 20-meter contour topography
- **SwiftKatieRoad1.dxf** – Highway and roads

- **SwiftKatieRiver1.dxf** – Rivers and creeks

The cleaned ‘‘dxf’ files were imported into Surpac and converted to string files.

- **SwiftKatieContour1.dxf – swiftkatiecontour1.str**
- **SwiftKatieRoad1.dxf – swiftkatieroad1.str**
- **SwiftKatieRiver1.dxf – swiftkatieriver1.str**

A digital terrain model (DTM) was generated in Surpac (swiftkatiecontour1.dtm) from swiftkatiecontour1.str. The rivers and roads string files were overlaid on the DTM to generate a 3D image of these files with respect to the DTM.

The Swift-Katie claims were derived by extracting the UTM NAD 83 corners of each claim from the MTO layer on the BC MapPlace system. A separate AutoCAD file (**SwiftKatieClaim1.dxf**) was created and converted and overlaid in Surpac to a corresponding string file (**swiftkatieclaim1.str**).

### 4.2 Block Model

#### 4.2.1 Assumptions

##### 4.2.1.1 Units

- Grams gold per metric tonne (gpt), meters [m]
- Copper in percent (%)
- Significant decimal places: gold = 3, copper = 3, tonnage = 0
- Y = Northing, X = Easting, Z = Elevation

##### 4.2.1.2 Cut-off Parameters

- High-grade cut-off: None
- Cut-off: variable cut-off with respect to gold and copper

### 4.2.1.3 Drill Hole Raw Data

Collar: Collar.csv
Survey: Survey.csv
Assay: Assay1.csv

**4.2.3 Report**

| | |
|---|---|
| Constraints: | - Report all blocks with a range of ≥ 0.05 g/t Au and at a step grade of 0.05 g/t Au, reporting both Au and Cu<br>- Report all blocks with a range of ≥ 0.05 % Cu and a step grade of 0.05 % Cu, reporting both Au and Cu |
| Specific gravity (in-situ): | - 2.7 mt/$m^3$ |
| Block volume: | - 3,375 $m^3$ |
| Block weight: | - 9,112.5 mt |

Each output file for gold and copper were input into 2 spreadsheets.

| | |
|---|---|
| Gold: | sk_MR_Au_1.xls |
| Copper: | sk_MR_Cu_1.xls |

A weighted average was calculated for each grade range. Subsequently, the grade and tonnage for each cut-off value was calculated for each of the mineral resource categories.

| | |
|---|---|
| Gold: | 0.05 to 3.95 g/t Au at 0.05 g/t Au steps, for both Au and Cu |
| Copper: | 0.05 to 3.95 % Cu at 0.05 % Cu steps, for both Au and Cu. |

The final mineral resources for the variable cut-off values for gold and copper were completed by subtracting the raw mineral resource categories from each other.

Measured = Raw Measured Values
Indicated = Raw Indicated Values - Raw Measured Values
Inferred = Raw Inferred Values - Raw Indicated Values

### 4.3 Classification of Resources

A new classification of mineral resources has been enacted in Canada since the 1988 Mineral Resources were estimated. National Instrument 43-101 and its companion policy 43-101CP and technical report requirements 43-101F1 were put in-place as of February 1, 2001. The mineral resource definitions are based on the Canadian Institute of Mining, Metallurgy and Petroleum's (CIM) definitions which were adopted on August 20, 2000.

Under these definitions:

> *A **Mineral Resource** is a concentration or occurrence of natural, solid, inorganic or fossilized organic material in or on the Earth's crust in such form and quantity and of such a grade or quality that it has reasonable prospects for economic extraction. The location, quantity, grade, geological characteristics and continuity of a **Mineral Resource** are known, estimated or interpreted from specific geological evidence and knowledge.*
>
> *The term **Mineral Resource** covers mineralization and natural material of intrinsic economic interest which has been identified and estimated through exploration and sampling and within which Mineral Reserves may subsequently be defined by the consideration and application of technical, economic, legal, environmental, socio-economic and governmental factors. The phrase 'reasonable prospects for economic extraction' implies a judgment by the Qualified Person in respect of the technical and economic factors likely to influence the prospect of economic extraction. A **Mineral Resource** is an inventory of mineralization that under realistically assumed and justifiable technical and economic conditions, might become economically extractable. These assumptions must be presented explicitly in both public and technical reports. (43-101CP, CIM, 2001)*

There are three subdivisions within the mineral resource category which are based on decreasing geological confidence (Measured, Indicated and Inferred).

#### 4.3.1 Measured Mineral Resource

> *A 'Measured Mineral Resource' is that part of a Mineral Resource for which quantity, grade or quality, densities, shape, physical characteristics are so well established that they can be estimated with confidence sufficient to allow the appropriate application of technical and economic parameters, to support production planning and evaluation of the economic viability of the deposit. The estimate is based on detailed and reliable exploration,*

*sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes that are spaced closely enough to confirm both geological and grade continuity (43-101CP, CIM, 2001).*

The Measured Mineral Resources at the Swift-Katie Deposit have been estimated at a variable cut-off grade for gold and for copper. This was done to illustrate the deposit's characteristics as the cut-off is varied for both gold and copper. The measured resource of the Swift-Katie deposit with respect to a gold cut-off is shown in the following table:

***Measured Mineral Resource***
***Gold Variable Cut-off***

| ***Cutoff*** (g/mt Au) | ***Tonnage*** (mt) | ***Gold*** (g/mt Au) | ***Copper*** (%) |
|---|---|---|---|
| 0.05 | 45,234,461 | 0.220 | 0.164 |
| 0.10 | 28,941,311 | 0.303 | 0.191 |
| 0.15 | 18,607,736 | 0.403 | 0.214 |
| 0.20 | 14,033,261 | 0.479 | 0.224 |
| 0.25 | 9,896,186 | 0.585 | 0.251 |
| 0.30 | 7,408,473 | 0.690 | 0.262 |
| 0.35 | 5,822,898 | 0.790 | 0.286 |
| 0.40 | 4,747,623 | 0.884 | 0.303 |
| 0.45 | 3,945,723 | 0.978 | 0.309 |
| 0.50 | 3,371,635 | 1.064 | 0.315 |
| 0.55 | 3,052,697 | 1.122 | 0.315 |
| 0.60 | 2,742,872 | 1.184 | 0.315 |
| 0.65 | 2,515,059 | 1.235 | 0.297 |
| 0.70 | 2,241,684 | 1.303 | 0.302 |
| 0.75 | 2,004,759 | 1.371 | 0.307 |
| 0.80 | 1,822,509 | 1.431 | 0.316 |
| 0.85 | 1,649,371 | 1.494 | 0.318 |
| 0.90 | 1,521,796 | 1.546 | 0.320 |
| 0.95 | 1,439,783 | 1.582 | 0.321 |
| 1.00 | 1,348,658 | 1.623 | 0.327 |

The copper cut-off is shown in the following table:

***Measured Mineral Resource***
***Copper Variable Cut-off***

| ***Cutoff*** (% Cu) | ***Tonnage*** (mt) | ***Gold*** (g/mt Au) | ***Copper*** (%) |
|---|---|---|---|
| 0.05 | 57,381,419 | 0.156 | 0.155 |
| 0.10 | 35,092,244 | 0.209 | 0.205 |
| 0.15 | 21,961,131 | 0.263 | 0.255 |
| 0.20 | 12,110,518 | 0.342 | 0.324 |
| 0.25 | 7,891,430 | 0.408 | 0.379 |
| 0.30 | 5,230,580 | 0.485 | 0.434 |
| 0.35 | 3,289,617 | 0.585 | 0.500 |
| 0.40 | 2,159,667 | 0.720 | 0.569 |
| 0.45 | 1,585,579 | 0.819 | 0.621 |
| 0.50 | 1,139,066 | 0.933 | 0.680 |
| 0.55 | 801,903 | 1.116 | 0.750 |
| 0.60 | 683,440 | 1.147 | 0.781 |
| 0.65 | 528,527 | 1.152 | 0.828 |
| 0.70 | 437,402 | 0.972 | 0.858 |
| 0.75 | 273,377 | 1.183 | 0.935 |
| 0.80 | 191,364 | 0.830 | 1.010 |
| 0.85 | 182,251 | 0.851 | 1.019 |
| 0.90 | 164,026 | 0.892 | 1.032 |
| 0.95 | 91,126 | 0.579 | 1.103 |
| 1.00 | 82,013 | 0.588 | 1.116 |

### 4.3.2 Indicated Mineral Resource

> *An 'Indicated Mineral Resource' is that part of a Mineral Resource for which quantity, grade or quality, densities, shape and physical characteristics, can be estimated with a level of confidence sufficient to allow the appropriate application of technical and economic parameters, to support mine planning and evaluation of the economic viability of the deposit. The estimate is based on detailed and reliable exploration and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes that are spaced closely enough for geological and grade continuity to be reasonably assumed (43-101CP, CIM, 2001).*

The indicated resource of the Swift Katie deposit with respect to a gold cut-off is shown in the following table:

***Indicated Mineral Resource***
***Gold Variable Cut-off***

| ***Cutoff*** (g/mt Au) | ***Tonnage*** (mt) | ***Gold*** (g/mt Au) | ***Copper*** (%) |
|---|---|---|---|
| 0.05 | 126,800,439 | 0.183 | 0.135 |
| 0.10 | 83,670,976 | 0.239 | 0.154 |
| 0.15 | 50,583,488 | 0.317 | 0.173 |
| 0.20 | 35,857,688 | 0.376 | 0.183 |
| 0.25 | 23,382,675 | 0.456 | 0.193 |
| 0.30 | 17,149,725 | 0.523 | 0.195 |
| 0.35 | 12,739,275 | 0.593 | 0.199 |
| 0.40 | 9,595,462 | 0.664 | 0.189 |
| 0.45 | 8,028,112 | 0.712 | 0.184 |
| 0.50 | 6,989,287 | 0.747 | 0.175 |
| 0.55 | 5,904,900 | 0.788 | 0.162 |
| 0.60 | 4,938,975 | 0.830 | 0.150 |
| 0.65 | 4,064,175 | 0.874 | 0.136 |
| 0.70 | 3,562,987 | 0.903 | 0.137 |
| 0.75 | 3,061,799 | 0.932 | 0.127 |
| 0.80 | 2,615,286 | 0.959 | 0.116 |
| 0.85 | 2,232,561 | 0.982 | 0.118 |
| 0.90 | 1,940,961 | 0.998 | 0.125 |
| 0.95 | 1,567,349 | 1.015 | 0.134 |
| 1.00 | 1,221,074 | 1.025 | 0.144 |

The indicated resource of the Swift Katie deposit with respect to a copper cut-off is shown in the following table:

***Indicated Mineral Resource***
***Copper Variable Cut-off***

| ***Cutoff*** (% Cu) | ***Tonnage*** (mt) | ***Gold*** (g/mt Au) | ***Copper*** (%) |
|---|---|---|---|
| 0.05 | 154,438,649 | 0.134 | 0.135 |

| 0.85 | 0 | 0.000 | 0.000 |
| 0.90 | 0 | 0.000 | 0.000 |
| 0.95 | 0 | 0.000 | 0.000 |
| 1.00 | 0 | 0.000 | 0.000 |

### 4.3.3 Inferred Mineral Resource

*An 'Inferred Mineral Resource' is that part of a Mineral Resource for which quantity and grade or quality can be estimated on the basis of geological evidence and limited sampling and reasonably assumed, but not verified, geological and grade continuity. The estimate is based on limited information and sampling gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes.*

*Due to the uncertainty which may attach to Inferred Mineral Resources, it cannot be assumed that all or any part of an Inferred Mineral Resource will be upgraded to an Indicated or Measured Mineral Resource as a result of continued exploration. Confidence in the estimate is insufficient to allow the meaningful application of technical and economic parameters or to enable an evaluation of economic viability worthy of public disclosure. Inferred Mineral Resources must be excluded from estimates forming the basis of feasibility or other economic studies (43-101CP, CIM, 2001).*

The inferred resource of the Swift Katie deposit with respect to a gold cut-off is shown in the following table:

***Inferred Mineral Resource***
***Gold Variable Cut-off***

| ***Cutoff*** (g/mt Au) | ***Tonnage*** (mt) | ***Gold*** (g/mt Au) | ***Copper*** (%) |
|---|---|---|---|
| 0.05 | 376,264,236 | 0.174 | 0.107 |
| 0.10 | 222,472,574 | 0.244 | 0.122 |
| 0.15 | 135,931,162 | 0.322 | 0.123 |
| 0.20 | 91,042,987 | 0.396 | 0.117 |
| 0.25 | 60,060,487 | 0.485 | 0.100 |
| 0.30 | 43,940,475 | 0.563 | 0.081 |
| 0.35 | 33,287,962 | 0.639 | 0.064 |
| 0.40 | 28,139,400 | 0.687 | 0.055 |
| 0.45 | 24,321,262 | 0.728 | 0.051 |
| 0.50 | 19,646,550 | 0.789 | 0.051 |
| 0.55 | 17,505,112 | 0.822 | 0.048 |
| 0.60 | 16,202,024 | 0.842 | 0.048 |
| 0.65 | 15,482,137 | 0.852 | 0.050 |
| 0.70 | 14,333,962 | 0.866 | 0.048 |
| 0.75 | 13,395,375 | 0.876 | 0.047 |

## 5.0 SWIFT AREA CORE RECOVERY, EXAMINATION AND ANALYSES

### 5.1 Core Recovery and Storage

The Swift core, from five of the eight drill holes, had been stored on site at the headwaters of Swift Creek since drilling in 1987 by Falconbridge Ltd. The steel core rack had suffered some damage over the years, because of heavy snow loads, resulting in minor spillage of some core. See Appendix III for photographs of the site and the core.

DDH 1-5 were re-boxed and re-tagged. DDH 1 and 2 were split and sampled. For details on the 1987 drilling, including a location map, see Assessment Report 17296, by S.G. Clemmer.

Once the program of re-boxing and re-labeling the core began it became apparent that almost (90%) of the core was in excellent condition and readily assignable to core boxes and intervals.

DDH 1 Boxes 1-11 Intact (Boxes 3, 4, and 5 required whole box composites) Total Depth: 92.66 meters
DDH 2 Boxes 1-21 Intact (Boxes 5 and 18 required whole box composites) Total Depth: 122.50 meters
DDH 3 Boxes 1-19 Intact (Boxes 18 required whole box composite) Total Depth: 107.90 meters
DDH 4 Boxes 1-7, 9-16 Intact (Box 8 missing) Total Depth: 92.60 meters

DDH 5 Boxes 1-21 Intact (Box 12 required whole box composite) Total Depth: 123.10 meters
DDH 6 Not inspected, in good cross-piled condition at Huser's Salmo Storage, Total Depth: 124.36 meters
DDH 7 Not inspected, good cross-piled condition at Huser's Salmo Storage, Total Depth: 137.20 meters
DDH 8 Not inspected, good cross-piled condition at Huser's Salmo Storage, Total Depth: 91.40 meters

Only one Box was completely unrecoverable (missing/destroyed) - Box 8 of DDH 4.

All core from the rack (DDH 1-5) was moved to Jack Denny's core facility in Salmo B.C. where it was organized and sampled and stored. DDH 6-8 are stored at Henry Huser's Salmo core storage facility along with all of the Katie deposit core. Total length of all 1987 Swift core holes is 891.78 meters.

Where possible (e.g. in non-composited boxes), samples were taken at regular 2 meter intervals, for the entire length of the holes. Splitting was done with 1 core splitter supplied by Ken Murray and another supplied by Jack Denny. Sampling was completed on holes 1 and 2 only. DDH 1 – Sample #s 314501 – 314538 (38 samples) from 1.2 – 92.66 meters, Avg. 2.4 meters/sample. DDH 2 – Sample #s 314539 – 314598 (60 samples) from 3.05 – 122.3 meters, Avg. 1.98 meters/sample. All Core was Photographed in groups of 3 Boxes (see photos in Appendix III).

**5.2 Core Examination and Analyses**

The sampling program allowed for detailed, albeit rapid, examinations of the 1987 drill core. Moderate to intense alteration and mineralization was seen throughout the core. Disseminated pyrite, at times very heavy was noted almost ubiquitously in the core (with the exception of the Dyke rock) as well as alkaline alteration. Magnetite (specularite?) and pyrite are the main metallic minerals present, while sections of chalcopyrite were noted. Quartz-carbonate veins and veinlets are common. Approximately 85% of the quartz veins were sampled in 1987 by Falconbridge.

The 98 samples from the current program were sent to Acme Analytical Laboratories Ltd. in Vancouver for Group 1DX analyses (see Appendix I).

**5.3 Thin Sections**

Six of the ninety-eight rock chip samples collected were selected for petrographic analysis, including thin section preparation and detailed inspection, staining, and in three cases polished section work. The assay samples 314516, 314517, 314541, 314570, and 314573 were selected for their degree and type of alteration, lithology, and/or mineralization. The purpose of the petrographic investigations was to provide an assessment of the alteration and mineralization specifically of the Swift property drilling and more generally of the Swift Katie property as a whole. Specifically, the mineralogical investigation described below was designed to determine whether the Swift prospect might be associated with an alkaline porphyry hydrothermal system.
Thin-sections were produced from representative chips of samples collected by Paul Gray, PGeo, for assay and multi-element geochemical analysis. Table 5-1 lists the samples collected as well as the analytical results. Petrographic work was completed by

Dr. Norman Gray, PhD., of the University of Connecticut. The sections produced have been digitally scanned at high resolution for reproduction and digital examination. Selected photo captures and Dr. Gray's comments are included in Appendix IV.

### 5.4 Staining

Each of the 6 samples selected for petrographic analysis was stained in order to identify carbonate minerals. An Alizarin red and potassium ferricyanide composite test stain was used. Although the results depend on the etching and staining time, as well as the crystallographic orientation of the carbonate section in general it can be stated:

Pink to red = Calcite
Scarlet to Mauve = Ferro-calcite
Light blue = Ferro-Dolomite
Colorless (unstained) = Dolomite
Blue = Ankerite

### 5.5 Descriptions and Interpretations

The samples selected represent a relatively small part of one mineralized system within a large property that exhibits several styles of mineralization. In general, the samples are fine grained, highly altered and possibly also strongly deformed, such that the original rock type cannot be absolutely ascertained. However, some of the samples, such as DDH2-8.6, DDH2-69.0 and DDH2-73.4 were identified as altered trachyandesite by the petrographer, including locally feldspar microlites and hornblende phenocrysts but predominantly with very fine-grained and highly altered groundmass. The samples examined appear to represent a shear zone style of mineralization that is hosted within Rossland Volcanics.

In sample DDH2-8.6, pyrophyllite is the principal alteration mineral in the sample and occurs commonly as patches within the groundmass. Other secondary minerals include sericite, chlorite, epidote (both well crystallized and as granular aggregates), hematite, pyrite and a carbonate (probably calcite). The mineral identified as pyrophillite may rather be talc (unlikely) or possibly sericite, however sericite commonly flakes which is not seen in these samples. More thin sections would clarify this point.

Throughout the rest of the thin sections, the alteration assemblage is much more simple and includes only carbonate with sericite plus minor epidote.

In general, sericite alteration is pervasive, with associated stockwork veining and brecciation, indicating active hydrothermal alteration, caused by relatively high temperature fluids under pressure. It is possible that these samples represent a structural or shear zone peripheral to the main porphyry system. The extensive pyrite is consistent with a volcanic hosted shear zone with a lateral relationship to a nearby porphyry system.

The pervasive iron carbonate alteration noted is typical for many gold mineralized hydrothermal systems. Hematite appears to represent a late stage oxidation product, possibly from a late-stage oxidizing fluid.

Although a positive link has not been established, it is possible that the Swift mineralization represents a transitional, shear hosted gold deposit that is directly related to the Katie alkaline copper-gold porphyry system. The initial petrographic analysis indicates a reasonably high temperature hydrothermal assemblage that could be closely related to a porphyry centre.

**Table 5-1: Thin Section Sample Descriptions and Assays**

## 6.0 CONCLUSIONS

The drill hole collar survey using GPS was of a preliminary nature and showed that there were some significant differences between the original chain and compass survey and the 2005 GPS check survey. There is still some doubt as to the precision of location of many of the hole collars.

The Block Model showed that there is a significant copper-gold resource contained in the Katie deposit. Figure 5 shows that drilling on the Katie deposit in the past has been done in a very irregular "early stage" manner which is not conducive to efficient and effective resource development.

The Swift drill core recovery program is complete and the core is now safely stored in Salmo. The valuation was not able to determine if there is an association between the Swift gold showings and the nearby Katie porphyry copper-gold deposit.

In 1988 Aerodat Limited flew a 2,660km airborne survey for International Corona Corporation south of the town of Salmo. The survey was conducted over and adjacent to the Swift Katie property and it identified some magnetic and EM anomalies that are significant, especially in the northern extremities of the present Property. No follow-up has been conducted on these anomalies since they were detected (refer to Assessment Report 18990). They are now available for examination on well constructed new logging roads and in new clear-cuts created by Atco Timber Ltd. in recent years.

## 7.0 RECOMMENDATIONS

A concerted effort should be made to locate all old Katie deposit drill hole collars so that they may be surveyed using high-precision differential GPS.

The Katie deposit is now ready for a regular grid drilling, both within and around the known deposit, in order to better define and expand the copper-gold resource. Some random target drilling is also warranted on geochemical and geophysical anomalies that lie outside the known deposit.

The 1988 Aerodat survey should be compiled and integrated with the Katie Swift database in order to better define trenching and drilling targets. Some of these targets may benefit from the use of Induced Polarization surveys prior to trenching and/or drilling.

## 8.0 ITEMIZED COST STATEMENT

| **ACTIVITY** | **$** |
|---|---|
| | |
| Core Boxes | 400 |
| | |
| Assays - 98 core samples | 2,356 |
| Preparation - 8 thin section samples | 2,000 |
| Maps (digital Trim II and hard copies for field) | 550 |

## 9.0 STATEMENT OF QUALIFICATIONS

John Arthur Chapman, Principal
J.A. Chapman Mining Services
18 – 1480 Foster Street, White Rock, BC, Canada V4B 3X7
Ph: 604.536.8356, Fx: 604.536.8351, E-mail: jacms1@telus.net

I, John Arthur Chapman of the City of Surrey, Province of British Columbia, Canada, do hereby certify as follows:

(1) I am a mining engineer residing at 30 - 1725 Southmere Cr., Surrey, British Columbia, Canada V4A 7A7;

(2) I graduated with honours in Mining Technology from the British Columbia Institute of Technology, June 1967;

(3) I graduated with honours in Mining Engineering (B.Sc.) from the Colorado School of Mines, January 1971;

(4) I am a Professional Engineer registered in the Province of British Columbia, Canada, since 1973;

(5) I am a Fellow of the Canadian Institute of Mining and Metallurgy;

(6) I have practised my profession continuously since 1973 in Canada and abroad;

(7) Since 1983 I have provided services to the mining industry as the Principal of J.A. Chapman Mining Services;

(8) I have personal knowledge of the Swift Katie property having visited the site more than four times since 2001, and as recent as 2005;

(9) I am not independent of the Swift Katie property as I directly own a 33.75% interest;

(10) I am a co-author of the Report entitled, "Core Sampling, Core Examination, Drill Collar Locating (GPS) and Deposit Block Modeling – Swift Katie Mineral Property", dated May 1, 2006.

Dated at White Rock, British Columbia this 3rd day of May 2006.

_____
John Arthur Chapman, B.Sc., P.Eng., FCIM

**Notes**

(1) Old grid (Noranda) baseline azimuth: +30 degrees.
(2) Rotation from Noranda grid to UTM NAD83: -30.233 degrees.
(3) Transformation utilizes three rotation points (West zone NKT-90-11, Central zone NKT-90-5, 17 zone NKT-91-17). UTM NAD83 coordinates were determined in the field on August 22, 2005 by Ken Murray and John Chapman utilizing a Garmin eTREX Legend and a Garmin GPSmap60C. The instruments were never more than four meters in difference (northing and eastings) and readings were averaged. No elevations were recorded, so the elevations on this sheet are from the old grid.
(4) Holes 2, 21 and 22 were abandoned in overburden.
(5) It is recommended that more field GPS work be done as other hole collars are identified in order to improve the precision of the UTM NAD83 drill collar database.

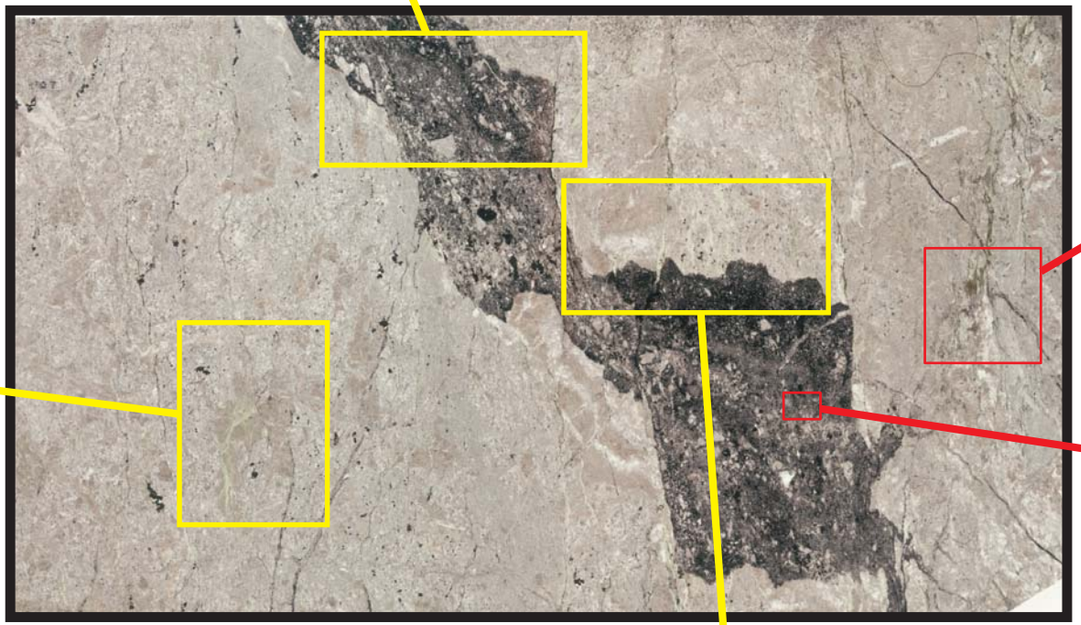
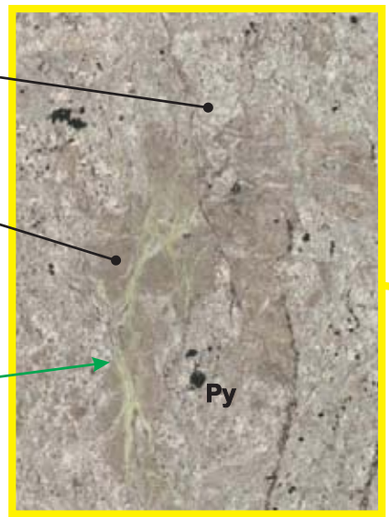
# APPENDIX IV

# THIN SECTION RESULTS

# DDH1-39.5

The dark dikelet which traverses the section is a cataclstic breccia injected forceably injected into dialational fracture. Note the variety and size range of the clasts. The fine-grained character of breccia groundmass is intensely mineralized by pyrite and other unidentified sulphides.



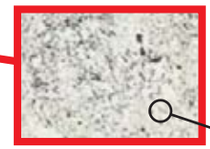


Quartz-sericite-calcite matrix

Massive carbonate clasts

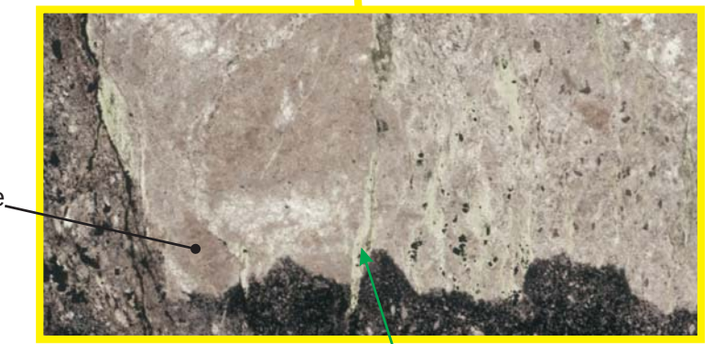
Green sericite veins (Fuchsite ?)
Although green it is **not** chlorite

A mixture of quartz, calcite and sericite comprise the fine grained matrix. Where the **quartz** is coarser and clearly visible it is ribboned, shows



Although intensely mineralized by pyrite and other sulphides the black colour of the catclastite dikelets is due to these finely disseminated **hematite platelets**.

1 cm



Massive carbonate clasts

Green sericite veins (Fuchsite ?)

The magnified images of areas shown in **red** are taken from a second thinner parallel section. As a result the correspondence is not exact

# DDH1-40.0

## *Hornblende Porphyry*

Highly altered chloritized hornblende phenocrysts set in an fine-grained groundmass consisting of biotite, secondary calcite and a nearly isotropic glass-like mesostasis containing abundant actinolite/amphibole microlites.

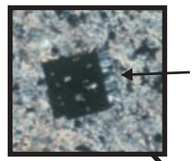
| | |
|---|---|
| Chlorite (after hornblende?) | 50% |
| Biotite | 25% |
| Calcite | 20% |
| Quartz | 5% |

## *Sericite-Calcite-Quartz Gneiss*

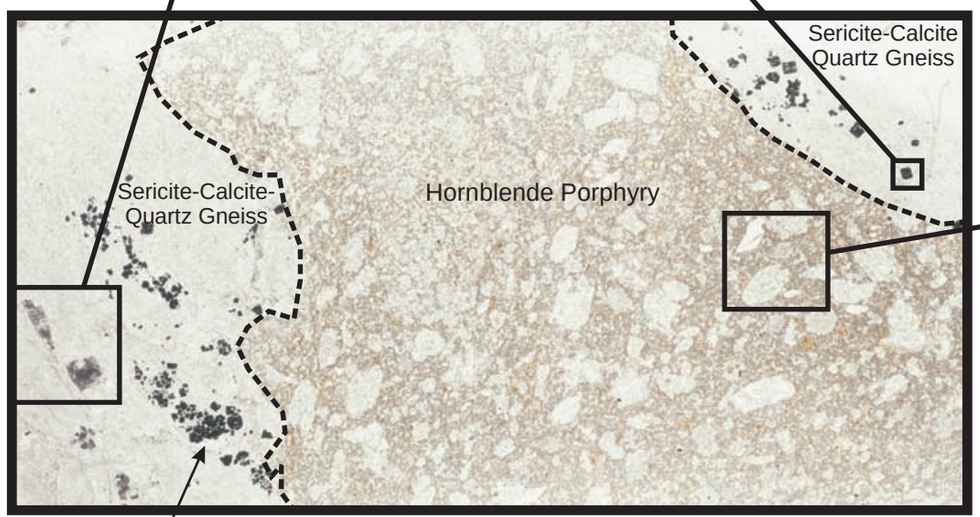
Highly altered and sheared volcanic. Sericite and calcite are the most abundant minerals but quartz, and pyrite are recognizable in the fine-grained groundmass. Some of the polysynthetically twinned felspar may be primary but the original mineralogy of the rock is masked by the pervasive alteration.

| | |
|---|---|
| Sericite | 45% |
| Calcite | 25% |
| Groundmass | |

These fine-grained angular clasts consist of euhedral altered feldspar microlites set in fine matrix heavily dusted with hematite and replaced by euhedral carbonate crystals. They may originally have formed a thin little dikelet of either an igneous or cataclastic rock



Pyrite with quartz fiber fringe implying some deformation post mineralization



Pyrite is disseminated throughout the section but is present in large cubes in this area

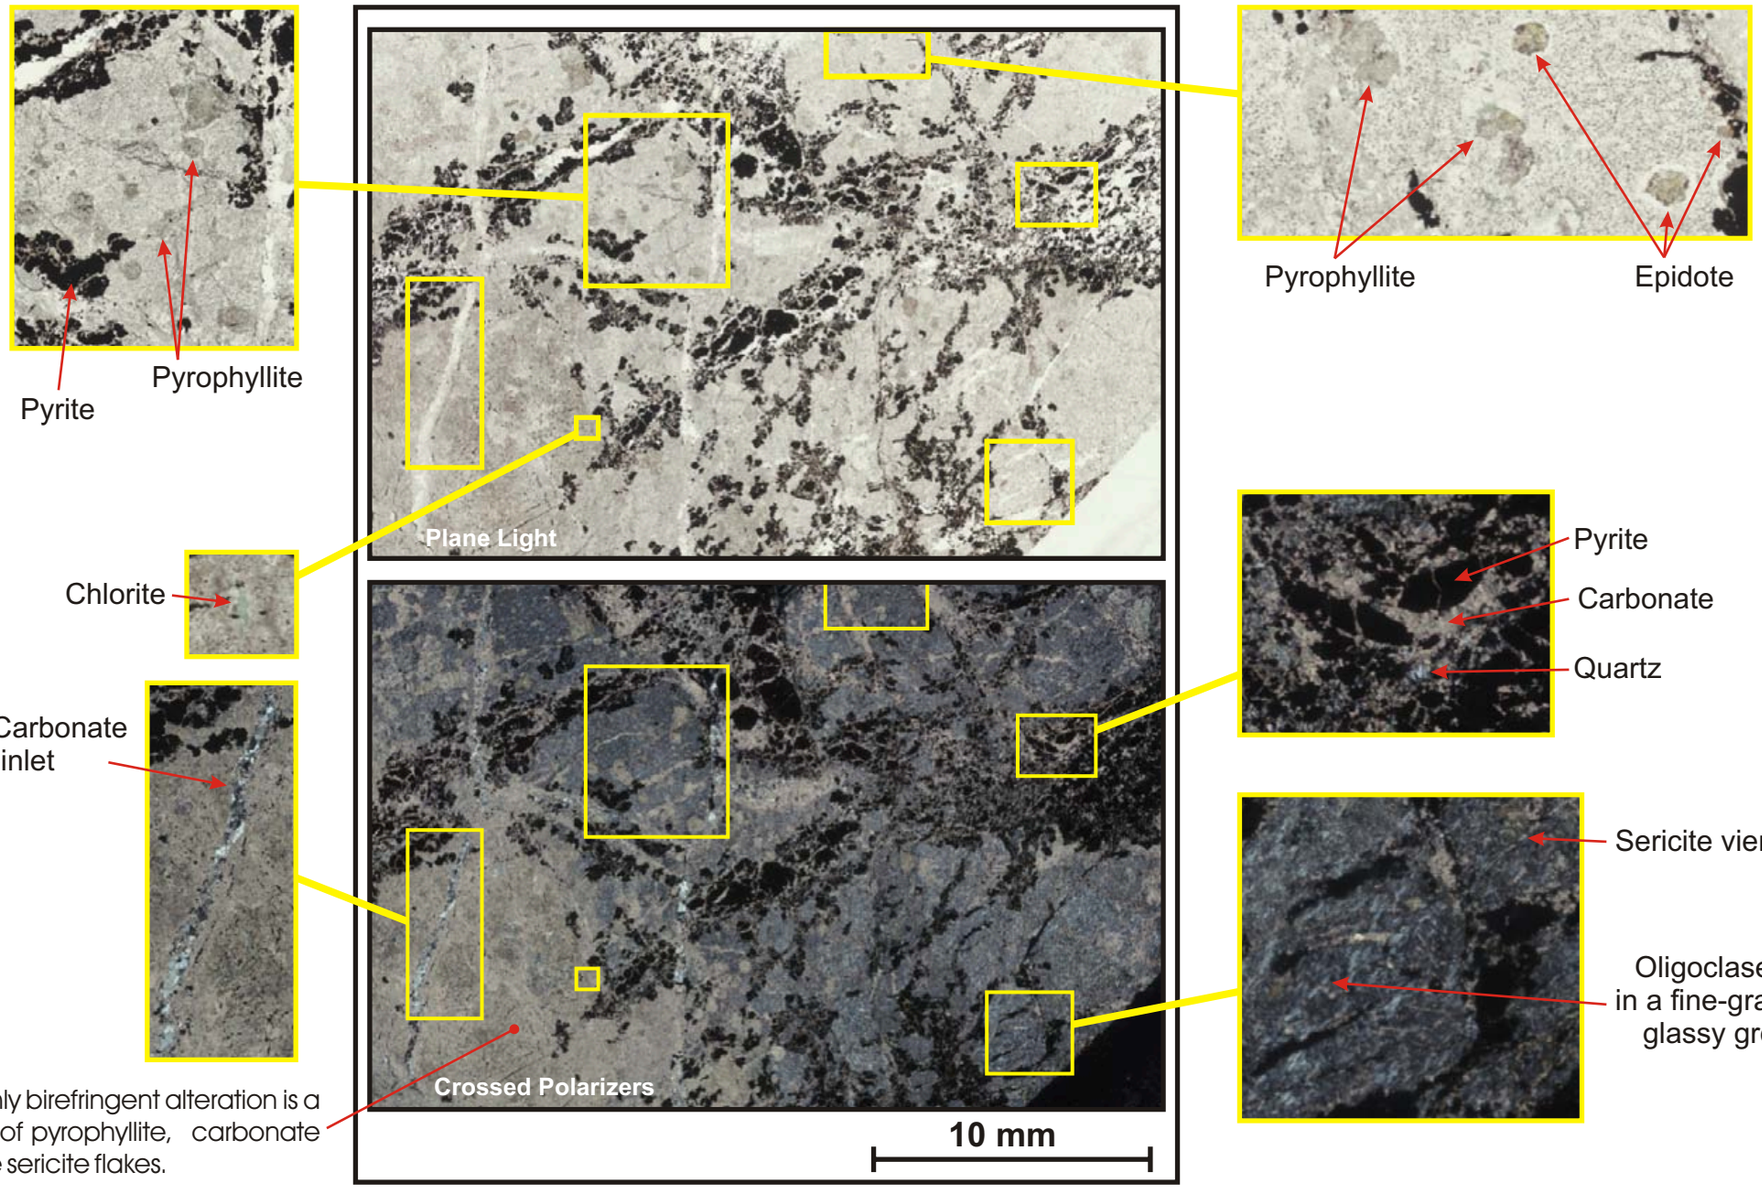
Highly birefringent buff-colored carbonate
X-Polarized
Hematite veinlet

# DDH2-8.6

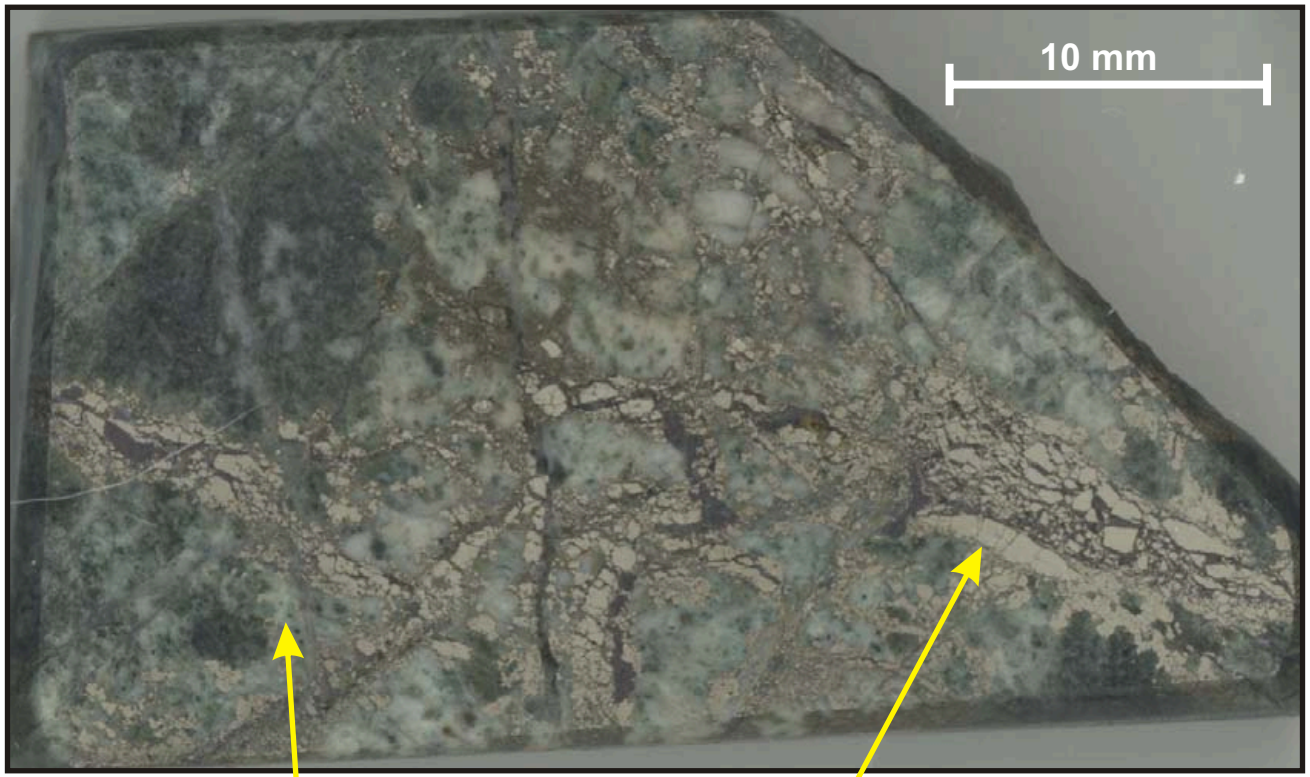
## *Hydrothermally altered trachyandesite*

The identifiable primary minerals include oligoclase microlites and quartz. Alteration minerals include sericite, pyrophyllite, chlorite, carbonate and epidote. A dense stockwork of brecciated pyrite veins cemented by quartz and carbonate traverses the sample.



The highly birefringent alteration is a mixture of pyrophyllite, carbonate and fine sericite flakes.

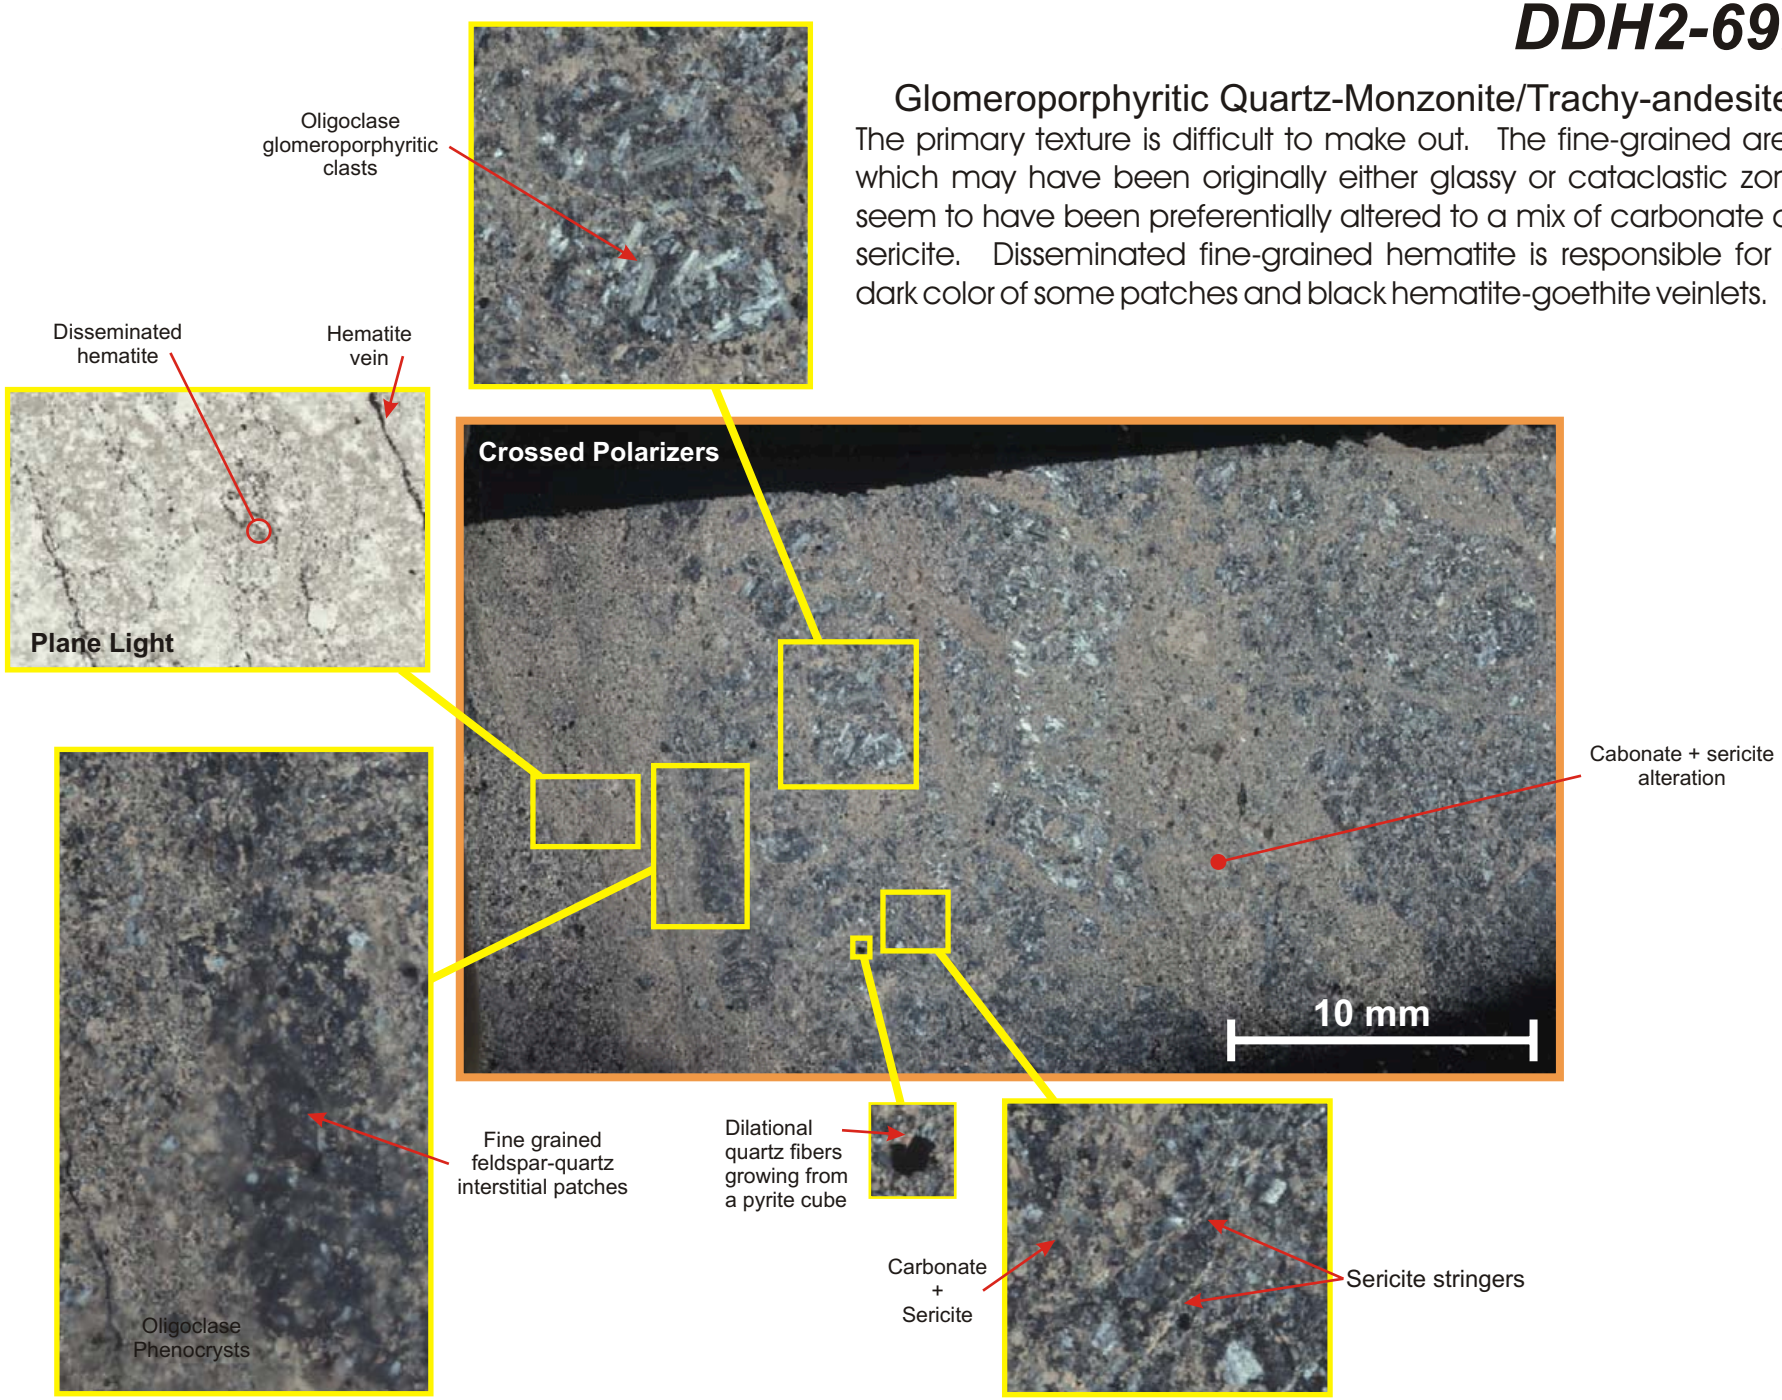
# *DDH2-8.6 Polished Chip*



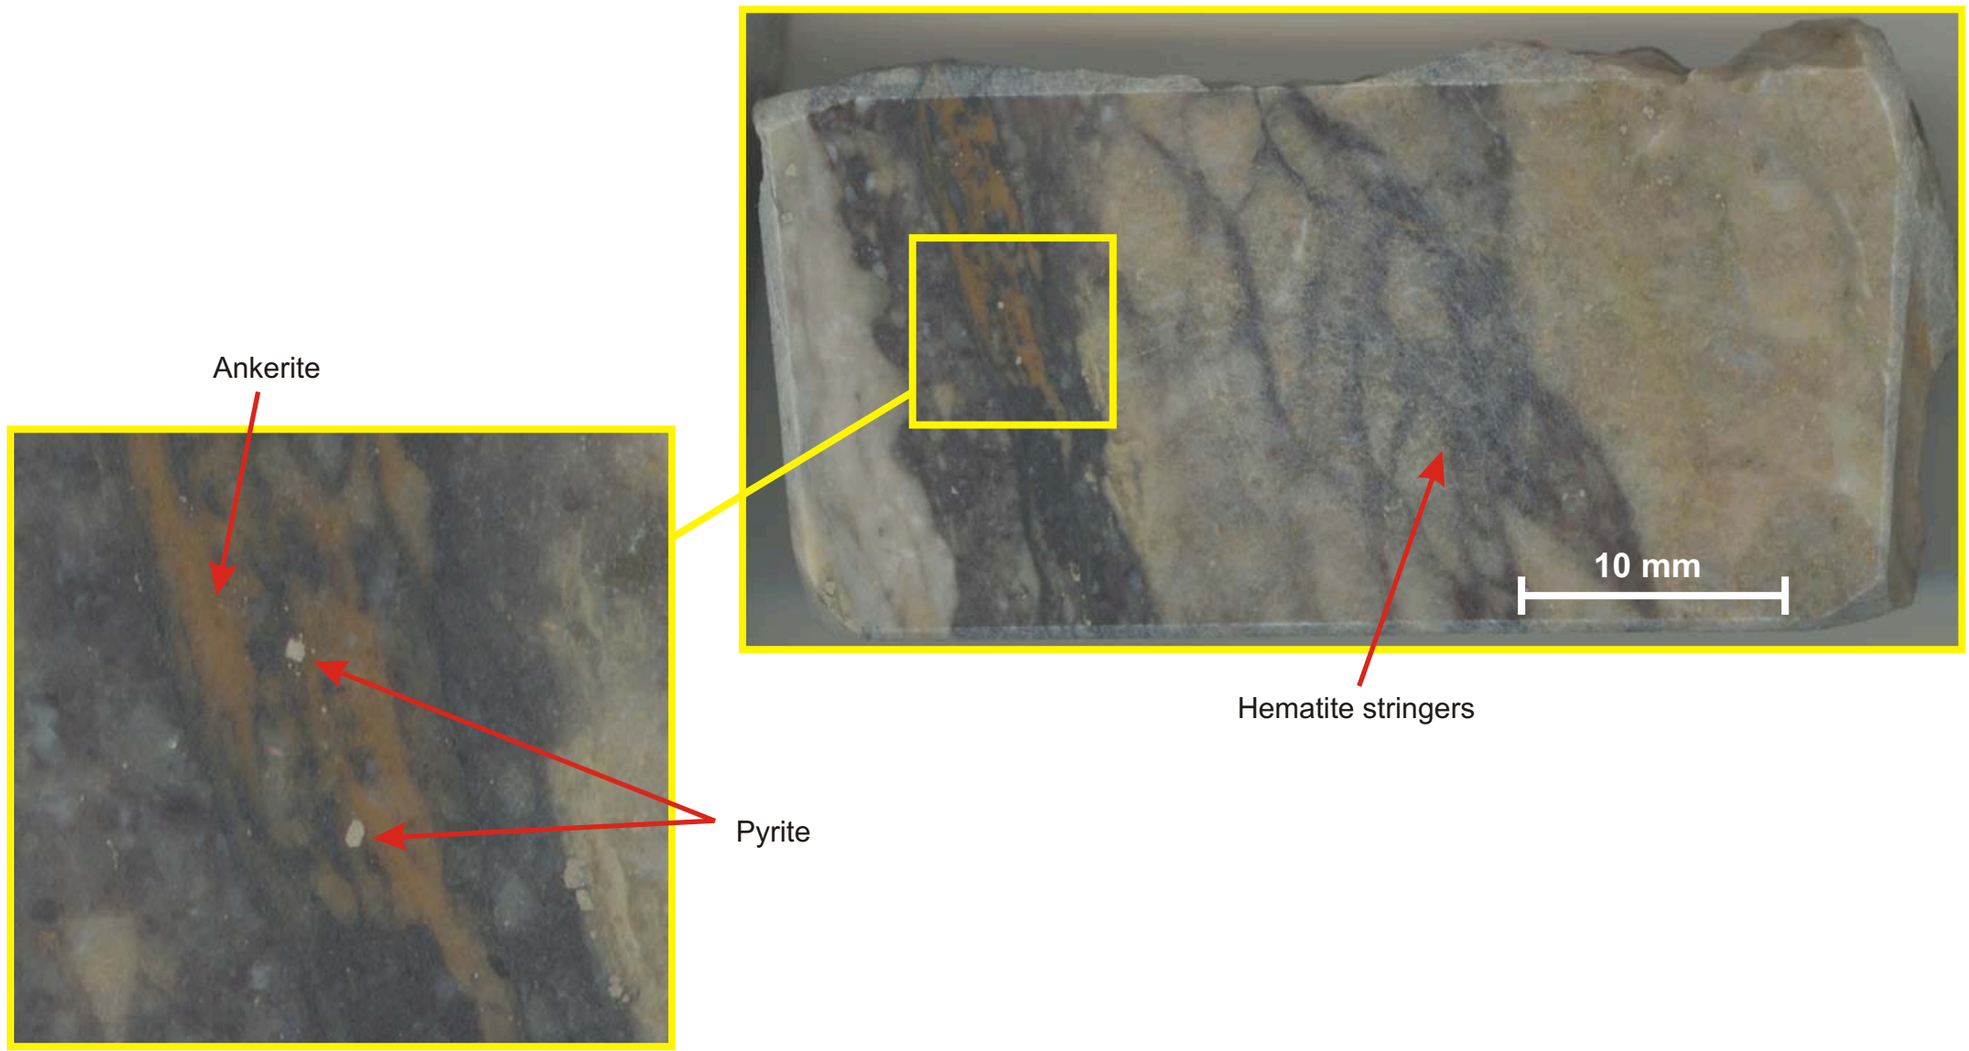
# DDH2-69.0

## Glomeroporphyritic Quartz-Monzonite/Trachy-andesite

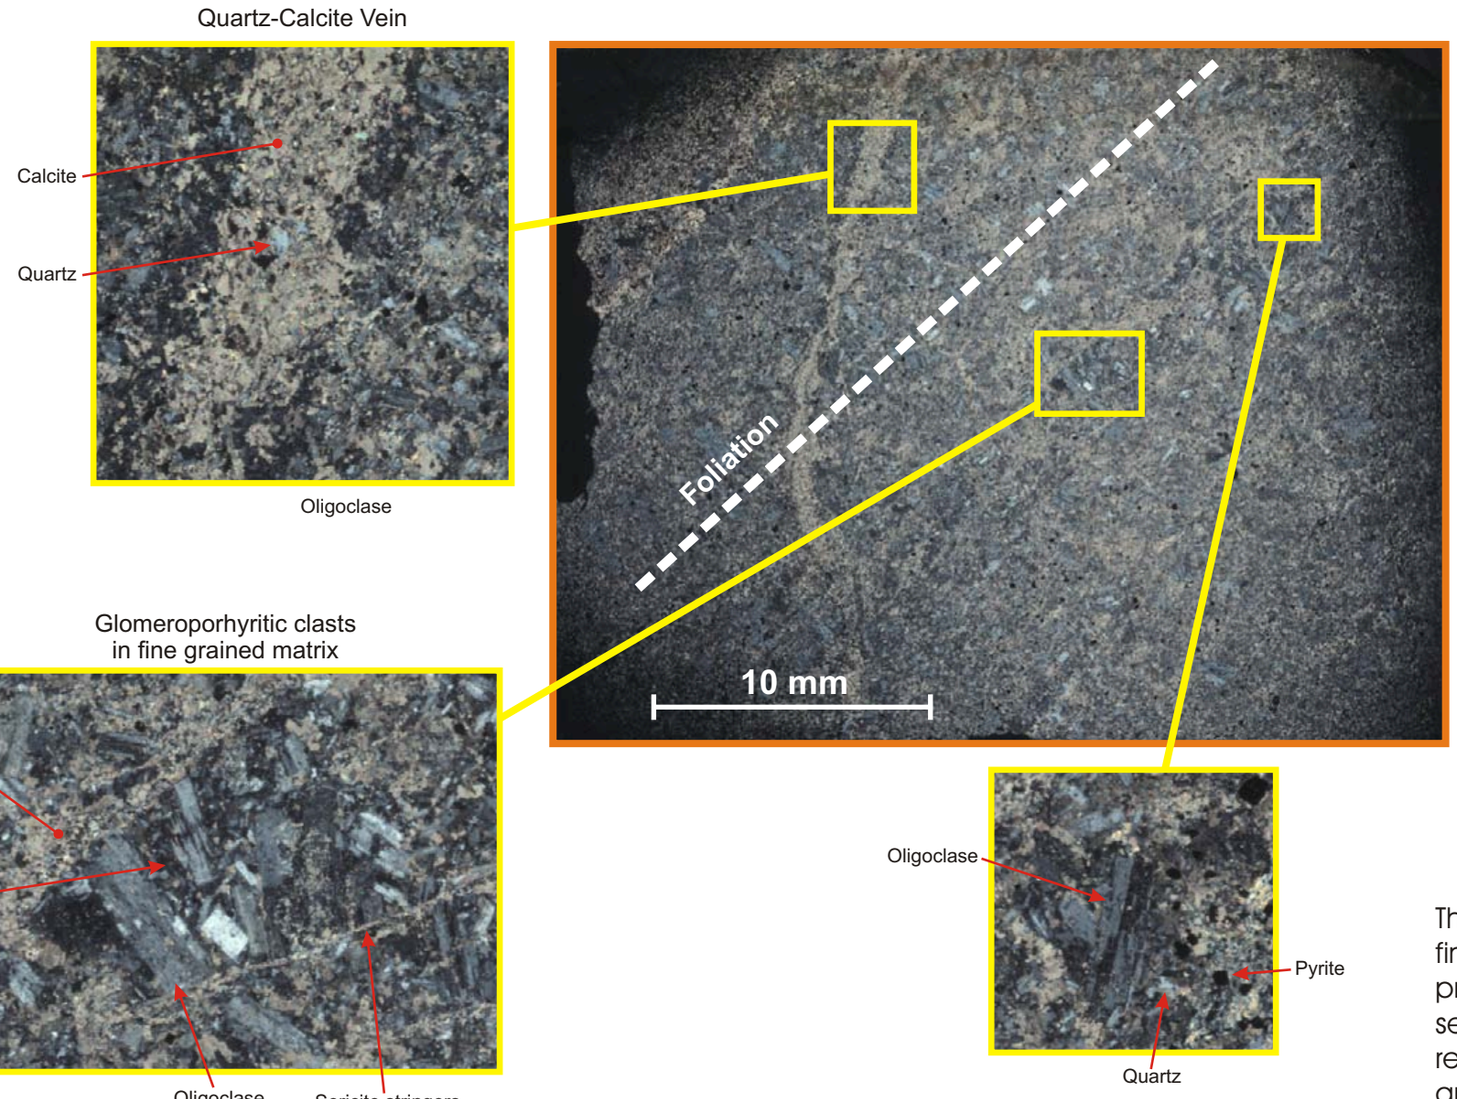
The primary texture is difficult to make out. The fine-grained areas, which may have been originally either glassy or cataclastic zones, seem to have been preferentially altered to a mix of carbonate and sericite. Disseminated fine-grained hematite is responsible for the dark color of some patches and black hematite-goethite veinlets.

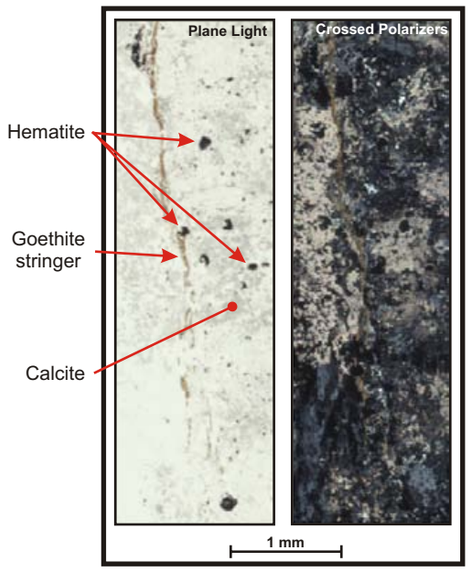


# *DDH2-69.0 Polished Chip*



# DDH2-73.4





*From Thin-Section DDH2-73.4b*

## Glomeroporphyritic Quartz-Monzonite/Trachy-andesite

The original texture is difficult to make out. The fine-grained 'glassy ?" areas seem to have been preferentially altered to a mix of carbonate and sericite. Disseminated fine-grained hematite is responsible for the dark color of some patches and black hematite- goethite stringers criss-cross the sample.
