SUMMARY

A Phase II diamond drill program was carried out on the CAC 3 mineral claim by Noble Metal Group Incorporated from July 13th to July 22nd, 2005.

The drill hole, designated DDH 05-03, was drilled to a depth of 297 metres (977 feet).

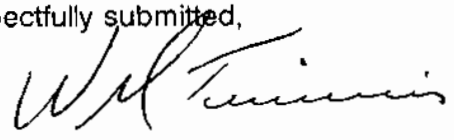
Hole 05-03 intersected extensive intervals of limestone and variable intervals of quartzite, interbedded phyllites and greywacke.

Weak to strong sulphide enrichment and carbonate replacement by sulphides and occurrences in quartz and carbonate veins and veinlets were intersected.

Anomalous gold values as well as substantial intervals of anomalous strontium and titanium occur in all three holes drilled in the Phase I and Phase II program.

Additional diamond drilling of anomalous zones is recommended to further explore and define the mineralization encountered to date.

Respectfully submitted,



W. G. Timmins, P.Eng.

Vancouver, B.C.

INTRODUCTION

The reader should refer to my Assessment Report dated October 12, 2005 detailing Phase I of the diamond drill program consisting of two diamond drill holes totalling 583.08 metres (1,813 feet) completed on July 13, 2005.

Assay results were not available at that time therefore the results of the assays of the first two holes are reported herewith as well as drill hole sections.

This report also chronicles results of work conducted as Phase II of the exploration program during which a third hole was drilled to a depth of 297 metres (977 feet) from July 13 to July 22, 2005.

PROPERTY DESCRIPTION AND LOCATION

The property is located approximately 21 kilometres north-northeast of the community of Likely, in the Cariboo Mining Division of British Columbia, Canada, NTS 93A073, 93A083 centred approximately at latitude 52°47'N, longitude 121°29'W (Figures 1 and 2).

The property consists of 22 four post located claims containing 388 units and 50 located two post claims for a total of 438 units. The claims are contiguous and cover an area of approximately 10,950 hectares. The property has not been surveyed.

A list of the claims, tenure numbers and expiry dates are tabulated below and illustrated on Figure 2.

NOBLE METAL GROUP INCORPORATED

CARIBOO MINERAL PROPERTY

KEITHLEY CREEK, B. C.
CARIBOO MINING DIVISION, B. C.

CLAIM AND INDEX MAP

DATE: Oct. 2005 | FIGURE NO. 2

ACCESSIBILITY, CLIMATE, LOCAL RESOURCES, INFRASTRUCTURE AND PHYSIOGRAPHY

The property is located in the Quesnel Highlands (Trough) of Central British Columbia with elevations ranging from 1000 to 1500 metres above sea level.

Topography varies from steep along the Keithley Creek and Snowshoe Creek to moderate and gentle at higher elevations.

Keithley Creek flows in a southeasterly direction through the centre of the property with many creeks such as Donaldson, Honest John, Rabbit, Snowshoe and Weaver Creeks flowing into Keithley Creek.

The area receives significant precipitation throughout the year as both rain and snow. Accumulations of snow may reach three metres or more during the winter months. Temperatures can vary from -25°C in winter to +30° in summer.

The natural vegetation is predominantly coniferous forest consisting of spruce, balsam, firs and cedar. Large portions of the property have been logged by clear cutting and most of these areas have been replanted. Many of the replanted areas contain second growth trees ranging from three to ten metres in height.

Access to the property is via the property is provided by an all-weather logging road to Keithley Creek from the community of Likely, B.C. From the old settlement of Keithley Creek, on Cariboo Lake, a logging road on the north side of Keithley Creek leads to the property. A network of logging and skid roads provide good access to all areas of the property, although some upgrading may be required.

A logging road also leads to the Keithley-Rabbit Creek grid area from Cariboo Lake parallel to Keithley Creek on the south side.

A complete camp consisting of trailers with built-on additions including kitchen and bunkhouse, three bedroom mobile, generator building, geological and core building, core building, generator building and garage is located on the J #1 claim about 12 kilometres from the main road at Cariboo Lake.

The community of Likely, situated on Quesnel Lake, is reached by paved highway from a point on Highway 97 about 12 kilometres southeast of the Town of Williams Lake. Distance from Highway 97 to Likely is approximately 90 kilometres.

Williams Lake is a logging and lumber centre serviced by scheduled daily air service from Vancouver. Necessary supplies and equipment as well as local labour and modern communications are readily available.

Power for exploration purposes would be supplied by portable generating units if required, while water services are plentiful from the numerous creeks, lakes and underground springs.

HISTORY

The Cariboo region of British Columbia is notable for the gold rush that began in 1860, which has continued to some degree to the present day. Placer gold was discovered on Keithley, Snowshoe, Little Snowshoe and French Snowshoe Creeks around the same time.

Prospecting for hard rock deposits started shortly after the Cariboo gold rush began with production in the Wells-Barkerville area beginning in 1935.

Noble Metal Group Incorporated and its predecessor company Cascadia Mines and Resources Ltd. have been carrying out intermittent exploration for lode deposits since 1979.

Various work programs were carried out in several areas of the property including initial soil geochemical surveys, magnetic and electro-magnetic surveys, Induced Polarization surveys, trenching and diamond drilling.

Early drill programs testing quartz and fault structures did not intersect gold values of interest, however recent drilling has shown anomalous values in gold, nickel, chromium, strontium and vanadium in the area south of French Snowshoe Creek. A comprehensive geochemical soil sampling survey was carried out in the Keithley-Rabbit Creek area and reported in 2004.

The most recent Induced Polarization surveys were carried out by Pacific Geophysical Ltd. on the J #1 claim in 1995 and 1996. Several anomalies were tested by diamond drilling in 1996 and 2001.

Two holes were drilled in Phase I of the 2005 exploration program.

GEOLOGICAL SETTING

Regional Geology

The Cariboo mining district is divided into four tectonically and stratigraphically unique terrains. The rocks of the four terrains range in age from Proterozoic to Jurassic and were deposits into an ocean environment. From east to west, the terrains are Cariboo (continental shelf clastics and carbonates, Barkerville (continental shelf and slope clastics, carbonates and volcaniclastics), Slide Mountain (rift floor pillowed basalt and chert) and Quesnel (island arc volcaniclastics and fine grained clastics.) (See Figure 4).

The Cariboo Terrain is of Precambrian to Permo Triassic age and is in fault contact with the western margin of the Precambrian North American Crater along the Rocky Mountain Trench. It can be divided into two successions, one Cambrian and older and the other Ordovician to Permo-Triassic. The older succession consists of grit, limestone, sandstone and shale and is unconformably overlain by the younger succession of basinal shale, dolostone, wacke, limestone and basalt.

The Barkerville Terrain consists of Precambrian and Palaeozoic rocks ranging in composition from grit, quartzite, and black and green pelite to lesser limestone and volcaniclastic rocks. The contact between the Barkerville and Cariboo terrains is the northwest trending, east dipping Pleasant Valley Thrust.

The Barkerville and Cariboo terrains are overthrust (Pundata Thrust) by the Slide Mountain Terrain. The Slide Mountain Terrain consists of Mississippian to Permian basalt in part pillowed, and chert pelite sequences intruded by diorite, gabbro and minor ultramafic rocks.

The Quesnel Terrain lies west of the Slide Mountain Terrain and consists of Upper Triassic and Lower Jurassic black shale and volcaniclastic greenstone.

Local Geology

The rocks in the vicinity of Yank's Peak belong to the Barkerville Terrain and have been named the Snowshoe Group by Struik (1988). Struik has further divided the sedimentary and volcanic rocks of the Snowshoe Group into fourteen informal subdivisions, Ramos, Tregillus, Kee Khan, Keithley, Harvey's Ridge, Goose Peak, Agnes, Downey, Eaglenest, Bralco, Hardscrabble, Unnamed carbonate, Island Mountain, and Tom. Igneous intrusions of the terrain consist mainly of diorite and gabbro sills with quartz porphyry rhyolite. All rocks have been regionally metamorphosed to low and middle greenschist facies.

The following table summarizes the composition of each group, as well as the estimated thickness (from Struik 1988).

Island Mountain Amphibolite (<150m)	Amphibolite, tuff siliceous mylonite
Hardscrabble Mountain (≤150m)	Black sulphide, argillite and muddy granule conglomerate
Bralco (<100m)	Grey limestone, locally pelletal, commonly marble, includes undifferentiated phyllite
Eaglenest (≥150m)	Grey and olive micaceous feldspathic, poorly sorted quartzite and phyllite
Downey (≥150m)	Olive-grey micaceous feldspathic, poorly sorted quartzite and phyllite, marble, metabasaltic volcaniclastics
Agnes (<150m)	Light grey conglomerate in part with calcareous matrix
Goose Peak (<250m)	Light grey, poorly sorted quartzite, phyllite, minor black sulphide
Harvey's Ridge (<300m)	Black micaceous, poorly sorted quartzite, sulphide and phyllite, minor muddy conglomerate, limestone and basaltic metavolcanics
Keithley (<300m)	Light grey quartzite, olive micaceous, poorly sorted quartzite, sulphide and phyllite

Kee Khan (<750m)	Marble, olive phyllite, sandy marble
Tregillius (>400m)	Olive-grey micaceous, poorly sorted feldspathic quartzite and phyllite, conglomerate
Ramos (>300m)	Olive micaceous poorly sorted feldspathic quartzite and phyllite, black sulphide and phyllite, amphibolite, marble, minor basaltic and felsic volcanics
Tom (<175m)	Olive-grey micaceous poorly sorted feldspathic quartzite, phyllite and schist; quartzose mylonite

The successions range in age from Hadrynian (Ramos through Keithley) to Palaeozoic (Harvey's Ridge through Bralco) and Upper Palaeozoic (Hardscrabble Mountain and Island Mountain Amphibolite).

Recent work by the British Columbia Geological Survey reported in Geological Fieldwork 2001, Report 2002-1, suggests that rocks of the Downey and Ramos may be equivalent to the Keithley succession.

Property Geology

The claims of the Noble Metal property are underlain by rocks of the Ramos succession of which interbedded quartzite and phyllite are the most abundant. The age of the Ramos succession is believed to be Hadrynian. A limestone formation is present in the Keithley-Rabbit Creek area (Bralco?).

The quartzite is olive to grey on fresh surfaces, is poorly sorted and generally medium to coarse grained. The quartz clasts are predominantly glass clear and grey with minor blue. The quartzite is usually micaceous and sericite, epidote, muscovite, chlorite and biotite occur along foliations. Some sections of the quartzite are weakly calcareous.

The phyllite varies from olive, grey to black with chlorite and accessory pyrite, and pyrrhotite. There is often rhythmic banding within the phyllite and contacts between the quartzite and phyllite are usually sharp. The limestone is grey to black with marbly sections, commonly vuggy with quartz and carbonate bands and stringers.

The main structure in the area is the Keithley Creek Thrust that runs from Shoal's Bay on Quesnel Lake northwest up Keithley Creek and crosses Lightning Creek in the Wingdam area. A north-south fault that may be a continuation of the Antler Fault continues from the southern end of Bowron Lake southwards to Snowshoe Creek, and the lower portion of Rabbit Creek, towards the Keithley Creek Thrust.

The quartzites, phyllites and greywackes are intruded by dioritic rocks and several zones of mafic, ultramafic and altered ultramafic rocks.

Deposit Types

The Barkerville Terrain hosts the principal gold occurrences of the Cariboo area. These include the Mosquito Creek, Island Mountain, Cariboo Gold quartz and Cariboo Hudson mines and the Snowshoe and Midas veins. Deposits of less economic importance include those of silver, tungsten, lead, zinc and copper.

The gold ore at the Mosquito Creek, Island Mountain and Cariboo Gold Quartz mines in the Cariboo Gold Belt occurs in (1) auriferous pyrite in quartz veins and (2) stratabound, massive auriferous pyrite lenses, termed "replacement ore".

The location of the gold deposits correlates with elements of (1) stratigraphy, (2) structure and (3) metamorphism.

1. ***Stratigraphic Controls:*** Lode gold deposits are almost entirely confined to the Palaeozoic section of the Snowshoe group. In the Keithley Creek-Snowshoe Creek area, the Palaeozoic Harvey's Ridge succession contains a high density of auriferous quartz veins.

2. ***Structural Controls:*** The auriferous replacement pyrite in limestone lenses is located in the hinge zones and less commonly along the limbs of regional and minor folds. Orientation of quartz veins is in part controlled by the regional fault and fracture pattern.

3. ***Metamorphic Controls:*** Lode gold concentrations are confined to rocks in the chlorite grade of metamorphism. The auriferous quartz veins in the Yank's Peak area vary greatly in dimension, ranging in width from a few inches to tens of feet and in length from a few tens of feet to greater than 1000 feet. They can be grouped into three types based on their strike, northerly, northeasterly and easterly striking. The vein quartz is usually milky-white in appearance and massive or slightly fractured with small crystal lined vugs. Ankerite is a common gangue mineral. The quartz is sparsely to moderately mineralized with sulphides. The highest gold values appear to be associated with the highest concentrations of pyrite.

DIAMOND DRILL PROGRAM

Phase II of the diamond drill program consisted of one vertical NQ drill hole to a depth of 297 metres (977 feet).

The diamond drill logs are entered as Appendix I. The drill hole location plan is located in the pocket at the rear and the drill sections of Phase I and Phase II are in the pocket ar the rear.

Drill core is stored in a secure building at the Noble Metal Group camp located at Keithley Creek.

Drill Hole 05-03 intersected large intervals (in the order of 100 metres) of limestone and variable intervals of quartzite, interbedded phyllites and greywacke.

Numerous intersections of weak to strong sulphide enrichment occurring as disseminations, bands, pockets, stringers, veins and carbonate replacement were encountered throughout the hole. Sulphides consist mainly of pyrite and pyrrhotite also occurring in quartz and carbonate veins and veinlets.

It is noted that in all three holes there were several occurrences of anomalous gold values ranging from 5 ppb to 40 ppb as well as substantial intervals of anomalous strontium from above 500 ppm to 3060 ppm, and titanium from above .05% to .17%.

SAMPLING

The drill core was transported from the drill site to the core building at the Noble Metral Incorporated camp where it was logged and split utilizing a diamond saw. In excess of 400 core as well as 54 sludge samples were logged and shipped for analysis.

Assay results were correlated and presented as Appendix II and assay certificates are appended in Appendix III.

CONCLUSIONS AND RECOMMENDATIONS

The three drill holes comprising Phase I and II of the exploration program were successful in determining the presence of anomalous gold, strontium and titanium values and sulphide mineralization such as pyrite and pyrrhotite occurring in limestone as replacement sulphides and in quartzite and phyllites and quartz vein structures.

It is the writer's opinion that additional drilling of geochemical soil anomalies outlined in the previous soil sampling survey on the Keithley-Rabbit Creek grid is warranted to further explore and define the mineralization discovered to date.

STATEMENT OF QUALIFICATIONS

I, William G. Timmins, of the City of Vancouver, in the Province of British Columbia, do hereby certify that:

1. I am a consulting geologist, with offices at 1016 - 470 Granville Street, Vancouver, B.C. V6C 1V5.

2. I have been practising my profession since 1965, having been engaged in the evaluation, exploration and development of mineral properties throughout Canada, the United States, Latin and South America, Australia and New Zealand.

3. I am a graduate of the Provincial Institute of Mining, Haileybury, Ontario (1956) and attended Michigan Technological University 1962-1965, Geology and was licensed by the Professional Engineers Association of B.C. (geological discipline) in 1969.

4. This report titled "Assessment Report, Phase II Diamond Drill Program on the CAC 3 Mineral Claim" dated June 26, 2006, is based on published and private reports, maps and data provided by Noble Metal Group Incorporated and in the public domain, and supervision of the project on site from July 13 to August 30, 2005. The author has reviewed relevant data prepared by reputable qualified persons and is responsible for his own geological analysis and conclusions.

5. I have no interest, nor do I expect to receive any interest in the properties or securities of Noble Metal Group Incorporated.

DDH 05-3

Started	-	July 13, 2005
Completed	-	July 22, 2005
Angle	-	90°
Size:	-	NQ
Grid Co-ordinates	-	3800N, 1525E
VTM Co-ordinates	-	0599287, 5853379
Elevation	-	1,347 metres
Total Depth	-	977 feet (297.8 metres)
Acid Test	-	@ 500 ft 89.5°
	-	@ 977 ft 87°

	METRES	DESCRIPTION
0 - 10	0.0 - 3.0	CASING
10 - 49	3.0 - 14.93	Quartzite, rusty, random white leached quartz stringers.
49 - 67.5	14.93 - 20.57	Quartzite, light grey, minor quartzite interbeds, dark bands, quartz-carbonate stringers, quartz clots, pyrite disseminations, rusty on breaks.
67.5 - 87	20.57 - 26.52	Limestone, carbonaceous sections, white calcite stringers and clots, black carbonaceous sections with finely disseminated pyrite, vuggy.
87 - 106	26.52 - 32.31	Limestone, light grey, quartz and carbonate stringers and bands (50° to core). Minor disseminated pyrite, arsenopyrite, stringers of pyrite.
106 - 125	32.31 - 38.10	Limestone as above, glassy quartz vein at 117.5 ft to 118.0 ft with minor pyrite.
125 - 145	38.10 - 44.20	Limestone as above, evident folding of light and dark bands, quartz and carbonate bands, stringers and clots.

FEET	METRES	DESCRIPTION
145 - 183	44.20 - 55.78	Limestone, light grey, dark carbonaceous bands 60° to 90° to core, few specks of pyrite. Dark bands 90° to core, quartz clots, quartz-carbonate stringers.
183 - 335	55.78 - 102.11	Limestone, light to dark grey, quartz stringers and bands, pyrite and pyrrhotite disseminations and replacement, fault gouge at 289 ft, stringers of pyrite and pyrrhotite contorted sections, from 321 ft broken and gougy sections, folded and contorted sections, relict bedding 80° to 90° to core.
335 - 355	102.11 - 108.20	Limestone, dirty, widespread quartz-carbonate injection, stringers, breccia folding pyrite and pyrrhotite stringers, section of broken core.
355 - 391	108.20 - 119.18	Phyllite, dark grey to black, fine grained bedding 70° to core, quartz and carbonate stringers and clots, broken core and gouge at 390 ft to 391 ft, leached calcite stringers with pyrite smears at 373 ft - down core.
391 - 408.5	119.18 - 124.51	Phyllite with limy sections to 401 ft, numerous quartz-carbonate veins, veinlets, stringers with pyrite and pyrrhotite and disseminations.
408.5 - 455	124.51 - 138.68	Greywacke, light to dark grey, fine to medium-grained, phyllite and limy interbeds, quartz clots and veinlets and carbonate stringers with pyrite, quartz-carbonate vein at 443 ft to 444 ft with green soft matrix (from olivine?), vuggy with pyrite replacement and blotches.
455 - 494	138.68 - 150.57	Limestone, dirty, dark grey, numerous rocks with pyrite fillings and cubic pyrite, folded, white carbonate bands, calcite filled fractures with disseminated pyrrhotite.
494 - 513	150.57 - 156.36	Phyllite, limy sections, quartz-carbonate stringers and bands, occasional specks of pyrite and pyrrhotite.
513 - 532	156.36 - 162.15	Limestone, dirty dark grey, bedding trending 70° to 90° to core, folded and contorted in places, odd specks of pyrite and pyrrhotite.
532 - 586	162.15 - 178.61	Quartzite, dirty light grey, disseminated pyrite and pyrrhotite, quartz-carbonate stringers at 552 ft to 554 ft, very soft green matrix (from olivine?) with quartz-carbonate, mineralized with pyrite replacement.

FEET	METRES	DESCRIPTION
586 - 668.5	178.61 - 203.76	Limestone, light to dark grey, dirty, bedded 70° to core, quartz and carbonate stringers, phyllitic section at 642 ft to 649 ft, occasional blebs pyrite and pyrrhotite - from 656.6 ft, limestone is cleaner and light grey to white.
668.5 - 695.5	203.76 - 211.99	Limestone, light grey to white, vuggy and leached in places, sections with disseminations and blebs and cubes of pyrite plus pyrite and pyrrhotite.
695.5 - 741	211.99 - 225.86	Limestone, dark grey, vuggy with clear calcite crystals, quartz-carbonate stringers, from 726 ft badly broken, gougy at 738 ft to 739 ft (fault zone).
741 - 763	225.86 - 232.56	Limestone, light grey to white, cracked and leached, good core from 744.5 ft.
763 - 854.5	232.56 - 260.45	Limestone, typical light grey, dirty, occasional disseminated pyrrhotite and pyrite, quartz-carbonate stringers, pyrite streaks and plates on slips, broken core from 810 ft - 819 ft, fault gouge at 817.5 ft to 819 ft. Vuggy sections with pyrite replacement.
854.5 - 856.5	260.45 - 261.06	Limestone, light grey, clean, banded, numerous quartz-carbonate stringers and bands and stringers of pyrrhotite.
856.5 - 875	261.06 - 266.70	Limestone, dark grey, from 868 ft, light grey and black bands, cracks and fissures with calcite, vuggy, pyrite and cubic pyrite.
875 - 977	266.70 - 297.79	Greywacke, interbeds of phyllite badly broken sections, 914 ft - 917 ft is probable fault shatter zone, pebbly and gougy, brecciated sections, quartz stringers with pyrrhotite and pyrite.

0.500 Gram sample is digested with Aqua Regia at 95 C for one hour and bulked to 10 ml with distilled water.
Partial dissolution for Al, B, Ba, Ca, Cr, Fe, K, La, Mg, Mn, Na, P, Sr, Ti, and W.
"R" Denotes duplicate sample analyzed.

0.500 Gram sample is digested with Aqua Regia at 95 C for one hour and bulked to 10 ml with distilled water.
Partial dissolution for Al, B, Ba, Ca, Cr, Fe, K, La, Mg, Mn, Na, P, Sr, Ti, and W.

"R" denotes duplicate sample analyzed.

0.500 Gram sample is digested with Aqua Regia at 95 C for one hour and bulked to 10 ml with distilled water.
Partial dissolution for Al, B, Ba, Ca, Cr, Fe, K, La, Mg, Mn, Na, P, Sr, Ti, and W.
"R" Denotes duplicate sample analyzed.
