PROPERTY GEOLOGY KEYWORDS (lithology, age, stratigraphy, structure, alteration, mineralization, size and attitude):

The property is underlain by granitic rocks of the Nelson Plutonic suite specifically the Spruce Grove Batholith. Gold and silver occurs in gently dipping quartz-pyrite-galena-sphalerite veins cutting sericite altered granodiorite. Veins are up to 40cm thick.

APPENDIX I SOIL ANALYSES

1.0 SUMMARY

This report summarizes the results of a small soil geochemistry program that was conducted on the Kami Property in the 2006 field season. The soil program was designed to test soil response in the vicinity of mineralized quartz vein float. Overall results were poor with several anomalous silver values and some very weak gold anomalies.

2.0 INTRODUCTION

This report details the result of a soil geochemistry program which was conducted on the Kami Property (the property), located west of Lumby, British Columbia. The program was carried out by partners in the Selkirk Mineral Syndicate in the summer of 2006.

A total of 44 B-horizon soil samples were collected and analyzed for gold and 28 other elements.

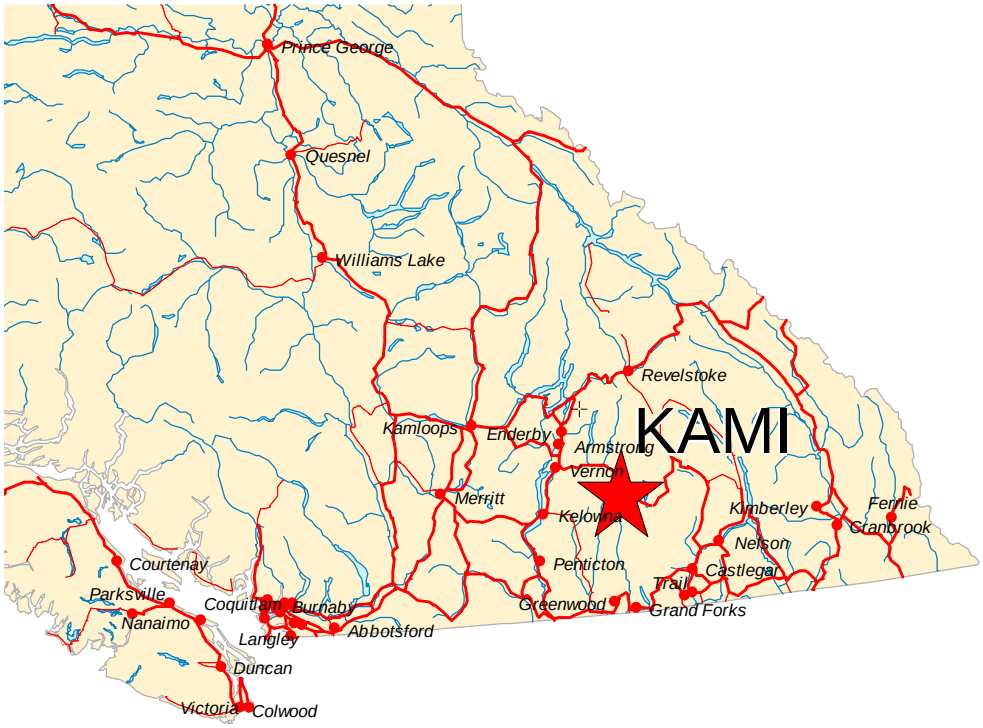
3.0 LOCATION, ACCESS AND PHYSIOGRAPHY

The Kami Project is located in the southern part of the Whatshan Range of the Monashee Mountains of southern British Columbia. The project area is 75 kilometers east-southeast of Vernon, and 30 kilometers northwest of the Needles ferry on Arrow Lake (see Figure 1).

Access into the claim blocks is excellent due to an array of well-maintained logging roads operated and maintained by Tolko Industries. The claims are accessed via the Kettle Forest Service Road which joins Provincial Highway #6 approximately 55 kilometers west of the Needles Ferry. From the highway, the property is approximately 18 kilometers via branch roads K-10 and K-15. Although four-wheel drive is recommended, the majority of the roads are accessible with two-wheel drive. These roads are at various times, active logging roads. Radio communication is recommended and the local frequency is 153.44 kHz.

The property is situated in a plateau area and topography would be considered moderate. Maximum relief is approximately 250 metres with maximum elevation of about 1900 metres. The forest consists of mixed stands of Spruce, Balsam Fir and Lodgepole Pine. The topography would not be considered rugged within the claim area. The property is located at the headwaters of Banting Creek which is an eastward flowing tributary of the Inonoaklin Creek which in turn drains into the Lower Arrow Lake at Edgewood.

Figure 1: LOCATION MAP



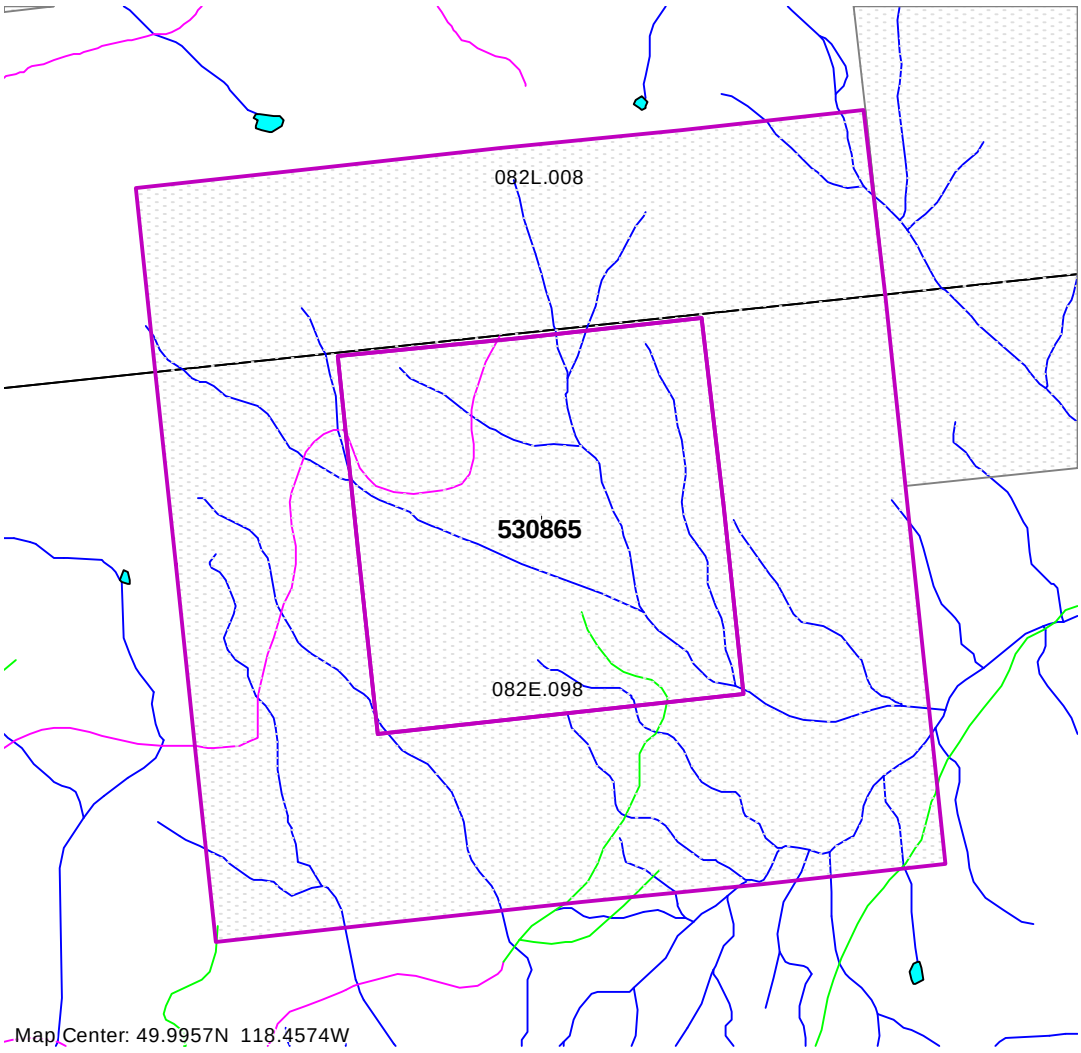
4.0 CLAIM STATUS

The claims are currently registered under the name of Mike Hudock but jointly owned by a prospecting syndicate, Selkirk Minerals Syndicate. The property consists of two claims with an effective area of 249.239 hectares.

TENURE #	# OF HECTARES	EXPIRY DATE
536244	249.239	March 30, 2009*
530865	83.08	March 30, 2009*

* After successful filing of this assessment report

Figure 2: CLAIM MAP



5.0 REGIONAL AND LOCAL GEOLGY

The entire property is underlain by the Spruce Grove Batholith, a Jurassic aged hornblende leucogranite. A significant, northerly striking, west dipping, normal fault, Bevan Fault, occurs approximately 10km to the east and separates the Spruce Grove Batholith from the Whatshan Lake Batholith which is a Cretaceous-aged, leucocratic, hornblende-bearing megacrystic quartz monzonite, (Thompson, et al, 2003). Geological information in this region is poorly constrained and the data should be used as a guideline at best. That being said, the geology of the property as examined to date, does appear to be underlain by a granodiorite. Evidence of faulting is seen in the area of the main workings and it is quite possible that the Bevan fault may occur much closer to the Kami property than is shown to date. Alternatively, mineralization at the Kami may be related to a splay fault off the Bevan fault. Significant gold mineralization has been discovered on the hanging wall side of the Bevan fault approximately 17km to the north on Columbia Yukon Explorations Inc. Barnes Creek Property, (Augsten, 2005).

6.0 EXPLORATION HISTORY

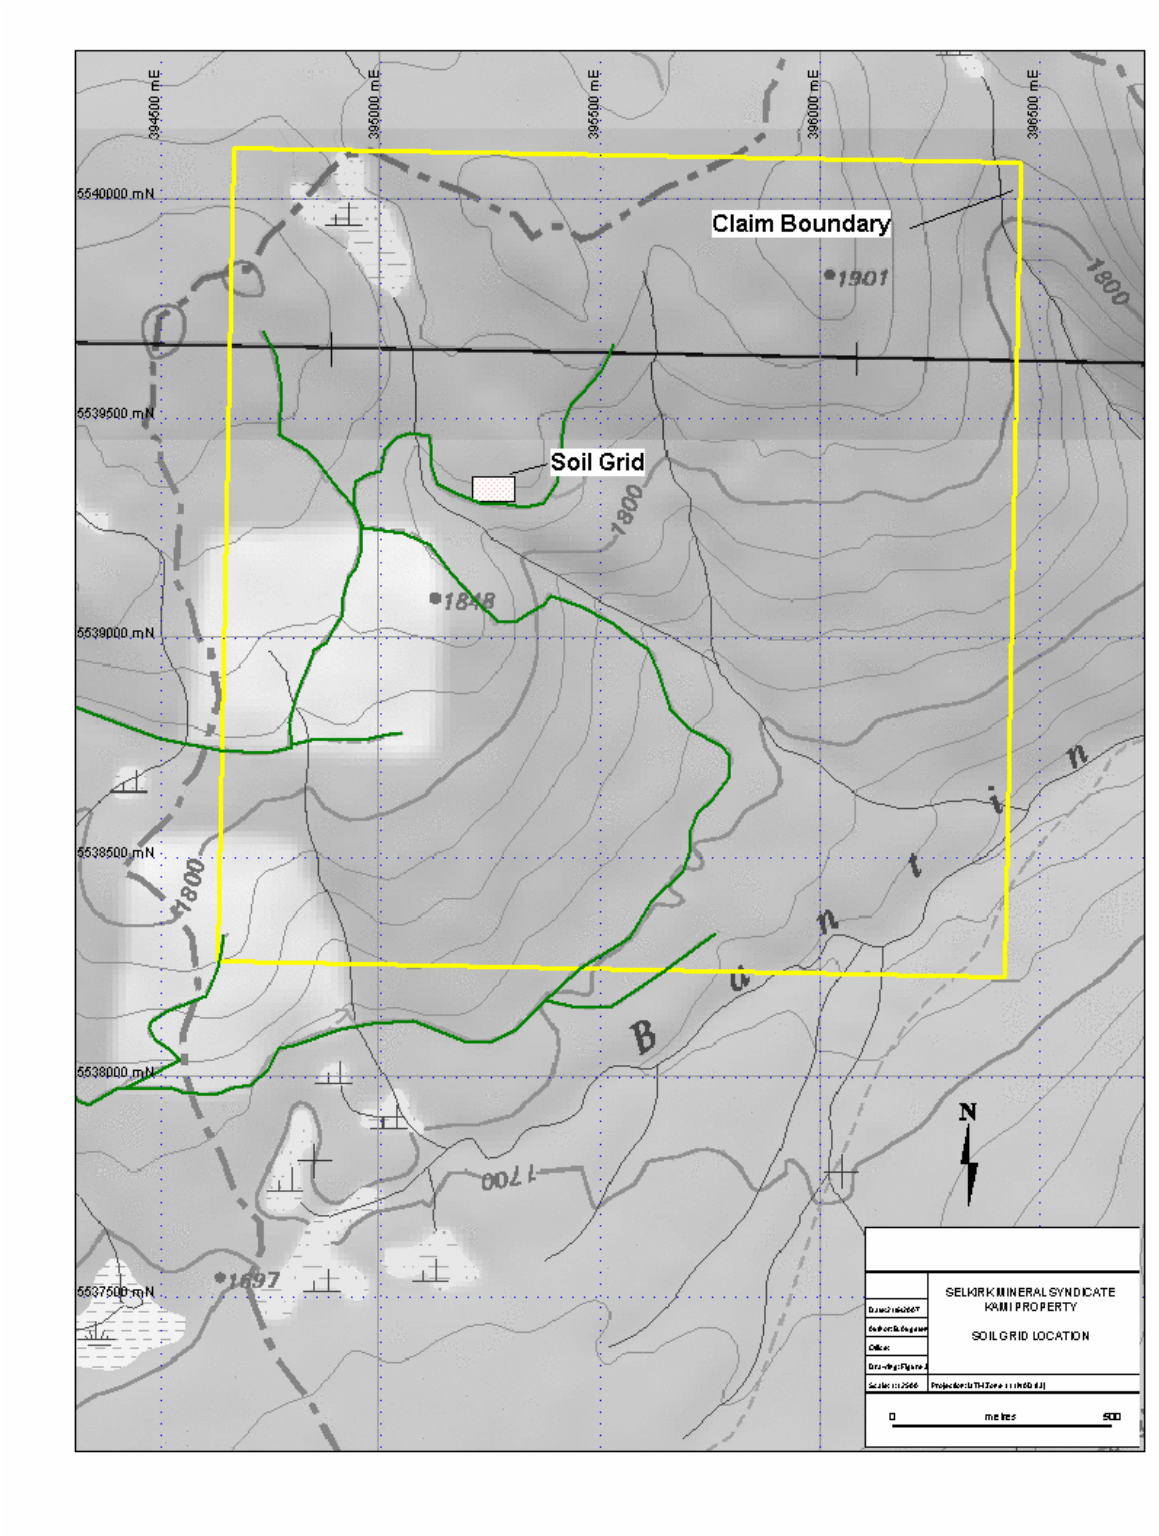
Exploration history on the Kami claims dates back to at least the early 1960's and perhaps earlier as evidenced by old workings and the remains of a prospectors cabin. However, none of this early work was ever systematically documented and no record of it exists in the government database. In the late 1997 Arnold Savjord under the auspices of a Prospecting Grant uncovered a series of narrow, gently dipping, gold and silver-rich quartz-pyrite-galena-sphalerite veins. His work consisted predominantly of trenching and bulk sampling in one area. Additionally he did some very limited soil and stream sediment sampling, (BCEM Expl, 1997). The current owner have done some cursory prospecting and sampling which confirmed the polymetallic nature of the quartz veins.

7.0 SOIL GEOCHEMISTRY

7.1 METHODOLOGY

A small tight spaced grid was established with lines spaced at 20 metres and soils collected at 10 meters on those lines. Lines and stations were established on even UTM coordinates. . Samples were collected in a kraft paper envelope. A total of 44 samples were collected in the 2006 field season.

Figure 3: SOIL GRID LOCATION MAP



7.2 ANALYTICAL METHODS

All analytical work was conducted by EcoTech Laboratory Ltd. of Kamloops, BC. Samples are catalogued and dried. Soils are prepared by sieving through an 80 mesh screen to obtain a minus 80 mesh fraction. Samples unable to produce adequate minus 80 mesh material are screened at a coarser fraction. These samples are flagged with the relevant mesh.

Geochemical Gold Analysis:

The sample is weighed to 30 grams and fused along with proper fluxing materials. The bead is digested in aqua regia and analyzed on an atomic absorption instrument. Appropriate reference materials accompany the samples through the process allowing for quality control assessment. Results are entered and printed along with quality control data (repeats and standards).

Multielement ICP Analysis:

A 0.5 gram sample is digested with 3ml of a 3:1:2 (HCl:HN03:H20) for 90 minutes in a water bath at 95°C. The sample is then diluted to 10ml with water. The sample is analyzed on a Jarrell Ash ICP unit. Results are collated by computer and are printed along with accompanying quality control data (repeats and standards).

7.3 RESULTS

Results are plotted for gold and silver on Figures 4 and 5 respectively. Assay results are tabulated in Appendix I.

GOLD:

Gold values were uniformly low with the exception of one value of 55ppb,(See Fig.4). No other anomalous elements correlate with this gold value.

SILVER:

Silver produced a more interesting result. Two northwest trending anomalies were defined in the northwest part of the grid with maximum values of 3.7ppm Ag, (See Fig. 5). No significant correlation with other elements exist with the exception of what appears to be elevated yttrium. It is uncertain what this means.

Figure 4: GOLD SOIL GEOCHEMISTRY

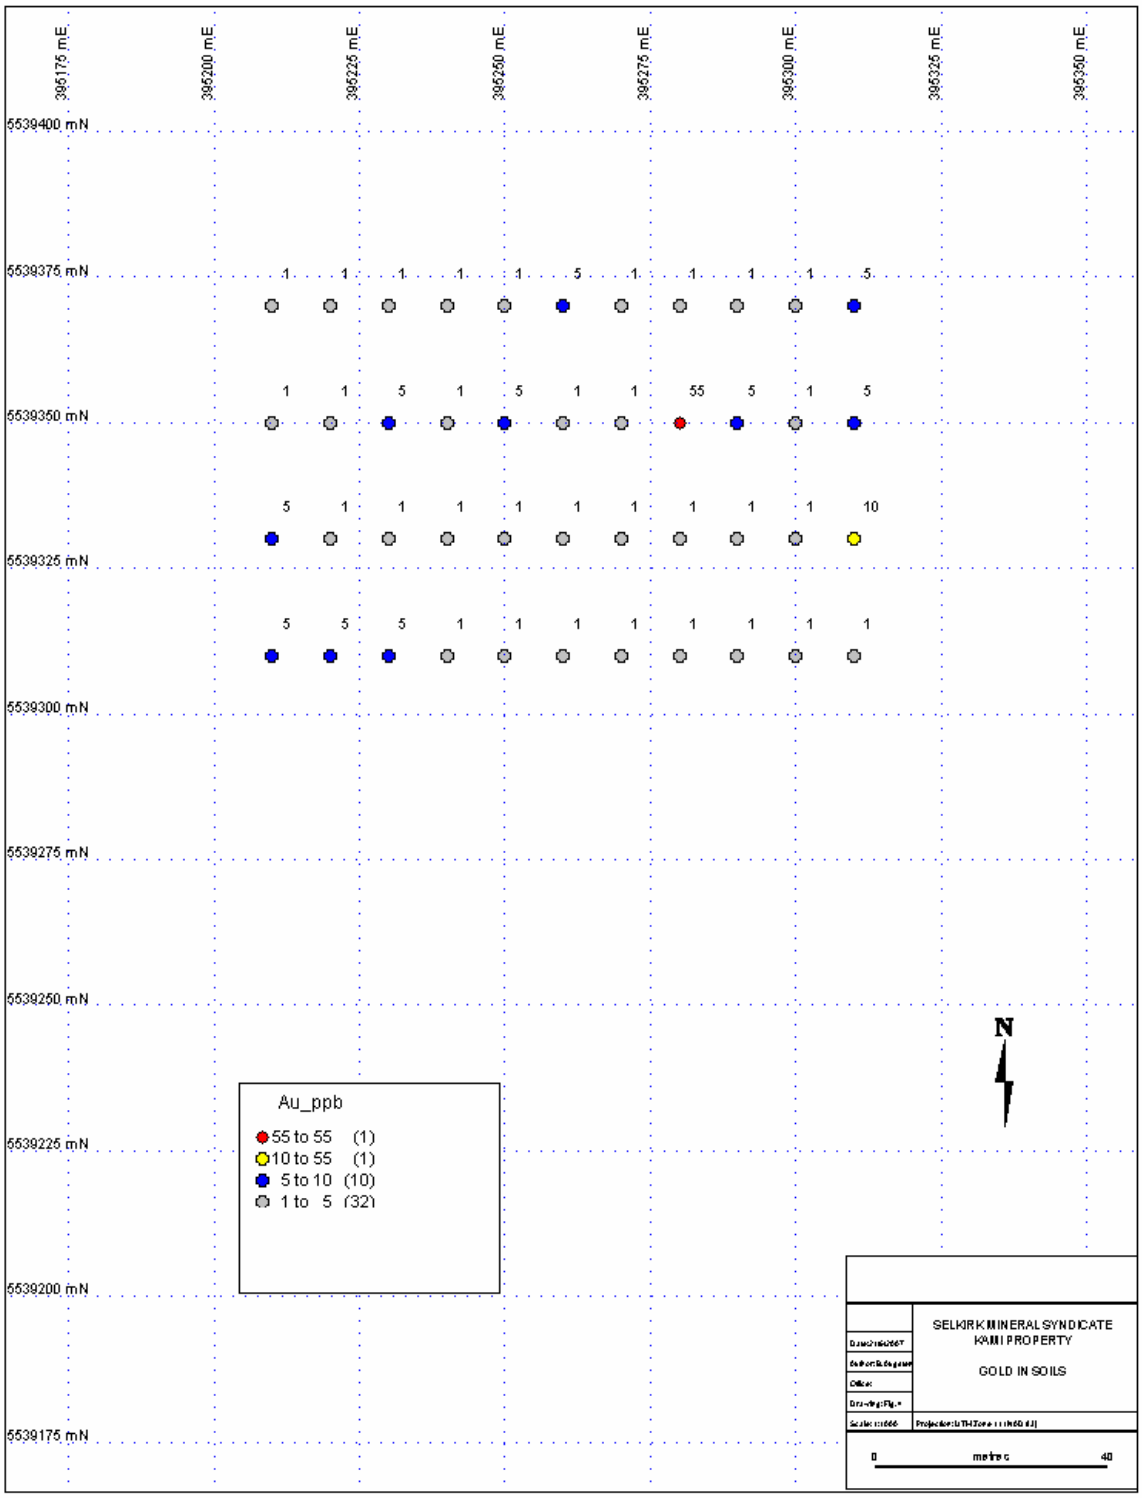


Figure 5: SILVER SOIL GEOCHEMISTRY

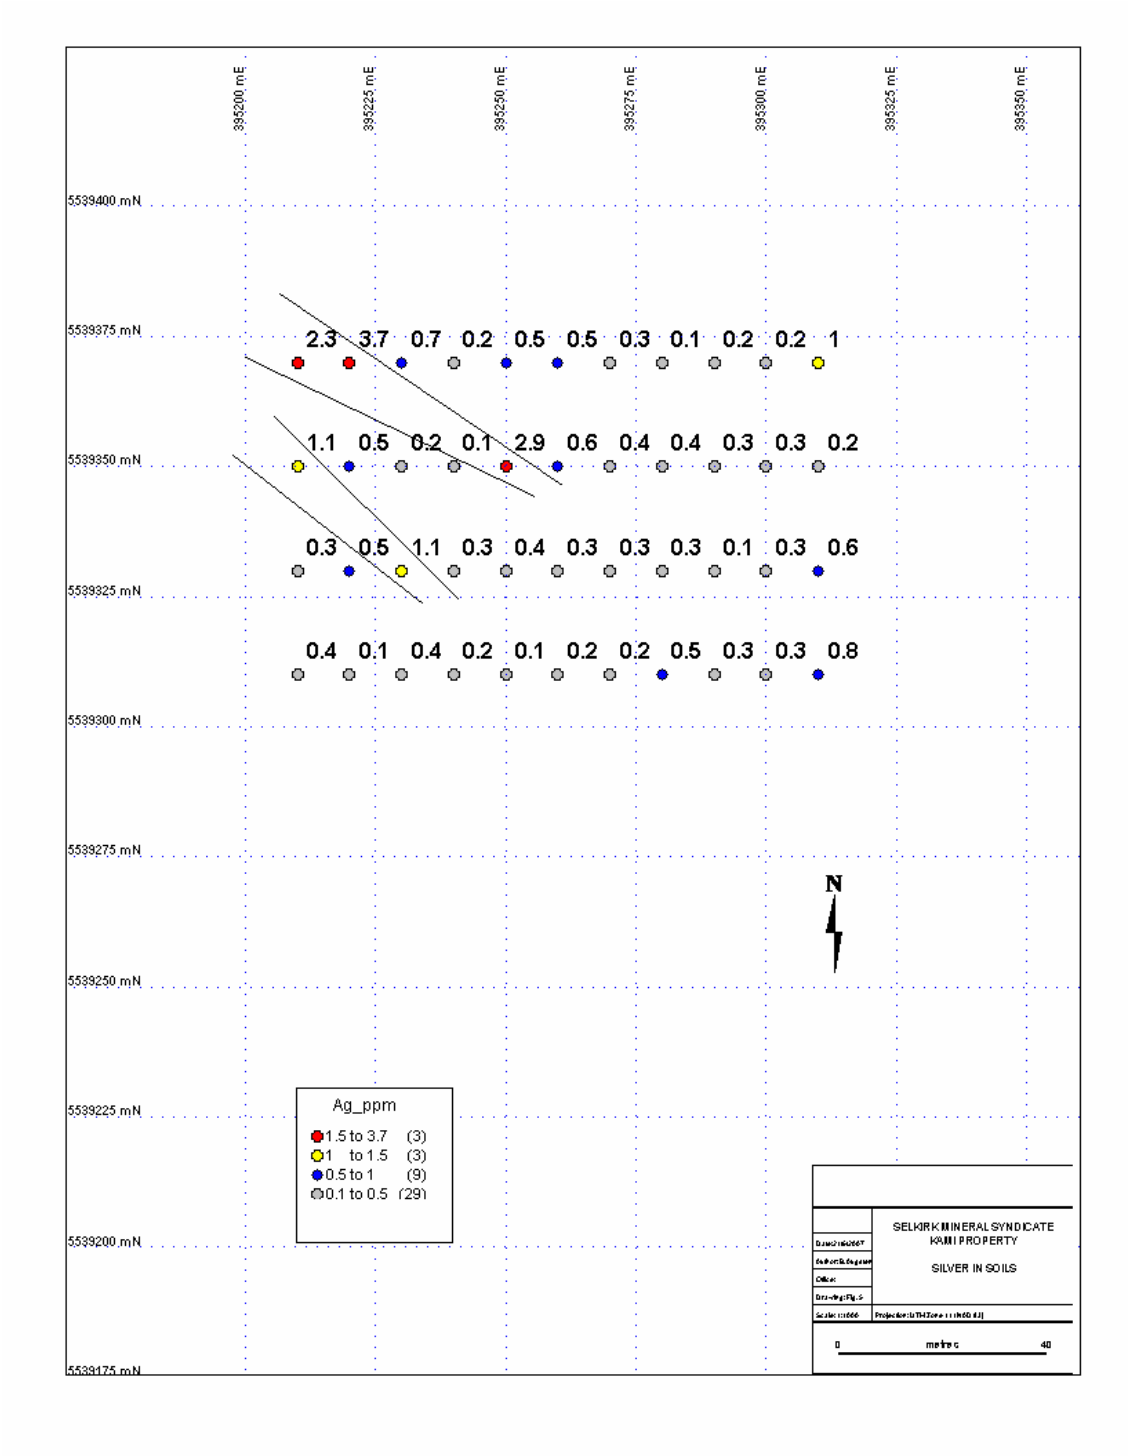

8.0 CONCLUSIONS AND RECOMMENDATIONS

The limited geochemistry program on the Kami property revealed some interesting features. By doing the soil program there was a recongnition that overburden coverage is shallow and in well-drained areas there is an expectation of finding well-deveoloped B-horizon soils. Glacial till was not seen but may occur in pockets especially in topographic lows. By and large the response for gold was poor notwithstanding the one anomalous soil at 55ppb. Silver geochemistry on the other hand produced two interesting northwest trending anomalies occurring in the northwest part of the grid.

It is recommended that firstly these soil anomalies be ground truthed to see if any geological reason exists for them. Hand trenching at these sites may be productive. Secondly, it is recommended that the entire property be covered by soil samples on a 100 metre by 25 metre grid.

Thirdly, basic prospecting on this property is sure to pay dividends. The overall low overburden depths and multiple occurrence of gold-bearing veins coupled with a history of virtually no exploration provide ideal conditions for prospecting discoveries.

9.0 COST STATEMENT

Labour	K. Murray (2 days @$250.00)	$500.00
	M. Hudock (2 days @$250.00)	$500.00
Trucks (4x4)	Truck Rental	$75.00
Fuel		$81.65
Food/Meals		$63.50
Analyses	Eco-Tech Laboratories Ltd (44 soil samples)	$849.00
Miscellaneous	Sample bags, flagging, tags etc	$25.00
Shipping		$44.83
Report Preparation		$500.00
	TOTAL	**$2,594.15**
