			replacement - minor sphalerite.									
360.06	380.18	**Andesite**	Moderate to strong chlorite-sericite alteration. 5-7%									
		Lapilli Tuff	quartz-carbonate occurring as replacements and									
			irregular veinlets. Minor disseminated pyrite.									
			Multiple fault zones within the andesite lapilli tuff are									
			marked by rubble and numerous intervals of clay									
			gouge ranging in thickness from 2-30 cm.									
			At 367.07 to 367.84 - aphanitic dacite replacement.									
			At 371.65 to 372.26 - aphanitic dacite replacement.									
			At 377.90 to 378.20 - interval of dacite replacement.									
			At 378.20 to 378.66 - interval of heavily fractured									
			premier porphyry bounded by fault zones marked by									
			clay gouge.									
380.18	385.06	**Fault**	The interval consists of 40% dacite, 20% andesite									
		Zone	lapilli tuff, and 20% premier porphyry fragments.									

			Strong sericite-chlorite alteration. Several clay gouge									
			intervals indicate extensive faulting. 5-10% quartz-									
			carbonate replacements, 5% disseminated pyrite.									
385.06	391.46	Andesite	Highly fractured and brecciated, light to dark green									
		Lapilli Tuff	andesite lapilli tuff. Moderate chlorite-sericite									
			alteration. 15-25% quartz-carbonate-adularia(?)									
			stockwork. 5-10% pyrite occurring as veinlets and as									
			disseminations.									
			At 387.35 to 387.41 - clay gouge indicating fault.									
			At 390.24 to 391.16 - interval of partial dacite									
			replacement (30-40%).									
			At 391.40 to 378.05 - quartz-carbonate vein at 35									
			degrees to C.A.									
391.46	398.48	Premier	Light to dark green rock, strong chlorite-sericite									
		Porphyry	alteration. 5% quartz-carbonate-adularia(?)									
			replacements. 1% disseminated pyrite.									
			At 393.93 to 394.05 - interval of 60-70% quartz-carbonate									
			replacement.									
398.48	414.33	Grano-	Dark green, medium to coarse grained rock. Weak									
		diorite	sericite-chlorite alteration. 2-5% quartz-carbonate									
			occurring as replacements and veinlets, 1%									
			disseminated pyrite.									
414.33	427.13	Premier	Dark green intrusive rock, patches of weak to									
		Porphyry	moderate silicification. 5-7% quartz-carbonate									
			occurring as veinlets and replacements, 1-3%									
			disseminated pyrite.									
427.13	432.01	Zone of	The zone is hosted within premier porphyry.									
		Strong	Moderate to very strong silicification with medium to									

PINNACLE MINES LTD _ MOUNTAIN BOY MINERALS LTD

		Silici-	dark grey very fine grained semi-chalcedonic quartz.									
		fication	The rock exhibits a network of thin, irregular fractures									
			filled with a black carbonaceous substance and/or									
			chlorite, and to a lesser extent quartz and carbonate.									
			Pyrite is 1-5% as disseminations and patches.									
432.01	454.73	Premier	Medium to coarse grained intrusion with 10-20% very									
		Porphyry	fine grained matrix and sporadic subhedral to euhedral									
			feldspar phenocrysts 0.50 to 2.00 cm in size. Weak									
			chlorite-sericite alteration, in many places weak									
			silicification. Minor quartz-carbonate veinlets. In many									
			places there are numerous small xenoliths.									
454.73	465.24	Zone of	Same as interval 427.13 to 432.01.									
		Strong										
		Silici-										
		fication										
465.24	496.34	Grano-	Medium grained rock, weak chlorite-sericite									
		diorite	alteration. In a few places the core is only partially									
			replaced by granodiorite. Minor quartz-carbonate									
			veining, minor disseminated pyrite.									
496.34	525.61	Premier	Medium to coarse grained rock with 10-20% very fine									
		Porphyry	grained matrix and sporadic subhedral to euhedral									
			feldspar phenocrysts 0.50 to 2 cm in size. Weak									
			chloritization and silcification. Minor quartz-carbonate									
			veinlets, minor disseminated pyrite.									
			At 496.34 to 498.48 - the rock has black matrix									
			dominated probably by carbonaceous substance									
			and/or chlorite.									
			At 507.47 to 507.56 - 1.00 cm wide quartz-chlorite vein									
			at 15 degrees to C.A.									
			At 519.82 to 520.00 - 5 cm wide quartz-carbonate vein									

			at 15 degrees to C.A.									
525.61	527.74	Siliceous	Aphanitic texture, locally weak propylitic alteration. In									
		Felsite	many places there is a black carbonaceous substance									
			and/or chlorite as fracture filling and irregular patches.									
			Minor pyrite.									
			At 526.83 to 527.23 - 2-3% pyrite.									
527.74	529.88	Premier	Same as interval 496.34 to 525.61.									
		Porphyry										
529.88	552.59	Siliceous	Aphanitic texture. In many places there is a black									
		Felsite	carbonaceous substance and/or chlorite as fracture									
			filling and patches. Trace to 5% pyrite as									
			disseminations, patches, and veinlets. Minor quartz-									
			carbonate veining.									
			At 544.21 to 544.82 - 3-5% pyrite, abundant black									
			carbonaceous substance and/or chlorite.									
552.59	554.27	Andesite	Dyke at feldspar - hornblende porphyritic andesite.									
			Strong chloritization, weak silicification.									
554.27	570.43	Siliceous	Same as interval 529.88 to 552.59.									
		Felsite										
			At 558.38 to 559.76 - minor epidote as disseminations									
			and patches.									
570.43	573.78	Premier	Medium to coarse grained rock with 20-25% fine									
		Porphyry	grained matrix and rare subhedral feldspar									
			phenocrysts 0.50 to 2 cm in size. Mafic minerals are									
			strongly chloritized and diffused. Minor quartz-									
			carbonate veining.									
573.78	575.55	Siliceous	Same as interval 529.88 to 552.59.									
		Felsite										

PINNACLE MINES LTD _ MOUNTAIN BOY MINERALS LTD

575.55	578.96	**Premier**	**Same as interval 570.43 to 573.78.**									
		Porphyry										
578.96	588.11	**Dacite**	**Beige colour aphanitic rock, in many places the rock is**									
			highly siliceous. Weak patchy chloritization throughout									
			the interval. Locally black carbonaceous substance									
			and/or chlorite as fracture filling, sporadically minor									
			epidote. Pyrite 1-3% as disseminations, small patches,									
			and veinlets.									
588.11	600.40	**Siliceous**	**Same as interval 529.88 to 552.59. In many places minor**									
		Felsite	**epidote.**									
			At 589.02 - 10 cm wide quartz-carbonate-pyrite vein									
			with minor chalcoyrite and galena. Vein is at 10									
			degrees to C.A.									
			At 593.35 to 593.57 - 7-10% pyrite, abundant									
			carbonaceous substance and/or chlorite.									
			At 593.99 to 594.51 - brecciated interval.									
			At 599.88 to 600.40 - 2-3% of a reddish, extremely fine									
			grained sphalerite(?).									
600.40	607.07	**Dacite**	**Beige colour aphanitic rock. In many places there are**									
			many xenoliths of premier porphyry. Locally patches									
			of chlorite. Minor quartz-carbonate veining. From									
			605.06 to 607.07 - very strong chloritization.									
607.07	616.65	**Sulphide**	**The zone is hosted within siliceous dacite which in**									
		Zone	**most part was replaced by dark green to black chlorite**									
			and 3-30% medium grained pyrite. From 610.37 to									
			611.89 the rock is composed of angular dacite clasts									
			and chlorite dominated matrix.									

PINNACLE MINES LTD _ MOUNTAIN BOY MINERALS LTD

			At 616.59 to 616.65 - 2-3% of extremely fine grained									
			sphalerite(?).									
616.65	634.45	Dacite	Aphanitic texture, in many places the rock is weakly to									
			moderately siliceous. Minor quartz-carbonate +/-									
			adularia(?) veining. In several places there is some									
			dark chlorite and carbonaceous substance as									
			fracture filling and replacement patches. Trace to 2%									
			pyrite.									
			At 634.45 - 1.5 cm wide carbonate-chlorite-pyrite vein at									
			20 degrees to C.A.									
634.45	639.63	Premier	Medium to coarse grained intrusive rock. 1-2% of									
		Porphyry	subhedral feldspar phenocrysts 0.50 to 2 cm in size.									
			Mafic minerals are strongly chloritized and diffused.									
			Trace to 1% disseminated pyrite, sporadic quartz-									
			carbonate veins. In places minor epidote mostly as									
			small scattered patches.									
639.63	644.66	Dacite	Same as 616.65 to 634.45.									
644.66	714.33	Premier	Same as 634.45 to 639.63.									
		Porphyry										
			At 647.87 to 648.11 - interval is 30-40% replaced by									
			quartz and pale yellow adularia(?). Also a trace of									
			galena was noted.									
			At 652.90 to 653.23 - quartz-carbonate replacement.									
			At 667.47 to 667.53 - section replaced by quartz and									
			carbonates.									
			At 668.29 to 668.45 - quartz-carbonate vein at 40									
			degrees to C.A.									
			At 669.88 to 669.97 - quartz-carbonate-chlorite-									

PINNACLE MINES LTD _ MOUNTAIN BOY MINERALS LTD

			adularia(?) vein at 40 degrees to C.A.									
			At 691.10 to 691.22 - quartz-carbonate vein at 35									
			degrees to C.A.									
			At 693.90 to 694.27 - quartz-carbonate vein at 25									
			degrees to C.A.									
714.33	733.84	Dacite	Medium grey to beige coloured aphanitic siliceous									
			rock. Minor quartz-carbonate veining, trace to 2%									
			pyrite.									
			At 716.25 to 716.59 - intense quartz-carbonate-									
			adularia(?) veining. It includes one main 4 cm wide									
			vein at 20 degrees C.A.									
			At 716.59 to 721.95 - several percent of extremely fine									
			grained reddish mineral or substance (limonite?)									
			occurring mostly as fracture filling and irregular patches.									
			patches.									
			At 723.17 to 723.26 - 12-15% pyrite.									
			E.O.H. 733.84 m

			At 425.91 to 426.68 - fault marked by rubbly core and									
			several intervals of clay gouge.									
			At 430.03 to 432.77 - interval of 20-30% felsite									
			replacement (possible presence of epidote).									
439.02	449.70	Andesite	Dark grey to greenish grey strongly chlorite-sericite									
		Lapilli Tuff/	altered andesite lapilli tuff with patches of weak to									
		Felsite	moderate silicification. 30-40% felsite (possible									
			presence of epidote) replacement. 5-10% quartz-									
			carbonate as irregular veinlets and replacements,									

			minor pyrite occuring as veinlets.									
			At 443.60 to 443.66 - two 1 mm thick sphalerite veinlets									
			with minor galena and pyrite.									
449.70	452.13	Premier	Greenish grey moderate to strong chlorite-sericite									
		Porphyry	altered rock. 1-2% quartz-carbonate occurring as									
			irregular veinlets, trace pyrite.									
452.13	480.79	Andesite	Light greenish grey to dark grey strongly chlorite-									
		Lapilli Tuff	sericite altered rock with patches of weak to moderate 2-5% qu									
			silicification. 2-5% quartz-carbonate occurring as									
			replacements and irregular veinlets, 2-3% pyrite as									
			irregular veinlets.									
			At 461.13 to 461.22 - interval of 15-20% pyrite with 10%									
			sphalerite.									
			At 461.43 to 461.52 - interval of 20-25% pyrite with minor									
			galena and sphalerite.									
			At 480.18 to 480.49 - minor sphalerite.									
480.79	511.59	Premier	Light to dark green premier porphyry, strong chlorite-									
		Porphyry	sericite alteration. 3-5% quartz-carbonate as									
			replacements and irregular veinlets, 1-3% pyrite as									
			disseminations and irregular veinlets.									
			At 480.95 to 481.10 - minor sphalerite.									
			At 487.20 to 487.20 - minor sphalerite.									
			At 489.63 to 489.79 - minor sphalerite.									
			At 505.03 to 505.34 - interval of 50% quartz-carbonate									
			replacement, minor sphalerite.
