INTRODUCTION

The authors were commissioned by the Board of Directors of Auramex Resource Corp. (the company) to carry out a mineral exploration program on the Surprise Creek Property (the property) to determine if there are ore bodies present on the property. A first phase of property scale stream sediment sampling and prospecting was carried out on part of the property during summer 2006 under the direct supervision of one of the authors. A portion of the summer 2007 work was follow-up to 2006 work. A first phase of property scale stream sediment sampling and prospecting was carried out on new ground acquired in 2007.

The property extends from highway 37A north up Surprise Creek for 12 kilometres (Fig. 1). The property covers three minor showings and is proximal to the past producing 'Goat' deposit.

The 2007 geological and geochemical program on the property was carried out on a property scale and involved the collection of 74 pan concentrate samples, 74 silt samples and 33 rock samples taken by a four person helicopter/truck supported crew between the 01 June 2007 and 29 August 2007 (Map 1). Significant anomalies were returned from many of the stream sediment and rock samples. These anomalies will be described systematically from south to north in **"Interpretation and Conclusions"**. Follow-up work on these anomalies and showings is recommended.

LOCATION AND GEOGRAPHIC SETTING

The property is located in the valleys and adjoining ridges of Surprise Creek (Fig. 1). Elevations range from 300 metres on Strohn Creek in the southeast part of the claims to 1,800 metres above sea level on the west edge of the property. Terrain is rugged with steep valley walls rising from the relatively flat valley bottom. Mature hemlock, cedar and spruce are present on the unlogged portions of the lower slopes changing rapidly to sub-alpine spruce and alpine vegetation from 1,000 to 1,300 metres. Approximately 30% of the merchantable timber on the property has been logged.

There is a bulk loading facility on year round ice free tidewater at Stewart. Stewart also has a paved air strip and all the facilities necessary to carry out mineral exploration and mine development. Paved road access to the rest of the province is possible via Highway 37A to Meziadin Junction, then Highway 37 to Kitwanga and Highway 16, which connects Prince George and Prince Rupert.

The property can be accessed by road from Stewart. Highway 37A crosses the property for about 4 kilometres of its width and a mine access road that extends from highway 37A for eight kilometres to the Goat past producer provide access to some parts of the property. More remote and higher areas of the property can be accessed by helicopter from Stewart, approximately a 20 minute trip in good weather.

PROPERTY

The property consists of 14 mineral tenures, listed in Table 1 below, totalling 6052.34 hectares. All claims are contiguous.

Table 1: Mineral Claims

Tenure Number	Claim Name	Owner	Good to Date	Area (hectares)
523449	LAUREN GOLD	200071 (100%)	31-Aug-08	378.76

542601	MICKEY 9	200071 (100%)	30-Sep-08	450.05
552315	MICKEY 10	200071 (100%)	19-Feb-08	449.93
552317	MICKEY 11	200071 (100%)	19-Feb-08	450.12
552318	MICKEY 12	200071 (100%)	19-Feb-08	450.10

The mineral claims are owned by R. V. Kirkham. The company holds an option to purchase 100% interest in the claims for cash (paid) and shares (payable over the three year term of option) with Kirkham retaining a 1% NSR with a \$2,000,000 buyout. The company was the operator of the 2007 program.

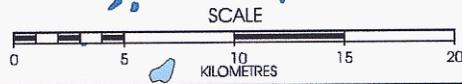

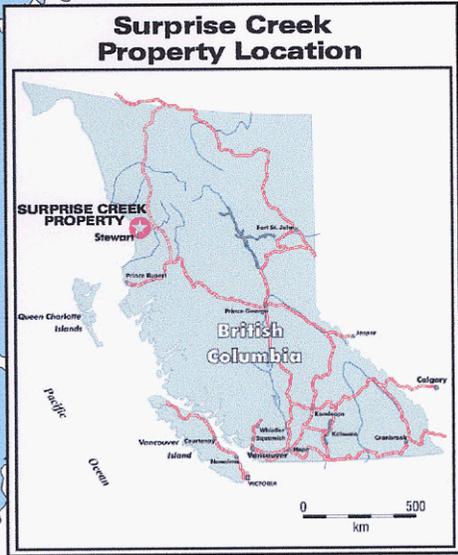

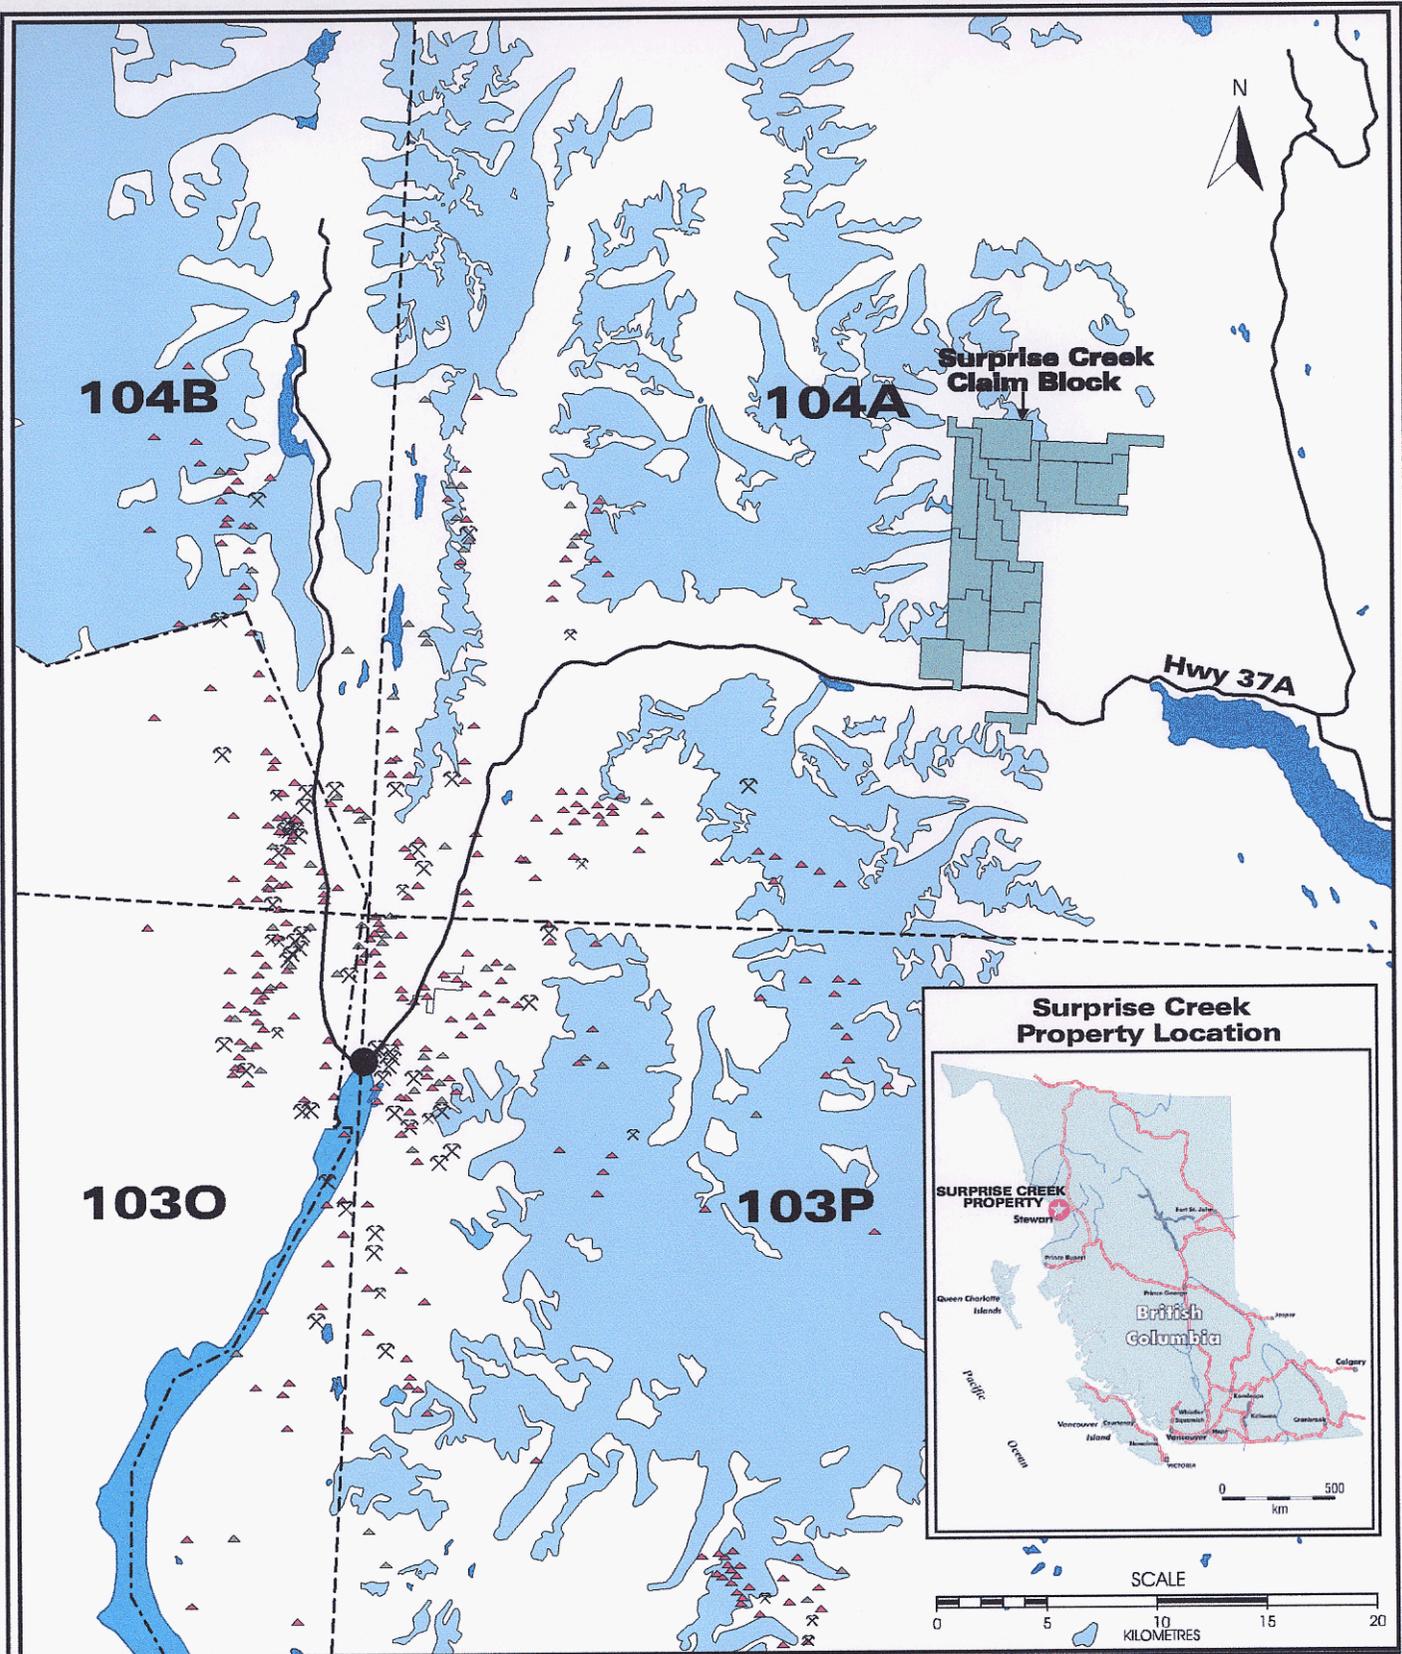

Figure 1: Claim Location Map

HISTORY AND PREVIOUS EXPLORATION

Approximately 1.4 kilometres west of the Surprise Property is the **Goat** Deposit. This showing was staked in 1960 as the Surprise claim group by Newmont Mining and Granby Mining. The claims were restaked in 1963 as the Goat group. Noradco acquired the claims in 1964 and completed trenching, sampling and 3 drillholes on the property. In 1965, 2 adits were driven on the F vein and 2 raises were driven to the G vein. In 1968, an agreement with Shield Minerals Corp. ensured continued underground development. In 1971, Abitibi acquired the Shield Minerals interest and incorporated Nordore Mining Co. In 1974, Nordore rehabilitated the workings now on the Ken 1-4 and Goat A-H claims. In 1974, the Remus claims were acquired as a millsite. About 1770 tonnes of ore was stockpiled. In 1976, about 295 tonnes of ore was milled from a portable concentrator. Development work on the E vein recommenced in 1979 and "some" material was put through the concentrator. In 1980, underground development continued and the mill operated for several months. The mill was destroyed by fire in 1981 and all work ceased. A geophysical survey was carried out over the property by Bond Gold in 1990. In 1991, Cameco conducted geochemical surveys and sampling on the Ken and Hugh claims.

REGIONAL GEOLOGY

Regional geology is shown on Figure 2. The Stewart area is on the eastern margin of

the Coast Plutonic Complex. Mesozoic volcanic and sedimentary rocks are intruded by Coast granitic rocks, ranging in age from early Jurassic to Tertiary, in the form of stocks and dyke swarms.

There are several styles of mineralization in the region, including structurally controlled quartz carbonate veins and stockworks, like the Silbak-Premier, which has produced 24,814 tonnes lead, 7,961 tonnes zinc, 1,853 tonnes copper, 1,333 tonnes silver, 81 tonnes cadmium and 62 tonnes gold from 5,876,992 million tonnes milled, located 8 kilometres west of the property. Volcanogenic massive sulphide deposits are also present, both Besshi and Kuroko style, as exemplified by the Granduc and Eskay Creek deposits, respectively. Granduc mine is a copper rich Besshi style volcanogenic massive sulphide deposit, which has produced 190,144 tonnes copper, 124 tonnes silver and two tonnes gold from 15,559,369 tonnes milled, located 21 kilometres west of the property. Eskay Creek is a gold rich, shallow sub-aqueous Kuroko style volcanogenic massive sulphide deposit, which has produced 4,293 tonnes of silver, 91 tonnes gold, one tonne zinc and 0.4 tonnes lead from 1,769,470 tonnes milled, located 60 kilometres northwest of the property. Copper gold alkalic porphyry deposits, calc-alkalic copper molybdenum porphyry deposits and molybdenum porphyry deposits also are present in the area as exemplified by Galore Creek, Schaft Creek and Kitsault, respectively. Galore Creek is located 100 kilometres northwest of the property and contains greater than one billion tonnes grading greater than one percent copper equivalent. Schaft Creek is located 120 kilometres north northwest of the property and contains greater than 3.5 billion tonnes of 0.35 % copper and 0.03 % molybdenum. Kitsault is located 100 kilometres southeast of the property and contains 104 million tonnes containing 0.11 % molybdenum.

Figure 2: Regional Geology

PROPERTY GEOLOGY

The bulk of the property is underlain by shale, greywacke and siltstone of the Middle Jurassic to Lower Jurassic Bowser Lake Group. The sediments to the north of the property were found to be intruded by a small stock of porphyritic quartz monzonite.

The southwestern corner of the property is underlain by north-striking, green andesitic agglomerates and minor intercalated siltstones of the Upper Triassic to Lower Jurassic Unuk River Formation (Hazelton Group). Thick, massive volcanic breccias occur on the southwestern margin. Northwest-trending quartz monzonite dikes intrude the volcanics. Several veins occur on the property, mostly bull quartz +/- calcite.

Showings on Surprise Creek Property

Murdock Showing

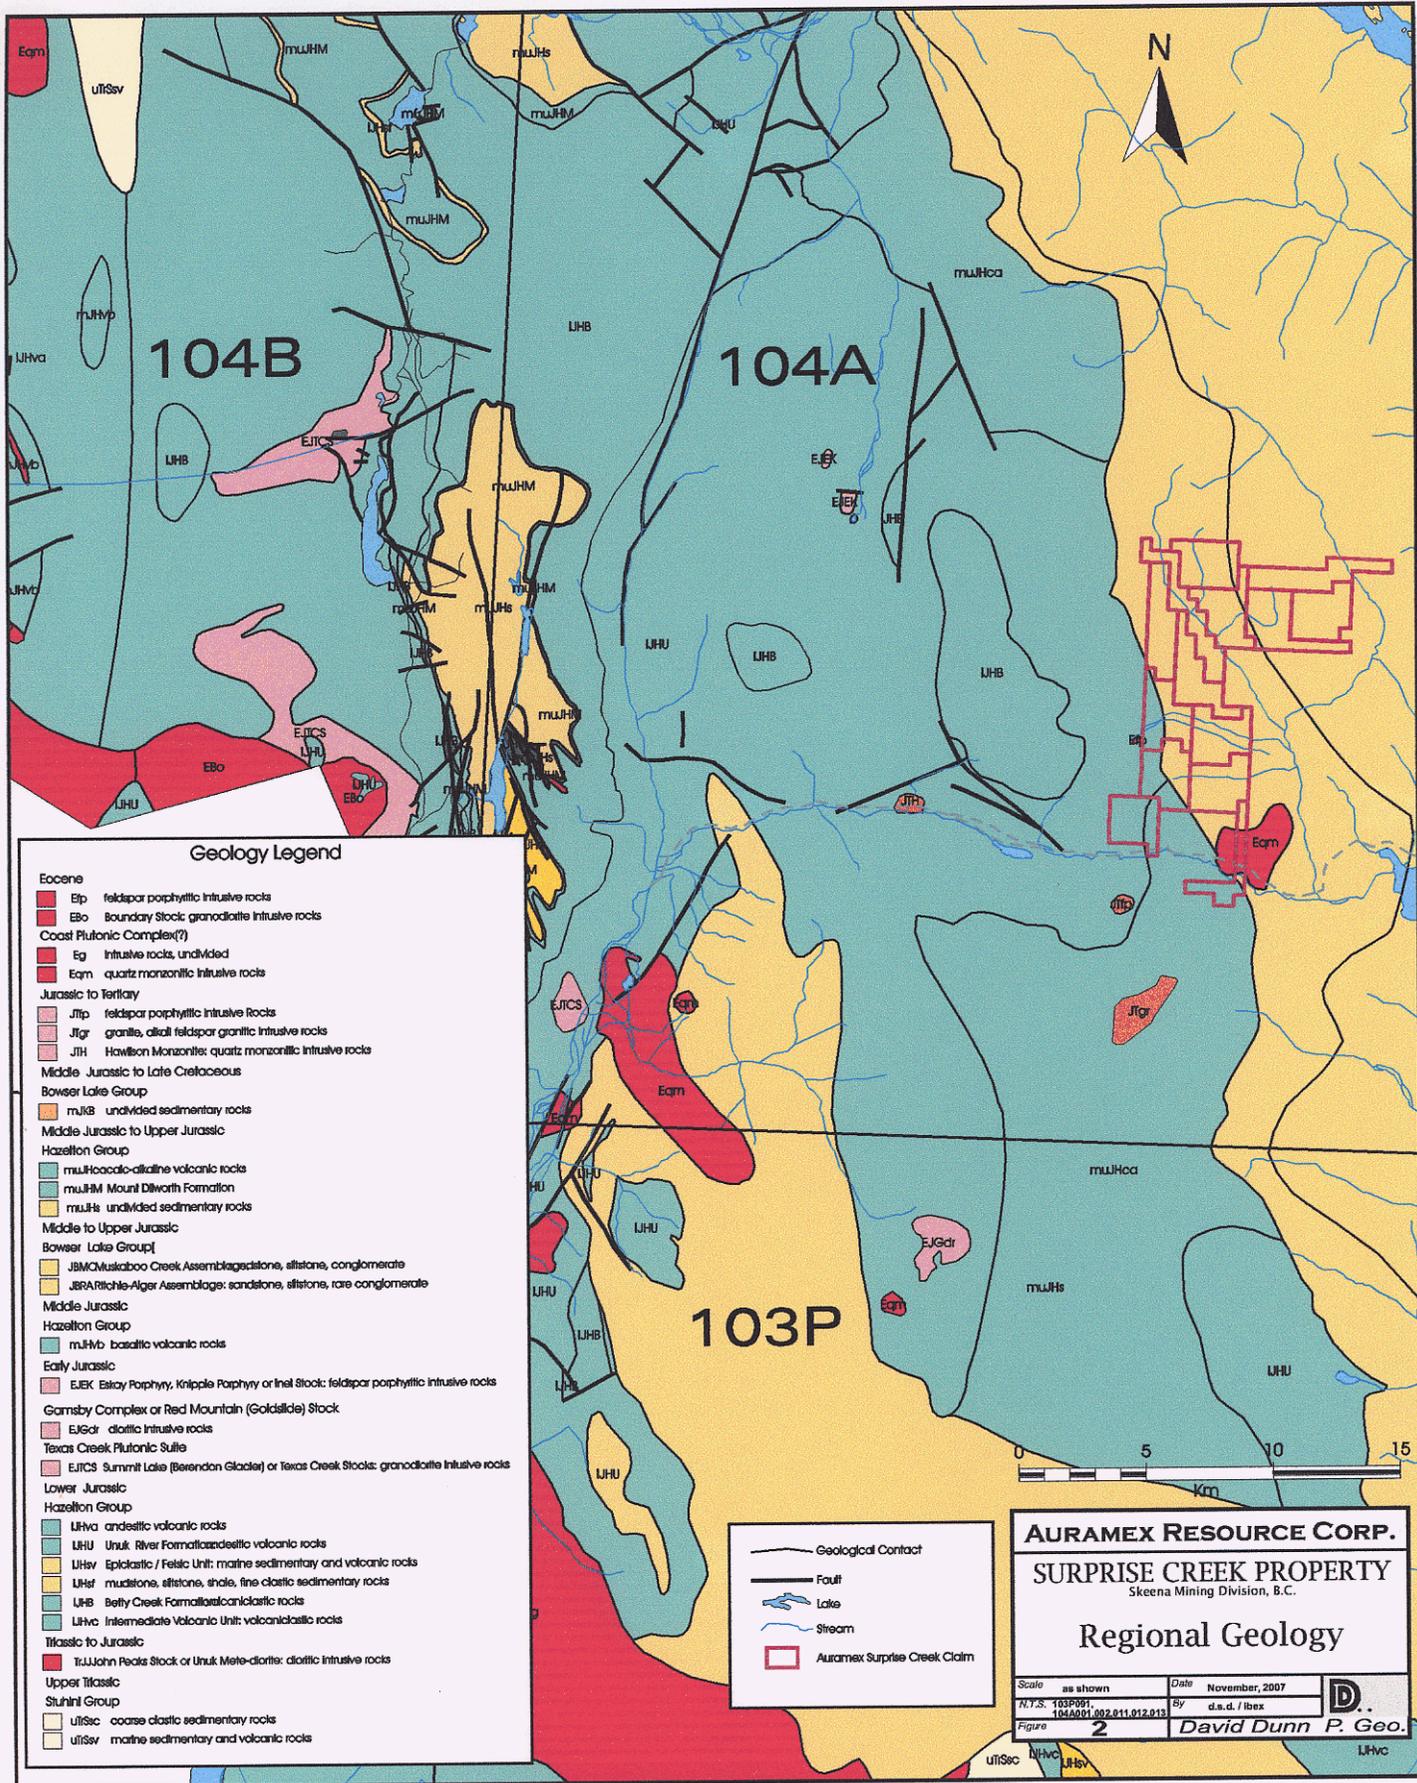

Primarily a lead showing of a vein hosted nature.

Montreal Showing

A silver-zinc-lead polymetallic vein-hosted showing.

Stewart Showing

A pegmatite hosted rare earth showing found south of Highway 37A.

Showings Proximal to Surprise Creek Property

Goat Past Producer

The area was originally staked by Newmont Mining and Granby Mining in 1960, and further developed over the years by various groups. The deposit was worked until a fire destroyed the mill in 1981. This showing is situated just south of the Goat Glacier about 34 kilometres east of Stewart.

The veins comprise crudely laminated sulphides and gangue. The sulphides include coarse-grained sphalerite, disseminated and massive arsenopyrite and pyrite, tetrahedrite, freibergite and minor galena. Gangue minerals include siderite, quartz and minor epidote and calcite. Galena-lead isotope analyses indicate a Tertiary age for the mineralization.

Recorded production during the period 1975 and 1979-81 was 1,794,049 grams of silver, 5,475 grams of gold, 52,641 kilograms of zinc, 4,071 kilograms of lead and 153 kilograms of copper.

Poly Showing

Another polymetallic vein hosted showing with silver, gold, copper, lead and zinc reported.

Fitzgerald Showing

Described in Minfile literature as a molybdenum porphyry showing.

Bear Pass Mining Showing

A copper, silver, lead, gold polymetallic vein showing south of Highway 37A.

Surprise Showing

This is described as molybdenum, copper porphyry deposit and it is situated 1.75 kilometres north of the property.

2007 GEOLOGICAL AND GEOCHEMICAL PROGRAM

Part of the 2007 program was designed to test the whole of the property using a program of prospecting and paired pan concentrate and silt stream sediment sampling. A standard silt sample, consisting of a gusseted kraft bag filled half full of the finest material available from active stream channels was taken. A pan concentrate sample consisting of one pan of -10 mesh material from the active stream channel panned to a black sand concentrate and one pan of moss from the active stream channel screened and panned to a black sand concentrate was taken at the same site as the silt sample. A ten to 20 gram concentrate was produced. The pan concentrate procedure produces a semi-quantitative result, very effective in detecting gold in the Canadian Cordillera. Analytical procedures are described below and results shown in Appendix C. Seventy-four pan concentrate samples and 74 silt samples were taken (includes samples related to Lauren Gold and Mickey Fraction claims). Sample locations are shown on Maps 1. Prospecting of the areas traversed was carried out and samples of any mineralized rocks encountered were taken. Two hundred ninety-four rock samples were taken.

The other major component of the program was follow-up work to the 2006 work on

Lauren Gold and Mickey Fraction claims. This consisted of prospecting and some paired stream sediments as described in the previous paragraph.

Assay results are shown in Appendix C. Assay treatment for silt samples was to screen to -80 mesh then dissolve a one gram sub-sample in aqua regia and measure 28 elements using ICP-ES. A ten gram sub-sample was fire assayed to recover gold, with the bead dissolved in aqua regia and measured using atomic absorption. Pan concentrate samples were screened to -20 mesh, then the whole sample digested using a four acid attack with the results measured for 29 elements using ICP-ES. A one assay ton fire assay was carried out on rock samples with aqua regia dissolution and ICP-ES measurement for gold. A one gram sub-sample was also subjected to four acid attack and measured using ICP-ES for 28 elements. All assays were carried out by Eco Tech Laboratory Ltd., Kamloops, B.C.

All samples were located using GPS receivers and plotted on BCTM 1:20,000 scale maps. Information for pan concentrates and silt samples are found in Appendix B. Alteration present and mineralogy of rock samples are also recorded in Appendix B.

INTERPRETATIONS AND CONCLUSIONS

The 2007 exploration program on the Surprise Creek property confirmed previously known geochemical anomalies, as well as identifying new ones. The following section will discuss the work in three zones of interest, Lauren Gold and Mickey Fractions, on which work was done in 2006, and the Mickey 1 to 12 claims on which the 2007 program was the first work by the current operator.

Lauren Gold

Sampling and prospecting on Lauren Gold confirmed last years' result (187700-6.74 g/t Au, 468 g/t Ag, 2.34 % Pb and 2.06 % Zn) with sample 261465 (aka 61465) 7.00 g/t Au, 1368 g/t Ag, 4.53 % Pb and 2.03 % Zn. The vein was exposed along 5 metres of its length, about 5 cm thick, dipping roughly 40° north. It is laminated quartz +/- calcite and visible pyrite, galena and sphalerite. The surrounding area of the vein sampled by 187700 (2006) and 261565 is grass covered for a radius of at least 15 metres. Though the vein is thin, it may extend laterally. Trenching and chip sampling should be conducted.

Sample 261567 (aka 61567) was collected from a stockwork vein with a near vertical orientation approximately 80 m east-southeast of 261465; it may or may not be associated with the vein sampled by 261565 but is similar in mineralogy. It returned 13.2 g/t Ag, 0.30% Pb and 0.86% Zn. Snow cover due to the record snowfall the previous winter hampered follow-up in the immediate area.

Mickey Fraction

Sampling consisted of 4 float, 2 grab, 7 pan concentrates and 7 silt samples. Pan concentrates on the western portion of the claim returned interesting results, 61036 returned 800 ppb Au and 61040 returned 480 ppb Au. They were collected from different, but parallel streams less than 200 metres apart. The stream from which 61040 was collected had abundant angular blocks of silicified tuff with calcite epidote +/-

pyrite stockwork. Pan concentrate 61469 (second time number used) from the central area of the claim returned 220 ppb Au.

Mickey 1-12 Claims

No sampling was conducted on these claims in 2006. Initial 2007 work included reviewing the data from the government-sponsored Regional Geochemical Survey (RGS). Results from the 2007 program were able to confirm and expand on findings from the RGS. Of note are the samples in the northern portions of the property.

Pan concentrate sample 41433 returned 150 ppb Au, and 41431 returned 120 ppb Au. Both were collected from a stream flowing into Surprise Creek in the northwestern portion of the property. Sample 43431 is upstream of 43433. RGS sample 1434 was collected in the same area and returned 88 ppb Au.

There were two areas of particular interest based on grab sample results. Sample 43041 returned 820 ppb Au and 515 ppm Cu, and this sample site is up hill of the two pan concentrate samples discussed above. Samples 43169 and 43170 were collected within 5 metres of each other and are thin vertical veins exposed for a minimum 10 metres. Results returned were 1.04 g/t Au, 727.7 g/t Ag, 4% Pb and 2.5% Zn in 43170, while 43169 returned 54.4 g/t Ag, 0.8%Pb and 1% Zn.

There were two pan concentrates of note in samples north of the highway, 54385 and 54389, which returned 780 and 6,580 ppb Au respectively. They are off claim, but sampled streams running off the property to the north. They are situated between previously known showings, but not downstream of any.

Pan concentrate 41444 returned 435 ppb Au. It was collected from a south flowing stream near where the Goat trail runs off the property. Some prospecting and cut off stream sampling should be done upstream.

RECOMMENDATIONS

Detailed prospecting, sampling and trenching should be carried out above the sites of the anomalous stream sediment samples and in the areas of anomalous and economically interesting rock samples as detailed above. This work should take a four person helicopter/truck supported crew 7-8 days to complete. The recommended program is estimated to cost \$25,000.

Respectfully Submitted,

David St. Clair Dunn, P. Geo.

Appendix D: Statements of Qualifications

I, David St. Clair Dunn, Professional Geoscientist, with a business address at 1154 Marine Drive, Gibsons, British Columbia, Canada certify that:

1. I am a graduate of the University of British Columbia and hold a degree of Bachelor of Science in Geology.
2. I have practised my profession as a prospector and geologist for 37 years.
3. I am registered as a Professional Geoscientist with the Association of Professional Engineers and Geoscientists of the Province of British Columbia (Reg. # 18479). I am a Fellow of the Geological Association of Canada and a member of the Association of Applied Geochemists, the Canadian Institute of Mining, Metallurgy and Petroleum, the Education Committee of the Association for Mineral Exploration of B.C., the Society of Economic Geologists and the Mining Exploration Group.
4. I have based my conclusions and recommendations in this report on a review of all available reports and direct supervision of the 2007 geological and geochemical program on the Surprise property.
5. I am the co-author of this report.
6. I am not aware of any material fact or material change from the information in this report that would make the report misleading.
7. I consent to the use of this report for the purpose of private or public financing.

15 November 2007

  

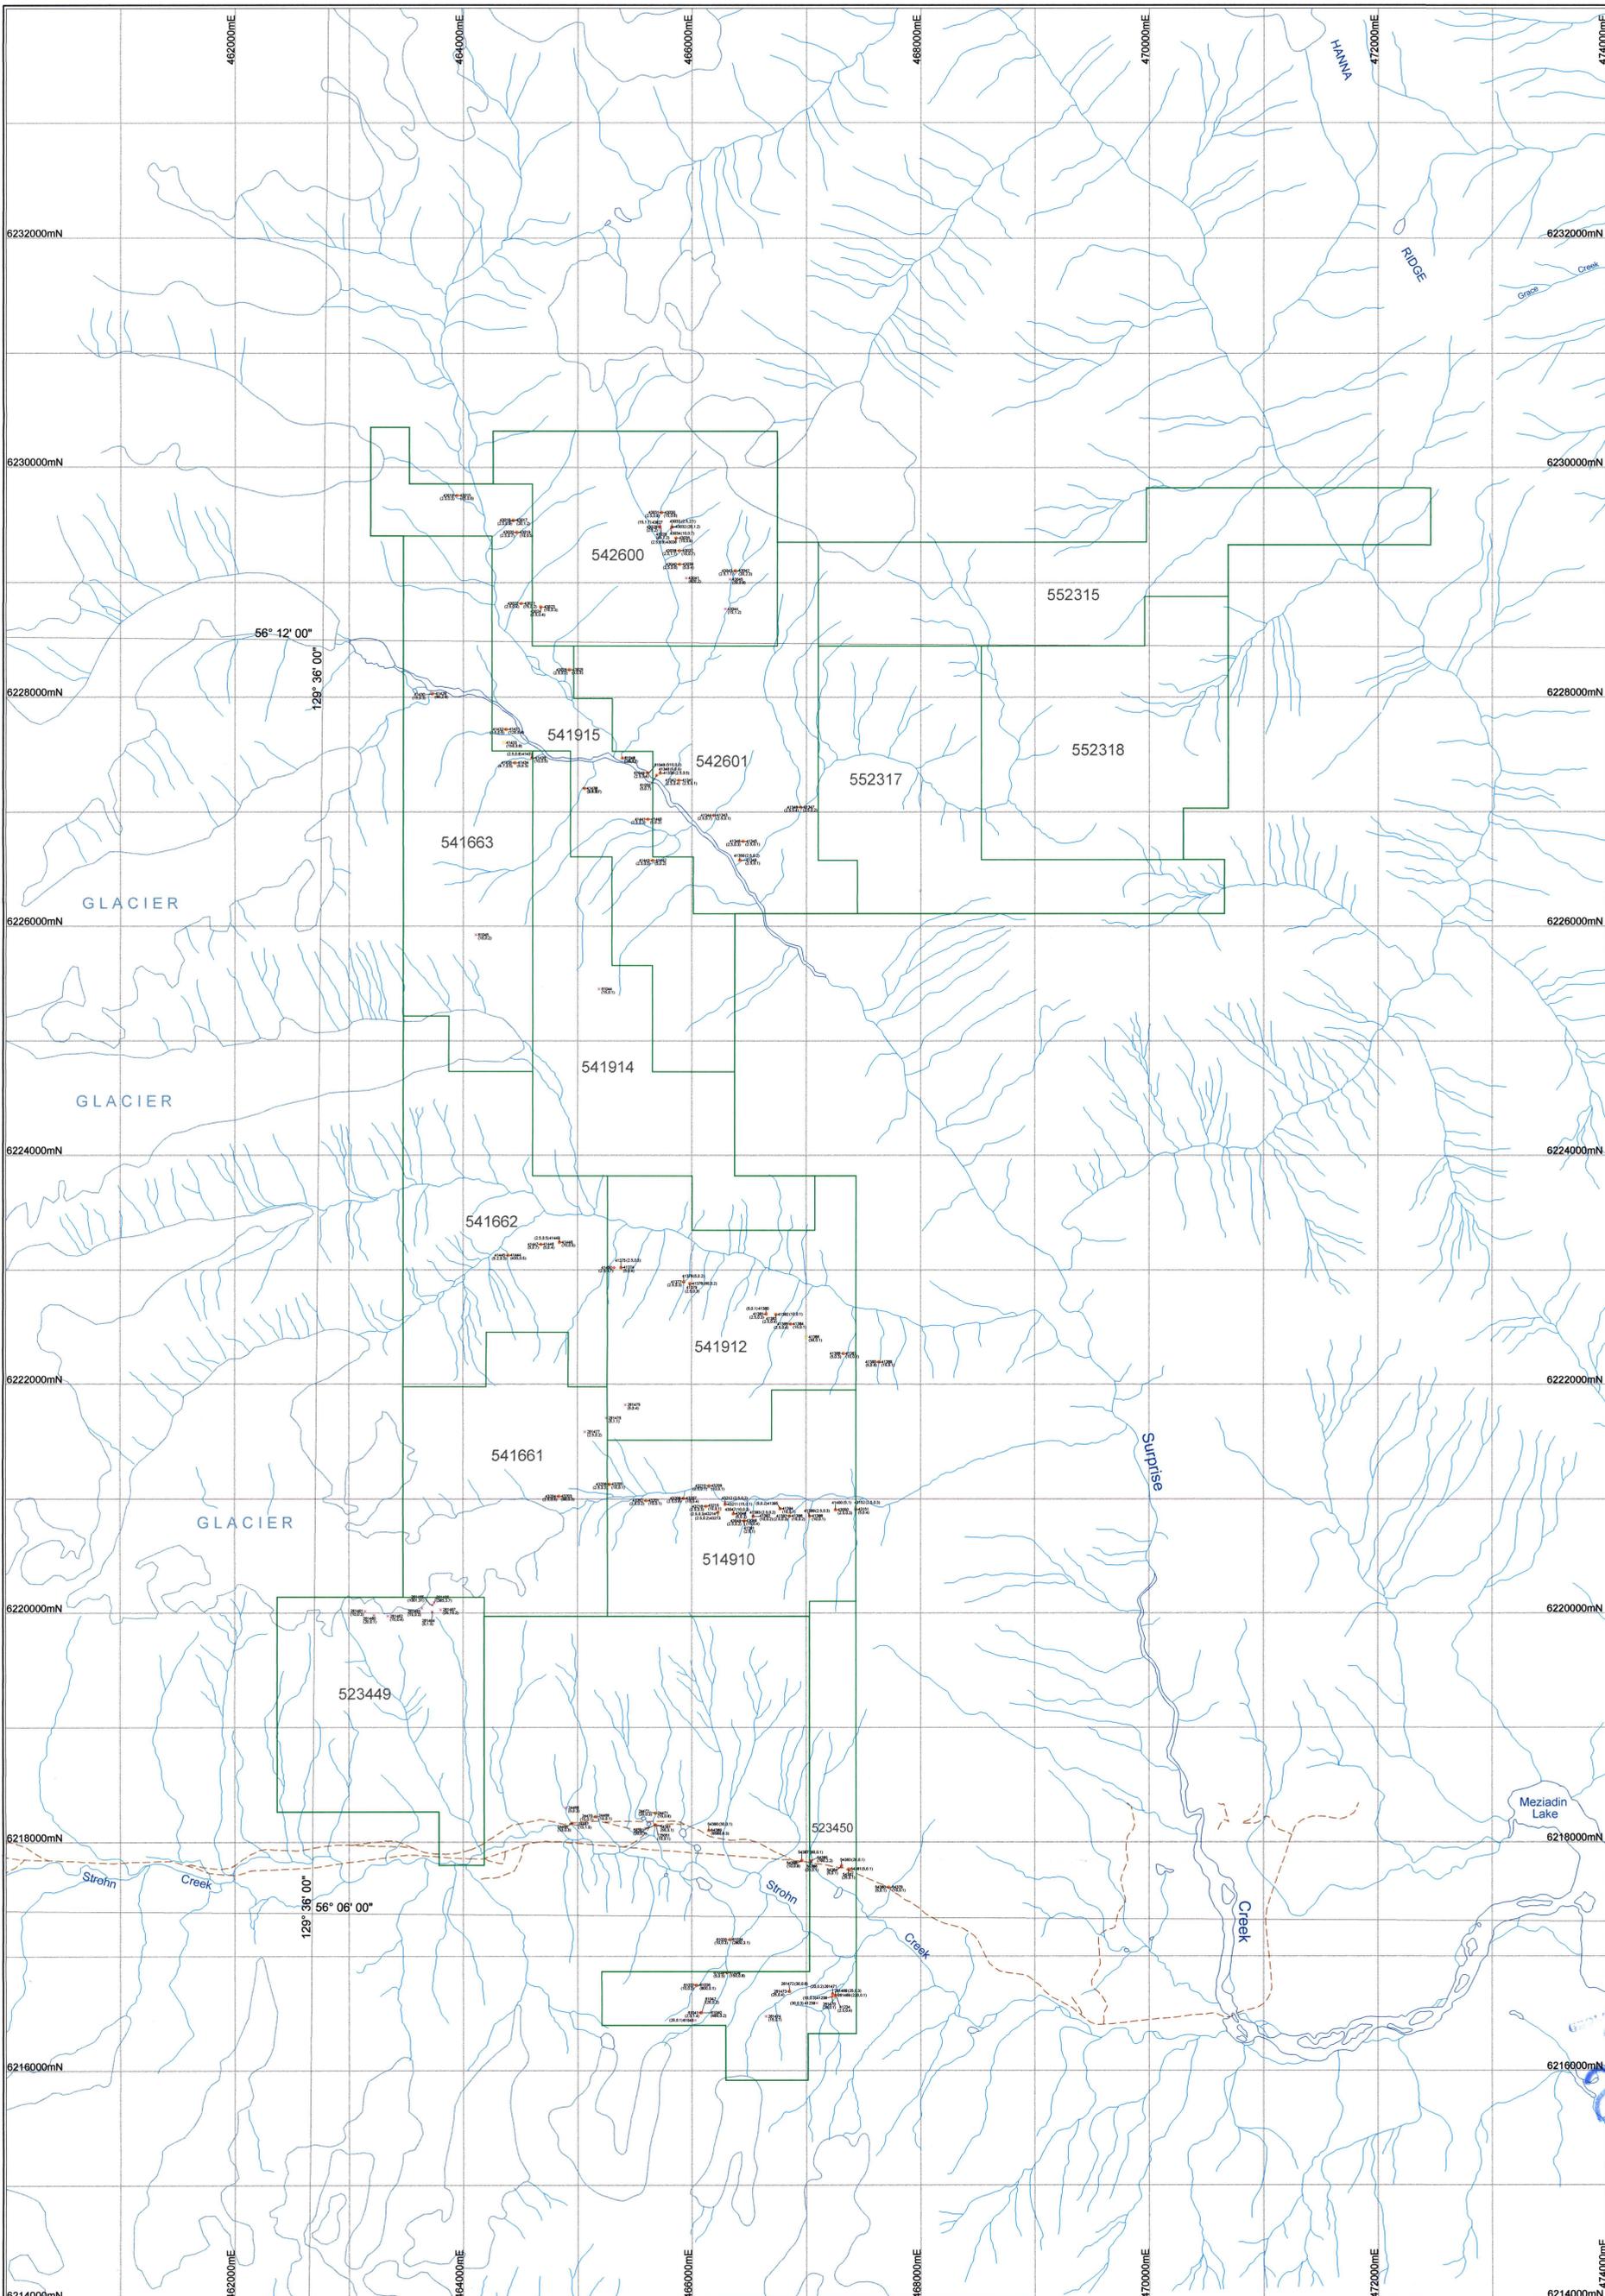

I, Clinton F. Davis, Professional Geoscientist, with a business address at 961 Cove Island Terrace, Ottawa, Ontario, Canada certify that:

1. I am a graduate of Carleton University and hold a degree of Bachelor of Science (Honours) in Geology.
2. I have practised my profession as a prospector and geologist for 10 years.
3. I am registered as a Professional Geoscientist with the Association of Professional Geoscientists of Ontario (1072).
4. I have based my conclusions and recommendations in this report on a review of all available reports and direct supervision of the 2007 geological and geochemical program on the Surprise property.
5. I am the co-author of this report.
6. I am not aware of any material fact or material change from the information in this report that would make the report misleading.
7. I consent to the use of this report for the purpose of private or public financing.
