SUMMARY

The Lucky Ship molybdenum property is located in west central British Columbia, Canada. The property is accessible via 85 kilometres of well maintained logging road from the town of Houston which is located on trans-provincial highway 16. Houston is also on the CN rail line which traverses central British Columbia and terminates at the port of Prince Rupert. New Cantech Ventures Inc. holds an option agreement whereby they can acquire a 100% interest in the Lucky Ship property. Since entering into the agreement in early 2005, New Cantech has completed exploratory programs including 21,954 metres of diamond drilling in 83 drill holes, surface magnetic and Induced Polarization geophysical surveys, metallurgical testwork and the construction of 1.2 kilometres of new access road plus the rehabilitation of existing drill roads. Significant results of programs completed through May 10, 2007 are contained in a number of recent company news releases and 43-101 compliant technical reports by Dr. N.C. Carter, P.Eng.

As of August 28, 2007 the Lucky Ship property consisted of 40 "cell" mineral claims covering an area of 16,995 hectares in the Omineca Mining Division of west-central British Columbia (Figure 1). All of the mineral claims are contiguous and cover an area between Morice and McBride Lakes or between latitudes 53° 58.3' and 54° 04.2' North and longitudes 127° 18.6' and 127° 32.0' West in NTS map-areas 93L/03W and 04E and 93E/14W (UTM coordinates 5981714 – 5992547N, 596226 – 611226E – Zone 9).

The Lucky Ship deposit is a porphyry Mo deposit with low concentrations of Cu and other base metals. As reported by Dr. Carter, the principal area of interest on the property is the 1000 x 600 metres, early Tertiary Lucky Ship pluton which is made up of two phases of porphyry intrusion and two breccia phases. Molybdenum mineralization, as molybdenite (MoS_2 disulphide), occurs in fractures, quartz veins, veinlets and stockworks best developed within an annular zone or shell marginal to a small (200 x 120 metres) porphyritic granite intrusion at the southeastern margin of a larger pluton of quartz-feldspar porphyry. Widths as defined by a 0.030% Mo cutoff grade range from 90 to 270 metres with the thickest portions developed along the eastern and western margins of the granite porphyry intrusion.

In 2005, 2006 and early 2007 New Cantech completed 10,168 metres of diamond drilling in 45 drill holes (Phases 1, 2 and 3). The results of this drilling were summarized in two previous assessment reports (McMillan, 2006; MacIntyre, 2007).

In 2007, New Cantech completed an additional 14,544 metres of diamond drilling in 49 drill holes. This work was done by Driftwood Diamond Drilling of Smithers B.C. The main objectives of this drilling program were to move that part of the Lucky Ship mineral resource classified as inferred into the indicated category and to provide initial groundwater (hydrology) information on the deposit. The groundwater drilling is part of the baseline assessments for project development. The results of the 2007 diamond drilling program are the subject of this report.

INTRODUCTION

In 2005 New Cantech Ventures Inc. entered into an option agreement to acquire a 100% interest in the Lucky Ship molybdenum property which is situated some 85 miles via logging road south of the community of Houston in west-central British Columbia (Figure 1).

As of March 17, 2008 New Cantech had completed 24,712 metres of diamond drilling in 94 holes, surface magnetic and Induced Polarization geophysical surveys, metallurgical testwork and the construction of 1.2 kilometres of new access road plus the rehabilitation of existing drill roads. Significant results of programs completed through August 2007 are contained in a number of recent company news releases, 43-101 technical reports and assessment reports..

Much of the current and historic information pertaining to the Lucky Ship project in this report is derived directly from a 43-101 compliant technical report by Dr. N.C. Carter that was filed on the SEDAR website in Janurary 2007. Sections pertaining to the 2006 and 2007 drilling programs were written by the author who was the qualified person in charge of the Lucky Ship drilling program in 2006 and 2007.

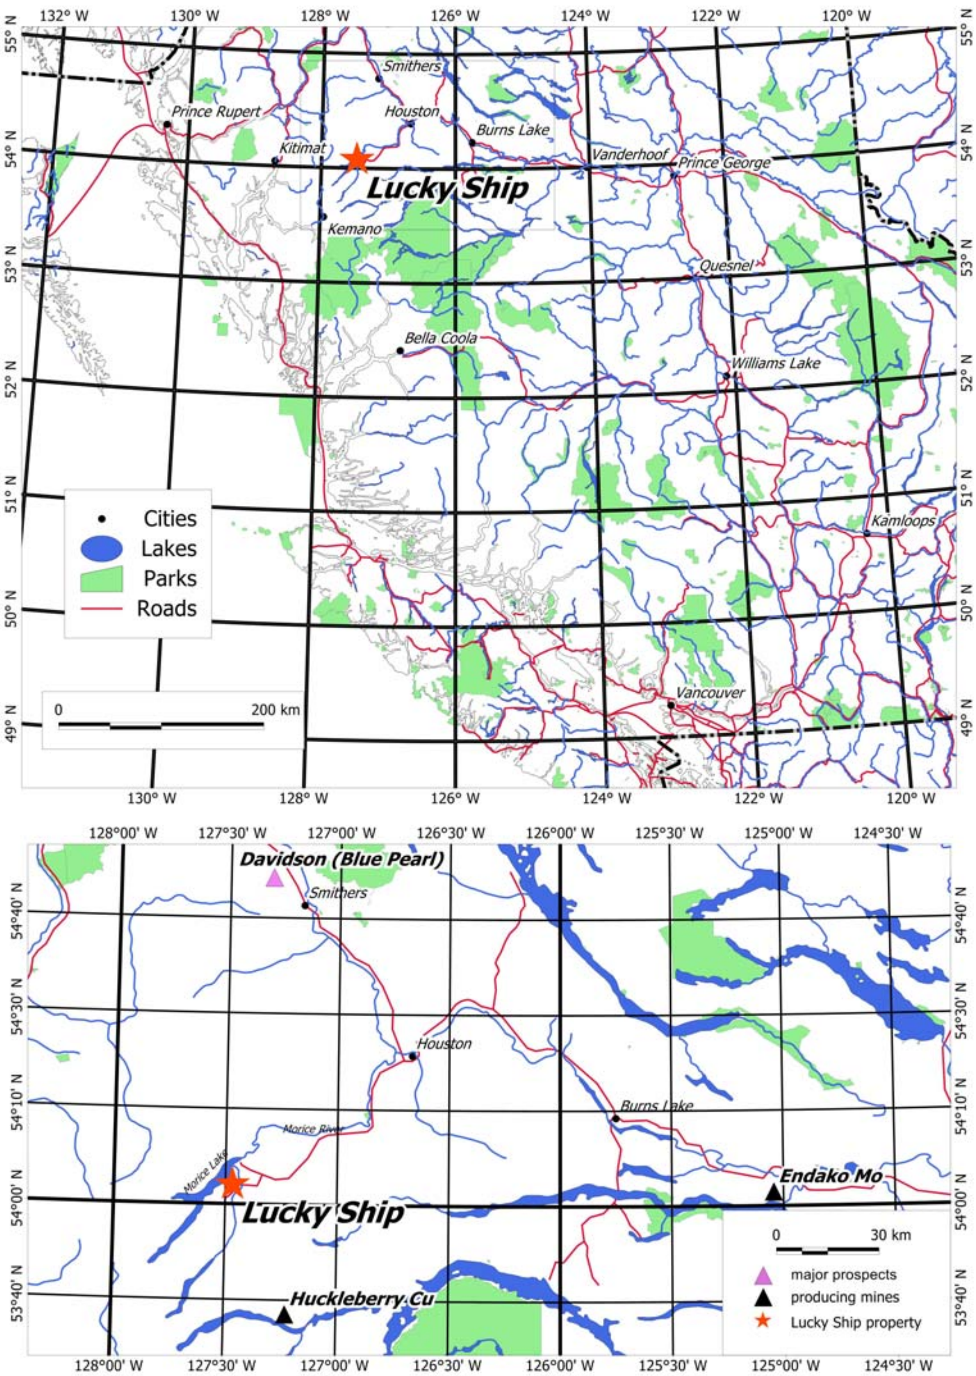

Figure 1. Location of the Lucky Ship Property

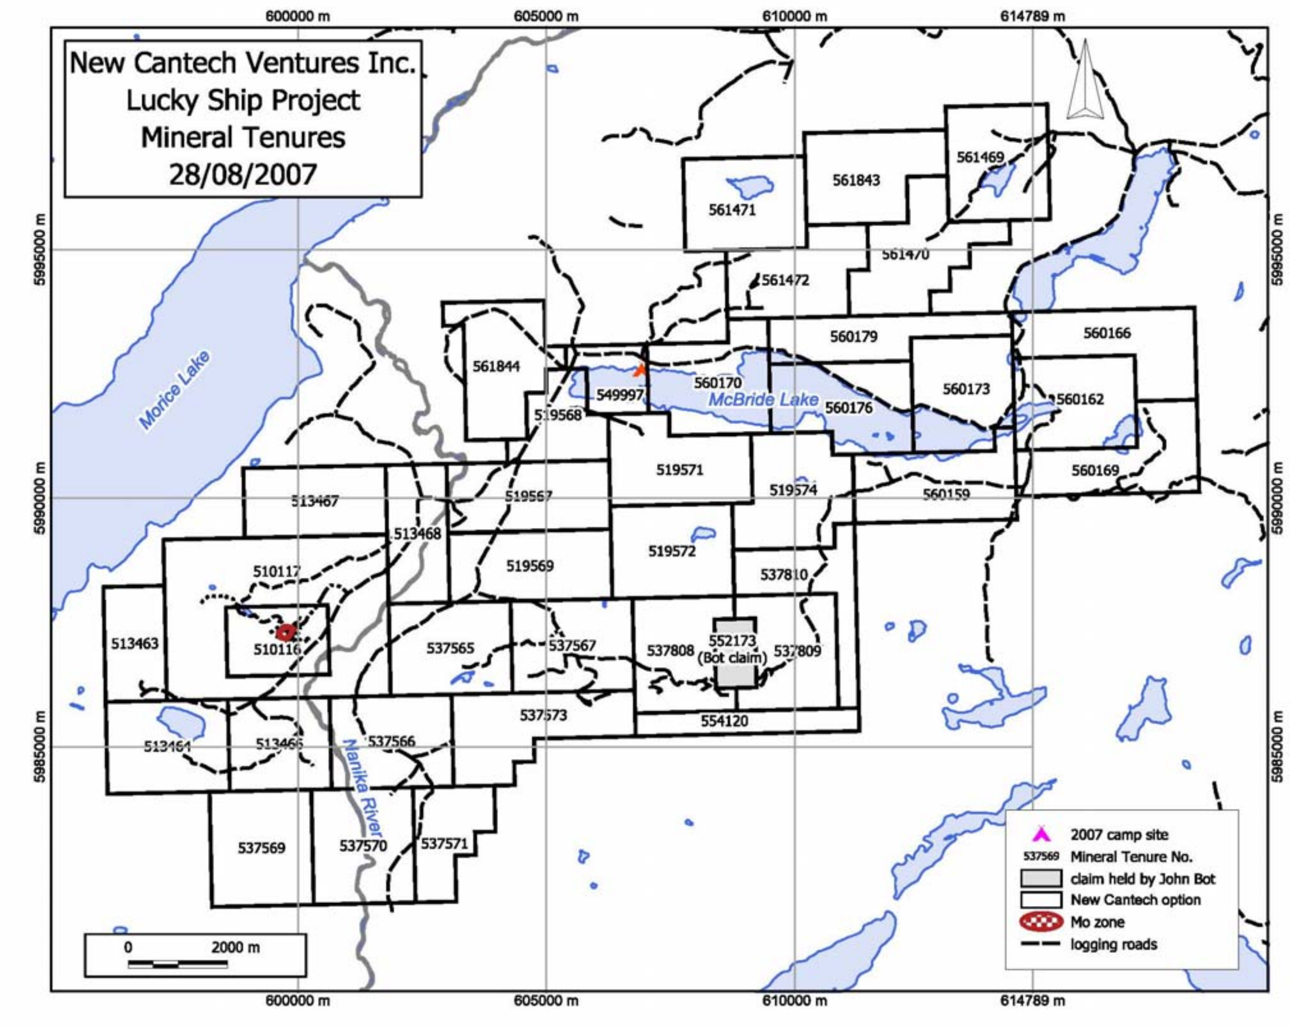

Figure 2. Mineral claims, Lucky Ship property

PROPERTY DESCRIPTION AND LOCATION

As of August 28, 2007 the Lucky Ship property consisted of 40 "cell" mineral claims covering an area of 16,995 hectares in the Omineca Mining Division of west-central British Columbia (Figure 1). All of the mineral claims are contiguous and cover an area between Morice and McBride Lakes or between latitudes 53° 58.3' and 54° 04.2' North and longitudes 127° 18.6' and 127° 32.0' West in NTS map-areas 93L/03W and 04E and 93E/14W (UTM coordinates 5981714 – 5992547N, 596226 – 611226E – Zone 9).

The claims listed in Table 1 are owned jointly by Donald G. MacIntyre and Victor H. Parsons. Initial claims located by these gentlemen in June of 2004 consisted of eight two-post legacy claims which were converted to "cell" claims in April of 2005. The configuration of the current claim holdings is shown on Figure 2; details of the claims are listed in Table 1.

Cell mineral claim 552173 located in the eastern property area (Figure 2) was originally held by John C. Bot but was purchased by New Cantech on February 17, 2008. Ownership has now been transferred to D. MacIntyre and V. Parsons and is covered by the Lucky Ship option agreement.

Table 1. List of Mineral Tenures, Lucky Ship Property

Record No.	Acquisition Date	Current Expiry Date	Area (hectares)
510116	April 3, 2005	June 4, 2017	284.969

ACCESS, CLIMATE, LOCAL RESOURCES AND INFRASTRUCTURE

The Lucky Ship property is accessible by way of 85 kilometres of forest service road from Houston B.C. (Figure 1). Average driving time is slightly less than 1 hour. Houston is on provincial highway 16 and the CN Rail line linking Prince George with Prince Rupert. The main access road to the property is the Morice Forest Service Road (FSR) which leaves Highway 16 four kilometres west of Houston and extends 75 kilometres south and west passing Lamprey Creek and Collins and McBride Lakes to a junction with the Morice-Nanika FSR. Two and half kilometres south of this junction a turnoff onto the Cutthroat FSR leads to a bridge crossing of the Nanika River (Figure 2) and the southern margin of the Lucky Ship property some five kilometres further on. A newly-constructed

1.5 kilometre access road with an average grade of 10-15% provides access to the east end of the principal mineralized area.

The Lucky Ship property is at the western margin of the Nechako Plateau a subdivision of the Interior Plateau very near it boundary with the Coast Range. Relief is relatively moderate within the claims area with the principal feature being a ridge rising some 500 metres above Morice Lake. Elevations within the claims area range from 820 metres above sea level at McBride Lake in the northeastern claims area to about 1250 metres on the aforementioned ridge between Morice Lake and Nanika River in the western property area (Figure 2). The entire property area is well forested by mature stands of pine, spruce, hemlock, balsam and alpine fir; logging clearcuts, each covering an area of several hectares, are distributed throughout the property area (Figure 2). Bedrock exposures are limited to drainages and some of the higher areas.

This part of British Columbia features short cool summers and long, relatively mild winters. Annual temperature variation in the region is approximately –25 to +25 degrees Celsius. and snowpack during the winter months ranges from 1 to 4 metres. Surface exploration is best carried out between early June and late October but diamond drilling can be carried out year round. A small lake at the old camp site, near the crest of the ridge in the western property area, plus several small streams can provide sufficient water for exploration purposes.

Most supplies and services are available in the communities of Smithers and Houston. Daily scheduled air service is available from Smithers airport.

HISTORY

The following description of historical work on the Lucky Ship property is from a previous report by Dr. N.C. Carter (Carter, 2007)

The earliest references to exploratory work on the Lucky Ship property are contained in various Annual Reports of the BC Minister of Mines and Petroleum Resources. The 1957 Annual report (p.12) reports the staking of 15 claims by Matthew Sam and Bill McRae of Topley and a subsequent option agreement with Consolidated Mining and Smelting Company of Canada Limited who completed 60 metres of trenching on “a zone of quartz stringers containing molybdenite that cut quartz porphyry.”

No further work is reported until 1963 when Plateau Metals Ltd. optioned the property and subsequently entered into an agreement with Southwest Potash Corporation (subsequently Amax Exploration Inc.). Over the next five years, this company increased the size of the property, constructed an access road, carried out a variety of surface surveys, undertook bulldozer trenching and completed 10,662 metres of diamond drilling in 23 holes. Most holes drilled were inclined holes to test the main molybdenum zone at various depths while one deep (1001 metres) vertical hole was completed northwest of the main mineralized zone. All of the core recovered was stored on the property in racks that had collapsed over time; salvageable core boxes have been cross-stacked for future reference.

Canamax Resources Inc., the successor company to Amax Exploration Inc., purchased the remaining Plateau Metals interest in the property for $90,000 in 1971, subject to a 5% net profits interest from potential future production.

Interest in molybdenum waned following a sustained price decline in the early 1980s and the original Lucky Ship claims were allowed to lapse. The property was subsequently re-staked in 1987 as the Star Ship 1-4 claims by Eric Shaede and Lorne Warren, who re-examined the Amax core and undertook a prospecting program, discovering a showing of chalcopyrite and pyrite at the northern periphery of the intrusive where a grab sample of sulphide mineralization in an area of quartz veining returned values of 2% Cu, 207 g/t Ag and 1 g/t Au (Shaede, 1987). The original claims expired and in 1991 were re-staked by the same individuals as the Lucky Ship 1-4 claims. The owners collected 24 soil samples at 10 metre intervals from a small (40x40 metre) grid over the copper showing; most samples were found to be anomalous in copper, silver and molybdenum (Shaede, 1991).

The most recent work on the property prior to its acquisition by the current owners was prospecting and geochemical analyses undertaken in 1994 on behalf of the then owner, William R. Gilmour (Carpenter and Harrington, 1994).

In June 2004, the Lucky Ship property was staked by D.G. MacIntyre and V.H. Parsons as 6 two post claims (Blue Sky 1-6). The property was then optioned to Candorado Operating Company who then added two additional four post claims of 20 units each. With the introduction of electronic staking in January 2005 all of these claims were converted to cell claims.

In June 2005, New Cantech Ventures Inc. acquired the Lucky Ship option agreement from Candorado.

Exploratory work completed on the Lucky Ship molybdenum property by New Cantech between June of 2005 and February of 2007 included the establishment of 30.8 kilometres of survey grid, Induced Polarization and magnetic geophysical surveys, rehabilitation of existing drill access roads, construction of 1.2 kilometres of new access road, bench scale metallurgical test work and 10,171 metres of diamond drilling in 45 holes.

The survey grid established in 2005 consisted of a 1400 metres long baseline oriented at an azimuth of 055^0 and twenty northwest-southeast cross lines of varying lengths established at 50 metres intervals off the baseline. Survey stations were established at 25 metres intervals along the cross lines. The grid in part replaced a 1960s vintage Amax Exploration grid. Geophysical Surveys

Peter Walcott and Associates Limited carried out magnetic and Induced Polarization surveys over the newly-cut grid in July, 2005 (Walcott, 2006). The magnetic survey utilized a GSM 19 proton precession magnetometer and base station manufactured by GEM Instruments of Richmond Hill, Ontario. This instrument measures variations in the total intensity of the earth’s magnetic field to an accuracy of plus or minus 1 nanotesla. A small, northerly trending magnetic high (150 nanoteslas) is coincident with the porphyritic granite plug which is central to the main, annular molybdenum zone. Flanking this feature on the east is a pronounced magnetic low which may be reflecting a northerly trending fault zone.

Porphyry deposits consist of disseminated sulphide minerals which respond well to Induced Polarization surveys. A pyrite halo surrounding the zone(s) of economic mineralization has a higher overall sulphide content which is usually reflected by a chargeability high. By contrast, the higher silica content in the central part of a typical molybdenum system is highly resistive.

The Induced Polarization survey undertaken in 2005 used a pulse type system manufactured by Huntec Limited and consisting of a receiver, transmitter and motor generator. The survey was carried out using a pole-dipole array with first to sixth separation readings obtained over the main molybdenum zone using a 25 metre dipole spacing. The horizontal position of the stations was recorded using a differential GPS while elevations were recorded to an estimated accuracy of 3 metres utilizing an altimeter and base station.

A 3-D modeling of the chargeability (IP) results obtained from the detailed survey conducted in the area of main molybdenum zone showed that the zone of higher chargeability is doughnut shaped in plan and is coincident with areas of higher sulphide concentration (pyrite halo) while the internal zone of low chargeability is some 450 metres in diameter with its centre some 200 metres northwest of the central part of the porphyritic granite plug. This is suggestive of the potential for additional molybdenum mineralization near the inner margins of the chargeability high.

Reconnaissance Induced Polarization surveying, undertaken in the central part of the Lucky Ship pluton utilizing a broader dipole spacing, identified zones of higher chargeabilities at depth beneath areas underlain by breccia complexes.

In 2005 and early 2006, New Cantech completed 4,934.45 metres of diamond drilling in 28 drill holes (LS05-24-LS06-51). The results of this drilling have been described in a previous report by R.H. McMillan (McMillan, 2006). Between June 2006 and February 2007 New Cantech completed an additional 5,233.64 metres of NQ diamond drilling in16 drill holes (LS06-52-LS06-68). This work included completion of a deep hole to a depth of 1,017 metres (LS06-68). This hole was started in September 2006 but was not finished until February 2007. The results of the 2006 drilling program, including hole LS06-68 are the subject of a previous assessment report (MacIntyre, 2007).

REGIONAL GEOLOGY

The following descriptions of regional and property geology have been modified from an earlier report by Dr. N.C. Carter (Carter, 2007).

The regional geological setting of the Morice Lake area is shown on Figure 3 which is based on a digital geological map of British Columbia prepared by Massey et al (2005). Detailed geological mapping of this particular area has been undertaken by Desjardins et al (1991) and by Diakow (1990).

The Morice Lake -Nanika Lake area is part of Stikine terrane, a subdivision of the Intermontane tectonic belt immediately east of its boundary with the Coast belt. Stikine terrane consists of a collage of Jurassic, Cretaceous and Tertiary magmatic arcs and related successor basins (Desjardins et al, 1991). Oldest rocks in the immediate area are Early to Middle Jurassic, calcalkaline, island arc-related volcanic, volcaniclastic and related sedimentary rocks of the Hazelton Group. Morice Lake is on or near the axis of the northeast-trending Skeena Arch and uplift of this structural feature between Middle Jurassic and Early Cretacous time resulted in the deposition of thick deposits of clastic sediments within fault-controlled basins. A major plate collision from the west in the Middle Cretaceous resulted in uplift of the Coast belt, extensive folding of layered rocks to the east and the shedding of clastic sedimentary debris eastward from the rising Coast metamorphic-plutonic complex. This was followed by the growth of a north-trending volcanic arc in the Middle to Upper Cretaceous and subsequent development of an extensional tectonic regime in Late Cretaceous to Early Tertiary time resulting in the basin and range geomorphology evident today.

As noted, the oldest layered rocks in the area illustrated in Figure 3 are volcanic and sedimentary rocks of the Hazelton Group of Lower Jurassic Age. Only the oldest unit, the TelkwaFormation, is present in this area where it is composed primarily andesitic pyroclastic rocks and massive augite-feldspar phyric basalts which are overlain well-bedded ash flows, ignimbrites and rhyolite flows and fossiliferous marine sediments. Clastic sediments of the Lower Cretaceous , an example of which underlies the southeastern part of the Lucky Ship property.

Erosional remnants of younger volcanic rocks including late Cretaceous andesitic volcanics of the Kasalka Group, felsic volcanics of the early Tertiary Ootsa Lake Group and mid Tertiary basalts of the Buck Creek Group overlie older sequences north and south of the Lucky Ship property.

The volcanic and sedimentary rocks underlying much of the Morice Lake – Nanika Lake area are intruded by a variety of plutonic rocks. Oldest of these are quartz monzonite, granodiorite and quartz diorite of the early Jurassic Topley Plutonic Suite and lesser granitic rocks of Mid-Jurassic age which border Morice Lake and occupy the axis of the Skeena Arch (Figure 3). Granitic rocks of similar age have been recognized further to the northeast in the vicinity of Babine Lake (Carter, 1981). Smaller porphyritic granodiorite and quartz monzonite stocks and plugs of the Late Cretaceous Bulkley Plutonic Suite and porphyritic quartz monzonite, hornblende-quartz-biotite-feldspar porphyry and granite porphyry of the early Tertiary (Eocene) Nanika Plutonic Suite cut older rocks north and south of Morice Lake (Figure 3). The pluton hosting the Lucky Ship molybdenum deposit is part of the Nanika Plutonic Suite.

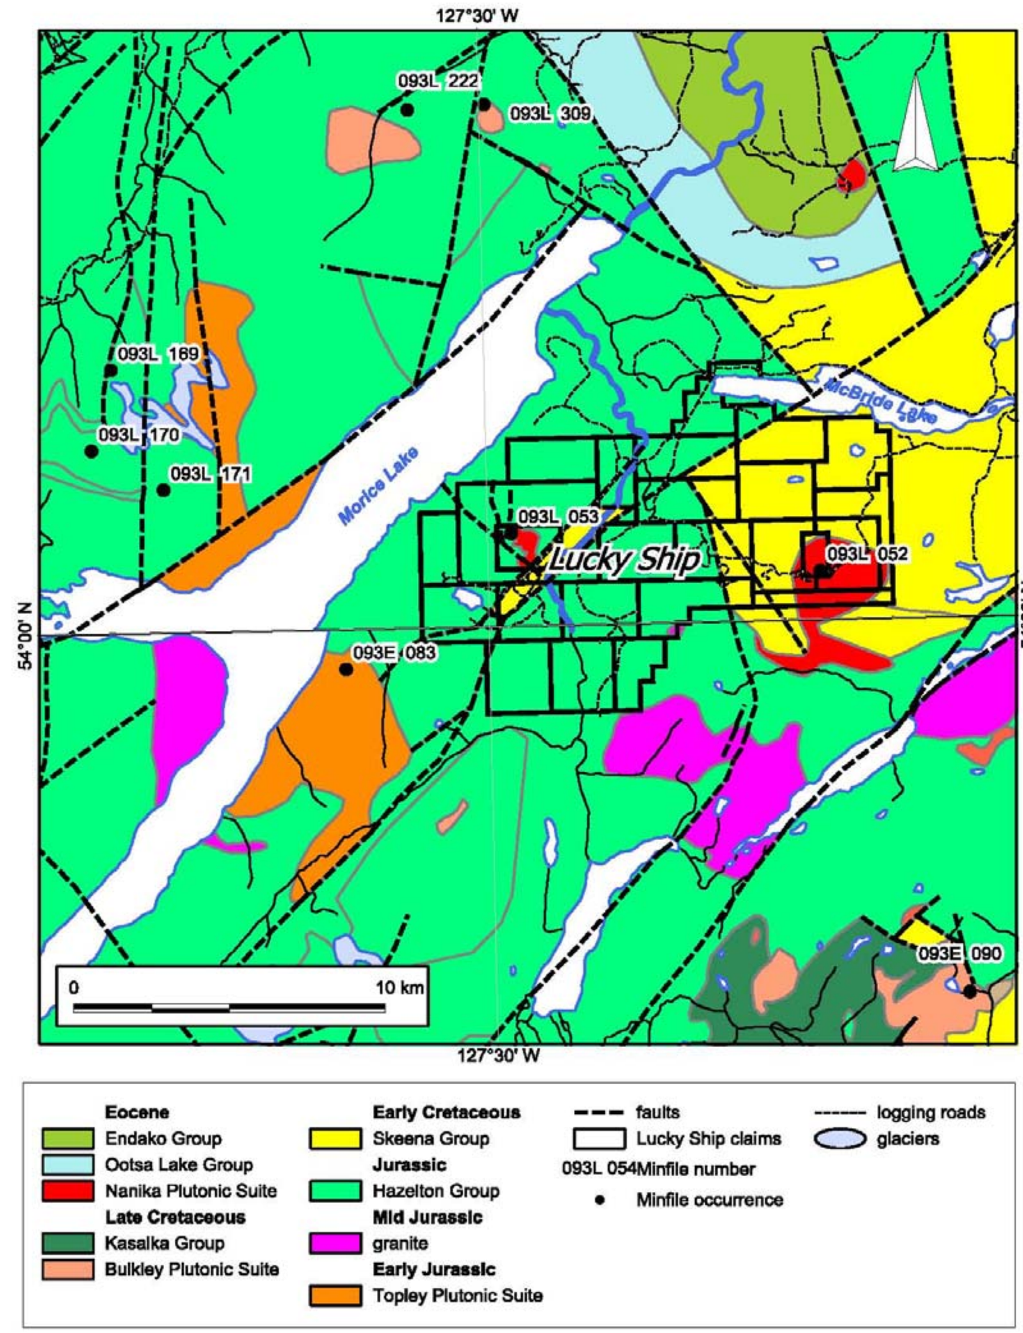

Figure 3. Regional geological setting, Lucky Ship property

This part of west-central British Columbia is well known for its number and variety of mineral deposits. Foremost among these are porphyry copper and molybdenum deposits which have been the focus of most exploration programs over the past 40 years. These porphyry deposits are related to granitic intrusions of three principal ages including those of the Eocene Nanika Plutonic Suite which host molybdenum and copper-molybdenum mineralization in a 300 kilometre long belt extending from north of Hazelton (Mount Thomlinson Mo prospect) south to Tweedsmuir Park and include such porphyry prospects as Big Onion copper-molybdenum, Lucky Ship molybdenum, Berg copper-molybdenum and Red Bird molybdenum.

Examples of porphyry deposits in the general area which are associated with granitic rocks of different ages include the Huckleberry porphyry copper-molybdenum deposit of late Cretaceous age (Bulkley Plutonic Suite) which is some 45 kilometres southeast of the Lucky Ship property. Huckleberry is currently being mined by open-pit methods by Imperial Metals Corporation at a rate of 20,000 tonnes per day. Between 1997 and 2005, a total of 57.6 million tonnes were milled from which 280,000 tonnes copper, 3,300 tonnes molybdenum, and 924 kg. gold and 26,000 kg. silver were recovered. Reported reserves/resources in early 2006 (Imperial Metals AIF on SEDAR; NI 43-101 compliant) for the East Zone were 12.25 million tonnes grading 0.526% copper and 0.015% molybdenum.

Another producing property 160 kilometres east of Lucky Ship is the Endako porphyry molybdenum deposit, another open pit mine owned by Thompson Creek Mining Ltd. This deposit, is hosted by granitic rocks of the Francois Lake Plutonic Suite of late Jurassic age. associated Daily milling rate is 26,000 tonnes per day and between 1965 and 2005, Placer Dome Inc., and later Thompson Creek Mining Ltd. processed 308.6 million tonnes from which 210.3 million kilograms molybdenum were recovered. Reserves/resources reported by new property owner Blue Pearl Mining Ltd. (Blue Pearl website - NI 43-101 compliant) include 74.0 million tonnes of proven and probable reserves grading 0.063% molybdenum and an indicated mineral resource of 51.8 million tonnes grading 0.070% molybdenum.

The Davidson (formerly Yorke-Hardy or Glacier Gulch) porphyry molybdenum deposit, located under Hudson Bay Mountain 5 kilometres west of Smithers and 90 kilometres north of the Lucky Ship Property, is related to a multiple phase intrusion of the Bulkley Plutonic Suite. The deposit hosts measured and indicated resources (NI 43-101 compliant) of 230 million tonnes grading 0.11% Mo at a cutoff grade of 0.06% Mo. The deposit also includes higher grade mineralization and Blue Pearl Mining Ltd. is investigating the feasibility of an underground mining operation.

PROPERTY GEOLOGY

The geology of the Lucky Ship Property is shown in Figure 4 which is based on geological work undertaken by T.J. R. Godfrey (1967) and A. Sutherland Brown (1966). Intrusive rocks on the Lucky Ship Property are well exposed in outcrop, in trenches and road cuts and in creeks on the ridge between Morice Lake and Nanika River and are part of the regionally extensive, Early Tertiary Nanika Plutonic Suite as initially described by the writer (Carter, 1981) and Desjardins et al (1991). This writer (Carter, 1981) obtained a potassium/argon radiometric age date of 49.9 +/- 2.3 million years from a sample of biotite hornfels collected marginal to the northern contact of the Lucky Ship pluton.

The following descriptions are based on published (Sutherland Brown, 1966) and unpublished (Godfrey, 1967; McMillan, 2005, 2006) reports and personal observations.

As indicated on Figure 4, the 1000 x 600 metres Lucky Ship high level (subvolcanic), composite pluton is elongate in a northwesterly direction and intrudes Lower Jurassic volcanic and lesser sedimentary rocks of the Hazelton Group, which, as previously noted, have been converted to biotite hornfels marginal to the intrusion. The pluton is made up of several intrusive phases of which the oldest and most areally extensive is the central quartz porphyry of rhyolite or granite composition. This is a white aphanitic rock with sparse quartz, K-feldspar and plagioclase feldspar phenocrysts set in a very fine-grained quartz and feldspar matrix. The southernmost part of this intrusive phase consists of dykes and sills cutting Hazelton group rocks and northerly-trending dykes also project from the northern contact (Figure 4).

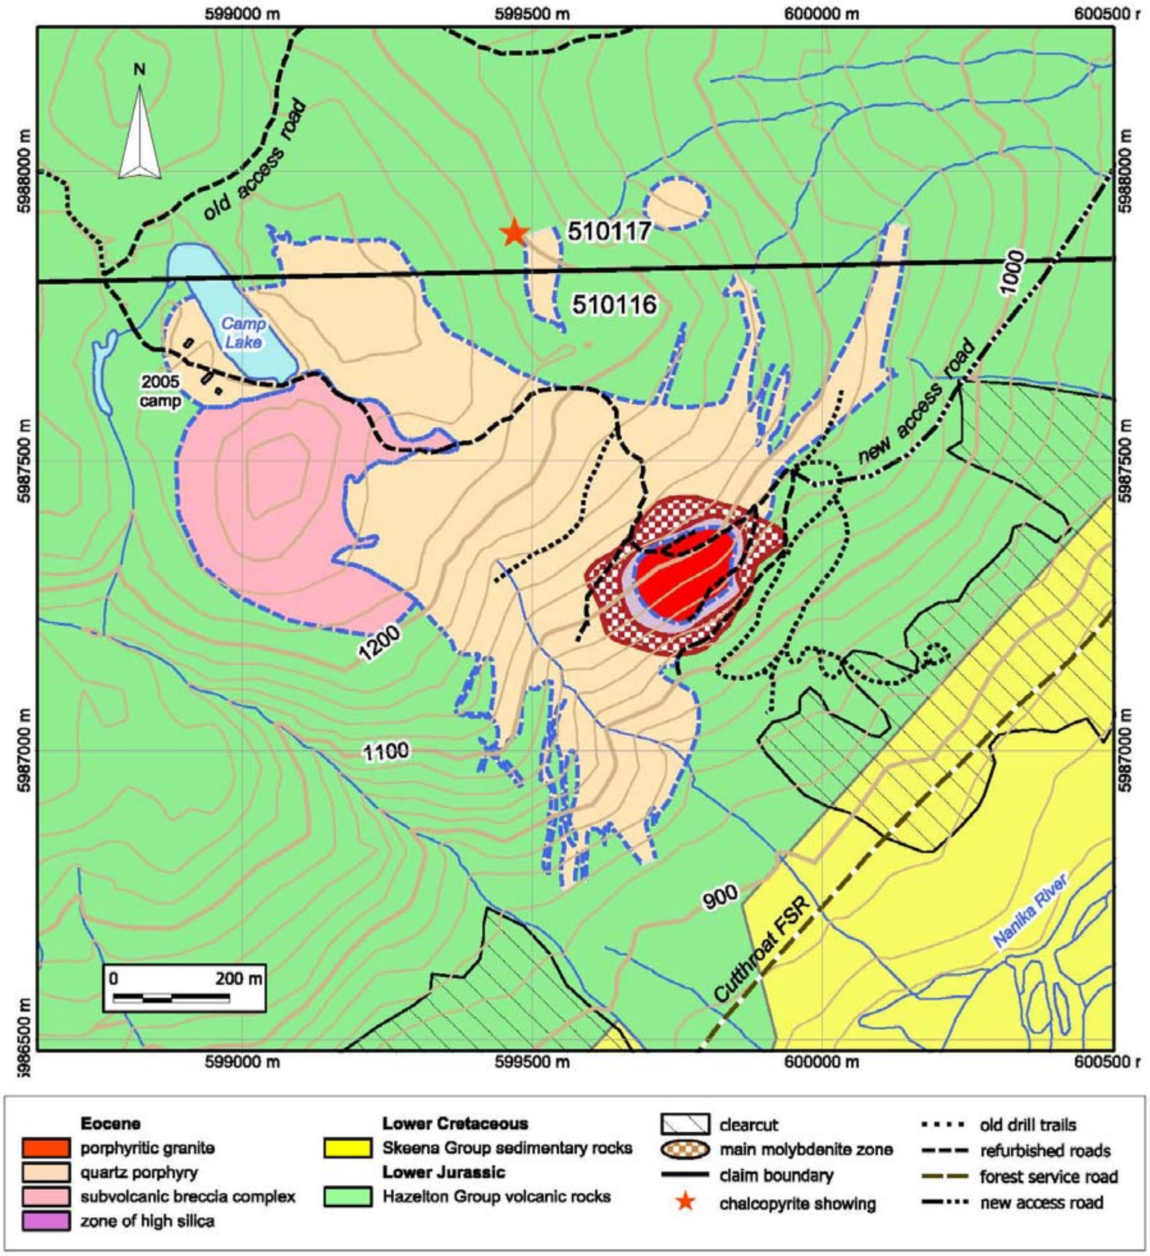

Figure 4. Geology of the Lucky Ship intrusive complex (after Godfrey, 1967)

The main, annular molybdenite zone is related to a subcircular, 200 x 120 metres porphyritic granite plug which is elongate in a northeasterly direction and intrudes the southeastern limits of the central quartz porphyry unit (Figure 4). Unaltered varieties of the granite feature plagioclase, quartz and K-feldspar phenocrysts in an aphanitic matrix. The elongate plug is enveloped by a 30 metres wide, highly silicified zone which is in part gradational outward to brecciated and hornfelsed Hazelton

Group rocks. The granite plug dips steeply north and based on 1960s drilling is thought to extend from surface to a depth of at least 350 metres. A quartz monzonite porphyry intrusion was intersected in hole LS06-68 at a depth of 750 metres below surface and this intrusion is interpreted to be a coarser grained equivalent of the granite porphyry.

The northwestern half of the composite Lucky Ship pluton includes two breccia phases. One of these is an intrusive quartz porphyry breccia complex containing up to 70% rounded fragments of material petrographically similar to the central quartz porphyry. The breccia fragments include both quartz porphyry and wallrock (Hazelton Group) and are up to 10 centimetres in diameter.

A circular, subvolcanic breccia body measuring 250 to 300 metres in diameter makes up the southwestern part of the Lucky Ship pluton (Figure 4). Thought to be at least in part extrusive, this unit is interpreted as being the latest (and possibly post-mineral) phase of Lucky Ship pluton. Breccia fragments include quartz porphyry and hornfelsed Hazelton group volcanic rocks plus exotic clasts of non-hornfelsed volcanic and sedimentary rocks.

The southeastern contacts of the Lucky Ship pluton are irregular and feature a number of dyke offshoots which parallel bedding attitudes in the Hazelton Group sequences marginal to the pluton. By contrast, the breccia complexes in the northwestern part of the pluton crosscut structures in Hazelton group rocks.

Fault zones within and marginal to the Lucky Ship pluton, which postdate the intrusion, have not appreciably offset intrusive contacts. These are usually present as gouge zones extending over several metres in drill holes and some of these caused problems with some of the 1960s drilling.

Molybdenite mineralization

The main molybdenite zone, as illustrated on Figure 4, is contained within a 300 x 200 metres, concentric, annular zone or shell surrounding the porphyritic granite plug near the southeastern margin of the Lucky Ship pluton. Like the central granite pluton, the annular molybdenite zone is elongate in a northeasterly direction and is subvertical with an apparent steep northerly dip or plunge. The zone extends outward from the 3 to 30 metres thick high silica zone surrounding the granite plug into the central quartz porphyry unit on its north, west and south sides and into hornfelsed Hazelton Group volcanic sequences to the southeast.

Where exposed on surface, molybdenum mineralization occurs in up to 60 centimetres wide, banded quartz-molybdenite veins separated by several metres of barren quartz porphyry or Hazelton Group hornfelsed volcanic rocks. These veins appear to be radial with respect to the porphyritic granite plug and grade inward to a well developed quartz and quartz-molybdenite vein and veinlet stockwork. This stockwork varies from a well defined zone up to 60 metres wide in quartz porphyry in the north and northwest parts of the annular zone to a broader, more irregular zone, up to 125 metres thick in the southwestern part of the zone. Zone widths in the southeastern part of the annular structure are between 25 and 60 metres.

Molybdenite (MoS_2) within the annular zone is fine-grained and several styles of mineralization have been noted. These include molybdenite along narrow, dry fractures without quartz, quartz molybdenite veins and veinlets with preferred orientations and/or randomly oriented stockworks, banded quartz-molybdenite veins up to several centimeters wide, and very fine –grained molybdenite in fine-grained silica.

Other styles of molybdenite mineralization have been noted outside the main annular zone. These include finely disseminated molybdenite in fine-grained quartz porphyry southwest of the main zone. This disseminated mineralization was accompanied by poorly developed quartz stockwork mineralization. Within the intrusive quartz porphyry breccia in the northern part of the pluton, molybdenite occurs as fine disseminations in very fine-grained silica rock, as coatings on dry hairline fractures and in several different ways in quartz porphyry fragments. Molybdenite mineralization in breccia fragments was encountered throughout a deep hole (65-5 – 831.4 metres) completed by Amax Exploration in the mid-1960s.

The Lucky Ship pluton and related molybdenum mineralization feature many of the characteristics described as being typical of porphyry molybdenum deposits by Wallace et al (1968 and 1978), Soregaroli and Sutherland Brown (1976), and Sinclair (1995a and b).

Porphyry molybdenum deposits worldwide are relatively low-grade deposits that are amenable to either open pit or underground bulk mining techniques. The deposits are associated with high-level to subvolcanic felsic intrusive centers, and usually feature multiple stages of intrusive activity. Mineralization is almost exclusively molybdenite, which may be accompanied by minor amounts of chalcopyrite, scheelite, huebnerite, wolframite, cassiterite, and other sulphide minerals as well as fluorite and anhydrite. Molybdenum mineralization occurs in quartz veinlet stockworks associated with intensely silicified rock, and in veins, sheeted veins, breccias and as disseminations in pervasively silicified rock.

Silicification is the most common alteration product in porphyry molybdenum deposits and is best developed in the core of the mineralizing system. Potassic alteration, in the form of K-feldspar and/or secondary biotite is also an important alteration type. Phyllic (clay-sericite) alteration may surround or be superimposed on a high silica – potassic core and be replaced outward by propylitic (chlorite-epidote) alteration. These hydrothermal alteration envelopes are often extensive and commonly contain several percent pyrite which are referred to as pyrite haloes. Volcanic and sedimentary rocks marginal to host granitic intrusions may be converted to biotite hornfels by contact metamorphism. Breccias are a common component of porphyry systems and contain fragments of earlier, sometimes mineralized phases.

Porphyry molybdenum deposits vary in shape from an inverted cup to cylindrical or annular and sometimes elongate and highly irregular. As noted, most deposits feature multiple episodes of intrusion and associated hydrothermal alteration and some of the larger deposits, including Climax and Urad-Henderson in Colorado, feature two or more stacked ore bodies.

PREVIOUS DRILLING

Amax Drilling, 1964-1968

Information pertaining to the diamond drilling done by Amax Exploration between 1964 and 1968 is incomplete. The following summary, prepared by McMillan (2005), is based on a 1967 summary Amax report by T.J.R. Godfrey that is available in the Property File of the B.C. Ministry of Mines and Petroleum Resources library in Victoria. A complete version of this report with assay results, drill sections, drill hole logs and maps is not available. However, earlier reports including drill sections and property scale maps where recovered from a warehouse in Vancouver in 2006. This information only covers holes drilled in 1964 and 1965 (LS64-1 to 4 and LS65-5-17). Significant drill hole intersections as listed in Godfreys 1967 report are summarized in Table 2.

The molybdenum grades listed in the foregoing table were obtained from BQ-sized drill core recovered from a number of inclined holes drilled on northwesterly azimuths (or into the hillside) to test the annular molybdenum zone mainly at depths of between 100 and 300 metres below surface. As indicated in the foregoing table, molybdenum grades averaging about 0.10% were encountered over hole lengths of between 12.2 and 128.0 metres. Several other areas of the property were also tested including the “Southern Lobe” and the “North Showing” (see above table) and one deep hole

(LS67-23 – 1001 metres) was drilled to test for mineralization at depth within the subvolcanic breccia unit.

Table 2. Significant Drill Hole Intersections, Amax Exploration, 1964-1966

* Drill hole with multiple intersections from different areas of the Main Molybdenum Zone (After McMillan, 2005, 2006)

As noted, the information in Table2 is not documented by assay certificates, nor is it known what minimum cutoff grades were used to calculate the average intersections. The lack of detailed drill logs permits only an estimate of the depths of mineralized intersections but notwithstanding the gaps in the information base, the available data proved to be invaluable in providing information regarding grades and distribution of molybdenum mineralization on the Lucky Ship Property. All of this work was carried out by Amax Exploration which was regarded as the most knowledgeable mining company involved in molybdenum exploration in the 1960's. One can safely assume that those in charge of this project maintained the highest professional standards in carrying out all phases of mineral exploration.

New Cantech Drilling – Phases 1, 2 and 3

In 2005, New Cantech completed 4934.45 metres of diamond drilling in 28 drill holes (LS05-24-LS06-51). The results of this drilling have been described in a previous report by R.H. McMillan (McMillan, 2006). Drilling done between June and November 2005 comprise New Cantech's Phase 1 drilling program. Drill holes completed in February 2006 make up the Phase 2 program. Significant drill hole intersections from the Phase 1 and 2 drill programs are summarized in Table 3.

Between June 2006 and February 2007 New Cantech completed an additional 5,233.64 metres of NQ diamond drilling in16 drill holes (LS06-52-LS06-68). This work included completion of a deep hole to a depth of 1,017 metres (LS06-68). This hole was started in September 2006 but was not finished until February 2007. The results of the 2006 drilling program, including hole LS06-68 are discussed in a previous assessment report. Drill holes completed as part of the Phase 3 program are summarized in Table 5.

In December 2006, Dr. N.C. Carter completed an NI 43-101 compliant resource estimate. A technical report in support of this resource estimate was filed on the SEDAR website in January 2007. Dr.

Carter's resource estimate was based on the results of 9,151 metres of diamond drilling in 44 holes completed by New Cantech Ventures Inc. in 2005 and 2006 and in part on results obtained from more than 10,000 metres of diamond drilling (23 holes) undertaken by Amax Exploration Inc. between 1964 and 1968. Dr. Carter's resource estimate did not include drill hole LS06-68, a deep hole (1017 metres) that was not completed until February 2007. Estimates of Indicated and Inferred Mineral Resources at cutoff grades of 0.030%, 0.060% and 0.090% Mo (molybdenum) are summarized in Table 5.

The Indicated Mineral Resources were defined by 2005 and 2006 drilling which consisted of several inclined holes on each of eight sections spaced 50 metres apart. These holes were designed to test the annular mineral zone at depths of between 50 and 400 metres below surface. The revised estimates, which also include estimates of resources at a cutoff grade of 0.090% Mo for the first time, consist of Indicated Mineral Resources which are more than double the previously reported estimates at cutoff grades of 0.030% and 0.060% Mo. The main mineralized zone remains open to depth.

Table 5. Mineral Resource Estimate (Dr. N.C. Carter, December 2006)

	Indicated Mineral Resource		**Inferred Mineral Resource**	
Cutoff Grade	Tonnes (millions)	Mo(%)	Tonnes (millions)	Mo(%)
0.030% Mo	52.6	0.071	8.3	0.070
0.060% Mo	28.7	0.089	2.9	0.101
0.090% Mo	10.3	0.120	1.4	0.121

PHASE 4 AND 5 DRILL PROGRAMS

Between February and September 2007, New Cantech completed a total of 14,544 metres of diamond drilling in 49 drill holes on the Lucky Ship property. This drilling was done by Driftwood Diamond Drilling of Smithers. The main objectives of this drilling program were to move that part of the Lucky Ship mineral resource classified as inferred into the indicated category and to provide initial groundwater (hydrology) and acid rock drainage information on the deposit by drilling a number of HQ size drill holes. The groundwater drilling was part of the baseline assessments for project development. The drilling program consisted of two phases. Phase 4 (LS07-69-114 plus a ARD-07) targeted the main molybdenum zone. Phase 5 (LS07-115-117) targeted a gossanous area upslope and north of the main molybdenum zone. Location of Phase 4 drill holes is shown in Figure 5. Phase 5 drill hole locations are shown on Figure 6.

Prior to commencement of drilling, a winterized tent camp was established at kilometre 74 on the Morice Forest Service Road in early February. This campsite was located at an old sawmill site next to McBride Lake. Access to the area of drilling was via the Morice forest service road to kilometre 75 then 7 kilometres via the Nanika and Cutthroat roads to a staging area at the start of the Lucky Ship access road. Snowmobiles and a snowcat were used to access the drill sites from the staging area, a distance of approximately 1.5 kilometres. In mid February, Driftwood Diamond Drilling of Smithers B.C. moved two skid mounted Hydrocore 2000 drills onto the property. Between February 20 and April 29, 2007 at total of 38 drill holes (LS07-69 to LS07-106) totaling 11,781 metres were completed. Because of spring thaw conditions which made roads to the property unusable, drilling on the property was suspended on April 29, 2007. In late June, Driftwood moved a skid mounted

Longyear 38 drill back onto the property and drilling resumed on July 5, 2007. Between July 5 and September 11, 2007, an additional 2,764 metres of diamond drilling in 12 holes (LS07-107 to LS07-117, ARD07) was completed. Holes LS07-107 to LS07-114 were drilled in the main molybdenum zone and were part of the Phase 4 drill program. Holes LS07-115 to LS07-117 were drilled near the top of the ridge approximately 300 metres northwest of the main molybdenum zone and constitute the Phase 5 drilling program. A single, vertical 89 metre hole (ARD-07) was drilled in the clearcut southeast and below the molybdenum zone for acid rock determination sampling.

Drill core was split and logged at the McBride Lake camp. Samples were then taken to Smithers for shipment to Acme Analytical Laboratories in Vancouver via Bandstra Transportation services. In July 2007, Acme established a sample preparation lab in Smithers and samples were then drop off at the lab for processing rather than being shipped to Vancouver. The Acme analytical facility in Vancouver is an ISO 9002 accredited laboratory. Samples were analyzed using the hot Agua Regia digestion and ICP-ES analytical technique. Significant intersections for the Phase 4 drilling program are summarized in Table 6. Following completion of the drilling program, drill core was strapped onto pallets and move to a warehouse in Telkwa, B.C. where it is currently being stored.

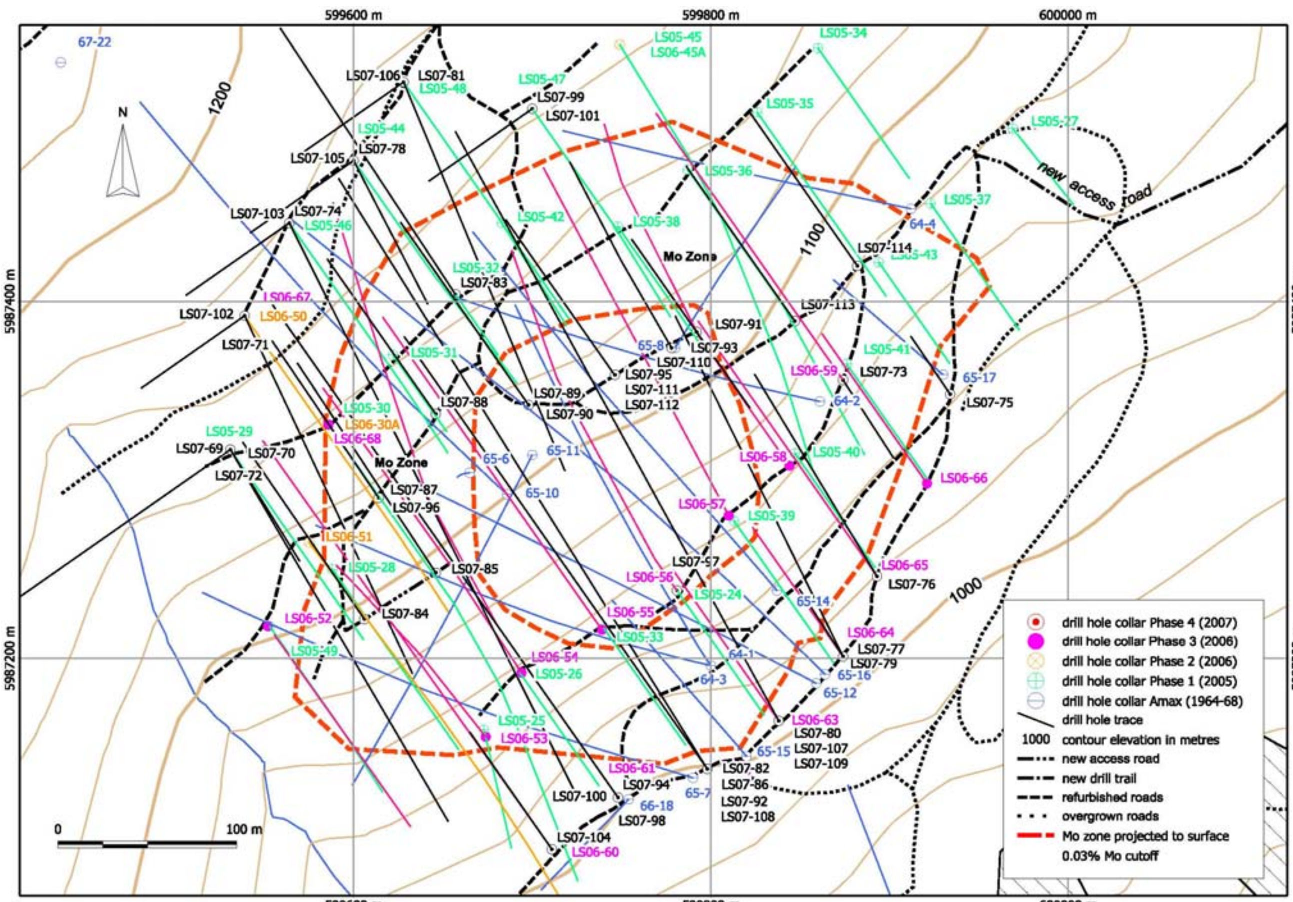

Figure 5. Drill drill hole locations, Lucky Ship property

Drill Hole Summaries – Phase 4 Drilling Program

LS07-69

Drill hole LS07-69 was collared at UTM coordinates 599531 east, 5987317 north, on section 15+50E and at an elevation of 1136.11 metres. It was drilled at azimuth 235 degrees and inclination -45 degrees to a depth of 231.04 metres. The hole was started on February 20, 2007 and finished on February 23, 2007. This hole was drilled to test ground conditions west of the main molybdenum zone. The hole intersected highly fractured quartz feldspar porphyry suggesting a possible fault zone. The hole was not split and sampled.

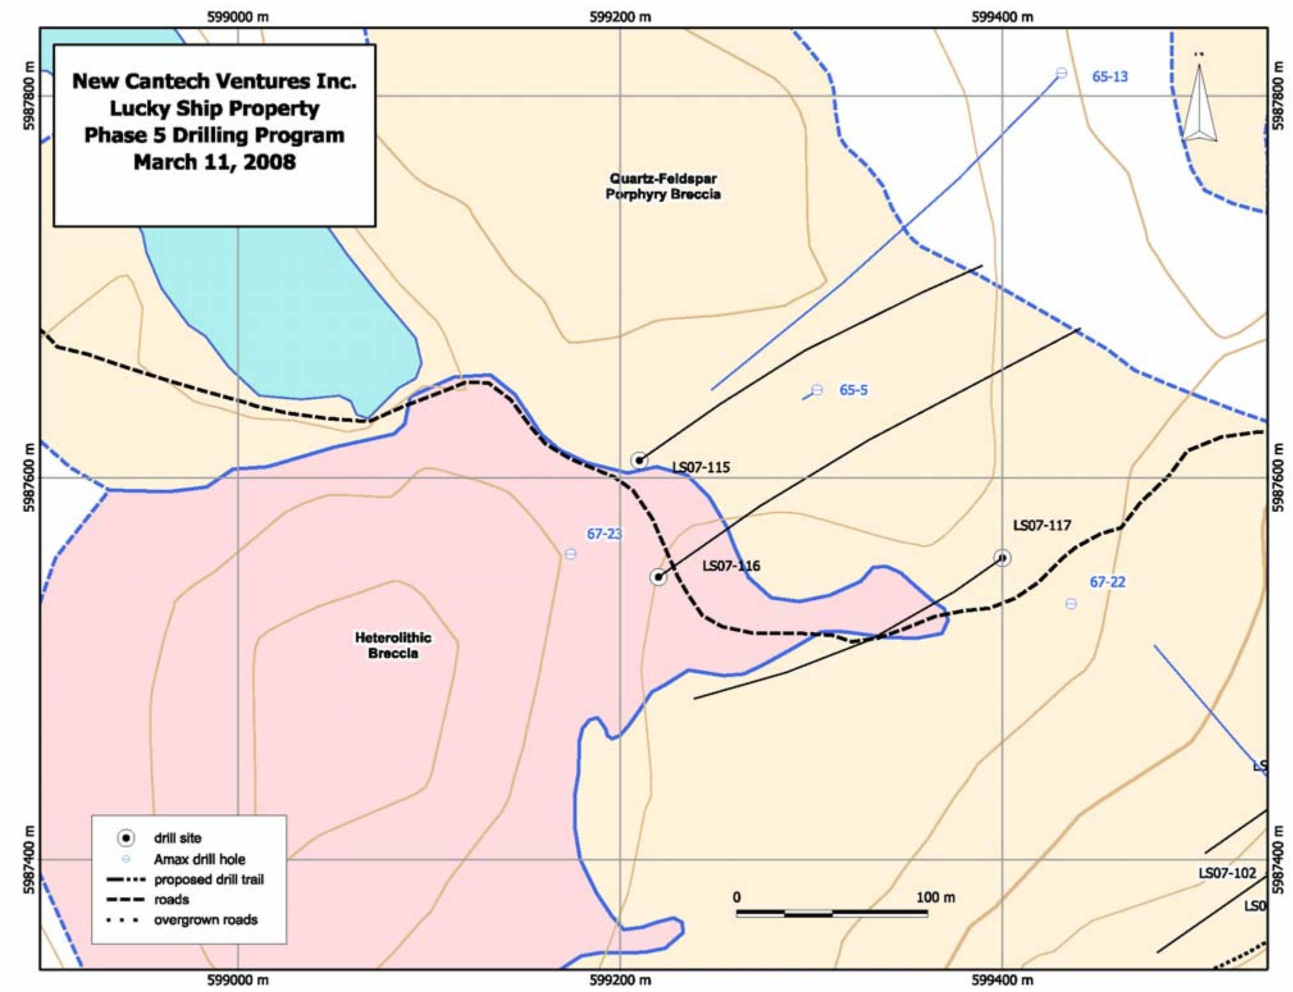

Figure 6. Phase 5 drill hole locations, Lucky Ship property

LS07-70

Drill hole LS07-70 was collared at UTM coordinates 599531 east, 5987317 north, on section 15+50E and at an elevation of 1136.11 metres. It was drilled at azimuth 145 degrees and inclination -60 degrees to a depth of 470.61 metres. The hole was started on February 23, 2007 and finished on February 27, 2007. The hole intersected the molybdenum zone from 103 to 445 metres. This 342 metre interval averaged 0.06% Mo. The best intersection was from 295 to 381 metres which averaged 0.11% Mo over a length of 86 metres.

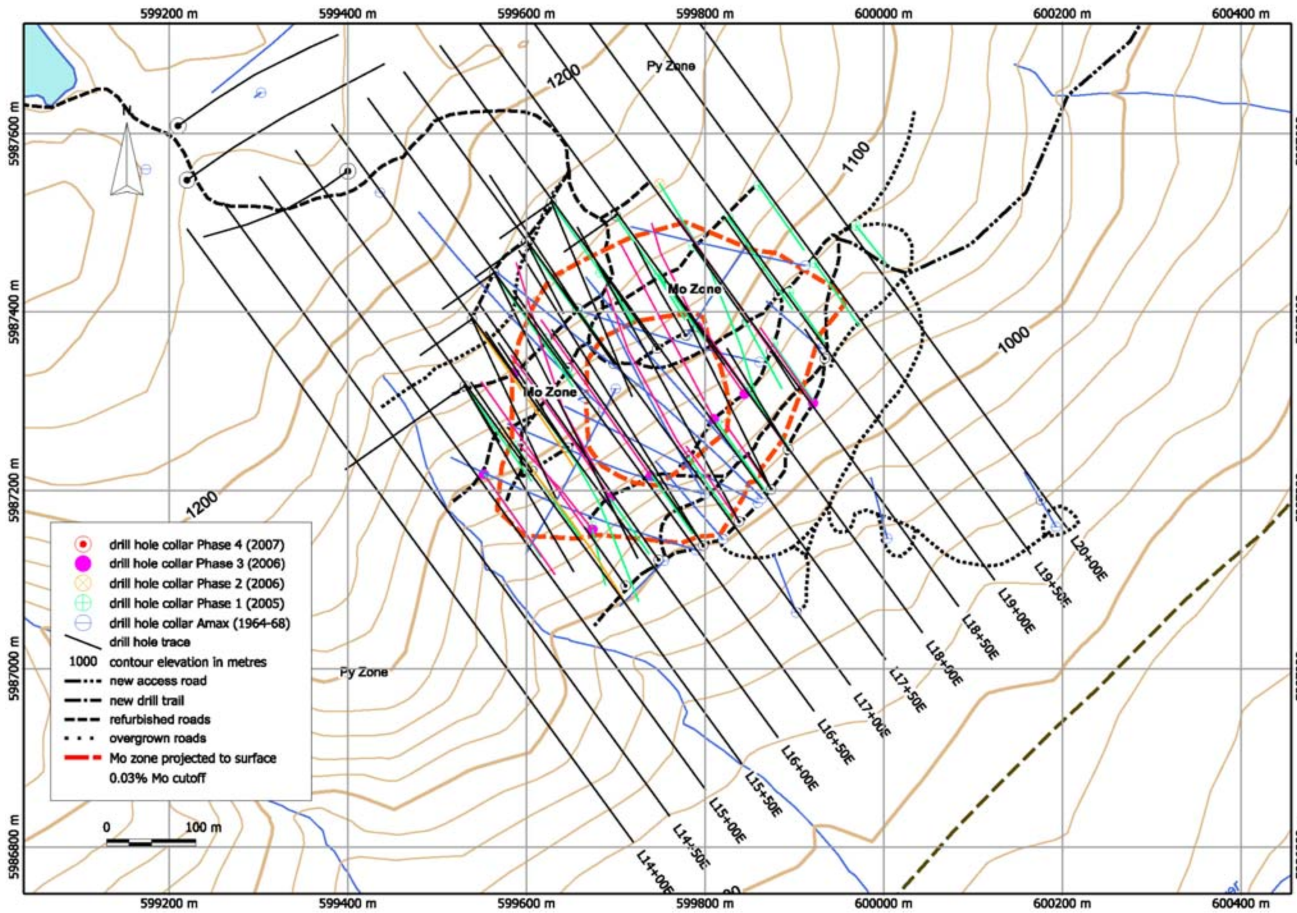

Figure 7. Drill plan and location of section lines, Lucky Ship Property

LS07-71

Drill hole LS07-71 was collared at UTM coordinates 599539 east, 5987392 north, on section 16+00E and at an elevation of 1165.97 metres. It was drilled at azimuth 145 degrees and inclination -60 degrees to a depth of 419.40 metres. The hole was started on February 26, 2007 and finished on March 3, 2007. The hole intersected the molybdenum zone from 157 to 422.5 metres. This 265.45 metre interval averaged 0.09% Mo. The best intersection was from 9 to 15 metres which averaged 0.44% Mo over a length of 6 metres.

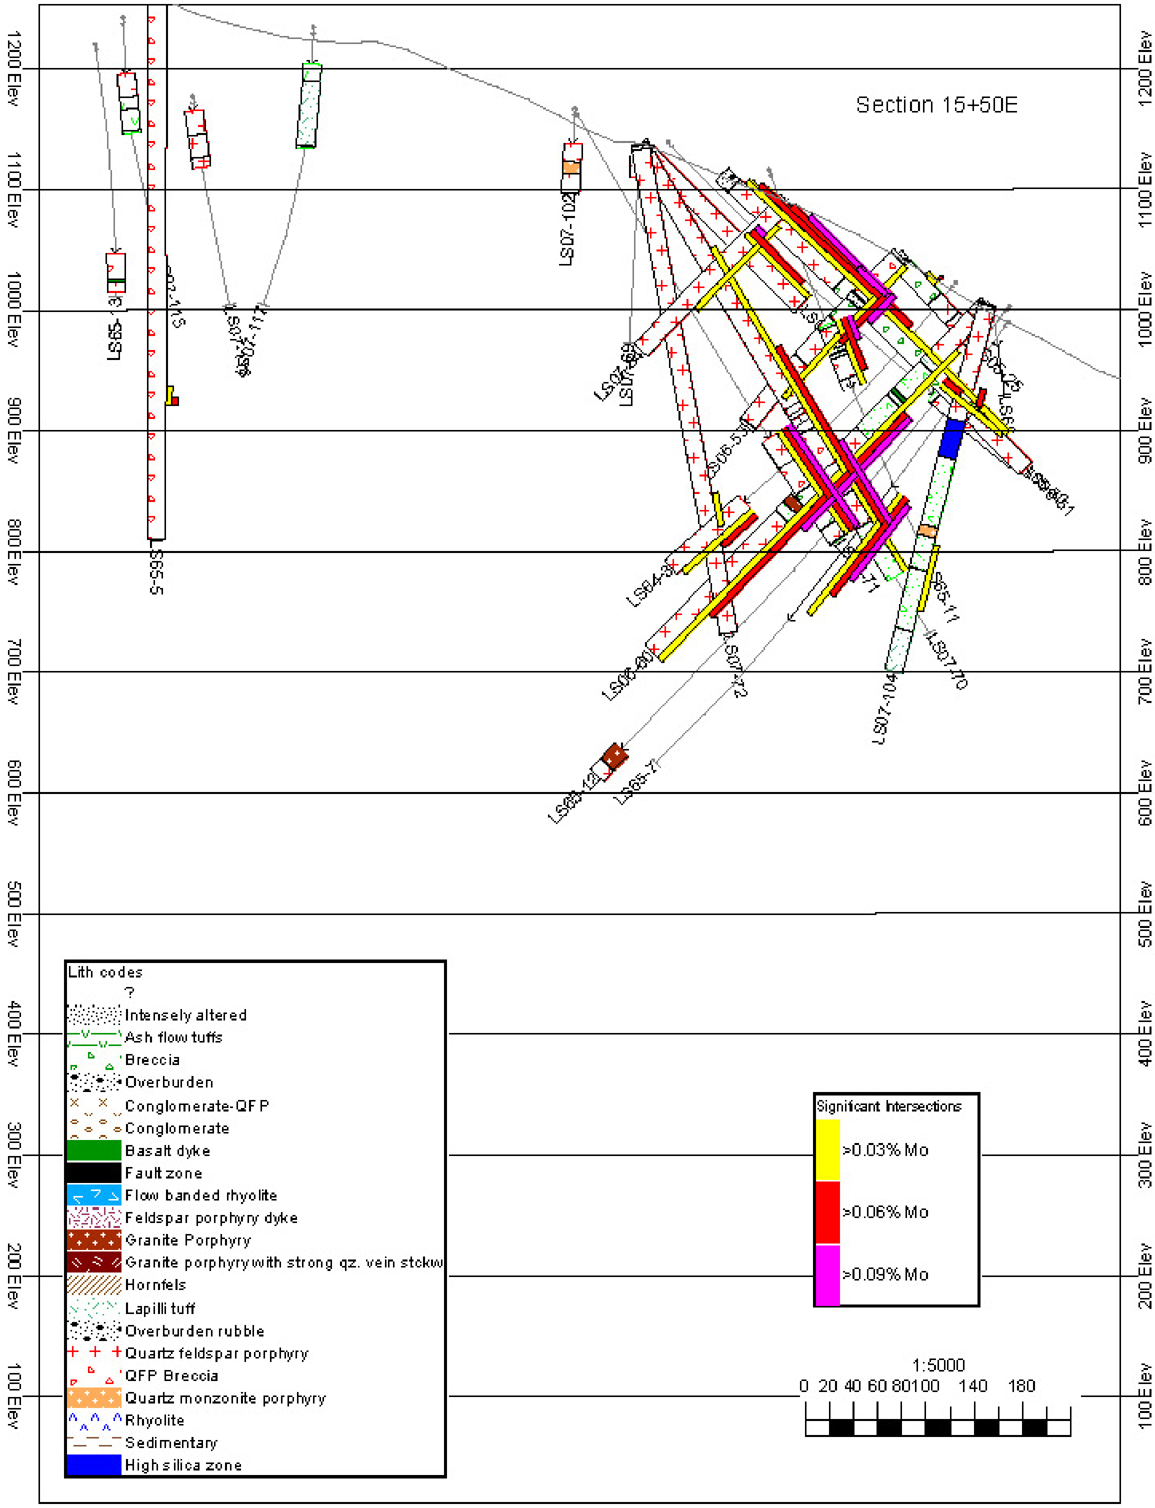

Figure 8. Drill section 15+50E, Lucky Ship Property

LS07-72

Drill hole LS07-72 was collared at UTM coordinates 599531 east, 5987317 north, on section 15+50E and at an elevation of 1136.11 metres. It was drilled at azimuth 145 degrees and inclination -80 degrees to a depth of 410.57 metres. The hole was started on February 27, 2007 and finished on March 2, 2007. The hole intersected the molybdenum zone from 294 to 322 metres. This 28 metre interval averaged 0.06% Mo.

LS07-73

Drill hole LS07-73 was collared at UTM coordinates 599874 east, 5987356 north, on section 18+50E and at an elevation of 1058.00 metres. It was drilled at azimuth 145 degrees and inclination -80 degrees to a depth of 308.15 metres. The hole was started on March 3, 2007 and finished on March 4, 2007. The hole intersected the molybdenum zone from 7 to 249 metres. This 242 metre interval averaged 0.05% Mo. The best intersection was from 139 to 151 metres which averaged 0.12% Mo over a length of 12 metres.

LS07-74

Drill hole LS07-74 was collared at UTM coordinates 599564 east, 5987444 north, on section 16+50E and at an elevation of 1173.73 metres. It was drilled at azimuth 145 degrees and inclination -60 degrees to a depth of 580.95 metres. The hole was started on March 3, 2007 and finished on March 9, 2007. The hole intersected the molybdenum zone from 45 to 339 metres. This 294 metre interval averaged 0.06% Mo. The best intersection was from 175 to 267 metres which averaged 0.1% Mo over a length of 92 metres.

LS07-75

Drill hole LS07-75 was collared at UTM coordinates 599934 east, 5987348 north, on section 19+00E and at an elevation of 1042.00 metres. It was drilled at azimuth 325 degrees and inclination -80

degrees to a depth of 228.90 metres. The hole was started on March 4, 2007 and finished on March 5, 2007. The hole intersected the molybdenum zone from 63 to 145 metres. This 82 metre interval averaged 0.04% Mo.

LS07-76

Drill hole LS07-76 was collared at UTM coordinates 599893 east, 5987246 north, on section 18+00E and at an elevation of 1012.00 metres. It was drilled at azimuth 325 degrees and inclination -65 degrees to a depth of 318.52 metres. The hole was started on March 6, 2007 and finished on March 8, 2007. The hole intersected the molybdenum zone from 35 to 309 metres. This 274 metre interval averaged 0.06% Mo. The best intersections were from 51 to 57 metres which averaged 0.19% Mo over a length of 6 metres and from 147 to 169 metres which averaged 0.11% Mo over a length of 22 metres.

LS07-77

Drill hole LS07-77 was collared at UTM coordinates 599874 east, 5987201 north, on section 17+50E and at an elevation of 1003.00 metres. It was drilled at azimuth 325 degrees and inclination -60 degrees to a depth of 450.19 metres. The hole was started on March 8, 2007 and finished on March 12, 2007. The hole intersected the molybdenum zone from 59 to 429 metres. This 370 metre interval averaged 0.05% Mo. The best intersection was from 133 to 147 metres which averaged 0.17% Mo over a length of 14 metres.

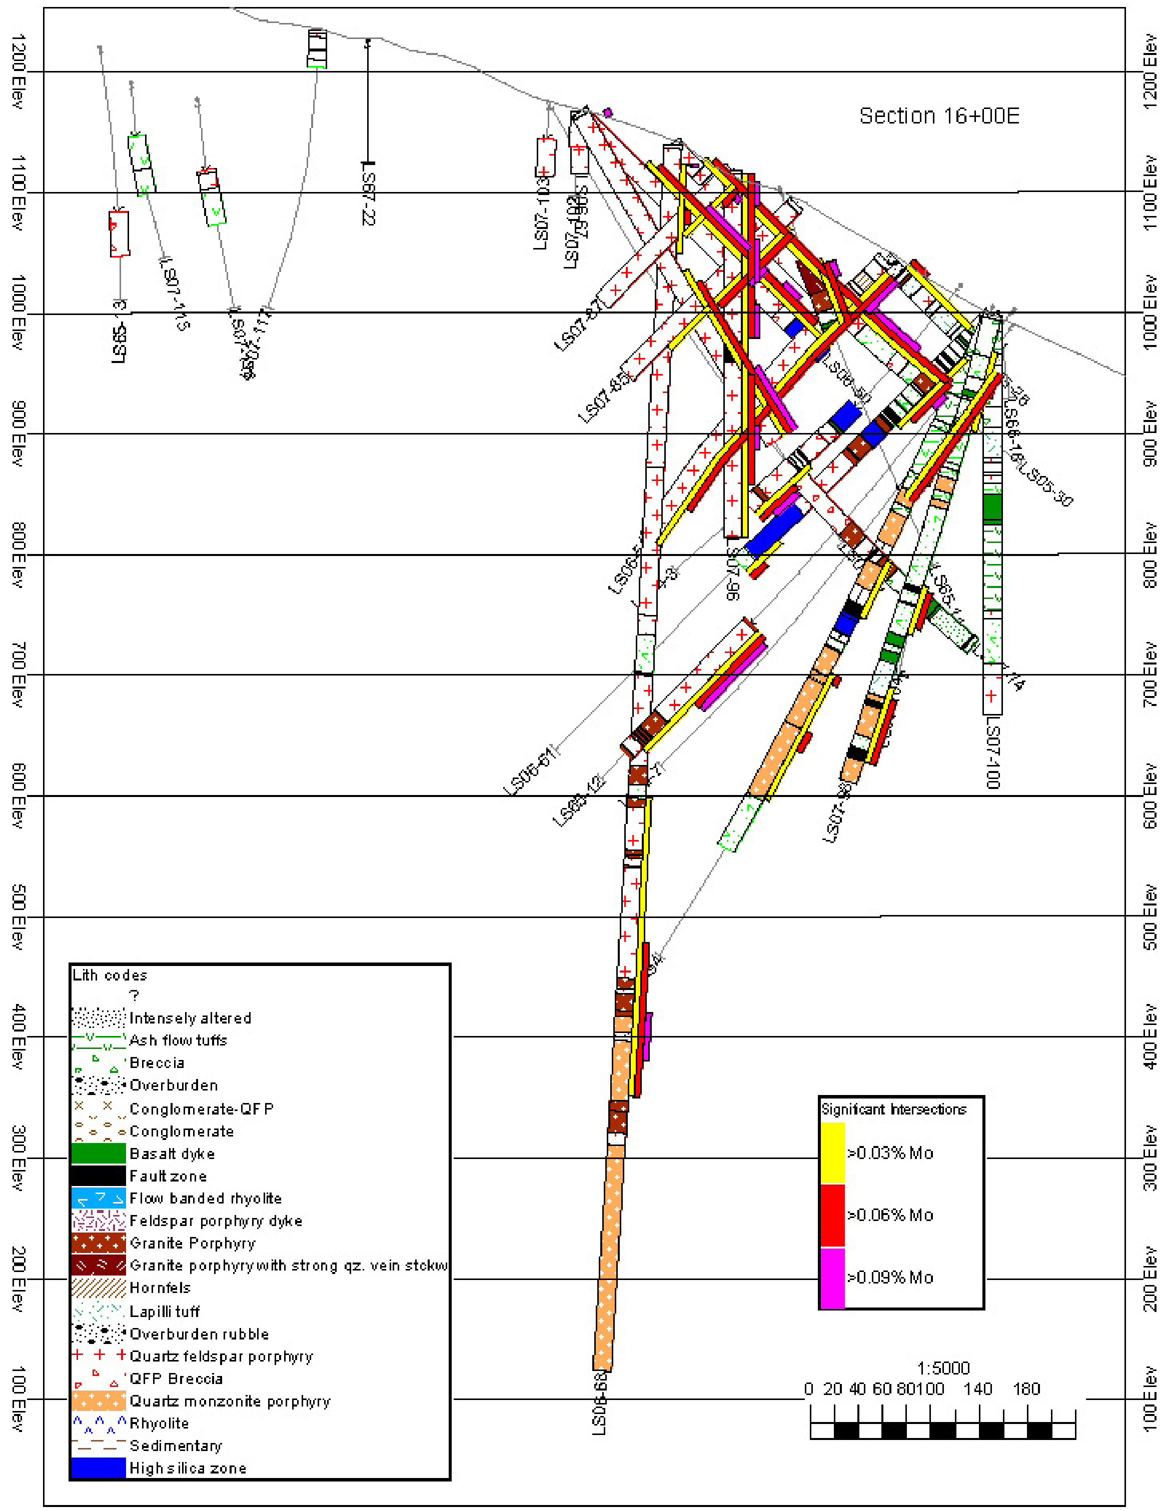

Figure 9. Drill section 16+00E, Lucky Ship Property

LS07-78

Drill hole LS07-78 was collared at UTM coordinates 599600 east, 5987479 north, on section 17+00E and at an elevation of 1171.96 metres. It was drilled at azimuth 145 degrees and inclination -80 degrees to a depth of 538.58 metres. The hole was started on March 9, 2007 and finished on March 15, 2007. The hole intersected weak molybdenum mineralization from 325 to 353 metres. This 28 metre interval averaged 0.04% Mo. A second molybdenum zone was intersected from 431 to 463 metres. This 32 metre interval also average 0.04%Mo.

LS07-79

Drill hole LS07-79 was collared at UTM coordinates 599874 east, 5987201 north, on section 17+50E and at an elevation of 1003.00 metres. It was drilled at azimuth 325 degrees and inclination -80 degrees to a depth of 260.60 metres. The hole was started on March 12, 2007 and finished on March 14, 2007. The hole intersected the molybdenum zone from 57 to 107 metres. This 50 metre interval averaged 0.04% Mo.

LS07-80

Drill hole LS07-80 was collared at UTM coordinates 599838 east, 5987165 north, on section 17+00E and at an elevation of 998.00 metres. It was drilled at azimuth 325 degrees and inclination -50 degrees to a depth of 581.56 metres. The hole was started on March 14, 2007 and finished on March 20, 2007. The hole intersected the molybdenum zone from 33 to 117 metres. This 84 metre interval averaged 0.06% Mo. Molybdenum mineralization was also intersected from 351 to 533 metres. This 182 metre interval average 0.06% Mo. The best intersection within this interval was from 497 to 501 metres which averaged 0.12% Mo over a length of 4 metres.

LS07-81

Drill hole LS07-81 was collared at UTM coordinates 599628 east, 5987523 north, on section 17+50E and at an elevation of 1167.40 metres. It was drilled at azimuth 145 degrees and inclination -65 degrees to a depth of 547.42 metres. The hole was started on March 15, 2007 and finished on March 21, 2007. The hole intersected the molybdenum zone from 253 to 550.5 metres. This 297.46 metre interval averaged 0.05% Mo. The best intersection was from 335 to 343 metres which averaged 0.18% Mo over a length of 8 metres.

LS07-82

Drill hole LS07-82 was collared at UTM coordinates 599798 east, 5987138 north, on section 16+50E and at an elevation of 994.00 metres. It was drilled at azimuth 325 degrees and inclination -50 degrees to a depth of 585.83 metres. The hole was started on March 20, 2007 and finished on March 26, 2007. The hole intersected the molybdenum zone from 293 to 565 metres. This 272 metre interval averaged 0.05% Mo. The best intersection was from 479 to 515 metres which averaged 0.07% Mo over a length of 36 metres. A 24 metre interval averaging 0.108% Mo was intersected between 51 and 75 metres and appears to be separate .

LS07-83

Drill hole LS07-83 was collared at UTM coordinates 599657 east, 5987404 north, on section 17+00E and at an elevation of 1135.00 metres. It was drilled at azimuth 325 degrees and inclination -45 degrees to a depth of 254.81 metres. The hole was started on March 21, 2007 and finished on March

23, 2007. This hole was drilled for geotechnical groundwater studies and the core was not split and sampled.

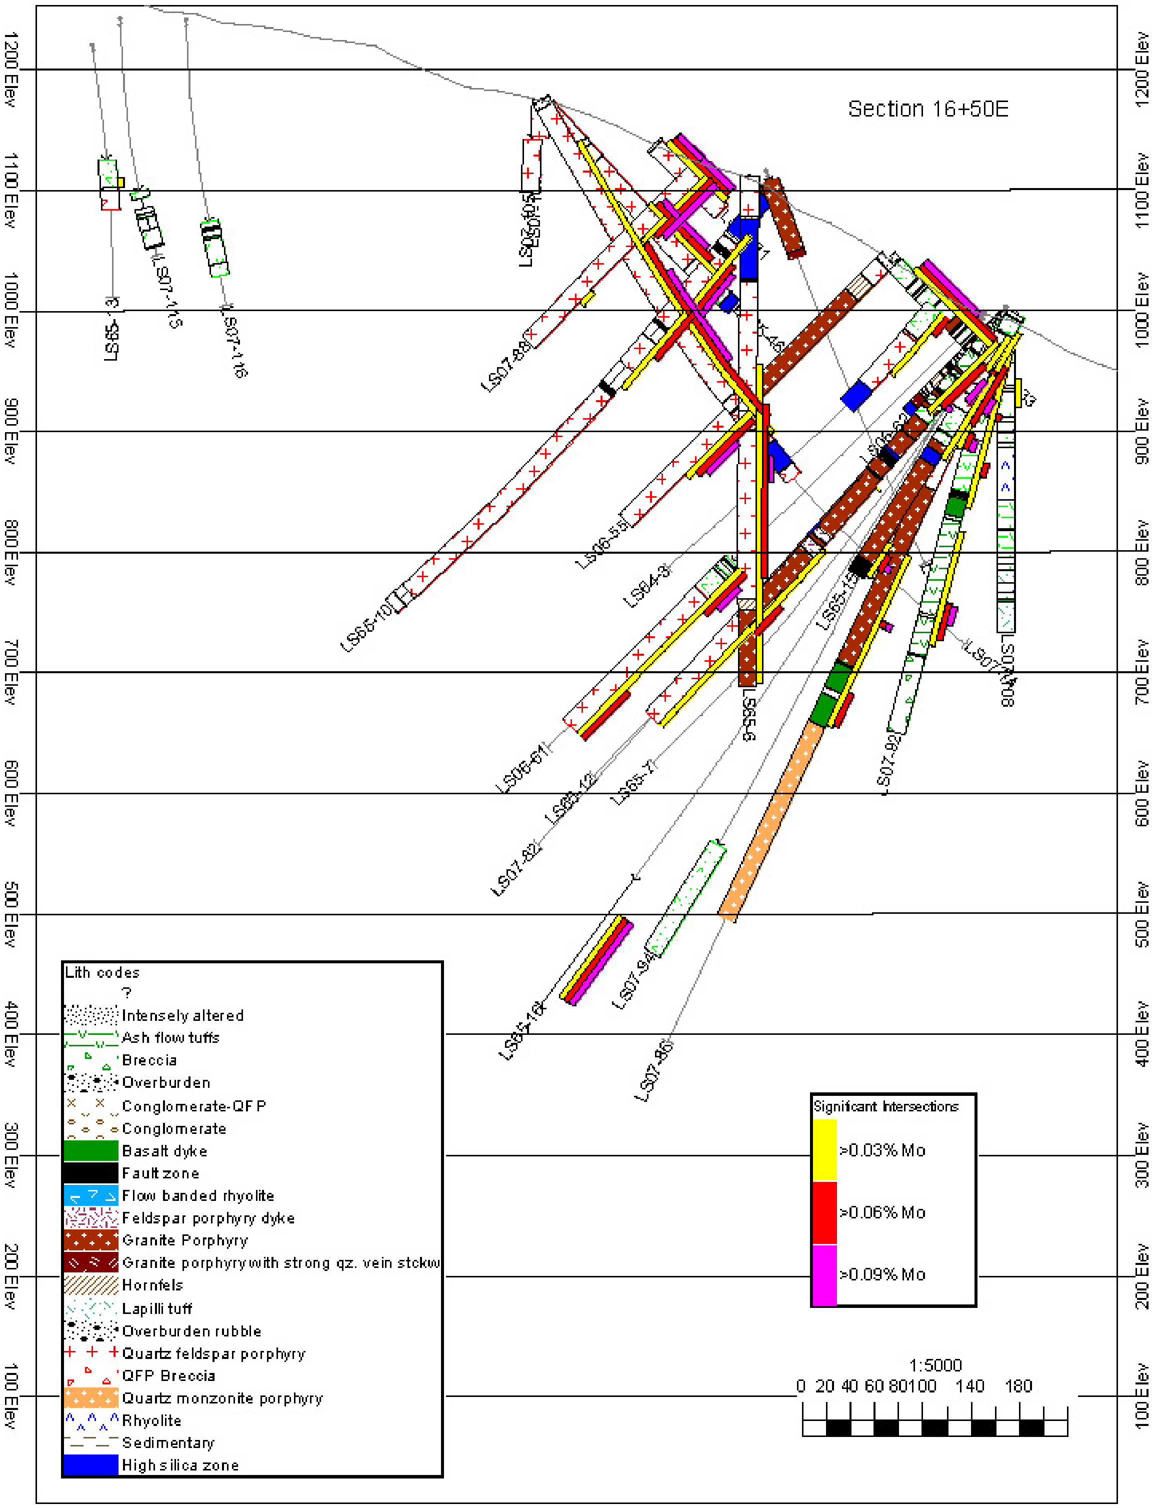

Figure 10. Drill section 16+50E, Lucky Ship Property

LS07-84

Drill hole LS07-84 was collared at UTM coordinates 599606 east, 5987222 north, on section 16+50E and at an elevation of 1090.00 metres. It was drilled at azimuth 325 degrees and inclination -45 degrees to a depth of 172.52 metres. The hole was started on March 23, 2007 and finished on March 25, 2007. The hole intersected the molybdenum zone from 19 to 117 metres. This 98 metre interval averaged 0.05% Mo.

LS07-85

Drill hole LS07-85 was collared at UTM coordinates 599646 east, 5987248 north, on section 16+00E and at an elevation of 1090.00 metres. It was drilled at azimuth 325 degrees and inclination -45 degrees to a depth of 199.34 metres. The hole was started on March 25, 2007 and finished on March 26, 2007. The hole intersected the molybdenum zone from 17 to 159 metres. This 142 metre interval averaged 0.07% Mo. The best intersection was from 55 to 75 metres which averaged 0.14% Mo over a length of 20 metres.

LS07-86

Drill hole LS07-86 was collared at UTM coordinates 599798 east, 5987138 north, on section 16+50E and at an elevation of 994.00 metres. It was drilled at azimuth 325 degrees and inclination -65 degrees to a depth of 663.55 metres. The hole was started on March 26, 2007 and finished on April 4, 2007. The hole intersected the southern half of the molybdenum zone from 45 to 115 metres. This 70 metre interval averaged 0.06% Mo. The best intersection was from 99 to 113 metres which averaged 0.11% Mo over a length of 14 metres. The northern part of the molybdenum zone was intersected from 213 to 369 metres. This 156 metre interval averaged 0.05% Mo with the best grades between 271 and 277 metres which averaged 0.15% Mo.

LS07-87

Drill hole LS07-87 was collared at UTM coordinates 599614 east, 5987290 north, on section 16+00E and at an elevation of 1118.00 metres. It was drilled at azimuth 325 degrees and inclination -45 degrees to a depth of 153.62 metres. The hole was started on March 27, 2007 and finished on March 28, 2007. The hole intersected the molybdenum zone from 7 to 67 metres. This 60 metre interval averaged 0.06% Mo. The best intersection was from 11 to 17 metres which averaged 0.15% Mo over a length of 6 metres.

LS07-88

Drill hole LS07-88 was collared at UTM coordinates 599646 east, 5987337 north, on section 16+50E and at an elevation of 1122.00 metres. It was drilled at azimuth 325 degrees and inclination -45 degrees to a depth of 207.57 metres. The hole was started on March 29, 2007 and finished on March 30, 2007. The hole intersected the molybdenum zone from 3 to 81 metres. This 78 metre interval averaged 0.16% Mo. The best intersection was from 31 to 67 metres which averaged 0.24% Mo over a length of 36 metres.

LS07-89

Drill hole LS07-89 was collared at UTM coordinates 599698 east, 5987342 north, on section 17+00E and at an elevation of 1115.00 metres. It was drilled at azimuth 325 degrees and inclination -45 degrees to a depth of 230.43 metres. The hole was started on March 30, 2007 and finished on April 1, 2007. The hole intersected the molybdenum zone from 53 to 137 metres. This 84 metre interval averaged 0.06% Mo.

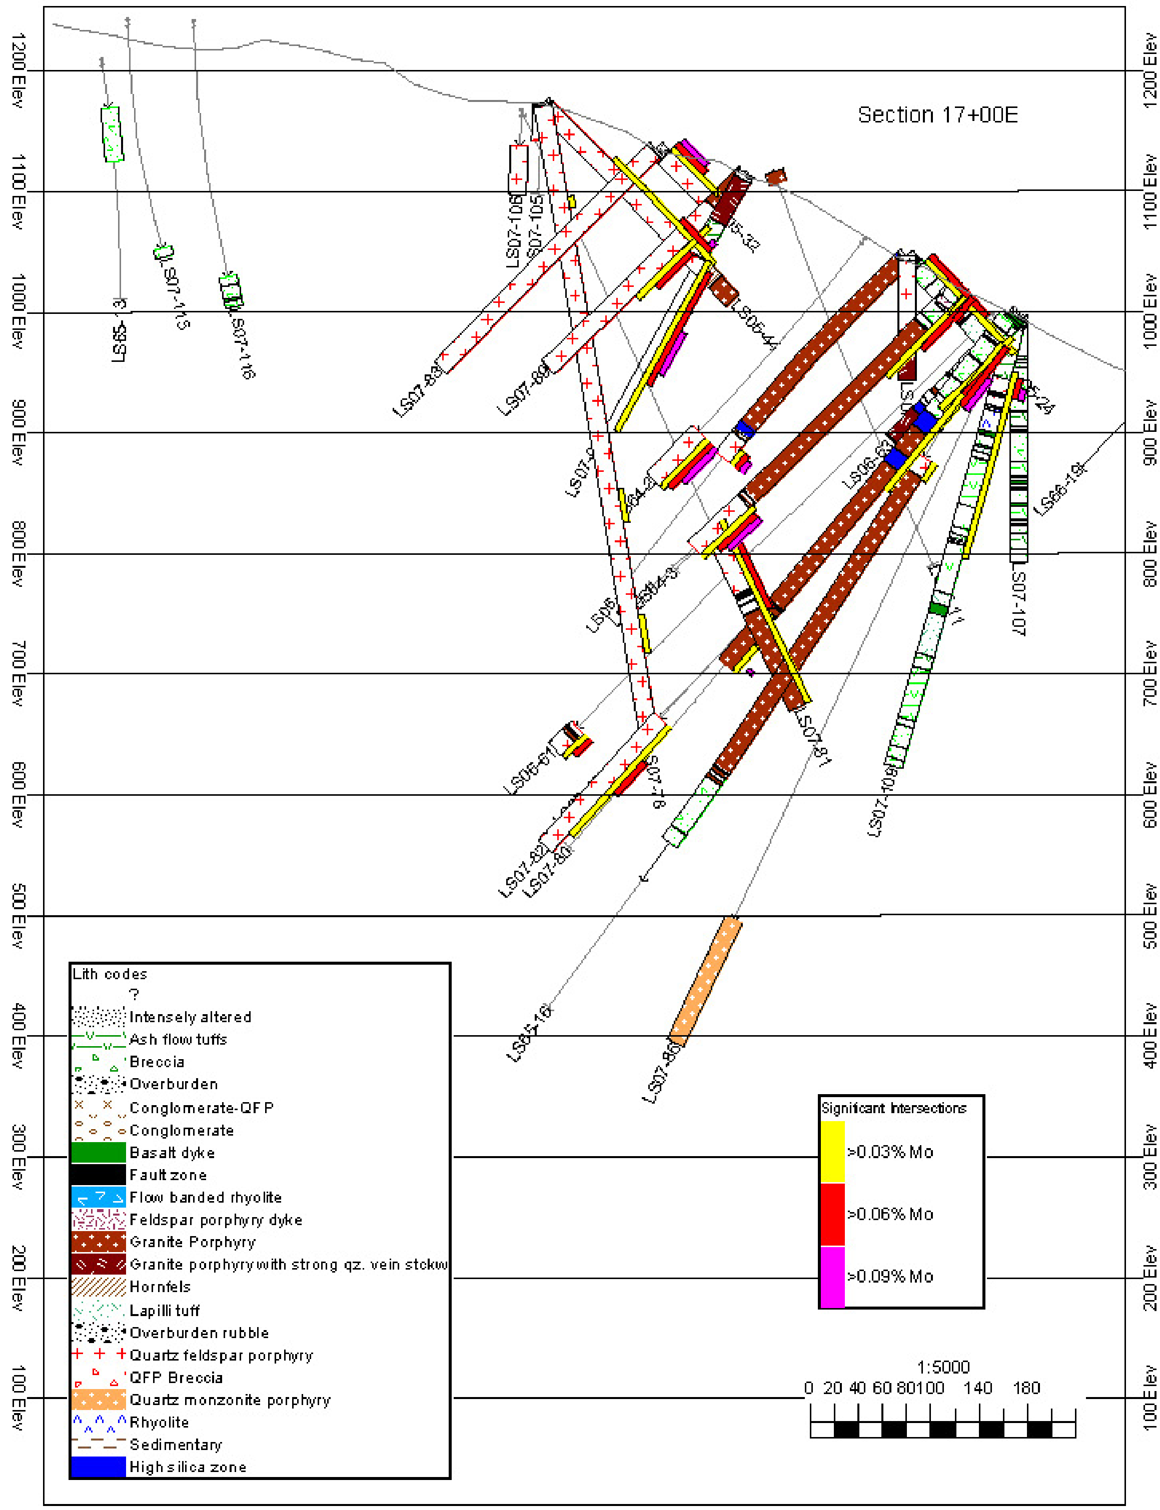

Figure 11. Drill section 17+00E, Lucky Ship Property

LS07-90

Drill hole LS07-90 was collared at UTM coordinates 599698 east, 5987342 north, on section 17+00E and at an elevation of 1115.00 metres. It was drilled at azimuth 325 degrees and inclination -60 degrees to a depth of 251.16 metres. The hole was started on April 1, 2007 and finished on April 3, 2007. The hole intersected the molybdenum zone from 79 to 239 metres. This 160 metre interval averaged 0.09% Mo. The best intersection was from 141 to 181 metres which averaged 0.15% Mo over a length of 40 metres.

LS07-91

Drill hole LS07-91 was collared at UTM coordinates 599792 east, 5987383 north, on section 18+00E and at an elevation of 1105.00 metres. It was drilled at azimuth 325 degrees and inclination -65 degrees to a depth of 206.96 metres. The hole was started on April 3, 2007 and finished on April 5, 2007. The hole intersected the molybdenum zone from 33 to 165 metres. This 132 metre interval averaged 0.05% Mo. The best intersection was from 91 to 129 metres which averaged 0.08% Mo over a length of 38 metres.

LS07-92

Drill hole LS07-92 was collared at UTM coordinates 599798 east, 5987138 north, on section 16+50E and at an elevation of 994.00 metres. It was drilled at azimuth 325 degrees and inclination -75 degrees to a depth of 355.70 metres. The hole was started on April 4, 2007 and finished on April 8, 2007. The hole intersected the molybdenum zone from 21 to 161 metres. This 140 metre interval averaged 0.05% Mo. The best intersection was from 79 to 85 metres which averaged 0.1% Mo over a length of 6 metres. A second zone of molybdenum mineralization was intersected from 181 to 279 metres. This 98 metre interaval average 0.06%Mo aond included a 16 metre interval from 243 to 259 metres that averaged 0.17% Mo.

LS07-93

Drill hole LS07-93 was collared at UTM coordinates 599792 east, 5987383 north, on section 18+00E and at an elevation of 1105.00 metres. It was drilled at azimuth 145 degrees and inclination -80 degrees to a depth of 303.58 metres. The hole was started on April 5, 2007 and finished on April 8, 2007. The hole intersected the molybdenum zone from 109 to 293 metres. This 184 metre interval averaged 0.07% Mo. The best intersection was from 185 to 193 metres which averaged 0.11% Mo over a length of 8 metres.

LS07-94

Drill hole LS07-94 was collared at UTM coordinates 599748 east, 5987122 north, on section 16+00E and at an elevation of 998.00 metres. It was drilled at azimuth 325 degrees and inclination -60 degrees to a depth of 599.54 metres. The hole was started on April 7, 2007 and finished on April 15, 2007. The hole intersected the molybdenum zone from 325 to 443 metres. This 118 metre interval averaged 0.05% Mo. The best intersection was from 325 to 333 metres which averaged 0.1% Mo over a length of 8 metres.

LS07-95

Drill hole LS07-95 was collared at UTM coordinates 599746 east, 5987359 north, on section 18+00E and at an elevation of 1108.00 metres. It was drilled at azimuth 325 degrees and inclination -90 degrees to a depth of 102.41 metres. The hole was started on April 8, 2007 and finished on April 10,

2007. The hole intersected the molybdenum zone from to metres. This metre interval averaged % Mo. The best intersection was from to metres which averaged % Mo over a length of metres.

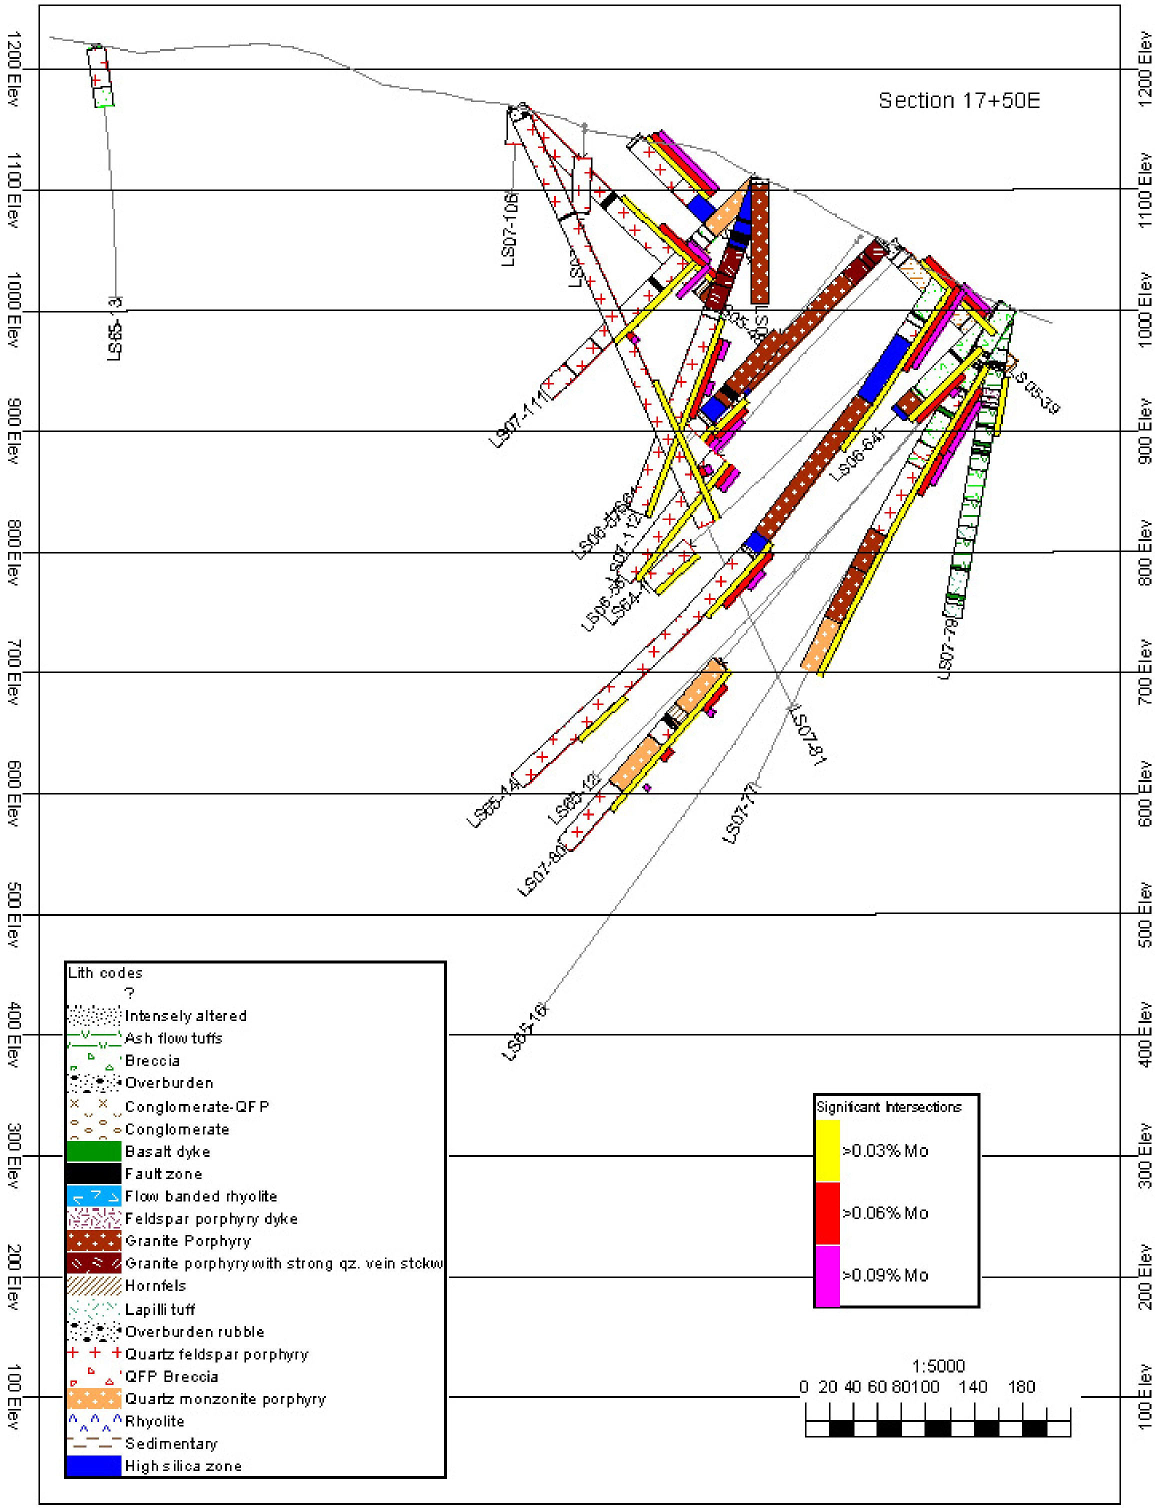

Figure 12. Drill section 17+50E, Lucky Ship Property

LS07-96

Drill hole LS07-96 was collared at UTM coordinates 599614 east, 5987290 north, on section 16+00E and at an elevation of 1118.00 metres. It was drilled at azimuth 325 degrees and inclination -90 degrees to a depth of 303.58 metres. The hole was started on April 10, 2007 and finished on April 13, 2007. The hole intersected the molybdenum zone from 3 to 303.6 metres. This 300.60 metre interval averaged 0.09% Mo. The best intersection was from 211 to 232 metres which averaged 0.18% Mo over a length of 21 metres.

LS07-97

Drill hole LS07-97 was collared at UTM coordinates 599781 east, 5987238 north, on section 17+00E and at an elevation of 1046.00 metres. It was drilled at azimuth 325 degrees and inclination -90 degrees to a depth of 102.41 metres. The hole was started on April 14, 2007 and finished on April 15, 2007. This HQ diameter hole was drilled for geotechnical groundwater studies and the core was not split and sampled.

LS07-98

Drill hole LS07-98 was collared at UTM coordinates 599748 east, 5987122 north, on section 16+00E and at an elevation of 998.00 metres. It was drilled at azimuth 325 degrees and inclination -75 degrees to a depth of 404.47 metres. The hole was started on April 15, 2007 and finished on April 19, 2007. The hole intersected the molybdenum zone from 29 to 97 metres. This 68 metre interval averaged 0.06% Mo. The best intersection was from 55 to 67 metres which averaged 0.12% Mo over a length of 12 metres. Molybdenum mineralization was also intersected between 231 and 273 metres. which averaged 0.06% Mo and between 319 and 385 metres with average 0.07% Mo

LS07-99

Drill hole LS07-99 was collared at UTM coordinates 599700 east, 5987508 north, on section 18+00E and at an elevation of 1153.00 metres. It was drilled at azimuth 325 degrees and inclination -90 degrees to a depth of 199.95 metres. The hole was started on April 16, 2007 and finished on April 19, 2007. This HQ diameter hole was drilled for geotechnical groundwater studies and the core was not split and sampled.

LS07-100

Drill hole LS07-100 was collared at UTM coordinates 599748 east, 5987122 north, on section 16+00E and at an elevation of 998.00 metres. It was drilled at azimuth 325 degrees and inclination -90 degrees to a depth of 331.32 metres. The hole was started on April 19, 2007 and finished on April 22, 2007. This hole was drilled outside the molybdenum zone and did not intersect any significant molybdenum mineralization.

LS07-101

Drill hole LS07-101 was collared at UTM coordinates 599700 east, 5987508 north, on section 18+00E and at an elevation of 1153.00 metres. It was drilled at azimuth 235 degrees and inclination -45 degrees to a depth of 102.40 metres. The hole was started on April 19, 2007 and finished on April 21, 2007. This hole was drilled outside the molybdenum zone and did not intersect any significant molybdenum mineralization. It was designed to test the molybdenum content and rock quality of waste rock within a possible open pit area.

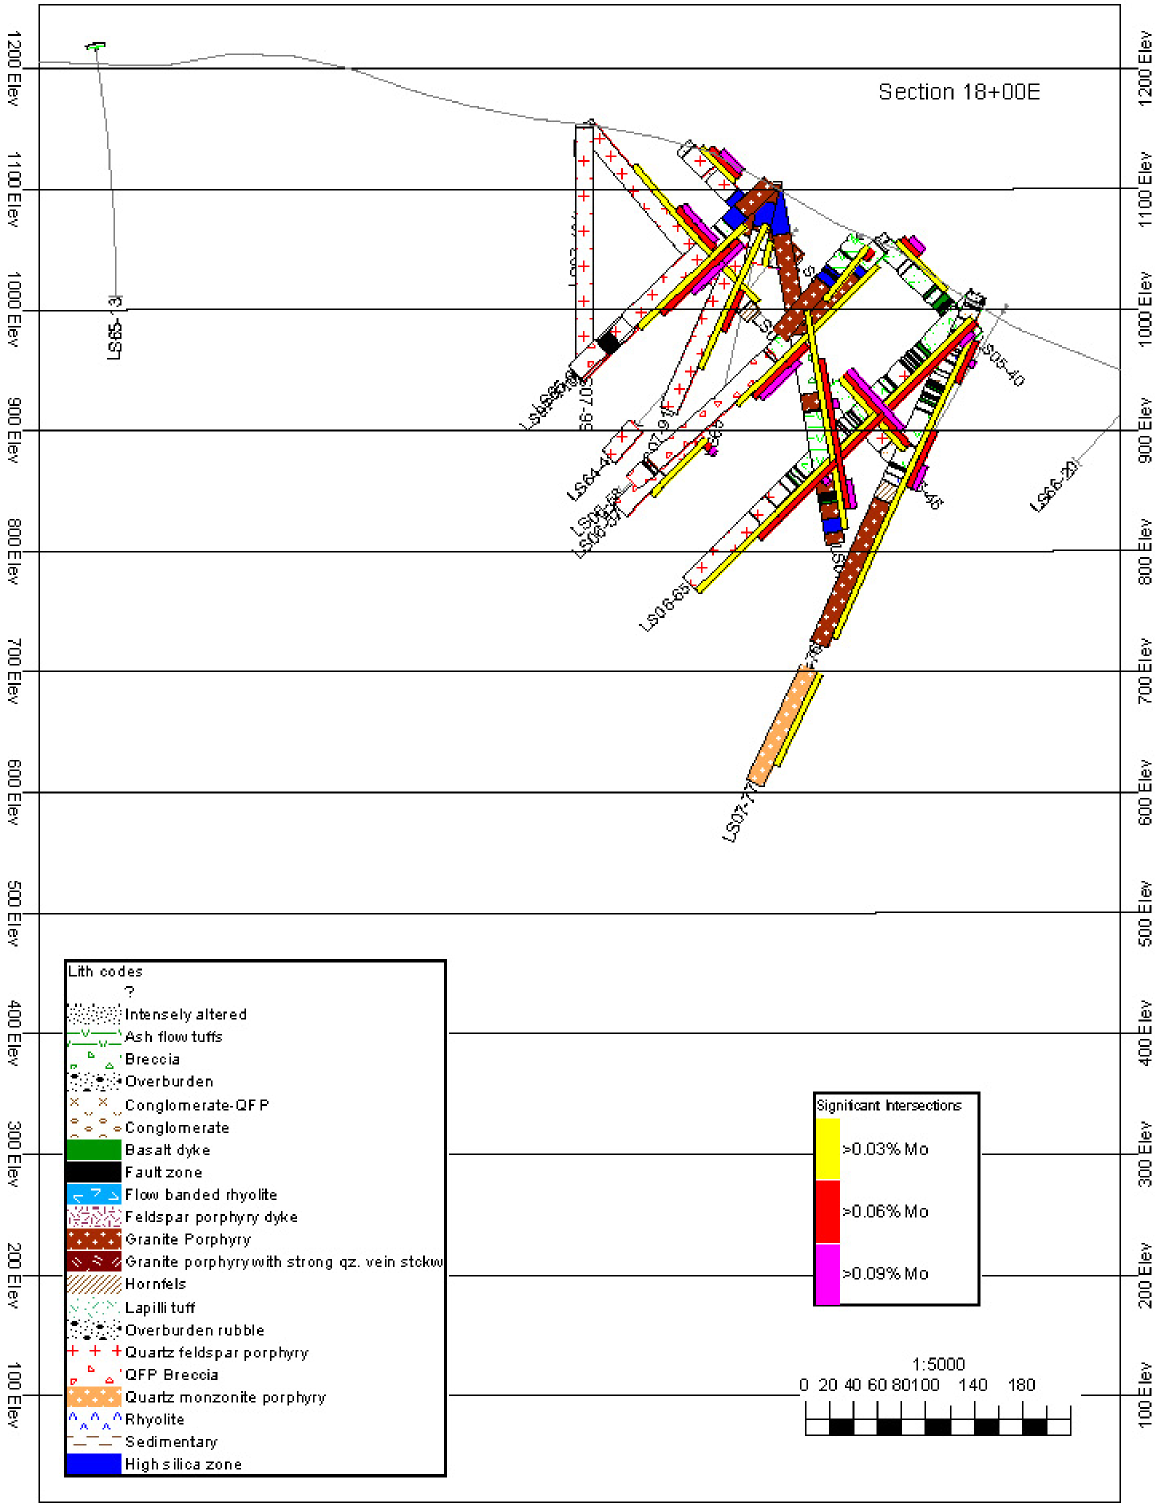

Figure 13. Drill section 18+00E, Lucky Ship Property

LS07-102

Drill hole LS07-102 was collared at UTM coordinates 599539 east, 5987392 north, on section 16+00E and at an elevation of 1165.97 metres. It was drilled at azimuth 235 degrees and inclination -45 degrees to a depth of 98.10 metres. The hole was started on April 21, 2007 and finished on April 22, 2007. This hole was drilled outside the molybdenum zone and did not intersect any significant molybdenum mineralization. It was designed to test the molybdenum content and rock quality of waste rock within a possible open pit area.

LS07-103

Drill hole LS07-103 was collared at UTM coordinates 599564 east, 5987444 north, on section 16+50E and at an elevation of 1173.73 metres. It was drilled at azimuth 235 degrees and inclination -45 degrees to a depth of 87.20 metres. The hole was started on April 23, 2007 and finished on April 24, 2007. The hole intersected the molybdenum zone from to metres. This metre interval averaged % Mo. The best intersection was from to metres which averaged % Mo over a length of metres.

LS07-104

Drill hole LS07-104 was collared at UTM coordinates 599711 east, 5987093 north, on section 15+50E and at an elevation of 1005.00 metres. It was drilled at azimuth 325 degrees and inclination -75 degrees to a depth of 313.03 metres. The hole was started on April 23, 2007 and finished on April 26, 2007. This hole was drilled outside the molybdenum zone and did not intersect any significant molybdenum mineralization. It was designed to test the molybdenum content and rock quality of waste rock within a possible open pit area.

LS07-105

Drill hole LS07-105 was collared at UTM coordinates 599600 east, 5987479 north, on section 17+00E and at an elevation of 1171.96 metres. It was drilled at azimuth 235 degrees and inclination -45 degrees to a depth of 105.50 metres. The hole was started on April 24, 2007 and finished on April 26, 2007. This hole was drilled outside the molybdenum zone and did not intersect any significant molybdenum mineralization. It was designed to test the molybdenum content and rock quality of waste rock within a possible open pit area.

LS07-106

Drill hole LS07-106 was collared at UTM coordinates 599628 east, 5987523 north, on section 17+50E and at an elevation of 1167.40 metres. It was drilled at azimuth 235 degrees and inclination -45 degrees to a depth of 99.00 metres. The hole was started on April 26, 2007 and finished on April 27, 2007. This hole was drilled outside the molybdenum zone and did not intersect any significant molybdenum mineralization. It was designed to test the molybdenum content and rock quality of waste rock within a possible open pit area.

LS07-107

Drill hole LS07-107 was collared at UTM coordinates 599838 east, 5987165 north, on section 17+00E and at an elevation of 998.00 metres. It was drilled at azimuth 325 degrees and inclination -90 degrees to a depth of 205.20 metres. The hole was started on July 5, 2007 and finished on July 11, 2007. This hole was drilled outside the molybdenum zone and did not intersect any significant molybdenum mineralization. It was designed to test the molybdenum content and rock quality of waste rock within a possible open pit area.

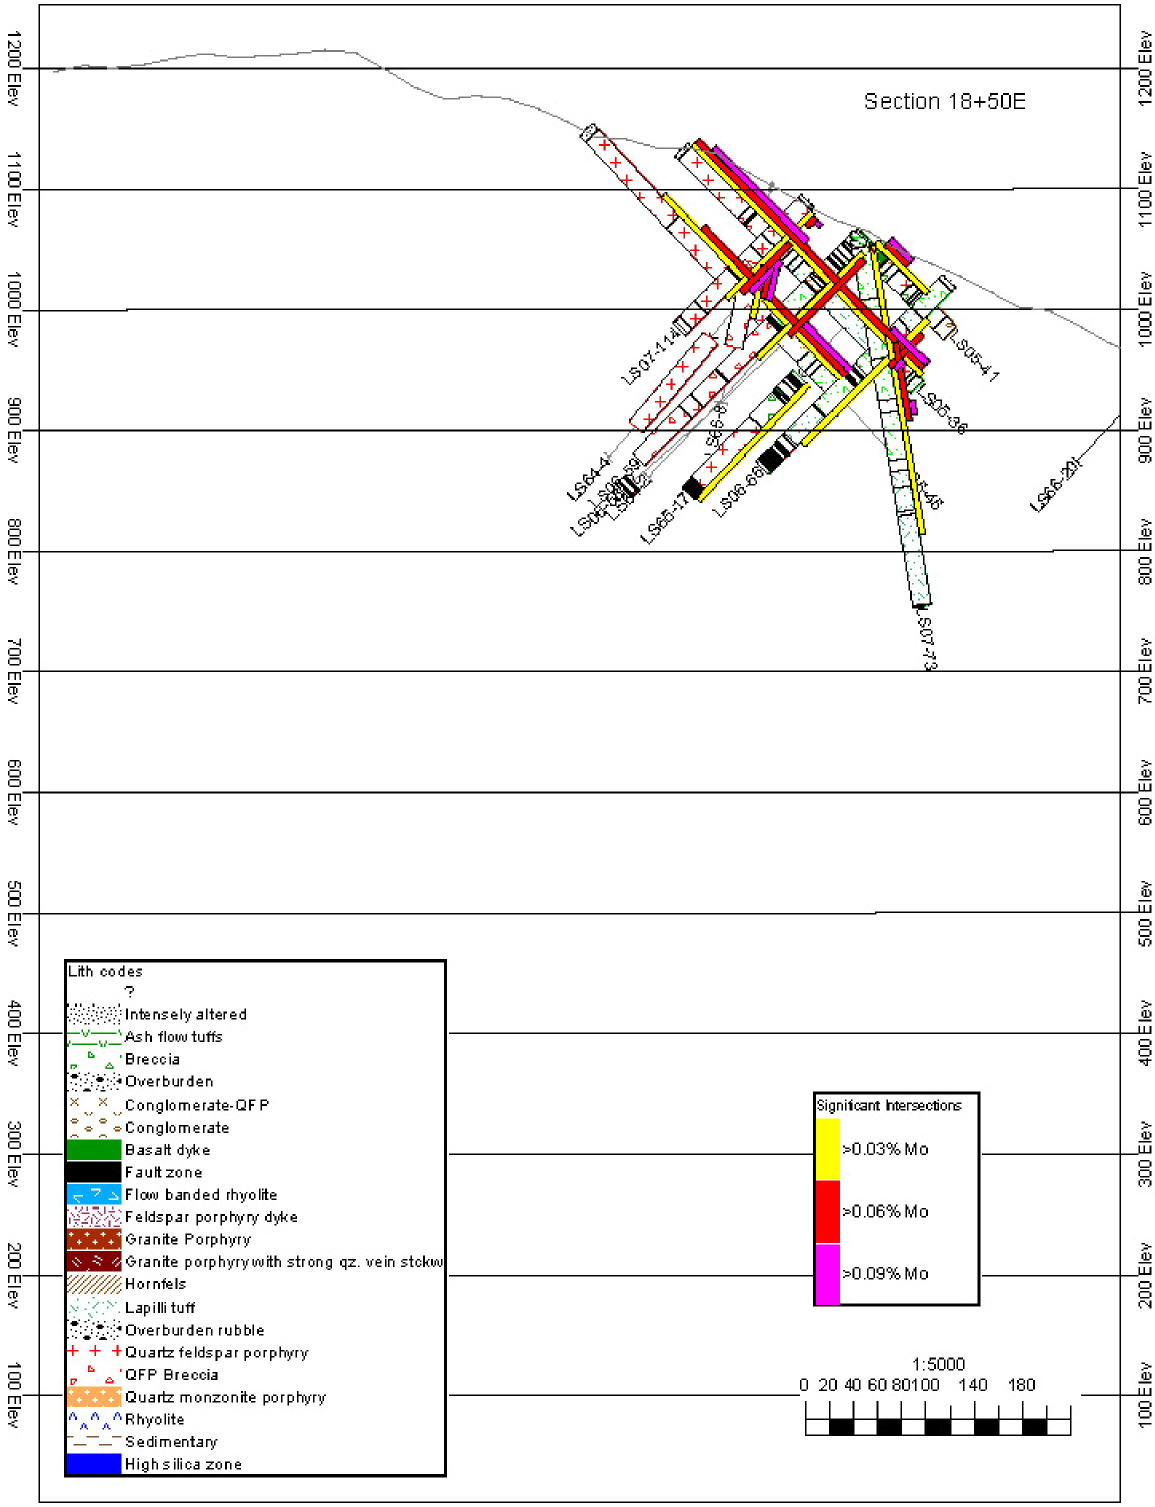

Figure 14. Drill section 18+50E, Lucky Ship Property

LS07-108

Drill hole LS07-108 was collared at UTM coordinates 599798 east, 5987138 north, on section 16+50E and at an elevation of 994.00 metres. It was drilled at azimuth 325 degrees and inclination -90 degrees to a depth of 260.90 metres. The hole was started on July 11, 2007 and finished on July 14, 2007. The hole intersected the molybdenum zone from 51 to 75 metres. This 24 metre interval averaged 0.04% Mo.

LS07-109

Drill hole LS07-109 was collared at UTM coordinates 599838 east, 5987165 north, on section 17+00E and at an elevation of 998.00 metres. It was drilled at azimuth 325 degrees and inclination -75 degrees to a depth of 205.13 metres. The hole was started on July 14, 2007 and finished on July 19, 2007. The hole intersected the molybdenum zone from 47 to 207 metres. This 160 metre interval averaged 0.05% Mo. The best intersection was from 51 to 69 metres which averaged 0.1% Mo over a length of 18 metres.

LS07-110

Drill hole LS07-110 was collared at UTM coordinates 599778 east, 5987374 north, on section NS and at an elevation of 1104.32 metres. It was drilled at azimuth 330 degrees and inclination -44 degrees to a depth of 227.38 metres. The hole was started on July 20, 2007 and finished on July 25, 2007. The hole intersected the molybdenum zone from 51.82 to 140.2 metres. This 88.39 metre interval averaged 0.08% Mo. The best intersection was from 67.06 to 103.6 metres which averaged 0.13% Mo over a length of 36.57 metres.

LS07-111

Drill hole LS07-111 was collared at UTM coordinates 599746 east, 5987359 north, on section 17+50E and at an elevation of 1108.00 metres. It was drilled at azimuth 325 degrees and inclination -55 degrees to a depth of 251.76 metres. The hole was started on July 25, 2007 and finished on July 27, 2007. The hole intersected the molybdenum zone from 73 to 181 metres. This 108 metre interval averaged 0.09% Mo. The best intersection was from 167 to 171 metres which averaged 0.36% Mo over a length of 4 metres.

LS07-112

Drill hole LS07-112 was collared at UTM coordinates 599746 east, 5987359 north, on section 17+50E and at an elevation of 1108.00 metres. It was drilled at azimuth 325 degrees and inclination -70 degrees to a depth of 294.50 metres. The hole was started on July 30, 2007 and finished on August 9, 2007. The hole intersected the molybdenum zone from 119 to 294.4 metres. This 175.43 metre interval averaged 0.06% Mo. The best intersections were from 135 to 151 metres which averaged 0.11% Mo and from 171 to 183 metres which averaged 0.11% Mo.

LS07-113

Drill hole LS07-113 was collared at UTM coordinates 599882 east, 5987420 north, on section 19+00E and at an elevation of 1080.00 metres. It was drilled at azimuth 325 degrees and inclination -45 degrees to a depth of 151.10 metres. The hole was started on August 10, 2007 and finished on August 12, 2009. The hole intersected the molybdenum zone from 3.05 to 69 metres. This 65.95 metre interval averaged 0.05% Mo. The best intersection was from 7 to 19 metres which averaged 0.089% Mo over a length of 12 metres.

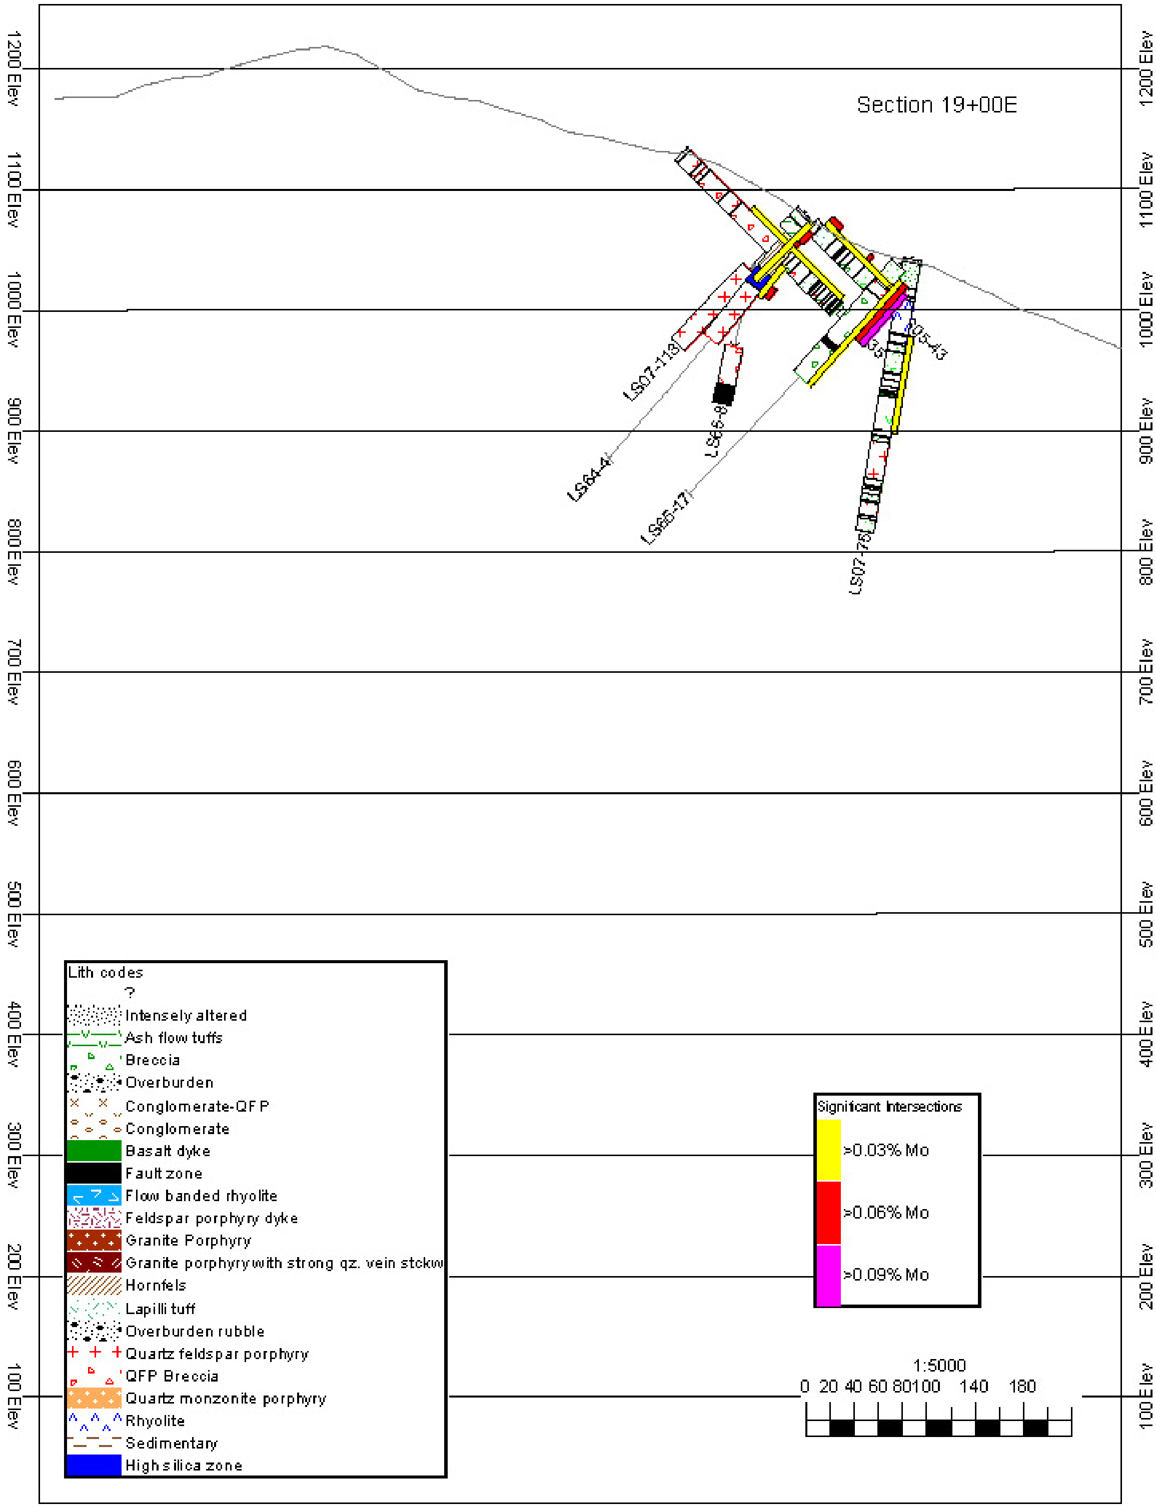

Figure 15. Drill section 19+00E, Lucky Ship Property

LS07-114

Drill hole LS07-114 was collared at UTM coordinates 599847 east, 5987389 north, on section 18+50E and at an elevation of 1090.00 metres. It was drilled at azimuth 325 degrees and inclination -45 degrees to a depth of 151.10 metres. The hole was started on August 13, 2007 and finished on August 16, 2007. The hole intersected the molybdenum zone from 3.05 to 105 metres. This 101.95 metre interval averaged 0.09% Mo. The best intersection was from 35 to 93 metres which averaged 0.1% Mo over a length of 58 metres.

Phase 5 Drill Hole Summaries

The target of Phase 5 drilling program was a north trending, steeply dipping zone of quartz-molybdenite veins observed in a large gossanous outcrop approximately 300 metres northwest of the main molybdenum zone (Figure 6). Three NQ diamond drill holes (LS07-115 to 117) were drilled between August 24 and September 11, 2007. Drill hole details are summarized in Table 7. Drill holes LS07-115 and 116 were drilled at azimuth 55 degrees and inclination -45 degrees. Hole LS07-117 was drilled at azimuth 235 degrees and inclination -55 degrees. Best intersections from these holes are listed Table 8.

Table 7. Phase 5 drill hole information

Drill Hole No.	Easting	Northing	Elevation	Length	Azimuth	Inclincation
LS07-115	599210	5987609	1242	285.59	55	-45
LS07-116	599220	5987548	1241	349.61	55	-45
LS07-117	599400	5987558	1234	291.69	235	-55

The lack of significant concentrations of molybdenum bearing veins in the area tested by the Phase 5 drilling suggests low potential for additional Mo resources in this area. However, the significantly higher background concentrations of Cu, Ag and Au found in this area are interesting and could indicate the presence of a different, more Cu rich target along the eastern contact of the Lucky Ship intrusive complex.

Table 8. Significant drill hole intersections, Phase 5 drill program

Drill Hole	From	To	Length	Mo %	Cu %	Ag gm/t	Au ppb
LS07-115	267	271	4	0.055	0.01	<2	66
LS07-116	271	273	2	0.002	2.89	52	1694
LS07-116	273	275	2	0.005	0.66	10	383
LS07-116	291	293	2	<0.001	0.41	13	74
LS07-117	47	49	2	0.075	0.01	<2	40

Note: all measurements in metres; ppb=parts per billion; gm/t=grams per tonne

SAMPLING METHODS, SECURITY AND ANALYTICAL PROCEDURES

Core logging of Phases 4 drilling completed in 2007 was undertaken by Dr.. D.G. MacIntyre, P.Eng. with assistance from V.H. Parsons, B.Sc., G. Owsiacki, B.Sc. G. Payie, B.Sc. and M. Eckfeldt Procedures used in all drilling undertaken to date include the affixing of embossed aluminum tags to all core boxes. These tags identify the hole number and hole interval. All core recovered was sampled at intervals of 2.0 metres. The core has been moved from the property to a warehouse in Telkwa B.C.

Drill core samples were split into two halves using a hydraulic core splitter with one half constituting a sample for analysis and the other half being retained as a permanent rock record. The split samples were placed in plastic sample bags with a sample tag and the bag labeled with a felt marker. The matching half of the sample tag was retained in a sample book as a record. Samples were shipped by truck transport to Acme Analytical Labs in Vancouver or to Acme's prep lab in Smithers. Acme is an ISO accredited laboratory which participates in proficiency testing and quality assurance and control procedures for sample preparation and analysis. The samples were crushed and pulverized with a 1.0 gram sample dissolved in aqua regia, a mixture of hydrochloric acid (HCl), nitric acid (HNO3) and de-mineralized water (2:2:2). This a strong acid digestion capable of decomposing metal salts, carbonates, sulphides, most sulphates and some oxides and silicates while aqua regia will digest precious metals including Au, Ag, Pt and Pd. A 100 ml. sample was then analyzed by Inductively Coupled Plasma - Atomic Emission Spectrometer (ICP-ES) - an instrument capable of determining the concentrations of multiple elements. A total of 23 elements were reported including Mo as well as most other elements which could be of economic interest and/or those which could negatively impact the quality of a molybdenum concentrate or be toxic to the environment.

Quality control of core samples is maintained by routinely analyzing a number of sample blanks, duplicates and control reference standards of a similar matrix and content as samples provided. Approximately every 25th sample submitted to Acme Analytical Laboratories from the Lucky Ship property was a blank sample consisting of unmineralized sedimentary rock from a nearby rock quarry.

Inter-laboratory checks of samples have also been undertaken. Some sample pulps, prepared and analyzed by Acme Analytical Laboratories, have been submitted to Eco Tech Laboratory of Kamloops, a B.C. certified Assayer, for check analyses. Eco Tech also utilized the Inductively Coupled Plasma (ICP) technique for their analyses and results from this laboratory were in excellent agreement with the original results, having a correlation coefficient of 0.98846 (McMillan, 2006).

Additional inter-laboratory checks have been performed on similar sections of drill core which were split and then quartered and submitted to both Acme and Eco Tech laboratories for analyses. Results from each laboratory were also found to be in reasonably good agreement, although not to the same degree as the sample pulps which is to be expected (McMillan, 2006).

INTERPRETATION AND CONCLUSIONS

The Lucky Ship property hosts fracture-filling and stockwork molybdenite mineralization within an annular zone marginal to a porphyritic granite plug which is one of four recognized intrusive and breccia phases within a larger pluton of early Tertiary age. The style of mineralization and the presence of multiple phases of intrusion are features typical of porphyry molybdenum deposits throughout the western Cordillera of North America.

Diamond drilling by New Cantech Ventures Inc. over the past three years has identified near surface Indicated and Inferred Mineral Resources containing significant molybdenum grades. The most recent phase of drilling as described in this report has significantly expanded the indicated resources. Recent and historic drilling indicates that this mineralized system remains open to depth.

Several other known zones of molybdenum mineralization within the Lucky Ship pluton have been only partially tested by previous work. The potential for additional zones of molybdenum mineralization at depth, similar to the well documented Urad-Henderson molybdenum deposits in Colorado (Wallace et al, 1978) remains an attractive exploration target.

A deep diamond drill hole, completed to a depth of 1017 metres, provided additional information regarding the potential for significant molybdenum mineralization at depth.

RECOMMENDATIONS

Lucky Ship is a mature exploration project with significant identified Indicated Mineral Resources at cutoff grades of between 0.030% and 0.090% molybdenum. The phase 4 and 5 drilling described in this report has helped to move much of the inferred resource into the indicated category. A revised resource calculation using sophisticated block modeling software is required to determine if any additional drilling is required to better define the limits and grade of molybdenum mineralization especially towards the margins of the deposit where there are fewer drill hole intersections.

The Lucky Ship property is obviously one of merit. Work on the property has entered the environmental and mine planning stages. This work is ongoing and will ultimately lead to a decision on whether or not to move the property forward and apply for an Environmental Assessment Permit. Various environmental baseline studies are currently underway and the securing of permits necessary for potential exploitation of the deposit will be an integral part of ongoing investigation of the Lucky Ship property.

APPENDIX A. STATEMENT OF QUALIFICATIONS

I, Donald George MacIntyre, Ph.D., P.Eng., do hereby certify that:

1. I am a Consulting Geologist, with residence and business address at 4129 San Miguel Close, Victoria, British Columbia, Canada.
2. I graduated with a B.Sc. degree in geology from the University of British Columbia in 1971. In addition, I obtained M.Sc. and Ph.D. degrees specializing in Economic Geology from the University of Western Ontario in 1975 and 1977 respectively.
3. I have been registered with the Association of Professional Engineers and Geoscientists of British Columbia since September, 1979, registration number 11970. I am a Fellow of the Geological Association of Canada and a member of the British Columbia and Yukon Chamber of Mines.
4. I have practiced my profession as a geologist, both within government and the private sector, in British Columbia and parts of the Yukon for over 32 years. My work has included detailed geological investigations of mineral districts, geological mapping, mineral deposit modeling and building of geoscientific databases. I have directly supervised and conducted geologic mapping and mineral property evaluations, published reports and maps on different mineral districts and deposit models and compiled and analyzed data for mineral potential evaluations.
5. The work described in this report was supervised and done by myself under contract to New Cantech Ventures, the property operators, between February 15, 2007 and September 15, 2007.

Dated this 23rd of April, 2008

"DMacIntyre"

D. MacIntyre, Ph.D., P.Eng.

APPENDIX B. SUMMARY OF EXPENDITURES

Camp accommodation costs (February 15, 2007 – September 15, 3007)						
Cook, First Aid Attendant, Camp manager	Rugged Edge Holdings, Smithers	Groceries, wages for cook, first aid attendant, camp manager, camp equipment rental including power generator, water pump, showers, washer, dryer, winterized tents, heaters, kitchen and dining room equipment, forklift for moving core etc.	210	days	$2,103	$441,781.91
Analytical (February 15, 2007 – Septembers 15, 2007)						
	Acme Analytical Laboratories Ltd., Vancouver	drill core analyses - package G7AR/GIF including sample prep., analyses, shipment, storage, replicate and duplicate analyses, internal and external standards	6,751.0	analyses	$42.10	$284,217.07
Diamond Drilling (February 15, 2007-September 15, 2007)						
M.Konst, M.Johnstone, B. McIntyre, L. Vipond, C. Hertz, A. Boivert, M. Lewis, S. Larsen, S. Walfrord, T. Houlden, J. Stephenson, A. Madison, W. Dyekns	Driftwood Diamond Drilling Ltd., Smithers	NQ/HQ diamond drilling, set casing, drill moves, mob, demob, travel time, camp costs	14,544	metres	$106.82	$1,553,647.96
					Total	$2,279,647

APPENDIX C. DRILL HOLE LOGS

Drill Hole	From (m)	To (m)	Code	Description
LS07-69	0.00	6.10	CASING	Casing
LS07-69	6.10	231.04	QFP	Quartz feldspar porphyry with quartz eyes from 10 to 20 per cent in a creamy white matrix. Very rare FeOx staining on fractures from 0 to 5 degrees to c.a. and from 45 to 50 degrees to c.a. Some clay alteration on 50 degree fractures Rare tuff xenoliths, up to 10 cm square. These are dark grey and contain small angular to subrounded fragments from 1 to 2 mm that are lighter in colour. No quartz veins noted. No sulphides. No MoS2.
LS07-70	0.00	9.75	CASING	Casing
LS07-70	9.75	122.75	QFP	Creamy white to grey quartz feldspar porphyry. Some fine biotite lathes noted locally but rare. Some greenish faint chloritic hues around some of the larger quartz eyes. Variably intense quartz veining throughout varying from < 1 mm to 1 cm but typically 5mm. MoS2 occurs as fine specks on films with quartz and occasionally with specks or grains of pyrite. Various areas are broken (significantly so) with associated argillic and chlorite alteration. These are described in the sections below. The rock is typically siliceous and hard but also has a mild argillic alteration as indicated by flaky feldspars.
LS07-70	122.77	256.05	QFP	Quartz feldspar porphyry. Creamy white to light grey. Quartz eyes from 5 to 15%, ranging up to 3 mm across. MoS2 bearing quartz stringers throughout increasing in frequency towards bottom of this interval. The core is generally competent containing only a few local areas of gouge or shattered rock. Near base of section, it starts to grade toward contact with breccia zone.
LS07-70	250.00	260.00	QFP	Quartz feldspar porphyry as above with similar alteration. Green tinged with weak argillic-sericite(?) and/or chlorite alteration. Starts of bleach and lose quartz eye texture. May be silicified over bottom half of interval starting at 253 but it is gradational. Up to, or more than, 190 quartz vein/stringers. Many (most) of these are <0.5 mm but indicate the intensity of the system. Some of the finest or thinnest are healed, most with quartz, and have been observed to carry MoS2.
LS07-70	266.50	274.00	QFP	Brecciated and cooked zone that may be quartz feldspar porphyry protolith or part of Intrusive Breccia (?) or both.
LS07-70	274.00	308.70	QFPB	Breccia with elements of what look like a med-grained intrusive around quartz feldspar porphyry fragments. It seems that this is the Intrusive Breccia of Godfrey (1967). The 'med grained intrusive' is likely a more finely milled, more homogeneous component of the breccia that swirls about the larger quartz feldspar porphyry clasts.
LS07-70	308.70	322.40	QFP	Seems to be a cooked and altered version of the quartz feldspar porphyry and is not brecciated
LS07-70	322.40	335.60	QFPB	Greenish Intrusive Breccia with areas of pink grey and brownish quartz feldspar porphyry(?) fragments from <1 mm to 10 cm. An irregular contact occurs at 322.3. where the Intrusive Breccia(?) contacts quartz feldspar porphyry of previous interval. The breccia contains variably coloured fragments of altered quartz feldspar porphyry and continues to end of hole????

LS07-70	335.60	365.44	QFP	A contact occurs at 335.6 of the Intrusive Breccia with altered, silicified quartz feldspar porphyry. The contact is sharp at 335.6 but breccia elements with dark matrix still appears over the next several metres to about 343 metres. Some rare quartz eyes still visible but mostly this section is silicified and the textures obscured.
LS07-70	365.44	421.00	TUFF	Dark green intermediate to mafic volcanic rocks shot through with banded quartz veins and pyritic fractures. Pyrite is very significant throughout this section in veins, fractures and patches in the matrix. Some subsections will be described below and consist of breccia zones and zones of apparent felsic rock with what appears to be elements of the dark green volcanic as a matrix. Some to a more "felsic" looking rock from the dark green is evident and one wonders if the "felsic" looking rock is just the bleached silicified and altered mafic volcanic. There seems to be crystal tuff sequence also and is described below. Quartz veining is common around 30 degrees, especially the thicker quartz veins. However, veins at 160 degrees are found crossing some of the 30 degree veins. Veins at various orientations occur from 1 to 90 although they are less common in the 80 to 90 degree range. Thickness varies from hairline to 16 cm. White carbonate occurs occasionally along fractures.
LS07-70	407.00	411.85	XLTF	Crystal tuff with 20 to 30 per cent broken crystals. Hard to determine where it begins because of alteration.
LS07-70	411.85	412.15	LPTF	Mottled breccia (lapilli tuff?) on top of massive fine grained mafic volcanic
LS07-70	412.15	421.00	TUFF	Intermediate to mafic tuff some bands, layers or beds are common at about 20 degrees. The 421 metre mark is an arbitrary mark where it is at least mostly fine grained massive mafic volcanics.
LS07-70	421.00	425.80	TUFF	A transition zone from the above rock to the rock of 426.8 to 440.8.
LS07-70	425.80	440.80	LPTF	No definitive contact with above rock (tuffs) is apparent. One hazy contact is at 425.8 but a gradational contact argument is possible. However, from 425.8 to 426 a striking change to a fine breccia has occurred. Clasts are typically less than 1 cm in a dark green matrix. Fragments of fine grained pinkish white-grey rock (quartz feldspar porphyry?) that shows little texture. This changes at 427.2 to a more massive pink-white-grey rock shot through with fractures and in places breccia fragments and green matrix.
LS07-70	440.80	441.60	DYKE	Black magnetic diabase dike shot though with pyrite veins.
LS07-70	441.60	448.75	LPTF	The dike marks the transition to another type of breccia consisting of felsic clasts and fragments and black fine grained fragments. The felsic clasts vary from 1 mm or less to 20 cm. The matrix is a fine dark grey material. The black clasts are rarer and vary up to 2 cm. This section grades (toward 448.75) to a predominately black-dark grey matrix with obscured small pale clasts.
LS07-70	448.75	461.77	LPTF	A slightly different breccia than previous interval. A felsic rock contains small black to dark grey-brown fragments typically less than 3 or 4 cm. The black fragments contain feldspar phenocrysts or a mafic (biotite) mineral. In turn, the felsic rock is brecciated and contained within a black matrix and is similar to that of the Intrusive Breccia of Hole 69. The writer could spend many hours working out

				the descriptive and interpretive details.
LS07-71	0.00	3.05	CASING	Casing
LS07-71	3.05	344.75	QFP	Creamy white to grey quartz feldspar porphyry. Quartz eyes are 5 to 15% of rock. Typically very little greenish hues in core but some locally, indicate areas of probable chlorite (and/or sericite) alteration. Some mild argillic alteration indicated by flakiness that highlights feldspars. Also some altered areas react with HCl indicating carbonate alteration. Some small inclusions (<1 cm) of a dark mafic volcanic (?).Badly fractured and broken to 13 metres and intermittently broken to 24 metres. Strong FeOx stain to 22.5 metres. Very little significant veining below 21 metres, mostly < or equal to 1 mm but a few > 2 mm and only have and estimated average of 5 per metre
LS07-71	184.70	344.75	QFP	Creamy white to grey feldspar porphyry with quartz eyes up to 15%. As above (0-184.7 m). There is typically a little greenish hue locally due to some chloritic alteration which intensifies locally. Some areas of more intense argillic and carbonated alteration occur often accompanying greater fracturing and/or breakage. Mo bearing veins occur throughout.
LS07-71	344.75	370.20	QFPB	Quartz feldspar porphyry breccia – healed and shot through with quartz veins and stringers. Some of the fragmentation is almost crackle (or random) but it typically the fragments have an angular face or edge and commonly a preferred fracture orientation of 25 to 35 degrees to core axis. Essentially the quartz feldspar porphyry rock is intensely fragmented and healed with quartz. The fragments are in place with little disruption or original orientation with respect to their neighbouring fragments. Much quartz matrix/veining is clear and unmineralized (no MoS2). The mineralized stringers are disrupted by the clear unmineralized vein/matrix but other areas show mineralized stringers offsetting the clear vein/matrix material. Twenty to thirty per cent of core is formed of introduced quartz vein and quartz material. Argillic alteration highlights feldspars but core is competent and hold together.
LS07-71	370.20	407.75	BRXX	A breccia consisting of dark grey to dark green fragment/areas. It appears that some of the dark green rock fragments are enveloped in the quartz feldspar porphyry near the contact zone near 370.2. The zone is altered, and like the previous quartz feldspar porphyry breccia, it is fracture-brecciated and shot through with quartz veins and quartz matrix. Mo bearing stringers do not seem significant although 30 to 50 per cent is locally made up of quartz.
LS07-71	407.75	421.90	QFP	Quartz feldspar porphyry rock – med grey with greenish (chloritic) tinge. Some quartz eyes are difficult to discern but feldspars are white and slightly clay altered within the darker matrix. The textures are similar to the quartz feldspar porphyry above the "quartz feldspar porphyry breccia" zone (344.7-370.2) as there is considerable quartz

				introduction and quartz feldspar porphyry fracturing towards becoming a breccia.
LS07-71	421.90	422.45	BRXX	Back into rock of 370.2 to 407.75 section where a breccia consists of dark grey to dark green fragment/areas and 30 to 50% of core is quartz. Little MoS2 is noted.
LS07-72	0.00	3.05	CASING	Casing
LS07-72	3.05	144.70	QFP	Creamy white to grey quartz feldspar porphyry with quartz eyes from 5 to 15 per cent of rock. An occasional inclusion of earlier country rock that is medium grey and appears to have clasts or fragments within.
LS07-72	147.70	410.57	QFP	Quartz feldspar porphyry as from 0-144.7 m. QUARTZ eyes from 5 to 15%. Locally feldspars are visible where argillic/chloritic alteration creates a colour contrast. The colour of the quartz feldspar porphyry is creamy white to grey except where chloritic alteration gives it a green tinge. MoS2 bearing quartz veins and stringers occur throughout in a similar manner to section 0-144.7. Infrequent veins over 5 mm will be documented below and some intense areas of MoS2 bearing stringers also will be indicated. Lesser MoS2 bearing fractures and stringers will not be indicate but occur.
LS07-73	0.00	6.10	CASING	Casing
LS07-73	6.60	50.10	TUFF	A very dark blackish-green basalt or microdiorite rock. Very fine plagioclase can be seen in the dark matrix, visible with a handlens. MoS2 occurs in vein stringers and on fractures.
LS07-73	50.10	73.25	TUFF	The above zone varies drastically after 50.1 metres. Afterwards brecciation and alteration is locally dramatic. Pale areas below 50.1 m indicate silicification and some carbonate infusion. There is probably an association of brecciation and silica flooding, the breccia providing conduits for fluid movement. MoS2 occurs in vein stringers and on fractures.
LS07-73	73.25	100.00	TUFF	Non brecciated (for the most part) and back into dark blackish-green microdiorite/basalt. A subsection from 88-91 metres is very infused (flooded) with silica. MoS2 occurs on veins and fractures. Pyrite occurs in fractures and in matrix.
LS07-73	100.00	135.00	TUFF	Starting to see areas of banding in the rock and suspect, though it very altered and locally brecciated, that this must be part of the laminated tuff mentioned by Godfrey (1967). Pyritic and banded quartz vein bearing with MoS2. Largely pale-white to grey and green rock.
LS07-73	135.00	145.38	QFP	Bleached quartz feldspar porphyry, very white – argillically altered and becoming very broken downhole starting at 139.85. From 139.85 to 143, it is broken and crumbly. From 143-145 it little more than gouge.
LS07-73	145.38	185.27	TUFF	Dark greenish tuff/breccia zone as described from 100 to 135 metres

LS07-73	185.27	194.45	BRXX	The 6 cm banded quartz vein at 185.27 metres marks the contact zone (at 52 degrees) of the dark greenish tuff/breccia zone (uphole) with a tectonic breccia zone (downhole) that consists of white (felsic) rock up to 90% of section. In much of the area, breccia fragments are still virtually in-place with a narrow channel of grey matrix surrounding them. Usually the fragmented areas have smaller clasts and are mingled with dark grey to green matrix. Banded quartz veins with MoS2 do occur in this section are few and less than a few millimetres thick. Several small zones (<10 cm) contain epidote and pyrite.
LS07-73	194.45	208.50	LPTF	Dark green andesitic lapilli/crystal tuff with small dark green fragments up to 1 or more centimetre to areas that look almost like sandstone but still dark green. Crystals of feldspar within occur within and locally appear broken. Several high angle (low angle (about 20 degrees) veinlets and fractures of pyrite throughout.
LS07-73	208.50	228.20	LPTF	Back to rock consisting mainly of lapilli tuff with some laminated tuffs noted near top of this sequence, followed by some tectonic brecciation and later introduction of magmatic matrix material. In places tuffaceous laminae are 40 degrees to core axis. Significant pyrite occurs in fractures and throughout often in association with chlorite and epidote patches. Many of the clasts have a greenish-white siliceous quality with medium green matrix.
LS07-73	228.20	231.70	QFP	An area of more massive pale (quartz feldspar porphyry like)rock that is shot through with stringers of banded MoS2 bearing quartz which fills irregular and ragged fractures.
LS07-73	231.70	307.00	LPTF	Same as 208.5 to 308.15 but the core is becoming more consistent in nature. The colour grades to a medium dark grey breccia with pale whitish fragments in darker matrix.
LS07-73	307.00	308.15	TUFF	A dark green-black andesite/microdiorite.
LS07-74	0.00	6.10	CASING	Casing
LS07-74	6.10	292.04	QFP	Creamy white pale grey quartz feldspar porphyry with up to 15% quartz eyes. Some areas show fine lathes of biotite. Alteration is weak throughout but some clay alteration is noted. No chlorite alteration is observed. Rare foreign clasts occur, typically < 2 cm. Weak MoS2 bearing banded quartz veins occur throughout. The core/rock is more broken to 88 metres with a few areas where it is shattered and gougy.
LS07-74	292.04	302.63	QFP	White to gray Quartz-feldspar porphyry, frequent Mo-qtz veins & stringers in multiple directions. Some alteration to brown & green locally. Also some brecciation with infill by silica, often with MoS2. Qtz & white feldspar phenocrysts usually abt 1 mm across. Some disseminated Mo in QFP.
LS07-74	302.63	303.84	GRPP	Brownish altered porphyry with contact with QFP at 45 CA. Small inclusion of similar material to 301.88 at 302.95. Rock shot through with numerous qtz veins, most of which contain MoS2. Small cubes of pyrite as at 303.10.
LS07-74	303.84	343.20	QFPB	Very brecciated gray-white QFP and brownish altered phase as seen @ 302.63-303.84. Some silica flooding. Mixed fragments of rock fell back into explosive breccia. Qtz veining abundant and Mo occurrences variable..

LS07-74	343.20	367.70	SILC	High silica rock with brecciated fragments of QFP. Some of phenocrysts have greenish tint due to chloritization. Not much MoS2, in places pyrite common. Locally the f.gr. silica has a sugary texture.
LS07-74	367.70	367.75	FAULT	Five-six cm wide fracture & shear zone, some calcite, black gouge, 20 CA
LS07-74	367.75	433.19	QFPB	Similar breccia as before the shear zone, though the QFP fragments in general have browner feldspars with occasional chloritization. Silica flooding remains intense..
LS07-74	433.19	449.95	GRPP	Medium-grained dark gray porphyritic granitic intrusive including white feldspars giving the rock a blotchy appearance. Significant biotite 5-10 p.c., in places altered. Occasional silica flooding and locally intensely fractured and crumbly. Mo-qtz veins fairly common, up to 3 cm wide in one place.
LS07-74	449.95	463.70	QFP	Greenish to white altered & highly brecciated QFP as described above. Locally core highly fractured. Qtz-Mo veins & stringers common. In places, sections resemble the blotchy granitic intrusive as above, over printed by silica veining and alteration. Here, white to pink feldspars & some biotite visible.
LS07-74	463.70	466.05	GRPP	Gray med-gr. Granitic porphyry with blotchy white feldspars, silica invaded.
LS07-74	466.05	472.40	QFP	Fine-grained greenish altered QFP in places silica flooded. Locally pink alteration of feldspars. Very fractured zone from 466.45 to 471.15 which contains significant MoS2, some biotite & pyrite.
LS07-74	472.40	488.85	GRPP	Med-grained gray granitic rock as before, with sig. small biotite flakes, not much altered. Some silica flooding in places. Locally abundant pyrite. Biotite generally small, abt 1 mm along long axis.
LS07-74	488.85	507.60	BRXX	Breccia with highly variable rock fragments, ranging from QFP to dark gray possible sediments or volcanics. Fragments separated by silica flooded matrix which in turn cut by qtz & feldspathic veins. Some Mo locally.
LS07-74	507.60	510.00	DYKE	Dark gray mafic dyke, brecciated ion places, white clay minerals, many qtz veins, pyr common. Weakly to strongly magnetic.
LS07-74	510.00	524.30	VOLC/SED	Dark gray to greenish hornfelsed volcanics and sediments, frequently cut by qtz veins. Sig. MoS2 in places, some pyrite. Flow banding or bedding occasionally visible. Occasional pinkish alteration of feldspars and fault gouge. Some places magnetic.
LS07-74	524.30	528.15	QFP	Gray to brown QFP, with flecks of biotite in places, some darker sections & inclusions espy toward 528. Abundant Mo stringers & veins. No magnetism.)
LS07-74	528.15	535.53	DYKE	Dark gray to black basaltic dyke, generally fine-grained, fractured & sheared in several places. Magnetic. Frequent pyretic disseminations, quartz veining, with occasional MoS2. Clay minerals along shears, and white calcite locally..
LS07-74	535.53	538.53	DYKE	Greenish fine grained basaltic dyke, magnetic, more competent than previous dyke. Some qtz & calcite veining, pyrite common, Mo sparse.

LS07-74	538.53	574.60	VOLC/SED	Variable light gray to dark gray to greenish volcanics & sediments. In places with a pitted appearance with angular to rounded fragments up to 1 cm across that could be tuff. Alteration fairly extensive, with epidote locally. Pyrite common, Some good veins of Mo-qtz but widely spaced. Rock is variably magnetic. Some pinkish-gray variations that could be rhyolitic volcanics. In these texture is somewhat blotchy. Rock generally competent, but with occasional highly fractured sections.
LS07-74	574.60	575.89	DYKE	Green fine-grained mafic dyke, magnetic. Pyr veins & blobs along fractures perhaps greater than 5 p.c. of rock.
LS07-74	575.89	580.95	VOLC/SED	Similar assemblage of variable volcanics & sediments as above. Some pyr, no visible MoS2.
LS07-75	0.00	3.05	CASING	Casing. Abundant rusted pyrite in rubble above ground rock.
LS07-75	3.05	24.00	VOLC/SED	Light to dark gray variable volcanics & sediments, including tuffs. Paler (potassic?) alteration along qtz veins. Very visible fragments in tuffaceous sections. Near-surface rusting of pyrite. Flow banding locally visible. Some MoS2 and pyrite. Variably magnetic with darker sections usually so, lighter ones not.
LS07-75	24.00	24.45	DYKE	Small mafic dyke, fine-grained.
LS07-75	24.45	30.90	VOLC/SED	Variable vols as before with tuff & some sediments (?). Sections of very broken core as at 26.15 to 29.57, calcite & clays along fractures.
LS07-75	30.90	31.60	DYKE	Mafic dyke as above. At 31.55, qtz-Mo stringer with pyr & clays.
LS07-75	31.60	34.10	VOLC/SED	Variable grayish Vols & seds as before. Some pinkish alteration, pyr visible but no Mo seen.
LS07-75	34.10	62.40	RHYL	Pink to brownish rhyolitic rock, blocky texture, some sections broken core, occasional MoS2 veins. Layering or flow banding visible in places as at 34.25 about 90 CA.
LS07-75	62.40	64.00	TUFF	Very crumbly black to gray section that looks like volcanic ash. Bedding very apparent. Fragments of rhyolitic rock in clayey groundmass, bedding 35-45 CA.
LS07-75	64.00	70.35	RHYL	Generally similar rhyolitic volcanics as before but with some darker sections. Fine-grained, in places fragments that look like tuff and breccia, some core highly fractured.
LS07-75	70.35	71.70	VOLC	Darker volcanic or possible sediment.
LS07-75	71.70	77.70	TUFF	Fine-medium grained gray-green tuff, fragments ranging up to 1-2 mm generally but some larger. Rock broken in places, also some pink rhyolite. Occasional Mo veins.
LS07-75	77.70	78.15	RHYL	Pink-gray rhyolite.
LS07-75	78.15	95.50	TUFF	Greenish gray tuff & volcanics. Variable, quite blocky in places, frequently broken & healed by qtz-Mo veins. Composition varies from rhyolitic to basaltic.
LS07-75	95.50	96.80	DYKE	Fine-grained black basaltic dyke, abundant pyrite, perhaps 5-10 p.c. locally.
LS07-75	96.80	101.65	SED	Dark gray spotty sediment with rounded, well-sorted gray grains in darker background (greywacke?). Grains generally abt 1 mm, some 2 mm. Several good Qtz-Mo veins.
LS07-75	101.65	107.57	VOLC	Black to medium-gray volcanics, fine-grained, some pyr & epidote. Occasionally rhyolitic. Not as much qtz-Mo as previous unit, but occasional stringers as at 102.05 & 102.68.

LS07-75	107.57	110.35	SED	Well-defined greenish to gray & black fine-grained sediments, bedding plainly visible at abt 60-65 CA, alternating darker & greener layers. In places bedding broken and deformed. Some pyr & calcite. Contact with previous volcanics clear. Greenish bands very soft, siltstone (?).
LS07-75	110.35	112.07	SED	Dark gray fine-med. grained wacke as described above (96.8-101.65), some qtz-Mo veins.
LS07-75	112.07	113.40	RHYL	Gray to pinkish rhyolitic volcanics, fractured in places, some visible flow banding..
LS07-75	113.40	115.35	DYKE	Dark green basaltic dyke, in places altered with lighter colour. Dense, fine-grained. Some pyrite, occasional qtz with minor Mo.
LS07-75	115.35	143.70	VOLC	Long section of variable volcanics, with occasional tuffaceous and sedimentary layers. Pinkish rhyolitic & darker volcanics near top of section. Deepre, becomes a compact whiter rhyoltic rock with greenish tint due to chloritic alteration & some epidote. In a few places resembles QFP but is distinguishable due to greenish colouring. This type includes quartz porphyry in a white feldspathic rhyolite. Locally abundant pyrite. Qtz-Mo veins fairly frequent, usually grouped.
LS07-75	143.70	148.35	SED	Very broken core. Some Mo visible as at 143.8, 145.15 and 147.30. From 145.50-148.34 seems to be a section of greywacke-type sediment.
LS07-75	148.35	149.24	RHYL	More competent white to pinkish rhyolitic rock, f.gr. with green tinting due to chlorite/epidote alteration & pyrite.
LS07-75	149.20	153.50	VOLC/SED	Very broken core, mixed sediments & volcanics, much pyrite.Very minor Mo, as at 151.05.
LS07-75	153.35	184.82	QFP	White to creamy unit of rhyolitic composition which has a green hue due to abundant linear chloritization. Other than the chlorite, this unit resembles QFP in other holes, with quartz eyes 1-4 mm across. Small stringers of qtz with pyrite, some qtz-Mo in varying directions but rare, much less than pyrite.
LS07-75	184.82	190.45	VOLC	Darker volcanic, andesitic composition with some possible tuff, locally abundant pyrite, a few Mo-qtz stringers.
LS07-75	190.45	191.88	VOLC	Lighter-coloured volcanic with greenish tint, chlorite & quartz eyes as above.
LS07-75	191.88	193.70	VOLC	Darker gray volcanic with rounded spotted areas which might be amygdules filled w. pyr, chlorite & epidote. Fragmented in places, as at 193-193.20 with pyr & epidote.
LS07-75	193.70	197.55	SED	Dark gray sediment with rounded qtz fragments abt 1 mm across mapped previously as greywacke. Some pyrite veining & epidotization but not as extensive as in previous units.
LS07-75	197.55	203.02	VOLC/SED	Mixed volcanics & sediments, some very visibly banded or bedded, other places blocky with pinkish alteration. Pyr is fairly abundant locally.
LS07-75	203.02	204.17	TUFF	Light greenish tuff..
LS07-75	204.17	204.95	DYKE	Black basaltic dyke, strongly to weakly magnetic, many pyrite stringers and masses. No visible Mo. Contacts about 45 CA.
LS07-75	204.95	215.59	QFP	Greenish chloritic volcanic with quartz eyes, as seen before, some qtz up to 4 mm across. Not much pyrite. Some good Mo intersections.

LS07-75	215.39	216.15	RHYL	Pink rhyolitic volcanic.
LS07-75	216.15	218.30	BRXX	Greenish breccia with chunks of angular gray to green pre-existing rocks in chloritic groundmass. Especially noticeable @ 218.25 is a large fragment of the rock at 204.95 to 215.59. Some pinkish rhyolite as well.
LS07-75	218.30	228.90	TUFF	Variable volcanics & sediments ranging from gray to green chloritic (as seen above) to pink-brown. Bedding & flow banding occasionally visible. Some pyr, occasional Mo veins.
LS07-76	0.00	6.10	CASING	Casing
LS07-76	6.10	9.86	SED	Black to dark gray hornfelsed sediment, fine-grained, very broken. Calcite along fractures.
LS07-76	9.86	11.81	TUFF	Spotted rock with dark gray fragments in lighter gray matrix, likely tuff. Some chloritization of fragments which in general are rounded. No visible bedding.
LS07-76	11.81	22.85	SLST	Dark gray f.gr. siltstone, brittle with occasional horizons that look like pebble conglomerate. Some quartz stringers & locally calcite & pyrite. Lighter-colored alteration along stringers.
LS07-76	22.85	23.58	RHYL	Green-gray rhyolitic ash, chunky, vuggy w. small quartz crystals along cavity. At 23.05-23.15, 1 mm quartz-MoS2 stringer, 5 ° to core axis .
LS07-76	23.58	35.15	VOLC	Variable dark-gray volcanics and sediments (Hazelton Gp)
LS07-76	35.15	35.65	BRXX	Green-gray brecciated rock with calcite along fractures.
LS07-76	35.65	47.85	VOLC	Back into mix of dark gray volcanics & sediments, with occasional sections of rhyolitic composition, also some typically-narrow black-spotted horizons.
LS07-76	47.85	50.20	RHYL	Pink-brown rhyolite, broken in some places, quartz & pyrite veining w. lighter alteration along veins, some MoS2.
LS07-76	50.20	53.50	VOLC	Greenish tinted volcanics or volcanoclastics as seen & described in Hole 75, with quartz eyes and feldspathic fragments, green coloring largely due to chloritic alteration & epidotization around pyrite. Good sections of MoS2.
LS07-76	53.50	59.70	RHYL	Variable rhyolitic volcanics, creamy to green to pink-brown, blocky in places, some flow banding visible as at 56.71 (60 ° to core axis). Good MoS2 in some places, not much pyr.
LS07-76	59.70	61.13	SED	Fine-grained sediment, with minor rhyolite. Bedding in seds, 85 ° to core axis , some quartz veining with pyr, brown alteration along veins. Minor MoS2-bearing stringers, at 60.63 & 60.75, about 60 ° to core axis .
LS07-76	61.13	69.55	VOLC	Volcanics, mostly rhyolitic, some andesitic. Flow banding visible locally. Some sections brecciated. Frequent veins of MoS2-quartz, occasional pyr.
LS07-76	69.55	72.95	VOLC	Volcanics, mostly rhyolitic, but with some darker sections, brecciated in places and some tuff (?). MoS2 common.
LS07-76	72.95	80.20	SED	Fine to med. grained sediments, layering clearly visible.
LS07-76	80.20	80.97	RHYL	Blocky gray to pinkish rhyolitic rock, some chlorite & pyr. One 2-3 mm quartz-MoS2 stringer abt 85 ° to core axis at 80.30.
LS07-76	80.97	81.94	DYKE	Dense black basaltic dyke, significant pyrite.
LS07-76	81.94	82.75	VOLC	Grayish volcanic, basaltic. At 82.16, 3-4 mm stringer MoS2-quartz, 40 ° to core axis , cuts earlier chloritic stringer.
LS07-76	82.75	84.55	SED	Gray to black mixed seds and vols. Bedding at 82.85 is 85 ° to core axis .

LS07-76	84.55	86.85	DYKE	Black f.gr. basaltic dyke, magnetic, with Pyr.
LS07-76	86.85	91.45	VOLC	Mixed darker colored volcanic, basaltic & andesitic composition.
LS07-76	91.45	92.50	DYKE	Black basaltic dyke with pyrite, as above.
LS07-76	92.50	93.74	VOLC	Mixed volcanics, in part brecciated. Good section of banded Quartz-MoS2 veins @ 92.73-93.02, 1-2 cm wide, parallel or 5 ° to core axis , largest vein offset by 1.5 cm.
LS07-76	93.74	94.30	DYKE	Black basaltic dyke as above.
LS07-76	94.30	96.88	VOLC	Lighter gray to greenish, brecciated and/or tuffaceous volcanics. Chlorite alteration. MoS2-Quartz veining common, very little pyr.
LS07-76	96.88	99.20	DYKE	Black basaltic dyke as above.
LS07-76	99.20	105.23	VOLC	Variable mixed volcanics, incl. rhyolite and andesite, brecciated sections, exhibiting flow banding occasionally. Some MoS2-quartz veining, occasional seds.
LS07-76	105.23	106.50	DYKE	Black basaltic dyke as before, with pyrite.
LS07-76	106.50	136.00	VOLC	Mixed variable volcanics & sediments, in places flow banded and bedding are well-defined and measurable. Some brecciation in vols. MoS2 is very common in some sections.
LS07-76	136.00	136.38	FAULT	Highly fractured core, calcareous clay gouge.
LS07-76	136.38	156.00	VOLC	Section of generally greenish volcanics & tuff (andesitic composition?). Frequent MoS2-quartz veining.
LS07-76	156.08	158.70	FAULT	Very broken core & gouge, some contained MoS2. Fault? MoS2 @ 156.45, 157.15, 157.35, 157.50
LS07-76	158.70	165.07	VOLC	Brownish Volcanic, tuffaceous in places.
LS07-76	165.07	172.15	RHYL	Rhyolite, white.
LS07-76	172.15	187.80	HRFL	Highly fractured rock with disrupted quartz vein stockwork, clay alteration, MoS2 smeared on fractures, some dark brown hornfels
LS07-76	187.80	318.51	GRPP	Granite porphyry, medium grey to pinkish grey to greenish grey, 25-35% 1-2 mm white clay altered feldspar, 1-5% 1-2 mm quartz, 1-5% 1 mm biotite; biotite altered to light green chlorite, patches of K-feldspar alteration toward end of hole, weak to moderate MoS2 as stringers, patches of quartz vein stockwork, some late pyrite, up to 286 rock is altered with biotite going to chlorite, weak to moderate quartz vein stockwork throughout, feldspars hard to see due to chlorite alteration; after 286 rock is less altered and granitic texture more visible
LS07-77	0.00	1.52	CASING	Casing
LS07-77	1.52	13.80	SED	Hornfelsed volcanic sediments, dark grey, fine grained, spotted texture due to secondary biotite, no visible bedding, some thin beds of poorly sorted wacke and granule conglomerate towards 13.8; rock is cut by quartz-pyrite veinlets, total pyrite content around 1-2%, pyrite veinlets have 1-2 mm bleached alteration envelopes; few widely spaced quartz-MoS2 stringers
LS07-77	13.80	63.30	AFTF	Ash flow tuff, medium to light grey, locally pinkish grey, mottled texture, siliceous with some interbedded crystal tuff; flow banding wavy@6-70 ° to core axis; some light grey rhyolite, locally spotted texture due to secondary biotite suggesting rock is hornfelsed; widely space quartz-MoS2 veins and stringers, quartz-pyrite veins with bleached alteration envelopes; overall weak to moderate MoS2 mineralization

LS07-77	63.30	67.50	QFP	Quartz-feldspar porphyry (QFP), light grey to cream to pinkish grey colour, fine-grained with 5-10% 1-2 mm feldspar, 1-5% 1-2 mm quartz eyes in fine-grained siliceous matrix; strong quartz-MoS2 vein stockwork
LS07-77	67.50	80.60	AFTF	Ash flow tuff, laminated to flow banded as previous, dark grey to medium grey mottled texture, very siliceous; flow banding less wavy than previous interval, approaching laminar bedding; spotted texture due to secondary biotite suggest rock is hornfelsed; 1-2% pyrite as veinlets and stringers with 1-4 mm bleached alteration envelopes; weak MoS2 mineralization as widely spaced stringers
LS07-77	80.60	81.80	DYKE	Mafic dyke, dark grey to black, probably lamprophyre composed largely of biotite, soft; 1-5% pyrite as wispy patches and irregular lenses
LS07-77	81.80	97.00	AFTF	Ash flow tuff as previous but with moderate MoS2 mineralization as banded quartz-MoS2 veins and stringers
LS07-77	97.00	112.50	GRPP	Granite porphyry, medium grey, 25-35% 1-2 mm feldspar, 1-55 1-2 mm quartz eyes, <1% black biotite flakes, hard siliceous rock; moderate to strong quartz-MoS2 veining as banded veins and stringers
LS07-77	112.50	114.00	HRFL	Hornfels, dark to medium grey, mottled texture; 1-2% pyrite as coarse grained veinlets
LS07-77	114.00	115.50	GRPP	Granite porphyry as previous
LS07-77	115.50	121.90	AFTF	Ash tuff or fine-grained volcanic sediment, alternating light and dark grey bands up to 2 cm thick @70-80 ° to core axis; could be flow banding; some widely spaced quartz-MoS2 stringers
LS07-77	121.90	151.80	XLTF	Crystal tuff, medium to brownish grey, 25-355 1 mm white clay altered feldspar crystal fragments; some light grey bleached patches; weak to moderate MoS2 as banded veins and stringers; pyrite veinlets with 1 cm bleached alteration envelopes common @20-30 ° to core axis
LS07-77	151.80	215.00	QFP	QFP, light grey as previous; strongly fractured and healed with quartz; mostly broken core; clay on fracture faces; moderate to strong MoS2 mainly as stringers; some quartz vein stockwork, black MoS2 seams in clay; pyrite on dry fracture faces
LS07-77	215.00	250.00	GRPP	Granite porphyry, greenish grey, as previous but slightly coarser-grained approaching quartz monzonite porphyry; feldspars white, clay altered; porphyry is highly fractured and strongly clay altered in places with numerous calcite veinlets; locally brecciated; MoS2 on fracture faces is sheared and polished forming slickensides in places; quartz veins with wispy bands of MoS2 and MoS2 stringers offset by late, post mineral fracturing
LS07-77	250.00	297.00	GRPP	Granite porphyry, less altered and fractured than previous interval; feldspars white, clay altered, black fresh biotite flakes; some anhydrite veins @10-20 ° to core axis; weak MoS2 as stringers; some pink K-feldspar veining and altered patches; bleached alteration envelopes on widely spaced quartz and pyrite veinlets
LS07-77	297.00	450.19	QMP	Quartz monzonite porphyry, crowded porphyry texture, medium-grained, 35-55% 2-4 mm white clay altered feldspar, 5-10% 2-3 mm quartz, 1-2% 1-2 mm biotie in a medium grey to pinkish grey quartz-plagioclase-K-feldspar groundmass; coarser-grained than granite porphyry but probably similar compositionally; few widely space quartz and quartz-MoS2 veins and veinlets,

				some MoS2 on dry fracture; late calcite veins @10-20 ° to core axis
LS07-78	0.00	1.52	CASING	Casing
LS07-78	1.52	538.61	QFP	Quartz-feldspar porphyry (QFP), 5-10%, 1-2 mm feldspar, 1-5% 1-2 mm quartz eyes in a light grey fine-grained aphanitic quartz-feldspar groundmass; moderate to strong MoS2 mineralization as banded quartz-MoS2 veins and MoS2-quartz stringers; MoS2 improves after 57.9
LS07-79	0.00	3.03	CASING	casing
LS07-79	3.03	14.00	HRFL	Hornfels, dark grey, fine-grained, no visible bedding, moderately hard, mottled texture in places, spotted due to secondary biotite, could be a volcanic sediment or ash tuff, pyrite stringers, 2-4% total pyrite, narrow bleached margins on veins and stringers, some bleached patches, silicified
LS07-79	14.00	35.60	ASTF	Ash tuff or volcanics siltstone, thin bedded to finely laminated, some fragmental beds - lapilli and crystal lithic tuff;, dark grey to light greenish grey to pinkish grey, silicified zones, spotted texture due to secondary biotite; bedding @70-80 ° to core axis; bedding and laminations disrupted in places by fracturing; feldspar crystal fragments visible in some beds, others very fines laminated, approaching flow bandis; strong pyrite as fracture coatings, veinlets and dissemination, 1-5% pyrite overall, maybe some chalcopyrite, weak to moderate MoS2 mineralization
LS07-79	35.60	46.40	LPTF	Lapilli tuff, dark grey to light grey, 15-20%, 2-4 mm subangular, rounded quartz, feldspar crystal fragments, dark grey to black to greenish grey rounded lithic fragments to 1 cm, light grey intervals silicified, 1-2% pyrite; spotted hornfels in places
LS07-79	46.40	48.05	FP	Crowded feldspar porphyry, white to grey, 35-55%, 2-4 mm feldspar, 5-10% 2-4 mm quartz, biotite altered to light green chlorite, light grey, fine-grained quartz-feldspar groundmass
LS07-79	48.05	49.20	LPTF	Lapilli tuff as previous
LS07-79	49.20	51.20	FP	Crowded feldspar porphyry as previous
LS07-79	53.00	69.70	ASTF	Ash tuff, finely laminated in places with alternating light and dark bands; light grey silicified patches; spotted hornfels texture in places
LS07-79	69.70	75.80	FP	Crowded feldspar porphyry as previous; mottled in places, biotite altered to chlorite; few MoS2 and pyrite stringers
LS07-79	75.80	76.10	BRXX	Breccia, black matrix comprised of black tourmaline and/or biotite
LS07-79	76.25	80.50	QFP	Quartz feldspar porphyry (QFP), fine grained medium greenish grey to light grey, 5-10% 1-2 mm greenish grey feldspar, 1-5% 1-2 mm quartz eyes, fes <1mm black biotite flakes in aphanitic greenish grey to light grey siliceous matrix
LS07-79	80.50	84.20	FP	Crowded feldspar porphyry as previous; some quartz-MoS2 veinlets, some visible biotite flakes, looks in places like granite porphyry

LS07-79	84.20	84.80	BRXX	Breccia, dark grey heterolithic angular clasts up to 1 cm in a dark grey to black tourmaline rich matrix
LS07-79	84.80	85.20	QFP	QFP, pinkish grey, siliceous, aphanitic, few visible phenocrysts
LS07-79	85.20	99.70	ASTF	Ash tuff as previous (53.0-69.7), thin bedded, spotted hornfels, bedding @60 ° to core axis, microfractured with narrow bleached alteration envelopes; light brownish grey, silicified in places, pyrite on fractures and in late veins; weak MoS2 mineralization
LS07-79	99.66	101.30	DYKE	Mafic dyke, black, aphanitic lamprophyre, soft, 1-5% pyrite as wispy patches, blebs, disseminations and stringers
LS07-79	101.30	114.00	ASTF	Ash tuff, as previous, or volcanic siltstone, thin bedded to finely laminated; some soft sediment deformation, bedding @70 ° to core axis, 1-2% pyrite on fractures and in quartz veinlets
LS07-79	114.00	117.30	DYKE	Mafic dyke as previous
LS07-79	117.30	120.60	ASTF	Ash tuff as previous; pyrite on dry fractures
LS07-79	120.60	122.60	DYKE	Mafic dyke as previous
LS07-79	122.60	124.10	ASTF	Ash tuff as previous, bedding @70 ° to core axix
LS07-79	124.10	124.30	DYKE	Mafic dyke as previous
LS07-79	124.30	137.30	ASTF	Ash tuff as previous
LS07-79	137.30	162.80	XLTF	Crystal lithic tuff, no visible bedding, dark grey with 10-15% 1-2 mm white feldspar crystal fragments, occasional clast up to 1 cm, hard siliceous rock, some bleached silicified patches, 1-2% pyrite, weak to moderat MoS2; increasing number of veins and belached envelopes toward 162.8
LS07-79	162.80	184.60	ASTF	Ash tuff, dark grey to dark green, bedding defined by light and dark bands, similar to previous ash tuff but thicker bedding, not finely laminated, some crystal tuff beds, siliceous, bleached intervals; in places rock is strongly fractured and bedding is disrupted; bedding @60-70 ° to core axis, some epidote patches, 1-2% pyrite as fracture coatings and disseminated
LS07-79	184.60	195.50	LPTF	Lapilli tuff, dark grey to light grey, aphanitic clast to 1 cm in dark greenish grey feldspathic matrix
LS07-79	195.50	219.40	ASTF	Ash tuff, finely laminated in places, same as 101-114, bedding @70 CA light grey to cream to brownish grey silicified patches to 213.5; very pyritic in places, chlorite alteration patches, some epidote associated with heavy pyrite
LS07-79	219.40	221.50	DYKE	Mafic dyke, aphanitic black, same as previous, 5-10% pyrite
LS07-79	221.50	242.10	LPTF	Lapilli tuff, medium greenish grey, 25-45% dark grey rounded clast to 1 cm in fine grained ash matrix; siliceous, 1-5% pyrite as dry fracture coatings, stringers, disseminated blebs with some associated chlorite and epidote in matrix
LS07-79	242.10	245.85	DYKE	Mafic dyke as previous, dark grey some medium greenish grey patches; 5-10% pyrite, relatively soft
LS07-79	245.95	249.85	XLTF	Crystal tuff, dark grey, fine grained siliceous, some medium greenish grey patches, 1 mm feldspar crystal fragments visible in places

LS07-79	249.85	260.60	LPTF	Lapilli tuff, dark greenish grey, some laminated beds 25-45% rounded lithic clasts up to 1 cm; silicified rims, locally clasts replaced by silica, poorly sorted, light grey and dark grey clasts, matrix greenish grey with feldspar crystal fragments; bedding @70 CA
LS07-80	0.00	3.05	CASING	casing
LS07-80	3.05	5.80	DYKE	Mafic dyke, black fme-grained soft lamprophyre, 1-5% pyrite as wispy bands, disseminated clots, discontinuous stringers
LS07-80	5.80	6.30	XLTF	Crystal lithic tuff, 5-15% 1 mm white feldspar crystal fragments, occasional lithic clast, dark rounded up to 1 cm in medium to dark grey ash matrix, mottled dark to medium greenish grey 1-2% pyrite
LS07-80	6.30	9.00	DYKE	Mafic dyke as previous, some pyrite stringers with bleached margins; weak MoS2 mineralization as quartz-MoS2 stringers, 1-5% pyrite overall
LS07-80	9.00	11.00	XLTF	Crystal lithic tuff as previous
LS07-80	11.00	20.10	ASTF	Ash tuff, laminated to banded, medium brownish grey to pinkish grey siliceous, bedding highly disrupted suggesting brecciation; angular laminated clasts, weak to moderate MoS2 as quartz-MoS2 veinlets, MoS2 stringers, coarse-grained pyrite in core of veins, 1-2% pyrite overall
LS07-80	20.10	36.60	ASTF	Ash tuff with 1-10% 1-2 mm white feldspar crystal ffagments, occasional elongate lithic clast to 1 cm suggesting bedding @45 ° to core axis; matrix fine-grained dark greenish grey to medium and light brow, some pinkish siliceous patches giving mottled textures; spotted texture due to secondary biotite; moderate MoS2 as quartz-MoS2 veins and stringers
LS07-80	36.60	37.00	FP	Crowded quartz feldspar porphyry, light grey, 35-55% 2-4 mm feldspar, 5-10% 1-2mmquartz in fine-grainedlight grey quartz-feldspar matrix, hornfels near contact;MoS2 stringers subparallelto the core axis
LS07-80	37.00	39.40	ASTF	Ash tuff as previous, hornfelsed with spotted texture due to secondary biotite
LS07-80	39.40	40.70	FP	Crowded feldsparporphyry as previous; quartz-MoS2 stringers subparallel to the core axis
LS07-80	40.70	42.80	XLTF	Crystal lithic tuff, hard siliceous dark grey hornfels with spotted texture to light grey with white feldspar crystal fragments and lithic clasts in light to medium grey siliceous matrix
LS07-80	42.80	46.00	ASTF	Ash tuff banded to laminated@70 ° to core axis dark grey to light brown to pink bands, very siliceous
LS07-80	46.00	50.65	QFP	Quartz-feldsparporphyry(QFP) fine-grained aphanitic,few visible crystals, fractured, cherty light greyMoS2 stringers throughout
LS07-80	50.65	56.05	ASTF	Ash tuff, some laminations visible, dark grey, spotted biotite hornfels; bedding @70° to core axis
LS07-80	56.05	56.50	DYKE	Mafic dyke as previous@25° to core axis
LS07-80	56.50	74.20	ASTF	Ash tuff as previous, finely laminated @70° to core axis, spotted hornfels texture
LS07-80	74.20	74.95	DYKE	Mafic dyke as previous
LS07-80	74.95	77.00	ASTF	Ash tuff, finely laminated intervals as previous; some disrupted and brecciated intervals; moderate to strongMoS2 as stringers
LS07-80	77.00	77.30	DYKE	Mafic dyke as previous
LS07-80	77.30	92.00	ASTF	Ash tuff as previous, dark grey with bleached altered

				intervals, spotted hornfels texture
LS07-80	92.00	96.80	GRPP	Granite porphyry,mediumgrey, 15-25% 1-2mmwhite clay altered feldspar, 1-5% 1-2mm quartz eyes, 1-2%black biotite flakes; moderate MoS_2 as stringers,quartz veining throughout
LS07-80	96.80	103.00	ASTF	Ash tuff as previous with increasing quartz vein stockwork toward 103.0. Diffuse bands of MoS_2 in quartz veins
LS07-80	103.00	114.60	XLTF	Crystal tuff, medium to dark grey to medium brown, 15-25% 1-2mm white feldspar crystal fragments in medium brown matrix
LS07-80	114.60	131.00	QFP	Quartz-feldspar porphyry with strong quartz vein stockwork, 70-90% of rock; broken core with a few 10-20cm pieces of unbroken core; weak MoS_2 as stringers and fracture coatings; calcareous clay on fracture faces
LS07-80	131.00	152.00	SILC	Mostly quartz vein stockwork, broken core, calcareous clay on fracture faces, remnants of bleached white QFP or granite porphyry; 80-90% quartz vein stockwork; few 10-20cm lengths of intact core, significant core loss in places; MoS_2 smeared on fracture faces, discontinuous bands of MoS_2 in quartz
LS07-80	152.00	162.30	SILC	High silica zone, more intact, intense quartz vein stockwork, 90-100% of rock, few bleached remnants of porphyry visible
LS07-80	162.30	314.30	GRPP	Granite porphyry, some flakes of biotite visible, 25-35% 1-2mm white clay altered feldspar, 5-10% 1-2mm quartz in medium grey to pinkish grey quartz-feldspar groundmass; quartz veins throughout, some calcite veins, trace pyrite, weak MoS_2 as stringers, discontinuous bands in quartz veins202.0 - start of interval with increasing number of quartz veins up to 30-40% of rock @40° to core axis, veins are finely laminated to banded; host porphyry altered to medium to light greenish grey; biotite altered to chlorite; some broken core
LS07-80	314.30	316.00	FAULT	Fault breccia; angular clasts of granite porphyry and quartz in soft clay matrix; some calcite cement; major fault, some irregular black seams of mo
LS07-80	316.00	322.40	GRPP	Granite porphyry transitional into quartz monzonite porphyry, same as 306-314.3, soft clay altered, highly fractured
LS07-80	322.40	325.50	FAULT	Fault breccia as previous
LS07-80	325.50	379.78	GRPP	Granite porphyry transitional into quartz monzonite porphyry, same as 160.3-314.4 but coarser-grained, more crowded porphyry texture, 35-55%, 2-4 mm white, clay altered feldspars, 5-10% 1-2mm black biotite flakes in pinkish grey quartz-feldspar groundmass, biotite fresh to chlorite altered, quartz veins often have pink to orange K-feldspar alteration envelopes up to several cm into the wallrock; fewer, more widely spaced parallel quartz veins than previous intervals, weak MoS_2 as widely spaced stringers, some blebs and disseminations in quartz veins
LS07-80	379.78	429.50	QMP	Quartz monzonite porphyry (QMP) same as previous but slightly coarser-grained, altered, K-feldspar envelopes on quartz veins, biotite altered to chlorite, patches of soft, clay altered core, some patches of pyrite but overall content low, some blebs and disseminations in quartz veins

LS07-80	429.50	440.75	HRFL	Hornfels, dark grey to black, faint banding @434.0 suggesting protolith is ash tuff; strong micro-fracturing @90° to core axis in places, core soft, pyrite on dry fracture faces, quartz veins displaced and offset, minor MoS2
LS07-80	440.75	443.10	QMP	Altered intrusive, probably QMP, light grey, clay altered, highly fractured, soft, some discontinuous and displaced MoS2 stringers, approaches fault breccia in places
LS07-80	443.10	446.84	FAULT	Fault breccia, angular clasts in dark matrix, highly fractured, soft, clay altered approaching gouge in places; completely broken up rock; fault zone
LS07-80	446.84	464.20	QFP	Quartz-feldspar porphyry, light pinkish grey, visible quartz eyes, micro-fractured approaching breccia in places, MoS2 seams, less altered and fractured after 456.0
LS07-80	464.20	515.00	QMP	Quartz monzonite porphyry as previous with highly fractured and soft clay altered intervals
LS07-80	515.00	581.56	QFP	Quartz feldspar porphyry, light grey to orange and pink altered zones; moderate MoS2 as stringers, contact with granite porphyry gradational, granite porphyry finer grained at contact
LS07-81	0.00	9.14	CASING	Casing
LS07-81	9.14	97.80	QFP	Quartz feldspar porphyry (QFP), white to light grey, 10-15% 1-2 mm white clay altered feldspar, 1-5% 1-2 mm quartz eyes in fine-grained aphanitic siliceous groundmass; weak MoS2, low pyrite content; moderate to strong MoS2 from 219
LS07-81	97.80	99.00	DYKE	Basalt dyke, dark green, post mineral
LS07-81	99.00	442.00	QFP	Quartz-feldspar porphyry as previous
LS07-81	442.00	446.30	FAULT	Fault breccia, fault zone, clay altered rock, angular to rounded clasts in clay matrix, MoS2 seams in clay, 10 cm calcite vein @444.2, 445.2 and 445.8
LS07-81	446.30	451.80	QFP	QFP as previous, greenish grey mottled texture, locally brecciated
LS07-81	451.80	452.00	FAULT	Fault breccia as previous, brown mud, gouge
LS07-81	452.00	460.00	QFP	QFP, highly fractured, clay altered approaching breccia in places; veining completely segmented; some good MoS2 in places
LS07-81	460.00	460.50	TUFF	Tuff, highly fractured with displaced quartz veins
LS07-81	460.50	550.41	GRPP	Granite porphyry transitional to quartz monzonite porphyry, crowded, 35-45% 2-4 mm white, clay altered feldspar, 5-10% 2-4 mm quartz, 1-5% 1-2 mm black biotite flakes in a pinkish grey siliceous aphanitic groundmass, frequent intervals of soft clay altered core, weak MoS2 mineralization
LS07-82	0.00	6.07	CASING	Casing
LS07-82	6.07	11.28	BRXX	Breccia, siliceous, pinkish grey, cherty clasts, fractured, healed with quartz, some MoS2 on fracture faces and as stringers
LS07-82	11.28	15.20	VOLC/SED	Volcanic sediment or tuff, aphanitic, cherty, pinkish grey, silicified; MoS2 stringers
LS07-82	15.20	22.80	ASTF	Ash tuff, dark grey, finely laminated in places @70-80 ° to core axis; fractues with narrow bleached alteration envelopes
LS07-82	22.80	23.60	FP	Feldspar porphyry, crowded, 25-35% 1-2 mm feldspar, MoS2 stringers
LS07-82	23.60	38.40	ASTF	Ash tuff, as previous, cut by quartz-MoS2 stringers

LS07-82	38.40	39.40	QFP	Quartz feldspar porphyry (QFP), 10-15% 1-2 mm feldspar, 1-5% 1-2 mm quartz in a fine-grained aphanitic light grey siliceous groundmass
LS07-82	39.40	57.70	ASTF	Ash tuff as previous but increase in pyrite stringers with bleached alteration envelopes extending up to 1 cm into the wall rock; 1-5% pyrite, some quartz-MoS2 veins and MoS2 stringers
LS07-82	57.70	60.70	GRPP	Granite porphyry, 15-25% 1-2 mm white clay altered feldspar, 1-5% 1-2 mm quartz, 1-2% 1 mm black biotite flakes in a fine to medium grained siliceous quartz-feldspar groundmass, good MoS2 as banded veins and stringers @30-40 ° to core axis and 70 ° to core axis; sharp dyke contact @80 ° to core axis
LS07-82	60.70	64.60	ASTF	Ash tuff, laminated, bleached, light brownish grey to lt greenish grey, laminations @85-90 ° to core axis
LS07-82	64.60	65.40	DYKE	Mafic dyke, black, soft, lamprophyre, 1-5% pyrite, irregular quartz-MoS2 veins subparallel to the core axis, lower contact @70 ° to core axis, upper contact @30 ° to core axis
LS07-82	65.40	81.25	ASTF	Ash tuff, bleached, silicified, laminated, brecciated in places; mottled dark grey to light pinkish grey colour; MoS2 stringers throughout; fractures have narrow bleached alteration envelopes
LS07-82	81.25	81.70	DYKE	Mafic dyke as previous
LS07-82	81.70	84.10	ASTF	Ash tuff as previous, MoS2 stringers and narrow banded veins, mottled texture
LS07-82	84.10	88.10	GRPP	Granite porphyry as previous; MoS2 stringers and banded veins
LS07-82	88.10	95.80	ASTF	Ash tuff as previous but with more quartz veining approaching 50%, bedding disrupted, some dark patches could be part of segmented mafic dyke; some earlier quartz-MoS2 veins but mostly later quartz veins
LS07-82	95.80	100.10	GRPP	Granite porphyry as previous with MoS2 stringers, few quartz-MoS2 veins
LS07-82	100.10	109.80	XLTF	Crystal tuff, medium brownish grey, 15-35% 1-2 mm white feldspar crystal fragments, irregular quartz veining up to 50-60% with diffuse MoS2 bands increasing toward 109.8 m.
LS07-82	109.80	127.00	GRPP	Granite porphyry with quartz vein stockwork up to 70-80% of rock; light grey bleached remnants with quartz eyes; could be QFP; where less altered biotite is visible; shattered rock healed with quartz; diffuse bands of MoS2 in quartz veins
LS07-82	127.00	145.80	GRPP	Granite porphyry with strong, parallel, quartz veins comprising 30-50% of the rock; veins are finely laminated in places and are mostly at 30 ° to core axis; few widely spaced MoS2 stringers, some diffuse MoS2 bands in quartz veins; some white, bleached intervals
LS07-82	145.80	149.00	SILC	High silica zone, 70-90% quartz vein stockwork, bleached light green to white remnants of granite porphyry between veins
LS07-82	149.00	156.50	FAULT	Fault breccia, quartz and granite porphyry fragments healed with calcite cement, white calcareous clay gouge in pleaces. Major fault
LS07-82	156.50	169.00	GRPP	Granite porphyry, altered and locally brecciated, biotite altered to chlorite giving rock medium greenish grey colour, quartz vein stockwork throughout cutting early set of parallel quartz veins @20-30 ° to core axis

LS07-82	169.00	170.20	FAULT	Fault breccia, light grey, angular to rounded clasts of granite porphyry and quartz veins in a light grey calcareous clay matrix
LS07-82	170.20	228.40	GRPP	Granite porphyry as previous
LS07-82	228.40	229.80	FAULT	Fault breccia, clast of quartz and porphyry in white calcareous matrix comprised of ground up calcite and clay
LS07-82	229.80	245.00	SILC	High silica zone, 70-95% quartz vein stockwork with white bleached remnants of porphyry between veins, few wispy MoS2 stringers in later quartz veins
LS07-82	245.00	328.80	GRPP	Granite porphyry, medium greenish grey, some pinkish grey groundmass, feldspar light grey, less altered than previous interval although locally white, clay altered, some fresh black biotite flakes, pink to orange K-feldspar alteration patches in places; quartz vein density drops of to 10-15% decreasing downhole; weak MoS2 mineralization as diffuse bands and disseminations in widely spaced quartz veins and stringers; MoS2 typically occurs along quartz vein margins
LS07-82	328.80	585.83	QFP	Quartz feldspar porphyry, light greenish grey, moderate MoS2 as stringers and quartz veins with MoS2 along vein margins, good frequency of stringers with spacing of 5-20 cm, MoS2 vein disrupete and segmented by later quartz veins, rock shattered and healed with quartz after main MoS2 mineralizing event
LS07-83	0.00	3.05	CASING	casing
LS07-83	3.05	254.81	QFP	Quartz feldspar porphyry, 15-20% 1-2 mm feldspar, 1-5% 1-2 mm quartz eyes in an aphanitic, light grey siliceous groundmass; some MoS2 stringers at top of hole
LS07-84	0.00	7.31	CASING	casing
LS07-84	6.70	172.52	QFP	Quartz feldspar porphyry, white 10-15% 1-2 mm feldspar, 1-5% 1-2 mm quartz eyes, 1-2% light green chlorite after biotite in a fine-grained aphanitic siliceous groundmass; good MoS2 as banded veins and stringers, core mostly broken into 5-10 cm pieces to 57.5, more massive after this point
LS07-85	0.00	4.26	CASING	casing
LS07-85	4.26	4.37	OVBD	Overburden rubble
LS07-85	4.37	199.34	QFP	Quartz feldspar porphyry, white to beige colour containing 1-2 mm feldspar and quartz eyes; groundmass is fine grained to aphanitic and siliceous; sparse flecks of pyrite throughout; some sections with greenish tinge due to chlorite +/- clay along fractures; core is blocky/broken from 20 to 40.3 m; some slightly limonitic (oxidized) sections; generally strong to moderate mineralization with numerous and multiple, well developed banded quartz-MoS2 veins up to 2.5 cm, stringers and veinlets
LS07-86	0.00	6.10	CASING	casing
LS07-86	6.10	8.23	OVBD	Overburden; broken/rubbly core of laminated tuff

LS07-86	8.23	59.31	ASTF	Ash tuff; generally finely laminated (< 1 mm to 10s of cm sections); dark green-grey colour with areas of chlorite along laminae; some chloritic areas contain patches and disseminations of pyrite; pyrite also occurs intermittently throughout the section. Some areas contain thin quartz-carbonate veinlets and stringers (1 mm) crosscutting laminations; quartz-carbonate veinlets (1-5 mm) cut MoS2 veins. Generally weak to moderate pyrite. Quartz-carbonate veinlets (1-5 mm) cut MoS2 veins. Weak MoS2 developed in small (1 mm) quartz veinlets in areas of granite porphyry dike/contact areas within tuff. Some lapilli tuff areas. Lower contact with granite porphyry is 12 to core axis; some banded quartz-MoS2 veinlets (< 1 mm) developed irregularly nearby.
LS07-86	59.31	80.10	GRPP	Granite porphyry; altered mottled grey-green colour with small (1-2 mm) quartz and feldspar eyes and small flecks of biotite; contains sparse pyrite throughout; weak MoS2 veinlets widely distributed. Upper and lower contacts with laminated tuff is generally silicified with quartz veining that also host sparse MoS2 veinlets. More intense quartz veining/silicification on upper contact with sparse patches/flecks of pyrite
LS07-86	80.10	98.50	ASTF	Laminated ash tuff - as previous; pyrite developed as patches, flecks and veins/veinlets; darker green colour due to more mafic composition; 25 cm lapilli tuff interval between 97.5-97.75 m
LS07-86	98.50	101.75	XLTF	Crystal tuff; light grey-green-brown colour contains feldspar crystals (1 mm). Some altered mafic dike sections caught up within the interval at 100.2-100.65 m and 101.3-101.5 m. Numerous and multiple quartz, quartz-pyrite and quartz-MoS2 veinlets up to 5 cm. Lower contact with mafic dike interval at 101.75 m is 30 ° to core axis.
LS07-86	101.75	102.90	DYKE	Mafic Dike. Very fine grained, dark green mafic dike cut by 1-5 mm quartz-calcite veinlets. Upper contact with crystal tuff is 30 ° to core axis; lower contact with crystal tuff is 30 ° to core axis.
LS07-86	102.90	117.00	XLTF	Crystal Tuff. Irregularly-sized beige feldspar crystals up to 1.5 mm are weakly altered giving a mottled grey-brown-green appearance/colour. Some local quartz-pyrite veins. Some areas of strong chlorite alteration usually contains multidirectional quartz veinlets. Some sections contain intense silicified/quartz veined and altered zones within which are moderate to strong quartz-MoS2 veins. Generally the overall crystal tuff interval is weakly MoS2 mineralized. From 107.5-117 m is a silicified/quartz veined zone containing quartz-MoS2 veins; silica/quartz veins up to 60% of this zone.
LS07-86	117.00	154.95	QFP	Quartz Feldspar Porphyry. Mixed quartz feldspar porphyry and granite porphyry throughout this interval. Generally the quartz feldspar porphyry is a pale green colour, aphanitic with quartz-feldspar eyes from 1-2 mm. 50% of interval is shot through with multi-directional quartz veins up to 2 cm and silicified sections; there are also threads and fragments of MoS2-quartz veins (< 1 mm). Chlorite occurs along slips and fractures.

LS07-86	154.95	316.22	GRPP	Granite Porphyry. Massive section with occasional very intermittent zones of quartz veining and thin, irregularly distributed MoS2-quartz veinlets generally <1 mm. The unit is a mottle green-grey colour with feldspar-quartz crystals (feldspar > quartz > biotite). Flecks of pyrite throughout with occasional < 1 mm veinlets. Weak MoS2 veins widely distributed along slip faces. Most major veinlets are documented but in between may contain tiny veinlets.
LS07-86	316.22	316.95	DYKE	Mafic Dike (see previous description). Upper contact with granite porphyry is @15 ° to core axis. Sparse pyrite throughout. Lower contact @25 ° to core axis and is marked by a quartz vein.
LS07-86	316.95	318.00	GRPP	Granite Porphyry (see previous description).
LS07-86	318.00	340.50	DYKE	Mafic Dike/Fault Zone. Section is faulted/crumbly; upper contact is 35° to core axis. Mafic dike (see previous description) but strongly crumbly/gougy black material. Small calcite veins throughout with pyrite veins; some splotchy pyrite. Also contains small sections of more coherent granite porphyry (326-327.7 m, 328-329 m). Mafic dike become more massive as it nears the lower contact with quartz feldspar porphyry but is still broken. Banded quartz-MoS2 veins become more abundant as the mafic dike zone approaches lower contact with quartz feldspar porphyry – several banded quartz-MoS2 + quartz-MoS2 + quartz-pyrite veins.
LS07-86	340.50	346.20	QFP	Quartz Feldspar Porphyry (see previous description). Upper contact with mafic dike (around 1 m section) is broken core, clay, some gouge with multiple quartz-MoS2, quartz-pyrite veinlets @10 to 30 ° to core axis. The quartz feldspar porphyry is massive with slight greenish hue due to chlorite alteration.
LS07-86	346.20	371.60	DYKE	Mafic Dike (see previous description). Dike is more competent and massive and cut by multiple quartz +/- MoS2 veinlets from < 1 mm to 1 cm with varying angles to core axis. Some patches and flecks of pyrite throughout with occasional < 0.5 mm veinlets. Major veins are documented but areas in between may contain lesser veinlets. The lower contact with the quartz monzonite porphyry is 30 ° to core axis.
LS07-86	371.60	663.75	QMP	Quartz monzonite porphyry. A speckled appearance due to tiny biotite and hornblende? crystals in a siliceous quartz-feldspar matrix exhibiting an overall equigranular texture. Quartz and feldspar eyes (0.5 to 1 mm) are evident throughout the interval. Rock is fresh looking, grey-green-beige colour with pink-green hue due to Kspar, and chlorite after biotite. Some Kspar crystals become larger (2 mm) giving a mottle appearance. Sparse flecks of pyrite throughout. Weak quartz-MoS2 veinlets throughout. Only more pronounced veins have been documented; there may be minor veining developed between the documented veins. The contact with the above mafic dike (371.6-378 m) is a silicified/quartz veined Kspar altered zone; there are some 0.5 to 1 cm quartz veins with pyrite @0 ° to core axis; at the 375 m mark in this contact zone is a 0.4 cm MoS2-quartz vein @25 ° to core axis. In some sections around the 600 metre mark, quartz-feldspar eyes become more pronounced.

LS07-87	0.00	6.71	CASING	Casing
LS07-87	6.71	7.00	OVBD	Overburden
LS07-87	7.00	153.62	QFP	Quartz feldspar porphyry – typically whitish grey in colour. Some tinges of green indicate areas of weak chloritic alteration. Ten to fifteen per cent quartz eyes ranging up to 2 mm. Occasional areas show feldspars up to 1.5 mm. Fine acicular mafics noted locally throughout (<1 mm long). Stringers and veins of of quartz, some banded and containing mo occurs consistently to 71 metres depth then diminishes downhole. Significant major stringers are documented but lesser stringers are not. The core is fractured and blocky to 86 metres and then become more competent. Pyrite is noted in association with the occasional fracture but is not abundant.
LS07-88	0.00	3.04	CASING	Casing
LS07-88	3.04	3.14	OVBD	Overburden.
LS07-88	3.14	207.56	QFP	Quartz feldspar porphyry – pale greenish grey indicating some minor chloritization of core. From 10 to 15 per cent quartz eyes. Occasional feldspar are observed and are often chlorite altered. Mo – bearing quartz veins are strong to 53 metres depth. Many of the thicker veins contain wallrock fragments. Some sections containing veins and stringers are so intense as to be virtually matrix surrounding in-place quartz feldspar porphyry breccia. Alteration is of a weakly chloritic and argillic nature. Iron oxide staining occurs on fractures from 0 to 23.16 metres depth. The core is largely competent but has some minor subsections where broken, crushed or even gougy. The main MoS2-bearing veins and zones are indicated below.
LS07-89	0.00	3.66	CASING	Casing
LS07-89	3.66	38.90	GRPP	Granite Porphyry. A highly silicified, siliceous and quartz vein injected interval that contains strong limonitic staining with dominant granite porphyry fragments; quartz feldspar porphyry fragments, mafic dike fragments and lapilli tuff fragments are distributed erratically throughout. Overall, the section hosts numerous, multiple and multidirectional quartz veining with some more massive quartz-rich areas. There is no obvious MoS2 content/mineralization. Core is highly broken from 11 to 21 m. Generally the granite porphyry fragments have a mottled, rusty tan appearance with small (1-2 mm) quartz and feldspar eyes and small flecks of biotite. The downhole contact with the Quartz Feldspar Porphyry interval is @45 ° to core axis.

LS07-89	38.90	230.42	QFP	Quartz Feldspar Porphyry. Generally the quartz feldspar porphyry is a pale green colour, aphanitic with quartz-feldspar eyes from 1-2 mm. On average, the MoS2 content/veining is moderate to low-strong. MoS2 is contained in banded quartz-MoS2 veins, quartz-MoS2 veins, MoS2-quartz veins, and as seams of MoS2. The interval is a generally massive unit with a pale green colour due to feldspars altered to chlorite. Some limonitic staining near the upper contact with the granite porphyry (38.9-41 m). 57.7-60.14 – Fault zone/gouge. Clay-chlorite rich, highly fractured, crumbly/broken core. Downhole from the fault zone MoS2 mineralization as quartz-MoS2 veins, quartz-MoS2 veins, MoS2-quartz veins, and seams of MoS2, from 0.5 mm to 9.5 cm, increases in concentration (60-230.42 m (EOH)). There are numerous, multiple, multi-directional network of veins/veinlets/seams; only the major veins are documented below. 111.56-211 m – the quartz feldspar porphyry is a lighter beige-white colour; does not have as strong a green hue due to chlorite. MoS2 mineralization appears to increase in veinlet density; 211-228 – more chloritic giving greenish hue
LS07-90	0.00	6.10	CASING	Casing and overburden
LS07-90	6.10	47.20	GRPP/QVS	Granite porphyry/silica flooded zone. Little to no MoS2 occurs. FeOx staining 44 metres. Intermittent zones are broken and/or crumbly. The granite porphyry is altered throughout, being shot through or in contact with zone milky white quartz veins and massive zones of quartz. Granite porphyry fragments are caught up in the quartz. No MoS2 noted until 46.2 metres where a few stringers wih MoS2 appear to 47.2 metres.
LS07-90	47.20	79.25	ASTF	Silica flooded ash tuff zone. Laminated ash tuff fragments within the quartz are mottled grey to dark green and are very distinct at 47.2 and 70.4 metres depth where laminated fragments occur. The section has much less quartz below 64.5 metres. Most of the tuff looks massive and aphanitic (no laminae). The lower part of the section from about 75 to 79.25 becomes a pale green with mafic clots. The section is up to 80% quartz from 47.2 to 64.6 but 70-80% tuff from 64.5 to 79.25. Rare MoS2-bearing stringers occur.
LS07-90	79.25	251.16	QFP	QFP – pale greenish to light grey to creamy greenish white. Quartz eyes visible throughout (10-15%). Significantly more Mo veining begins. Still contains about 20% dead white quartz to about 85 metres. Core is competent through except where indicated. Rock retains greenish (chloritic) hues throughout with large chloritically altered feldspars observed locally. Much less fine stringer and veinlet content in bottom 60 metres.
LS07-91	0.00	3.05	CASING	Casing
LS07-91	3.05	30.15	SILC	High Silica/Silicified Zone. Generally a white, highly siliceous crystalline unit with multiple and numerous quartz veins that gives an appearance of massive quartz overall. From 3-15 m and 18.44-19.8 m is a strongly limonitic (oxidized) section with some manganese oxide (pyrolusite) developed; core is strongly fractured/broken. No MoS2 mineralization is evident in the entire interval. The lower contact grades into a granite porphyry unit that

				is strongly injected with quartz veining/silica.
LS07-91	30.15	49.00	GRPP	Granite Porphyry. The granite porphyry is strongly cut and altered by numerous quartz veins/silica injections that gives the hostrock a fragmented or disrupted appearance. Some areas of granite porphyry are distinctly mottled green due to chlorite alteration; quartz eyes are evident. The quartz veins are crosscutting, numerous and multidirectional. Some granite porphyry remnants within the silica/quartz veined zones have a red-pink colour due to Kspar. Very weak MoS2 in this interval. There are minor areas of limonitic quartz/silica from 31.1-32.1 m. 46.8-47.18 – Mafic Dike. Very fine-grained, black, pyritic mafic volcanic. Contains 1-2 mm quartz-calcite veinlets. Lower contact with quartz feldspar porphyry appears to be marked by 15 cm of quartz/silica veining with weak MoS2
LS07-91	49.00	206.96	QFP	Quartz Feldspar Porphyry. A massive, light green unit with 1-2 mm quartz-feldspar eyes in a siliceous groundmass; some feldspar to chlorite alteration. Widely scattered flecks of pyrite throughout with occasional more intense areas of pyrite concentration, usually in chlorite-rich sections. Some altered granite porphyry and quartz feldspar porphyry fragments and clasts, several centimetres in size, are widely distributed in the quartz feldspar porphyry. Numerous, multiple and multidirectional quartz veining throughout interval. The quartz feldspar porphyry appears more beige-white (unaltered) from about 102.11 to 206.96 (EOH) and contains moderate to low strong MoS2 mineralization. Only major MoS2 veining is documented (~ 3 mm and larger); usually smaller MoS2 veining occurs between.
LS07-92	0.00	3.00	CASING	Casing
LS07-92	3.00	3.10	OVBD	Overburden
LS07-92	3.10	56.60	ASTF	Ash tuff - locally with fine laminae. Not very competent to 50.9 metres. Broken throughout due to altered brittle nature of rock. This rock is generally soft and altered and tends to break easily. The core varies from med grey to grey green to dark greenish grey. Weak (infrequent) veins to 56.6 metres but with strong MoS2 within as bands. Some thin MoS2 bearing stringers and fractures occur between those main MoS2-bearing veins noted below. Pyrite is noted in fractures and in veins throughout.
LS07-92	56.60	65.10	QFP	Quartz feldspar porphyry dike with irregular blocky contacts. It is whitish grey in colour. Moderate argillic alteration. Quartz eyes observed as are fine mafic lathes (biotite) (< 1% mafics).
LS07-92	65.10	104.40	ASTF	Ash tuffs with good sections showing laminae as in previous ash tuff sections. Most of the laminae are dark green to dark grey and light grey to whitish. Pyrite is common throughout. Weak MoS2 bearing veins occur.
LS07-92	104.40	149.00	XLTF	Crystal tuff. The contact is marked by calcite vein at 104.1 metres. Feldspar crystals are < 2 mm and make up 30 to 50% of rock mass. The rock is dark greenish grey in colour. Intermittent altered (argillic and gougy to 118.8

				metres due to 0-30 degree fracturing.
LS07-92	149.00	154.63	FAULT	Intensely altered and rotten contact area. Cataclastic/shear fabric highlighted by thin veinlets at 80 to 90 degrees. Some gougy/crumbly areas.
LS07-92	154.63	170.43	DYKE	Mafic dike. Dark green, fine grained and competent throughout.
LS07-92	170.43	173.30	XLTF	Crystal tuff as described in above crystal tuff section.
LS07-92	173.30	257.00	ASTF	Mixed ash tuff, crystal tuff and some lapilli tuff. Ash tuff has laminated subsections with laminae from 1 mm to tens of centimeters thick. The laminae are typically from 70 to 80 degrees. Clots of epidote and pyrite occur related to fractures. Pyrite is common in fractures.
LS07-92	253.80	257.00	BRXX	A fracture/contact at 35 degrees marks a crushed and healed zone to 257 metres. This marks the transition to an altered volcanic breccia after 257.7.
LS07-92	257.00	290.00	ASTF	Altered ash and lapilli tuff section. Laminae are not evident. Strong argillic alteration obscures textures. Moderate MoS2-bearing quartz veining occurs.
LS07-92	289.00	355.70	BRXX	Silicified tuff breccia. The previous section grades to a very competent silicified dark green rock with similar features but more obscured as a result of the silicification. The pale tuff is still observed as “clasts” but appear to be soaked and silicified and as a result, much hazier. Strong pyrite in veins occurs throughout often with epidote. Mo mineralization is weak.
LS07-93	0.00	3.66	CASING	Casing
LS07-93	3.66	43.45	SILC	High Silica/Silicified Zone. A limonitic/oxidized silica flooded/silicified zone; massive white crystalline quartz/quartz veining that is moderate to strongly fractured; core is generally broken and crumbly in sections. Manganese oxide (pyrolusite) is developed in the upper 14 m. Some very widely dispersed, up to 4 mm, very weakly mineralized banded quartz-MoS2 veinlets. There are occasional limonitic/silicified granite porphyry fragments throughout; fragments increase in frequency as you near the lower contact with the granite porphyry unit (26-43.45 m). Strongly broken/crumbly/fractured core at the following intervals: 7.5-9 m and 12-14.2 m; very strongly broken/fractured from 20.5-26.3 m. The contact with underlying granite porphyry is vaguely gradational as limonitic staining is not evident and the frequency of mottled green-grey and quartz veined granite porphyry becomes more distinct and prevalent in addition to an increase in MoS2 mineralization.
LS07-93	43.45	116.38	GRPP	Granite Porphyry. This unit is cut by numerous, multiple, multidirectional and criss-crossing quartz veining that give the appearance of overall fragmentation. The granite porphyry itself contains quartz and feldspar eyes, 1-2 mm in size, in a siliceous/feldspar rich groundmass with widely distributed biotite flakes; the biotite and feldspar have been altered to chlorite resulting in a green-grey mottled appearance; occasional Kspar results in a pinkish hue. Weak to weak-moderate MoS2 mineralization is developed throughout the unit; most occur as quartz-rich veinlets. Greater than 2-3 mm MoS2 veining has been

				documented but generally there is little to no veining in between.
LS07-93	116.38	120.20	SILC	High Silica/Silicified Zone (see previous description). Strongly silica injected/silicified zone with granite porphyry fragments throughout with weak banded quartz-MoS_2 vein mineralization. Massive, white, crystalline quartz. Upper contact with granite porphyry is 40 ° to core axis. Some fault gouge/brecciation @0 ° to core axis at 118.54 m.
LS07-93	120.20	127.80	GRPP	Granite Porphyry (see previous description). Upper contact with High Silica zone is 15 ° to core axis. Lower contact with volcanic breccia is 80 ° to core axis and marked by a 1.9 cm quartz vein with a centre seam of 0.5 mm MoS_2.
LS07-93	127.80	177.34	BRXX	Volcanic Breccia. A multilithic volcanic breccia containing a wide variety of fragments of varying sizes (cm scale to 10 cm). Fragment composition is crystal tuff, laminated tuff, altered quartz feldspar porphyry?, mafic tuff and granite porphyry. This interval has been injected with multidirectional quartz veining, pyrite veins and banded quartz-MoS_2 veins. Generally weak MoS_2 in the interval. Some mafic dikes and chloritic quartz feldspar dikes cut the section. Some laminated tuff at 136.8 m. MoS_2 veins greater than or equal to 3 mm are documented; generally little (weak) intervening mineralization.
LS07-93	177.34	191.27	GRPP	Granite porphyry. See previous description. A mottled green-grey with occasional slight pink hue in local areas; quartz-feldspar eyes (1-2 mm), biotite to chlorite altered crystals. Some sections are a stronger green colour, losing the mottled appearance due to stronger chloritic alteration. Flecks of pyrite throughout. Groundmass is siliceous. Generally weak to low-moderate MoS_2 mineralization.
LS07-93	191.27	192.76	FAULT	Fault zone. Area of brecciation/gouge (chlorite, clay) with disrupted 5 mm banded quartz-MoS_2 vein @0 ° to core axis. Original rock appears to be granite porphyry. Downhole contact with crystal tuff @50 ° to core axis.
LS07-93	192.76	242.95	XLTF	Crystal Tuff. Silica-injected zone from 192.76 to 193.4 m. Broken (0.5-1 mm) white-beige feldspar crystals in a medium to dark green, silicified intermediate to mafic groundmass. Weak to low-moderate MoS_2 mineralization. Small granite porphyry dike cuts the section. Some chloritic fault/gouge/brecciated zones locally. Feldspar crystals give a finely speckled appearance overall. Some lapilli tuff sections throughout. Mafic dikes and fragments of mafic dike also occur.
LS07-93	242.95	244.55	DYKE	Mafic dike. Black, fine grained, pyritic. 243.2 m – 1.4 cm quartz-MoS_2 vein @0 ° to core axis. Vein just above the contact (242.95 m) cuts off quartz-MoS_2 vein in dike; downhole contact @35 ° to core axis. Some crystal tuff fragments caught up in dike. 244.1-244.5 – 1 cm quartz-MoS_2 vein @0-10 ° to core axis, anastomoses.

LS07-93	244.55	244.98	XLTF	Crystal tuff (see previous description)
LS07-93	244.98	245.85	DYKE	Mafic dike (see previous description).
LS07-93	245.85	251.62	XLTF	Crystal tuff (see previous description)
LS07-93	251.62	267.40	GRPP	Granite porphyry (see previous description). Upper contact is a 4 mm MoS2-quartz vein @35 ° to core axis.
LS07-93	260.90	267.40	FAULT	FAULT ZONE. Broken, crumbly core; fault gouge, fractured and brecciated. Some coherent core pieces up to 20 cm throughout. MoS2 mineralization continues in this interval. From 263-267.4 m is a FAULT/highly brecciated zone with strong fracturing and crumbly, clay/chlorite gouge.
LS07-93	267.40	269.85	DYKE	Mafic Dike – Fault Contact Zone. Upper contact is @0 ° to core axis. From 267.4-268.5 m is strong fault gouge; clay-chlorite, highly fractured/brecciated. Overall interval contains banded quartz-MoS2 veining. Downhole contact with granite porphyry is marked by 1 cm calcite vein @25 ° to core axis. The dike is pyritic with multiple calcite veining.
LS07-93	269.85	282.34	GRPP	Granite Porphyry (see previous description). 273.35-282.34 – a zone of increased silicification and quartz veining as it approaches the downhole HIGH SILICA ZONE interval; some fault gouge (chlorite-clay) throughout this section with associated brecciation/fracturing. MoS2 mineralization continues. There are also some granite porphyry fragments caught up in this zone.
LS07-93	282.34	294.40	SILC	High Silica Zone (see previous description). Upper and lower contacts are strong FAULT gouge (clay) zones; extremely crumbly core/clay mud. Generally the interval is broken core with some coherent core pieces up to 15 cm size. Highly silicified/quartz veined zone; crystalline quartz with MoS2 mineralization throughout (weak to low-moderate).
LS07-93	294.40	303.58	GRPP	Granite porphyry. A massive, medium to dark green unit with little to no faults/fractures. Quartz-feldspar eyes (1-2 mm) in a siliceous groundmass; biotite to chlorite alteration. Weak to absent MoS2 mineralization.
LS07-94	0.00	3.00	CASING	Casing
LS07-94	3.00	38.60	BRXX	Volcanic breccia – Pinkish, feldspar bearing, subvolcanic rock is matrix around primarily tuff fragments. Clasts vary from felsic ash tuff to more intermediated ash and lapilli tuff. Some rare granite porphyry or quartz monzonite porphyry fragments are observed. Weak Mo veining is noted.
LS07-94	38.60	73.20	ASTF	Felsic and intermediate ash tuffs. Some lapilli clast. Some laminae present. The sequence (to at least 53 m) is healed or clast supported breccia with fragments largely in place, or apparently in place. The matris seems to be the same as the clasts. If these are in fact large lapilli then some further brecciation occurred on impacted into the ashy matrix.
LS07-94	73.20	97.60	ASTF	Ash tuff breccia overprinted with silica. The pale (felsic) tuf clasts fade into the background due to this black alteration/silicification. The black overprint is more obvious in this interval, especially from 73.2 to 83 percent metres. Laminae of ash tuff are prominent. Pyrite on fractures is especially heavy and frequent in these black silicified zones.

LS07-94	97.60	104.10	ASTF	Laminated, non-brecciated ash tuff
LS07-94	104.10	145.55	XLTF	Crystal tuff with some small lapilli observed.
LS07-94	145.55	160.43	ASTF	Ash Tuff with laminae around 70 degrees.
LS07-94	160.43	174.40	QMP	Quartz monzonite porphyry. Competent pinkish grey hues becoming greenish locally due to chlorite alteration of biorite. Biotite makes up less than 5 per cent of rock. Weak mo q veining, typically less than 0.5 cm and not frequent.
LS07-94	174.40	181.23	ASTF	Laminated ash tuff. Irregular contact of quartz monzonite porphyry at 174.4 metres. Some minor quartz monzonite and some minor amorphous dikelets. Very strong pyrite on fractures.
LS07-94	182.23	208.50	QMP	Quartz monzonite porphyry as above. Very weak mo q veining.
LS07-94	208.50	227.40	QMP/QVS	Quartz monzonite porphyry/Silica breccia zone. Quartz flooded and veined zone that appears to be qfp with some quartz eye features. However, some mafic remnants indicate qmp that has been altered by the silica. The altered qmp occurs as bx fragments with a mass of quartz matrix and veins (up to 50 per cent and more locally). The qmp fragments are pale creamy buff in colour. Some of this unmineralized q veins shows banding. Typically weak mo bearing stringers occur and a few stronger veins are noted.
LS07-94	227.40	249.30	QMP	Qmp – as described in zone above 208.5 metres. Greenish in colour with pink Kspar. Weak mo q veining.
LS07-94	249.30	274.00	QMP/QVS	Qmp/quartz bx zone. Qmp bx is largely clast supported but some large dead q veins boost the qtz content locally. Same description as previous qmp/quartz bx zone at 208.5-227.4 metres. Still, some textures appear similar to qfp. Strong mo on fractures and stringers and bx networks.
LS07-94	274.00	277.70	FAULT	Fault? Largely broken, crumbly and gougy. No definite shear fabric or fracture/fault orientation.
LS07-94	277.70	292.20	SILC	Silica flooded-tuff (?) breccia section. Mottled dark brown and grey with lapilli (?) clasts. Seventy per cent tuff clasts – broken up and healed by unmineralized q. Some mo bearing taken q occurs moderately.
LS07-94	292.20	298.70	QMP/QVS	Altered qmp/silica-quartz breccia zone as before. Weak mo. Good intrusive contact at 292.1 but blocky (no orientation).
LS07-94	298.70	305.00	TUFF	Dark tuff/quartz breccia.
LS07-94	305.00	306.80	QMP/QVS	Qmp – Silica/quartz breccia as previous qmp/quartz breccia zone. Greenish hue from chloritic alteration.
LS07-94	306.80	329.30	QMP	QMP – not brecciated but is noticeably silicified. Amorphous hazy silica zones overprint the country rock appearing to soak into it. Weak mo q veining.
LS07-94	329.30	335.30	QMP	Contact of qmp with dark grey too blackish tuff. Shot through with parallel to subparallel white q veins at 45 degreess. This section has a 60 degrees fabric through and remnant intrusive textures of the qmp are observed. The zone observed appears to be a flooded shear with introduced black mineral (manganese?).
LS07-94	336.30	378.00	QMP	Qmp – hazy silicified throughout. Textures of qmp occasionally lost in silicification. Foliated zones uup to 30 cm appear to be chlorite or manganese rich (black mineral) shear zones healed or flooded with silica. They contain small and finely comminuted fragments of the qmp

				country rock that are obscured or black due to being soaked in introduced “black silica”.
LS07-94	377.50		FAULT	Fault contact – gougy, chloritic fracturing at 5 degrees
LS07-94	377.50	445.28	QMP	Good pink qmp holding together and generally competent. Very weak mo q veining
LS07-94	445.28	599.54	TUFF	Black foliated clastic rock (mafic tuff) with small pale and dark angular fragments and small white crystal (?) pieces (<1mm). Feint banding is observed indicative of bedding. Pyrite in stringers and fractures is common throughout. Weak mo q veining. Hematitic coatings on fractures
LS07-95	0.00	3.05	CASING	Casing
LS07-95	3.05	102.41	GRPP	Granite porphyry with significant silica/quartz zone. The unaltered zones show feldspar and biotite(?) (< 3 mm but typically < 1 mm). The fresh rock has a greenish grey hue due to weak pervasive chlorite alteration. The feldspars make up about 30% of the rock and the mafics about 5%. The core is shot through with varying amounts of quartz that is typically unmineralized with respect to MoS2. Very weak MoS2 veining is noted from about 25 metres depth and increases in strength after about 40 metres but still weak. The core is weakly argillically altered to 5.3 metres and fairly competent. From 5.3 to 30.7 metres it is strongly broken and argillically altered and oxidized, with prominent iron oxides staining. FeOx stain is notable from 3.05 to 33.1 metres after which the core is greenish to grey, competent and holding together in large sections. Carbonate veining and/or alteration also occurs.
LS07-96	0.00	3.00	CASING	Casing
LS07-96	3.00	3.20	OVBD	Overburden rubble, pebbles and mud.
LS07-96	3.20	3.60	DYKE	Lamprophyre? Dike. Dark grey-black, very fine to fine grained, equigranular texture. Groundmass is feldspar-biotite with olivine? crystals.
LS07-96	3.60	142.15	QFP	Quartz Feldspar Porphyry. Generally the quartz feldspar porphyry is a massive, beige-white colour, aphanitic with quartz-feldspar eyes from 1-2 mm in a siliceous matrix. Some specks of pyrite throughout. Weak chlorite alteration of feldspars in some areas. On average, the MoS2 content/veining is moderate to low-strong. MoS2 is contained in banded quartz-MoS2 veins, quartz-MoS2 veins, MoS2-quartz veins, and as seams of MoS2. The larger or more significant MoS2 veins are documented; numerous MoS2 veinlets usually occur between. 70-72.8 – fault/clay gouge; crumbly, broken core; 1.2 cm banded quartz-MoS2 vein @0 ° to core axis
LS07-96	142.15	159.00	FAULT	Fault zone. Clay/chlorite gouge, crumbly, broken core. Uphole fault contact with quartz feldspar porphyry is @0 ° to core axis and is marked by strong chlorite along fault plane/slip at 143 m with fault @10 ° to core axis. At 142.15 the fault cuts off 1-4 mm MoS2-quartz veins that are @25-30 ° to core axis. Clay/chlorite throughout entire interval with MoS2 mineralization. Some coherent, massive core sections up to 15 cm length and total about 12 pieces. 149.31 m – fault angle @0 ° to core axis and marked by strong chlorite gouge.

LS07-96	159.00	303.58	QFP	Quartz feldspar porphyry. See previous description. 213.4-230 – core is broken, crumbly, brecciated with several chloritic fault slips, clay gouge; mineralized with banded quartz-MoS2, MoS2-quartz and quartz-MoS2 veinlets throughout. Some more massive, coherent pieces of core up to 20 cm dispersed throughout. 225.1-230 – FAULT ZONE – strongly broken/crumbly core with clay/chlorite gouge; fault plane @0 ° to core axis; section is mineralized with MoS2 and pyrite content has increased; 271.7-280.6 – broken core with some faulting and clay/chlorite gouge sections. Fault planes @20, 30 and 40 ° to core axis. Some coherent, massive core pieces up to 20 cm dispersed throughout. Increased pyrite content. Brecciated and faulted MoS2 veins throughout.
LS07-97	0.00	3.00	CASING	Casing
LS07-97	3.00	62.00	QFP	Quartz feldspar porphyry breccia/Silica zone – greater than 50 per cent quartz throughout. Overall it appears that quartz feldspar porphyry fragments are suspended in a quartz matrix. In some areas the quartz feldspar porphyry clasts are so altered, bleached and silicified as to appear similar to the quartz matrix. The quartz feldspar porphyry occurs as an aphanitic rock with occasional quartz eyes and chloritically altered feldspar. No mafics occur. The colour of the quartz feldspar porphyry clasts are a creamy whitish grey with a green chloritic tinge. MoS2 in stringers and quartz veins is uncommon and weak or infrequent and narrow (typically <1 mm). Mineralized veins cut across quartz feldspar porphyry fragments and the quartz matrix. FeOx staining is strong to 10.5 metres and still weakly visible on fracture faces to 26 metres. No definitive mafics or altered mafics are observed until around 62 metres where some clasts are interpreted as granite porphyry. Significant mineralized veins and features are indicated below.
LS07-97	62.70	72.46	QFP	Mixed granite porphyry and quartz feldspar porphyry zone where clasts appear to be of both types. The much altered nature of the zone makes it difficult to quantify the clast types but most appear to be quartz feldspar porphyry having quartz eyes, no mafics and a fine groundmass.
LS07-97	72.46	102.41	GRPP/QVS	Granite porphyry/silica zone – altered granite porphyry showing remnant mafic textures and biotite molds. This grades to more definitive intrusive textures with strong mafics (biotite) by 88.5 metres and to the end of hole. Much stronger MoS2 mineralization in terms of MoS2-bearing vein frequency and width occurs. Twenty per cent quartz vein content occurs through this section.
LS07-98	0.00	3.00	CASING	Casing. Some silicified volcanic breccia cobbles/boulders.

LS07-98	3.00	34.44	BRXX	Silicified sub-Volcanic Breccia. A silicified/silica injected or flooded volcanic breccia interval. Some banding/laminations are preserved throughout with significant areas that have a porcellanous/cherty appearance due to silica alteration/flooding; these areas are also brecciated. Fragments in the breccia are silicified and cm size. Matrix to breccia in places is a red-brown feldspar-quartz mix. Local areas contain these red-brown matrix areas as fragments themselves floating in a siliceous/flooded groundmass (15.3-26 m). After 26 m , the section appears to grade to a silica-enriched zone (may be altered quartz feldspar porphyry). From 26-34.44 m, this is an area of a more massive, white, silicified unit with quartz fragments (may be quartz feldspar porphyry). At 14 m there is a 25 cm section of quartz feldspar porphyry with quartz fragments; at 15 m, a 50 cm section of quartz feldspar porphyry with quartz fragments. Minor pyrite stringers throughout the interval; calcite stringers/veinlets locally. Weak MoS_2 mineralization; major veins greater than or equal to 3-4 mm are documented with little to no intervening veining evident. Chlorite-pyrite occur along fracture planes.
LS07-98	34.44	53.69	TUFF	Silicified Laminated Tuff/Lapilli Tuff Breccia. A distinctive, silicified or silica flooded laminated tuff to lapilli tuff breccia that has a porcellanous/cherty appearance. Local areas of remnant laminated tuff. The interval is generally brecciated and fractured and re-flooded with silica; has a brown-red-green colour. Some fault/gouge sections. Weak to low-moderate MoS_2 mineralization with local pyrite. 39.5-43 – FAULT/crumbly core @0 ° to core axis; clay-chlorite gouge, contains MoS_2 mineralization. Some coherent 10 cm core pieces. Interval is brecciated/fractured.
LS07-98	53.69	65.20	QFP	Quartz Feldspar Porphyry (see previous description). Upper contact is fault/clay gouge @10 ° to core axis. Interval is grey-white to slight green colour due to chlorite alteration; 1-2 mm quartz and feldspar eyes in a siliceous matrix. Moderate MoS_2 mineralization throughout; some occasional pyrite veinlets (2 mm). Silicified and fractured/brecciated areas. Lower contact with mafic dike is @20 ° to core axis.
LS07-98	65.20	70.50	DYKE	Mafic Dike (see previous description). Uper contact is @20 ° to core axis; lower contact is @25 ° to core axis. Dark black, fine grained interval; pyritic patches and veinlets cut by 1-2 mm calcite veinlets and 1-2 mm banded quartz-MoS_2 veinlets.
LS07-98	70.50	72.85	QFP	Altered Quartz Feldspar Porphyry. Massive green-grey unit with slight pink hue (Kspa?). Green colour due to chlorite alteration. Siliceous with quartz-feldspar eyes. Downhole contact with Tuff/Breccia porcellanous unit is @50 ° to core axis.
LS07-98	72.85	90.00	TUFF	Laminated Tuff/Lapilli Tuff Breccia (see previous description). Laminated ash tuff sections at 76.4-77 m and 77.6-79.35 m; laminations @80 ° to core axis; 86.25-90 – massive section of quartz/silica altered quartz feldspar porphyry? containing increased MoS_2 veining; upper contact appears gradational @20 ° to core axis and marked by anastomosing 2-3 mm banded quartz-MoS_2 veins @0-5 ° to core axis that continues downhole to a massive 2

				cm banded quartz-MoS2 vein @0 ° to core axis that extends from 86.4-87 m
LS07-98	90.00	126.80	XLTF	Crystal Tuff (see previous description). A green-grey-brown ‘speckled’ appearance due to crystals of feldspar-quartz in an intermediate to mafic groundmass. Some darker sections due to chlorite enrichment/alteration. Some silicified sections with pale green hue; more massive texture with brecciation. Weak to low-moderate MoS2 mineralization throughout the interval. Some local lapilli tuff sections. Calcite-pyrite in local concentrated areas.
LS07-98	126.80	132.00	TUFF	Mafic Ash Tuff. A dark green-black, finely laminated mafic ash tuff crosscut by quartz-calcite-pyrite veinlets. Downhole contact @50 ° to core axis and is marked by faulted 5-6 mm quartz veins with pyrite; uphole contact @20 ° to core axis.
LS07-98	132.00	140.00	XLTF	Crystal Tuff (see previous description).
LS07-98	140.00	152.00	QMP	Quartz Monzonite Porphyry. A massive, almost equigranular unit with quartz-feldspar crystals/eyes in a siliceous groundmass with biotite, specks of pyrite and biotite altering to chlorite resulting in mottled appearance. Some areas with light pink hue due to Kspa; feldspar crystals altered to clay. Weak MoS2 mineralization.
LS07-98	152.00	159.54	XLTF	Crystal Tuff (see previous description). Some quartz monzonite porphyry fragments throughout. Interval contains numerous quartz with MoS2 veins. Some local areas of fine grained, black ash tuff. Downhole contact with quartz monzonite porphyry is 85 ° to core axis; clean, sharp and marked by 1 mm quartz-MoS2 vein
LS07-98	159.54	165.50	QMP	Altered Quartz Monzonite Porphyry. A chlorite altered interval from 159.54-163 m and then lightens in colour (less altered). Some pink Kspar rich areas locally. Downhole contact with laminated tuff interval is ragged but ~ @90 ° to core axis.
LS07-98	165.50	233.78	TUFF	Laminated Tuff/Ash Tuff to Lapilli Tuff. Generally a dark green-black-grey colour with laminations obvious throughout the interval but becomes more massive ash tuff (no laminations). Some silica/quartz flooded areas with brecciation; these areas also locally have a porcellanous appearance. Moderate MoS2 mineralization throughout; pyrite veinlets and patches locally. Some fault (chlorite-clay) gouge areas. Laminations generally @70-80 to core axis; some laminae are banded quartz-MoS2 veining. Some crystal tuff areas developed. Strong chlorite altered areas usually contain pyrite. 185.26-188.8 – FAULT ZONE. Chlorite-clay gouge, brecciated/fractured core; contains MoS2. Uphole fault contact may be @30 ° to core axis; downhole contact @10 ° to core axis; 203-220 – more massive ash tuff, no laminations; becomes slightly coarser crystal tuff

LS07-98	233.78	238.25	FAULT	FAULT zone/gouge. Uphole contact may be 45 ° to core axis; downhole contact may be 90 ° to core axis. A strong fault gouge (chlorite-clay) zone that is light green to dark green colour. Extremely crumbly, shattered/fractured/brecciated core; some coherent core pieces up to 35 cm. Section is silicified; some pink Kspa areas. Interval contains pieces of banded quartz-MoS2 veins up to 2 cm in width.
LS07-98	238.25	248.40	TUFF	Ash Tuff/Lapilli Tuff (see previous description).
LS07-98	248.40	249.70	FAULT	Fault zone. Chlorite-clay gouge. Fractured/brecciated core. Uphole contact may be @20 ° to core axis; downhole contact @10 ° to core axis. Some crumbly/broken core.
LS07-98	249.70	276.15	TUFF	Ash Tuff/Lapilli Tuff (see previous description).
LS07-98	276.15	285.65	DYKE	Mafic Dike. Black, very fine grained mafic volcanic unit with pyrite-calcite veinlets and chlorite patches throughout. Weak MoS2 mineralization. Downhole contact is @5 ° to core axis; uphole contact @90 ° to core axis.
LS07-98	285.65	291.15	TUFF	Ash Tuff/Lapilli Tuff (see previous description).
LS07-98	291.15	300.10	DYKE	Mafic Dike (see previous description). Uphole contact is @30 ° to core axis; downhole contact is @0 ° to core axis and marked by a 5 mm banded quartz-MoS2 vein. The interval contains no MoS2 mineralization.
LS07-98	300.10	329.43	LPTF	Lapilli Tuff. A dark green-grey, mafic volcanic unit containing chloritic fragments from 0.5 to 1 cm size. Weak MoS2 mineralization throughout; 1 mm pyrite veining common. Generally a chloritic altered interval.
LS07-98	329.43	334.56	QMP	Quartz Monzonite Porphyry. Uphole contact with tuff unit is 85-90 ° to core axis and a bit ragged; contact is cut by 1-3 mm banded quartz-MoS2 vein. Downhole contact is fault (chlorite-clay) gouge @30 ° to core axis. The interval is generally a massive, mottled grey-green pinkish colour; feldspar alters to clay, biotite alters to chlorite, with some Kspa enriched zones. Texture is feldspar-quartz eyes (1-2 mm) in a siliceous, fine grained, massive siliceous groundmass. Some fault (chlorite-clay) gouge sections throughout. Specks of pyrite and some veinlets throughout. Weak Mos2 mineralization overall. Some banded quartz-MoS2 veins are developed in a 3 m zone near the uphole contact with the tuff unit but then mineralization drops significantly downhole away from the contact. In the entire interval, only 3 mm veins and larger are documented; there is little to no intervening veins.
LS07-98	334.56	339.30	FAULT	FAULT/gouge zone. Uphole contact is @20 ° to core axis; downhole contact is @20 ° to core axis. Both contacts are highly fractured/clay gouge. The interval is strongly brecciated/fractured with clay-chlorite. Very weak MoS2 mineralization throughout.
LS07-98	339.30	365.10	QMP	Quartz Monzonite Porphyry (see previous description). A 3 mm banded quartz-MoS2 vein @10 ° to core axis is developed along and near the uphole contact with fault zone; downhole contact @20 ° to core axis of fault-chlorite gouge.

LS07-98	365.10	375.88	TUFF	Crystal/Lapilli Tuff – FAULT zone. Downhole contact with quartz monzonite porphyry @30 ° to core axis. The interval is fractured/brecciated with calcite-quartz veining and chlorite fault gouge with pyrite. Weak to low-moderate MoS2 veining and occasional broken vein pieces. Uphole contact with quartz monzonite porphyry (365.1-366.7 m) is probably FAULT - gouge, crumbly/chloritic broken core; some coherent core pieces up to 20 cm size. The overall interval probably represents a fault zone.
LS07-98	375.88	377.13	QMP	Quartz Monzonite Porphyry (see previous description). Downhole contact @20 ° to core axis; 5 mm banded quartz-MoS2 vein @0 ° to core axis cuts through contact into downhole Tuff section.
LS07-98	377.13	384.97	FAULT	FAULT Zone/Mafic Crystal Tuff. Downhole contact @45 ° to core axis marked by strong chlorite gouge (30 cm section from contact going uphole). Interval has very strong chlorite-clay gouge and is highly fractured/brecciated. Some visible banded quartz-MoS2 veining. Almost the entire interval is gouge.
LS07-98	384.97	404.46	QMP	Quartz Monzonite Porphyry. Uphole contact with tuff/fault zone interval is marked by 45 cm pink-white calcite vein. The downhole contact of the calcite vein @30 ° to core axis; uphole calcite vein contact @45 ° to core axis.
LS07-99	0.00	1.52	CASING	Casing
LS07-99	1.52	199.95	QFP	Quartz feldspar porphyry – creamy grey-white with some areas that are greenish tinged indicating chloritic alteration. Quartz feldspar porphyry has 10 to 15% qtz eyes (<2 mm) and occasional areas where feldspar phenocrysts are apparent (<3 mm). Rare foreign clasts are medium grey and probably mainly tuffs. Foreign clasts start to increase dramatically around 162 metres and continue to increase to end of hole, making up as much as 5 per cent rock after 162 metres. Clasts range from a few millimeters to 10 centimetres. Fracturing, some with pyrite have 0.1 to 1 cm envelopes of dark grey alteration that appears to be silicification. These are typically from 0 to 30 degrees in orientation. Only a few larger veins with MoS2 are noted to 70 metres. Thinner MoS2 bearing veins, stringers and fractures occur but are not frequent. Major veins and features are noted. Hairline fractures with MoS2 are observed but not typically noted below. All measurements (orientations) are to core axis (0 degrees). The core is competent (much less broken) from 34 to 70 metres.
LS07-100	0.00	3.00	CASING	Casing
LS07-100	3.00	13.30	BRXX	Volcanic breccia/tuff breccia. Intrusion of pink feldspar sub volcanic (quartz monzonite porphyry related?) is matrix around felsic ash tuff to lapilli tuff. Most clasts are felsic ash but some lapilli clasts within the tuff are more mafic. Other foreign clasts (not felsic tuff) seem to occur within the pink feldspar subvolcanic matrix. Very broken core to 14.5. Very weak MoS2 quartz veining occurs.

LS07-100	13.30	32.00	ASTF	White felsic and siliceous ash tuff. Some small intermediate lapilli clasts occur as do some very small dark disseminated specks (?). Feint swirly laminae are observed locally. Numerous 30 degree healed micro fractures with grey silicified envelopes and pyrite. MoS_2 in thin banded quartz veins and stringers. Grades to breccia around 32 metres.
LS07-100	32.00	42.00	LPTF	Zone where felsic ash tuff grades to more of a breccia with larger foreign clasts. (lapilli) but also has zones where it was broken and re-healed by the reddish intrusive (subvolcanic?) (quartz monzonite porphyry?) matrix. Still weak MoS_2 quartz veins.
LS07-100	42.00	76.00	BRXX	Volcanic breccia composed of felsic lapilli tuff with grey tuff clasts and fine pink (quartz monzonite porphyry) clasts that is probably the same matrix as at hole beginning and at the beginning of Hole 94. The white ash tuff is broken and intruded locally by the fine medium grained quartz monzonite porphyry matrix. MoS_2 quartz veining starting to increase in thickness if not in frequency.
LS07-100	76.00	93.17	BRXX	Tuff breccia, still porcelaneous ash tuff at beginning. Banded ash beds (laminae) at 40 degrees and lapilli tuff. Areas of subsequent brecciation where porcelaneous ash tuff is shattered and healed by a darker material. Not seeing the reddish (quartz monzonite porphyry?) matrix around tuff clasts. This section could be a combined with previous section.
LS07-100	93.17	117.85	LPTF	Lapilli tuff (?) section. Still with porcelaneous (cherty ash) matrix at top. Medium grey to green clasts are angular and typically < 2 cm. Crystal tuff clasts also.
LS07-100	117.85	122.20	QFP	Felsic dike. Probably quartz feldspar porphyry. It is aphanitic rock with rare quartz eyes and fine biotite. The pinkish pale grey hues could mean that it is related to the quartz monzonite porphyry.
LS07-100	122.20	129.60	BRXX	Mottled dark green and grey volcanic breccia or tuff with clasts of feldspar porphyritic rock (crystal tuff?) and the biotite bearing felsite (quartz feldspar porphyry or quartz monzonite porphyry). A fine dark silica material appears to be the healing matrix.
LS07-100	129.60	132.46	XLTF	Altered dark green crystal tuff.
LS07-100	132.46	139.00	QFP	Felsic dike. Same as in 117.85 section. Pinkish hue with quartz eyes and some fine biotite. QFP or fine quartz monzonite porphyry.
LS07-100	139.00	149.00	XLTF	Dark green to dark grey crystal tuff with 30 per cent broken crystals.
LS07-100	149.00	168.80	DYKE	An unusual zone where rock is a black aphanitic, mafic rock to 154.8 and then becomes a cherty, porcelaneous texture occurs and seems to overprint the crystal tuff. From about 161-167 metres. From 159.2-160.9 metres is more of the black mafic (dike?). The contact at 159.2 is blocky but sharp. Pyrite occurs as thin veinlets and fractures throughout but very little MoS_2 quartz veining occurs.
LS07-100	168.80	173.70	DYKE	Mafic fine dike (?) Pyrite common along fractures and veinlets. Some hazy fragments may indicate a tuffaceous genesis. The contact at 173.7 with laminated ash tuff appears gradationa. Very little MoS_2 quartz veining.
LS07-100	173.70	244.80	ASTF	Intermediate to felsic ash tuffs with some good laminae that vary from greens to dark grey to light grey. Pyrite throughout often with epidote. Infrequent MoS_2 veins

				bury they are thicker.
LS07-100	244.80	251.55	QFP	Silicifed, altered intrusive dike. Some fine altered mafic remnants and quartz eyes.
LS07-100	251.55	288.05	TUFF	Tuff sequence. As above 244.8. More toward intermediate to mafic lapilli tuffs. Only hints of bedding laminae. Rare MoS2 quartz veining. Pyrite is common throughout in fractures and seams. Some epidote is often associated with the pyrite. Calcite on fractures. Largely broken to at least 296.75 (end of run).
LS07-100	288.05	331.31	QFP	White quartz and feldspar intrusive dike. Some fine mafic remnant lathes. Biotite(?) Hornblende(?) Very altered throughout, especially broken from 258-292.8. Still pyritic throughout. From 297 to hole's end this cherty siliceous rock carries significant clasts (up to 10 per cent) of a grey to green colour (tuffs?). Some of the cherty felsic matrix appears to have quartz eyes and feldspar remnants. This rock could be an altered and silicified quartz feldspar porphyry. Very broken and brittle throughout No apparent MoS2 quartz veining after 296.5 metres.
LS07-101	0.00	3.00	CASING	Casing
LS07-101	3.00	102.41	QFP	Quartz Feldspar Porphyry. Pale grey to cream buff (when dry). Contains about 10% quartz eyes and locally feldspars are visible and compose up to 10%. Medium grey foreign clasts (crystal tuff?) occur sporadically throughout. Competent throughout but broken along numerous fractures. Weak MoS2 quartz veining. Veins rarely are >5 mm. Pyrite bearing fractures with siliceous envelopes typically 20 to 30 degrees.
LS07-102	0.00	6.09	CASING	Casing. From 6.09-7 m, broken core.
LS07-102	6.09	61.60	QFP	Quartz Feldspar Porphyry (see previous descriptions). White to white-beige to very pale green hue in some local areas. A massive siliceous unit with quartz-feldspar eyes (1-2 mm) set in a finer grained siliceous groundmass. Widely distributed biotite and specks of pyrite; biotite alters to chlorite. Weak MoS2 mineralization in the interval. Only 4 mm and greater MoS2 veins documented; smaller veins may occur between. From 35 to 61.6 metres, mineralization decreases substantially.
LS07-102	61.60	76.00	QMP	Quartz Monzonite Porphyry (see previous descriptions). A massive, light green-pink-grey unit that has a speckled appearance due to feldspar to clay altered eyes. Feldspar-quartz eyes (1-2 mm) set in a siliceous groundmass; biotite and specks of pyrite widely dispersed. Uphole contact with the quartz feldspar porphyry may be @70 ° to core axis and is fault gouge; downhole contact with quartz feldspar porphyry is crumbly, rubble fault gouge. Little to no MoS2 mineralization in the interval.
LS07-102	76.00	98.14	QFP	Quartz Feldspar Porphyry (see previous description). Uphole contact with quartz monzonite porphyry is crumbly/broken fault gouge from 75.9-77 metres. No or very little MoS2 mineralization in the interval.
LS07-103	0.00	3.00	CASING	Casing.

LS07-103	3.00	87.17	QFP	Quartz Feldspar Porphyry (see previous descriptions). White to white-beige to very pale green hue in some local areas. A massive siliceous unit with quartz-feldspar eyes (1-2 mm) set in a finer grained siliceous groundmass. Widely distributed biotite and specks of pyrite; biotite alters to chlorite. Very weak MoS2 mineralization in the interval. Only 3 mm and greater MoS2 veins documented; very sparse mineralization overall with some veinlets less than 1 mm. From 3 to 42 metres, the quartz feldspar porphyry has a very pale green hue; downhole after 42 metres it becomes more white to white-beige from 42-64 m. Overall from 19 to 87.17 m (EOH) the interval is very broken up and blocky with numerous 5-10 cm core pieces but also up to 20 cm. Some crumbly/gouge areas at 55.3 m and 58.1 m. 64-75.75 – a green-white-beige siliceous quartz feldspar porphyry with feldspar eyes altered to clay resulting in a mottled appearance. Uphole contact with the whiter quartz feldspar porphyry is broken and vague/gradational? 75.75-87.17 (EOH) – a white (not mottled) quartz feldspar porphyry
LS07-104	0.00	1.52	CASING	Casing
LS07-104	1.52	99.90	QFP	Quartz Feldspar Porphyry. This interval is a massive, white-beige (grey) colour with quartz-feldspar eyes (1-2 mm) set in a finer grained siliceous groundmass. Biotite and specks of pyrite are widely distributed; biotite alters to chlorite. Silicified/siliceous tuff fragments and quartz vein fragments occur throughout the interval. Some local zones of breccia due to quartz/silica flooding that contains angular fragments of tuff, quartz feldspar porphyry and quartz veins. Some areas exhibit a red-brown felsic matrix containing 1-2 mm white feldspar and quartz crystals. Generally there is very weak and tiny (less then 0.5 mm) veinlets of MoS2 mineralization from 1.52-32 m. From 58-86 m MoS2 veining increases in frequency. Quartz and/or pyrite veining (1-3 mm veinlets) are more prominent and increase in intensity from 21-32 m. Only major veins (3-4 mm and larger) are documented; smaller veinlets may occur between.; 32-132 – a silica-quartz flooded breccia zone within the quartz feldspar porphyry; fragments throughout with increased chlorite alteration that results in a pale green hue. MoS2 becomes more prevalent as specks and patches; 58-86 – MoS2 veining increases in frequency
LS07-104	99.90	132.00	SILC	Silica Flooded/Healed Quartz Feldspar Porphyry. Siliceous unit with tuff and quartz vein? fragments up to 5 cm size. Some MoS2 along fragment boundaries in the breccia. Generally the interval is a creamy, beige-white colour. Weak MoS2 mineralization; pyrite developed locally with quartz-MoS2 veins. Local areas (112.75-113.75 m) of red-brown breccia unit with angular fragments of quartz and quartz feldspar porphyry set in a siliceous (red-brown) finer groundmass.

LS07-104	132.00	190.70	TUFF	Crystal Tuff/Lapilli Tuff Breccia. A mafic volcanic breccia unit, dark green-grey colour which contains some laminated tuff sections and crystal tuff sections. Fragments are 2 mm to 5 cm in size on average. A silicified/silica injected or flooded volcanic breccia interval. Pyrite and/or chlorite occur along fractures; some calcite veining locally. Some banding/laminations are preserved throughout with significant areas that have a porcelaneous/cherty appearance due to silica alteration/flooding (161-183 m); these areas are also brecciated with some Kspa enriched zones. Generally low-moderate MoS2 mineralization. Some more massive ash tuff areas near downhole contact with quartz monzonite porphyry.
LS07-104	190.70	199.35	QMP	Quartz Monzonite Porphyry. A massive, green-grey, almost equigranular unit with quartz-feldspar crystals/eyes in a siliceous groundmass with sparsely distributed biotite, specks of pyrite and biotite altering to chlorite resulting in mottled or speckled appearance. Some areas with light pink hue due to Kspar; feldspar crystals altered to clay. Very weak MoS2 mineralization in the interval
LS07-104	199.35	227.20	TUFF	Ash tuff, lapilli tuff, crystal tuff. This section bears a “crackle” like brecciated texture (same as 132 to 190.7 metres) The matrix in the crackle zone is greenish and siliceous. The rock is green with pale whitish areas which generally indicate a felsic ash. Pyrite-bearing fractures to EOH.
LS07-104	228.20	279.50	TUFF	Tuff section. As in 199.35 to 227.2 but “crackle” nature is largely gone. Ash tuff laminae intact and distinct locally. Ash laminae vary from pale green to dark green to almost white. The core is competent and holds together well: 260.45-261.61 – Fault A chloritic clay fault contact gouge zone starts 260.45 metres and is marked by strong planer fracture with a pink-white calcite vein (1.2 cm thick). The vein and fault contact at 260.45 is 35 degrees. The entire zone to 261.61 is gougy, chloritic and grey. Mo quartz veining drops off to weak at beginning of this section
LS07-104	279.50	316.08	LPTF	Lapilli tuff. A gradational contact occurs around 279.5 but is obscured by the broken core. Clasts are dark green and the matrix is medium green. Clasts vary from 1 mm to 1 or 2 cm across. Pyrite and epidote and or calcite occur on fractures throughout. Weak MoS2 quartz veins occur. Core is competent and unbroken to end of hole.
LS07-105	0.00	3.00	CASING	Casing
LS07-105	3.00	3.20	OVBD	Overburden
LS07-105	3.20	105.46	QFP	Quartz feldspar porphyry- grey to creamy buff aphanitic matrix with 10 per cent quartz eyes. Occasional weak chloritic alteration of feldspar giving a pale greenish hue. Rare medium grey foreign tuffaceous clasts occur occasionally. Core is competent but moderately fractured (at 45 and 65 to 75 degrees) and consequently broken throughout. Common silicified, pyrite-bearing fractures at 15 to 30 throughout. The silicified envelopes are up to 5 mm on each side of fracture. Very weak MoS2 quartz veining. The veins are typically less than 1 mm and rarely > 5 mm. Significant veins are given below.
LS07-106	0.00	6.10	CASING	Casing.

LS07-106	6.10	99.06	QFP	Quartz Feldspar Porphyry (see previous descriptions). White to white-beige to very pale green hue in some local areas. A massive siliceous unit with quartz-(feldspar) eyes (1-2 mm) set in a finer grained siliceous groundmass. Widely distributed biotite and specks of pyrite; biotite alters to chlorite. Very weak MoS2 mineralization in the interval; most veins in local isolated areas are hairline size (0.5 mm and less) but generally very sparse to no mineralization. One area (62.78-64.95 m) contains angular, cm size, dark grey quartz vein fragments in quartz feldspar porphyry groundmass. Overall the core within the entire interval is moderately broken up and blocky; only the strongly broken core sections are documented. 38.4-44.5 – quartz feldspar porphyry is a stronger white colour; from 44.5 to 99.06 m (EOH) it is white-grey with very slight pale green hue. 76-80.5 – numerous and relatively widely spaced hairline-size quartz and banded quartz-MoS2 veinlets @80 to 90 ° to core axis.
LS07-107	0.00	2.78	CASING	Casing
LS07-107	2.78	9.05	VOLC/SED	Dark gray volcanics and occasional sediments, with some lighter greenish phases. Frequent Qz veins containing pyrite, with rare MoS2. Alteration of host to lighter gary pinkish-green along veins (K-ALT). Locally where Py common some magnetism. Py stringers generally at low angles to CA, about 20-25 CA. Locally some calcite..
LS07-107	9.05	11.10	XLTF	Gray crystal tuff fragments generally 1 mm across, some bigger. Abundant disseminated Py, occasional Mo-Qz veinlets
LS07-107	11.10	34.80	BRXX	Pinkishgray blocky volcanic breccia, possibly rhyolitic composition. Bedding or layering ccasionally visible. Layers fragmented often and could be ash tuff. Varies in colour to cream-white to (rarely) darker gray. Py fairly common, but also some Mo in stringers and along sheared surfaces. Very siliceous. Core broken in places.
LS07-107	34.80	37.60	VOLC/SED	Darker gray volcanics & sediments as seen at beginning of hole. Some fracturing & Qz veins, with scattered Py. Minor calcite locally. Core quite broken. Possible fault.
LS07-107	37.60	39.50	BRXX	Pinkish-gray volcanic breccia as above.
LS07-107	39.50	43.80	TUFF	Darker gray volcanics as above, some pinkish sections, small fragments which could be ash tuff. At 40.80, 1 cm Qz-calcite vein, 30 CA
LS07-107	43.80	54.75	TUFF	Pinkish-gray brecciated volcanics & volcanoclastics as above, felsic, with occasional grayer sections Some calcite, occasional Qz-Mo veins, visible flow banding in places. Highly fractured, with some clay alteration.
LS07-107	54.75	63.75	XLTF	Pale gray to whitish crystal tuff with greenish tint, some biotite flakes. Larger qz and white feldspar fragments in finer matrix. Could also be a QFP dyke. (Could be a horizon marker: Also seen in Hole 108 at 58.50-61.63) Stringers of Mo-Qz fairly common, broken by later veining, minor Py in places.
LS07-107	63.75	79.30	TUFF	Variable pinkish gray volcanic, blocky in places, some brecciation and banding. Occasional Qz-Mo veins. Darker sections as noted previously. Locally some calcite
LS07-107	79.30	80.40	ASTF	Generally thinly laminated pinkish gray ash tuff, laminations abt 50 CA. Py stringers as at 0.0 woith paler gray ateration banding 3 mm wide.

LS07-107	80.40	93.50	ASTF	Grayish f.gr. volcanic, not as brecciated as above, occasional vaiations in colour to pink gray, Py stringer common, some Py blebs, occasional Mo-Qz veins.
LS07-107	93.60	95.30	ASTF	Thinly laminated greenish-gray to darker gary ash tuff and/or seidemnts. At 9.35 to 95.05, vertical fracture with coating of PY. Layering is 70-90 CA. Py also dissem. Throughout.
LS07-107	95.30	96.32	TUFF	Mixed gray-green volcanic. Abundant Py, up to 20 p.. locally, epidote & Py concentrations
LS07-107	96.32	97.12	DYKE	Basic andesitic dyke, f.gr., Py abt 10-15 p.c., magnetic.
LS07-107	97.12	121.50	TUFF	Mixed volcanics and tuffs ranging from rhyolitic to andesitic. Some layering, some patches of Py and epidote. Py can be up to 5-10 p.c. locally. Rare veins of Mo.
LS07-107	121.50	134.60	XLTF	Generally gray crystal tuff with whitish fragments, usually abt 1 mm. Some variations, e.g. lapilli tuff at 12.45 to 128.3 Occasional Volcanics as above.
LS07-107	134.60	135.40	DYKE	Mafic dyke, heavily pyritized & epidotized. Strongly magnetic. (VP logs)
LS07-107	135.40	137.25	TUFF	Mixed volcanics and ash tuffs as above. Frequent Py stringers and epidotization, as at 135.94 to 136.45, nearly parallel to CA.
LS07-107	137.25	140.40	DYKE	Mafic dyke, Py rich, core very broken. Magnetic. Fractures often filled with vuggy epidote. Occasional banded veins of vuggy almost “rotten” Qz which comes apart from the mafic rock. Contains Mo along edges and with Py centres. As at 137.80 and 138.0.
LS07-107	140.40	143.20	TUFF	Contact at 25 CA of maafic dyke and white aphanitic felsic dyke, possibly tuff or rhyolite, with small stringers of Mo, plus dissem. Py and minor dissem. Mo.
LS07-107	143.20	144.80	DYKE	Mafic dyke, Py rich. Very broken core. Magnetic. One separated Qz vein, 6 mm, “rotten” as above, pyr core, Mo on edges.
LS07-107	144.80	146.03	TUFF	Greenish gray volcanics as above. Brecciated and with some fine laminations. Abundant Py, epidote & chlorite espy on fracture surfaces as @ 145.65-145.76. Some calcite along fracture surfaces as @ 144.70.
LS07-107	146.03	146.60	DYKE	Mafic dyke, Py abt 5-15 per cent.
LS07-107	146.60	156.10	TUFF	Variable mixd volcanics and tuffs, greenish-gray, some horizons of crystal tuff & ash tuff, Py common, some small mafic dykes, occasional banded Qz-Mo veins. Epidote often ssociated with Py.
LS07-107	156.13	159.00	DYKE	Mafic dyke, abundant Py, core very broken. Py perhaps 5-15 p.c. of rock, magnetic.
LS07-107	159.00	168.80	XLTF	Mainly crystal tuff but with some variable volcanics. White fragments in tuff abt 1 mm across generally. Some Py but less common than previous units. Some Qz-Mo stringers.
LS07-107	168.80	171.52	ASTF	Dark to med. Gray friable volcanic ash with some sections altered to pink or chloritized. Larger fragments visible in places. Some minor calcite. Very little Py, only rare Mo-Qz. Layered appearance in places and contacts with previous & subsequent units Brecciated at contact with previous unit, @ 40 CA.
LS07-107	171.52	173.73	TUFF	Creamy white, pinkish tinge, more silica-rich volcanic, felsic. At beginning of unit, several Mo-Qz stringers in multi directions. Later in unit te dark stringers appear to be chloritic, clays or micaceous. Very little Py.
LS07-107	173.73	174.70	BRXX	Dark-gray breccia &/or ash similar to unit @ 168.8-171.52

LS07-107	174.70	175.40	TUFF	Same creamy white rhyolitic rock as above. Black micaceous zig-zag layering with Py on surface of layers.
LS07-107	175.40	182.20	TUFF	Gray-green as tuff & breccia as above. Some sectionsconsiderable Py & epidote as at 177.15, 178.20, 181.46. Pink breccia fragments @ 179.20, 179.80. Contact with next unit 25 CA.
LS07-107	182.20	194.50	ASTF	Creamy white siliceous volcanic & ash as above, chloritie layers in places. After crush zone noted below becomes greener..
LS07-107	194.50	205.13	TUFF	Variable green to gray volcnics & volcaniclastics, with occasional breccia, epidote & Py common locally. No Mo identified. EOH. (Hole shut down due to drilling problems.)
LS07-108	0.00	3.66	CASING	Casing
LS07-108	3.66	16.05	VOLC	Variable aphanitic volcanics and volcaniclastics of rhyolitic to andesitic composition. Pinkish to greenish gray. Some tuffaceous sections. Volcanics blocky fracture. Mo common, some pyrite veining with characteristic alteration along veins. Broken core in some sections. Some calcite alteration.
LS07-108	16.05	16.80	LPTF	Pale grey lapilli tuff, fragments up to 1 cm. Mo-qz stringers 1mm wide 16.10 to 16.35, @ 5° and 45°
LS07-108	16.80	37.15	VOLC	Variable gray to greenish gray volcanics and volcaniclastics. Some flow banding visible locally, also some brecciated zones. Occasional Mo veins and pyrite in veinlets and blebs.
LS07-108	37.15	37.75	DYKE	Mafic dyke, Py perhaps 5%
LS07-108	37.75	56.30	VOLC	Variable gray volcanics as above, some brecciated sections. End of HQ at 48.77
LS07-108	56.30	58.50	QFP	Broken core. Pieces largely seem to be of lighter colored (cream light to light grey) felsic rock with small biotite flakes and quartz eyes, possibly QFP
LS07-108	58.50	61.63	QFP	Lighter gray to cream felsic rock as seen with broken core. Qz eyes. Some biotite. Mo present. Probably crystal tuff, but could be QFP dyke. Assigned to former because of greater amounts of biotite than normally seen in QFP. This unit also seen in LS-107 at 54.75-63.75.
LS07-108	61.63	81.86	VOLC	Variable volcanics & volcaniclastics ranging in composition from rhyolitic to andesitic. Some laminated ash tuffs and breccia locally.Some MoS_2 & Py bearing veins.
LS07-108	81.86	82.43	DYKE	Mafic dyke, Py common, magnetic.
LS07-108	82.43	86.04	VOLC	Variable dark to light gray volcanics. Some banding as at 83.60. Some Py, no visible Mo. (End logging by V. Parsons)
LS07-108	86.04	96.20	RHYL	White to light gray felsic volcanics, silica-rich, bands, possibly flow bands as at 90.39-90.56, 20 CA. Qz eyes & feldspar fragments Qz-Mo stringers abundant with varying orientations. Mo-Qz veins are common, 1-5 cm as at 92.34, 30 CA. Rare Py stringers. Some dissem. Py in matrix & Py blebs or patches on fracture surfaces. Some fracture surfaces also have light green tinge. Core broken mostly. (Start of logging by M. Eckfeldt.)

LS07-108	96.20	103.25	TUFF	Black to dark gray volcaniclastics, and little pinkish-gray volcanics, possibly with some mafic dyke. Blocky & brecciated in spots. Volcaniclastics could be altered (?) lapille & crystal tuff. MoS2 rare. Py stringers & Py-epidote common especially on fracture faces, rare calcite stringers with some on fracture faces.
LS07-108	103.25	108.09	XLTF	Variable dark-green, pinkish-white mixed volcanics. Probably crystal tuff as @ 107.38 & brecciated ash tuff as @ 104.76. Some Qz-Mo veins & stringers. Some dissem. Py & patchy Py n fracture surfaces. Rare Py stringers. Some calcite veins, core is soft to nail.
LS07-108	108.09	150.35	RHYL	Creamy white to light grey felsic volcanics as above. More prevalent flow banding & Qz eyes, and small black mineral, possibly pyroxene. Common (strong) Qz-Mo stringers, occasional Qz-Mo veins. Py stringers rare, some dissem. on fractures. Appears to be possible silification of flow banding.
LS07-108	150.35	174.51	XLTF	Dark to pinkish gray variable cystal tuff. Some brecciated zones as at 150.82. Weak Qz-Mo veining Moderate Py stringers & blebs. Moderate calcite veining & fracture surface coatings. Core is soft & crumbly from 150.35 to 152.46, probably a fault zone.
LS07-108	174.51	176.11	RHYL	Flow-banded rhyolite as above Strong Qz-chlorite veining filling fractures. Diss. Py. Rare Py stringers as @ 176.0 Very weak Mo mineralization, some weak diss. Fracture coatings as @ 175.77. Coe is mostly fragmented.
LS07-108	176.11	199.19	XLTF	Black gray to pinkish with green cystal tuff as above. Moderate Py blebs with epidote, diss. & stringers. Very weak MoS2 mineralization, stringers with Py. Some ash tuff @197.38-198.08. Slight magnetism.
LS07-108	199.19	203.36	RHYL	Flow-banded rhyolite dyke as seen previously. Weak to moderate MoS2 mineralization, mostly conc. In 1 mm stringers, 25-30 CA as @ 201.52. Some Mo coating fracture surfaces as @ 202.08. Weak to moderate Py mineralizations in stringers & blebs, some weak dissemination as @203.13 Also appears to be some chlorite in stringers & on fracture surfaces.
LS07-108	203.36	209.50	XLTF	Dark gray-green, very fine grained crystal tuff, possibly some mafic dykes, patchy silicified zones, some brecciation usually associated as @ 25.74-206.0. Weak MoS2 mineralization, rare stringers with Py in centre. Strong to moderate Py, with some epidote, mineralization. Some magnetism, usually associated with black mineral surrounding Py blebs, probably magnetite.
LS07-108	209.50	219.41	LPTF	Heavily silicified lapilli & crystal tuff. Creamy-gray-green colour. Probably chlorite ALT. Rare MoS2 mineralization, very weak in stringers @ 211.95-212.05, 1 mm, 16 CA. Moderate to strong Py & epidote. Appears to be some layering of lapilli tuff @ 218.22-218.8, ab 50 CA, Py & epidote in stringers and blebs. Some diss. Patches on fracture surfaces
LS07-108	219.41	227.38	RHYL	Flow-banded rhyolite dyke as above. From 221.20 to 222.79 core is fragmented. From 222.82 to 227.38, core is soft & gougy. Weak MoS2 mineralization in rare stringers & fracture coatings, weak Py, rare patchy fracture coatings as @ 222.18. Chlorite ALT is very strong in the gougy zone & some calcite coatings, slickenslides are also present in the gougy zone. This is no doubt a **fault zone**.

LS07-108	227.38	233.19	LPTF	Variable dark green to creamy pink lapilli tuff. Brecciated throughout. Very weak MoS2 mineralization in rare stringers. Moderate Py & epidote stringers. Some calcite veins.
LS07-108	233.19	235.68	DYKE	Mafic dyke. Very weak MoS2. Rare Qz-Mo stringer with Py in centre as @ 233.90-234.0, 1 mm, 20 CA. Strong Py stringers, blebs & disseminations, with moderate epidote. Some calcite veins & fracture coatings.
LS07-108	235.68	260.90	LPTF	Variable dark gray-green, some creamy white, lapilli tuff as seen 227.38-233.19. Core is very broken from 235.68 to 245.47. Gougy @ 245.47. Mafic dyke from 250.08 to 250.32. Appears brecciated throughout as previously seen. Very weak MoS2 mineralization, in stringers as @ 241.36, < 1 mm, 15 CA, or as fracture surface coatings as @ 243.21. Moderate to strong Py & epidote. Some calcite veins. Chloritic alteration. Epidote up to 5-7 p.c. in places.
LS07-109	0.00	4.57	CASING	Casing. (Start logging by M. Eckfeldt)
LS07-109	4.57	7.94	XLTF	Dark gray to gray-pinkish fine crystal or ash tuff. Weak to moderate Qz-Mo stringers. Weak Py mineralization. Core is fragmented from 7.15-7.75, stringers usually have light alteration bands.
LS07-109	7.94	8.35	XLTF	Light gray to whitish crystal tuff. Appears to be more crystals than matrix. Lighter colour could be due to higher proportion of feldspar clasts &/or alteration by migrating fluids analogous to alteration bands around some stringers? Weak Mo mineralization Moderate Py, sericitic alteration?
LS07-109	8.35	10.37	XLTF	Dark to pink crystal tuff, ash tuff as above. Very weak Mo. Rare Qz-Py-Mo stringers. Moderate Py in stringers & disseminated
LS07-109	10.37	12.16	XLTF	Light gray to white crystal tuff as above. Moderate MoS2 in stringers & veinlets. Weak Py. Some epidote blebs.
LS07-109	12.16	29.22	VOLC	Variable pinkish to dark-gray brecciated volcanics. Soft gougy sections 12.16-12.48, 16.24-16.57. Core is predominantly fragmented. Weak Mo stringers & rare veins. Moderate Py, some dissemination in gouge. Calcite coating many fracture faces. Variable volcanics alternates with above fine crystal tuff & above white crystal rich tuff.
LS07-109	29.22	29.91	ASTF	Ash & some light crystal-rich tuffs. Core is all fragmented with some gouge. Argillic alteration. Fault.
LS07-109	29.91	54.49	ASTF	Dark gray to creamy-pink layered ash tuff. Brecciated in some spots as at 31.65. Ash layers abt 50-70 CA. Weak MoS2 increasing from previous units. Weak Py, occasional blebs, rare stringers. Rare to occasional MoS2 veins & stringers.
LS07-109	54.49	67.37	QFP	Gray-green to creamy white Qz monzonite or QFP, 5-7 p.c. Qz, abt 5 p.c. chlorite flecks. Some chlorite & possibly sericitic alteration. Moderate MoS2, common stringers & occasional veins. Weak Py, rare blebs & stringers.
LS07-109	67.37	70.28	FAULT	Fault zone in above unit, brecciated. Not as chloritic, probably some sericitic alteration. Moderate MoS2. The Qz-Mo is mixed throughout fault zone in large patches. Py very weak, some dissemination. Qz healing breccia is vuggy, often with some Mo. Occasional Qz-Mo stringers..
LS07-109	70.28	78.86	QFP	Qz Monzonite, possibly QFP as seen previously. Chloritic ALT. Moderate to 74.76, then it becomes weak. Qz-Mo stringers are frequent, rare veins. Py is very weak, rare patchy fracture face coatings.

LS07-109	78.86	80.48	ASTF	Dark-gray creamy pink layered. Ash tuff as seen above. Layers abt 62 CA, weak MoS2. Occasional Qz-Mo stringers.
LS07-109	80.48	82.67	RHYL	Flow-banded rhyolite. Band is 20 CA. Weak MoS2, Qz-Mo stringers are common. Weak Py, rare stringers, some patchy fracture face catings. Core is fragmented from 81.23 to 82.67.
LS07-109	82.67	100.15	RHYL	Layered 79 CA, often brecciated. Ash tuff as seen above. Weak to moderate MoS2, stringers are frequent, occasional veining. Weak Py as stringers, occasionally in Qz-Mo centres. Most stringers have narrow < 1mm alteration bands, light coloured.
LS07-109	100.15	104.13	DYKE	Basalt dyke, contact with previous unit is 20 CA. Occasional Qz veining with some MoS2. Py stringers & patches common, in places up to 10 p.c. Weak to strong magnetism. (Start logging by V. Parsons)
LS07-109	104.13	112.55	VOLC	Mixed volcanics & volcaniclastics including blocky rhyolitic to andesitic composition, pinkish gray to darker gray in colour, some tuffaceous beds and lapilli fragments. Weak to moderate Qz-Mo veining, some Py. Couple of places, 104.50-104.78, and 104.90-105.02 with basalt dyke included.
LS07-109	112.55	114.43	DYKE	Basalt dyke. Weak to string magnetism, green black rock. Py abt 5 %. Core largely broken in later part of interval.
LS07-109	114.43	118.68	LPTF	Mainly lapilli & ash tuff but with some mixed Vol. sections. Tuff fragments from 1 mm to 1 cm across. Some Mo veins & Py, mainly along fracture surfaces.
LS07-109	118.68	123.75	VOLC	Mixed volcancs & volcaniclastics as above. Some laminated tuff sections, others lapilli & some blocky volcanics. Minor Mo & some Py-epidote.
LS07-109	123.75	124.04	FAULT	Fault breccia with clay gouge fill. Fault line 20 CA.
LS07-109	124.04	164.35	XLTF	Gray crystal tuff with occasional sections of more blocky volcanic. Fragments are 1-2 mm, rounded or rectangular. Some Py, espy along fractures. Some Mo occurrences, weak to moderate.
LS07-109	164.35	183.47	VOLC	Mixed greenish-gray to gray volcaniclastics & volcanics of rhyolitic to andesitic composition, including some tuffaceous sections & occasional lapilli. Mo occurrences weak to moderate generally but locally some strong Mo veining. Some Py.
LS07-109	183.47	189.00	VOLC	More variable volcnics & volcaniclastic but generally darker in colour, andesitic. Some tuff layers & occasional clay alteration.
LS07-109	189.00	193.48	ASTF	Layered ash tuff, darker than usual in some intervals. Blocky & broken in places. Significant Py, Mo infrequent.
LS07-109	193.48	194.10	ASTF	Very broken core, likely ash tuff.
LS07-109	194.10	196.35	VOLC	Variable volcanics, tuffaceous in places but not like laminated sections as above. Pink ALT common. Some Mo.
LS07-109	196.35	196.90	FAULT	Probable faulting. Crushed rock & clay gouge. (End of logging by V. Parsons, July 19/07)
LS07-109	196.90	239.06	VOLC	Variable blackgray-green-white brecciated volcanics. Many gougy fault zones. Same unit as seen @ 12.16-29.22. MoS2 stringers & veins moderate until about 208 where becomes weak. Chloritic or propylitic ALT? Greenish rocks with epidote in Py blebs. Some weak magnetism. (Start of log by M. Eckfeldt)

LS07-109	239.06	249.41	LPTF	Dark greenish gray lapilli tuff. Fragments generally range up to 1 cm. Clay ALT along some fracture surfaces. Epidote & Py commonly associated & common. Mo occurrences rare. (Logged by V. Parsons)
LS07-109	249.41	257.63	DYKE	Dark green basaltic dyke or volcanic. Very compact & f.gr. Occasional Qz veins & stringers, usually containing Py. Mo very infrequent. Strongly magnetic. Py or Pyrrhotite might be up to 10 % locally.
LS07-109	257.63	292.66	LPTF	Mainly dark to medium-greenish lapilli tuff with minor intervals of andesitic volcanics. Fragments are easily distinguished, some up to 3 cm long. Py significant in some locations, Mo virtually absent.
LS07-109	292.66	304.49	ASTF	Variable light gray-green, fine grained massive to layered ash tuff. As layers 62 CA. Weak Mos2 with rare stringers & even more rarely veins. Moderate Py in occasional stringers & blebs. (Logging by M. Eckfeldt)
LS07-109	304.49	348.16	XLTF	Dark to medium gray variable crystal & lapilli tuff. Alternates over short intervals. Weak MoS2, rare stringers. Moderate to strong Py with occasional blebs, veins & commonly stringers
LS07-109	348.16	353.77	TUFF	Dark gray tuffs with lapilli. Core very competent. Py up to 10% in places. Very minor Mo locally.(From here to EOH logged by V. Parsons)
LS07-109	353.77	372.00	TUFF	Generally pale-green chloritized tuff, with occasional volcanics, Some Py, occasional weak Mo. Small uff fragments mostly chloritized.
LS07-109	372.00	382.29	TUFF	Variable volcanics & volcaniclastics of andesitic & basaltic composition. Some lapilli tuff intervals. Py common. Mo rare to non-existent. Colours vary from med. To dark gray.
LS07-109	382.29	388.93	TUFF	Mixed ash, lapilli & massive tuffs. Some Py & epidote, also chloritization locally. No visible Mo. EOH. (Hole terminated short of target due to drill bit problems.)
LS07-110	0.00	1.52	CASING	Casing
LS07-110	1.52	17.81	QMP	Medium to light gray; Qz Monzonite; moderate silicification. Many zones of broken core. Rusty weathering on fracture faces. Very weak MoS2 on rare stringers. Weak pyrite, rare stringers and dissemination on fracture faces
LS07-110	17.81	29.06	QMP	Strongly weathered rusty-white, strongly silicified/Qz veined QFP or Qz-Monzonite. Probably QFP because of the increased amount of QZ eyes. Qz veins occasionally banded with dark sulphides, but no MoS2. If MoS2 is present, it’s very weak. Pyrite also very weak, some dissemination but could be weathered to creak rust colour.
LS07-110	29.06	36.93	QMP	Qz-Monzonite as seen above only strongly silicifed, Qz-veined some moderate rusty weatheri ng; weak MoS2 in rare stringers and rare Qz veins. Weak pyrite. Some dissemination, could be causing rust colour.
LS07-110	36.93	53.96	QFP	Strongly silicified QFP as above, less rusty, could also be some volcanics alternating but stronger silicification masks lithology. MoS2 increasing but still weak. Rare vein occasional stringer, weak pyrite as above.
LS07-110	53.96	57.88	VOLC	Graygreen to pinkish strongly silicified Qz-veined volcanics. Possibly some crystal tuff. Weak MoS2, rare stringers & fracture face coatings. Py is very weak.
LS07-110	57.88	59.57	DYKE	Black basaltic volcanic, not silicified. Very weak MoS2 in rare stringer; weak to moderate PY ib stringers & blebs. Some Chalcopyrite as @ 58.07.

LS07-110	59.57	183.00	QFP	White to light gray QFP as above. Weaker silicification. Very weak chlorite alteration. MoS2 is weak in occasional stringers & rare veins until abt 72.0 m where it becomes moderate to strong with frequent stringers & common veins. At 102.0, the MoS2 is more moderate with only occasional veins but frequent stringers. Py is very weak, some fine disseminations on fracture faces, rare stringers, Some calcite locally on fracture faces. (End logging by M. Eckfeldt)
LS07-110	150.18	183.00	QFP	Same QFP as logged above, occasional fragments of grayish country rock begin showing up at 159.25 & increasingly common deeper one goes into this interval. Some fragments fairly large, up to 4 by 2 cm, consisting of f.gr. vol or seds. Qz-Mo stringers weak to moderate, usually < 2 mm. (Start logging by V. Parsons)
LS07-110	183.00	194.00	FAULT	Fault zone. Very broken & fractured QFP, with much clay gouge, in places with Mo mineralization & some Py. Fracture zone @ 183.0 runs 15 CA & is 20 CA at 193.98. Some sparse magnetite along some fractures (weakly magnetic). Also calcite loclly.
LS07-110	194.00	227.38	QFPB	Matrix is QFP as before but with increased fragments over that seen before the fault zone. Mixed xenoliths make up perhaps 10-20 p.c. of rock. These fragments generally consist of gray f.gr. vols or seds, but occasionally include broken up fragments which might be tuff toward bottom of hole. Occasional Qz-Mo stringers & veins. Conclusion: QFP breccia.
LS07-111	0.00	3.66	CASING	Casing
LS07-111	3.66	59.50	QMP	Highly fractured and silicified quartz monzonite as seen at beginning of LS07-110. Deeply weathered in places. Monzonite has an orange-brownish colour, greenish, and biotite is locally chloritized. Silica content commonly up to 50% of core in places, occasionally more. Crush zones and broken core common. Mo very rare, pyrite also infrequent.
LS07-111	59.50	66.90	VOLC	Medium to dark gray very brecciated probable volcano clastic and volcanics. May be altered tuff. As above unit rock is very broken, silicified and sheared in places. Core highly broken from 61.70 to 63.30 and again from 63.70 to 64.30.
LS07-111	66.90	74.45	QFP	Probable altered QFP, silicified with abundant quartz veining and greenish tint due to chloritization of quartz eyes. Generally more fractured than typical QFP. Some MoS2 starting to show but still weak. Some places as 67.10-67.30 and 71.80-71.93 very broken core
LS07-111	74.45	120.52	QFP	Creamy white to pale-greenish QFP, core generally more competent than above units but with some fractured sections. MoS2 ranges from weak to strong in places but small stringers common. Pyrite not common. Some quartz veining and silicification though much less than above. Some shearing and argillization.
LS07-111	120.52	124.50	FAULT	Fault zone. Very crushed core and clay gouge. Rock is essentially same QFP and MoS2-quartz stringers visible in small bits of intact core plus on broken gouge. Eg. 123.80 and 122.95
LS07-111	124.50	193.40	QFP	Same QFP as before fault zone. Quartz-MoS2 stringers still common with occasional thicker and banded quartz-MoS2 veins. Occasional shearing. Pyrite is not significant. Some pale-green chloritized feldspars in shears. Locally

				some K-alteration of feldspars
LS07-111	193.40	223.55	QFP	Same QFP as above, some MoS2-quartz veins and stringers but not as frequent as higher in hole. As hole gets deeper, the number of country rock fragments increases as seen at lower levels of LS07-110. Some pyrite on fractures
LS07-111	223.55	251.76	QFP	QFP as above. Approaching closer to the end of the hole, fragments of country rock increases, as do barren quartz veins. Occasional MoS2 stringers and veins. Pyrite is rare
LS07-112	0.00	7.62	CASING	Casing
LS07-112	7.62	35.63	SILC	Deeply weathered, Fe oxidized high silica zone with SiO2 flooding of broken intrusive. Orange brown quartz monzonite as seen in hole LS07-111. Core very broken with large fractured sections which likely are fault zones. MoS2 weak with only a few occurrences. Occasional minor Pyrite. Much clay alteration and sericite on shears.
LS07-112	35.63	37.76	FAULT	Very broken core, possible fault zone. Rock type same silica flooding.
LS07-112	37.76	47.25	SILC	Same silica flooded rock as above. Some very broken sections.
LS07-112	47.25	47.65	SILC	Very broken core. Some MoS2 at 47.40
LS07-112	47.65	49.20	SILC	Same as above. @49.06 MoS2 on shear surface.
LS07-112	49.20	50.20	SILC	Very broken core, possible fault. Crumbly with clay gouge.
LS07-112	50.20	50.65	SILC	Same silica flooded rock as above
LS07-112	50.65	54.10	FAULT	Probable fault zone. Very smashed up core. Some pyrite and Fe oxides. Couple visible MoS2 stringers.
LS07-112	54.10	58.88	SILC	Silica flooded intrusive as above with gray SiO2 probably 90-95% of rock. Minor pyrite and some MoS2 but very weak.
LS07-112	58.88	60.81	GRPP/QVS	Same silica flooded intrusive as above. Core is very broken with moderate clay alteration, and chloritic alteration. Weak MoS2 on fracture faces and quartz veins. Rare pyrite blebs. Possible fault zone.
LS07-112	60.81	83.57	GRPP/QVS	Variable greenish-gray with biotite instrusive, alternating with gray-creamy intrusive. Strong silica flooding as above, but appears to be stronger in gray-creamy intrusive. Moderate chloritization and clay alteration of feldspars. Core mostly competent. MoS2 is weak in common stringers and occasional veins. Weak pyrite in rare stringers and blebs.
LS07-112	83.23	93.12	GRPP/QVS	Same variable unit as above only silicification appears to be locally banded with gray sulphides. Most banding 40-50^{o} CA
LS07-112	93.12	114.93	GRPP/QVS	Same silica flooded, or perhaps strong quartz Stockwork, variable gray-green with biotite and gray-creamy intrusives as seen above. Alternating quickly. Common MoS2 stringers in thicker quartz. MoS2 is weaker than above unit though. Pyrite is very weakly disseminated and patchy.
LS07-112	114.93	121.16	VOLC	Gray-pink-brown volcanic varying with creamy-gray-green intrusive, weak chloritic alteration. Strongly silicified with SiO2 veins in varying directions. Weak MoS2 in stringers and disseminated pyrite. Volcanics appear broken in places

LS07-112	121.16	218.00	QFP	Light gray-green QFP, 3-5% 1-2mm quartz eyes. 15-20% 1mm feldspar grains. Many feldspars are chloritized weakly. Some broken core. Weak to moderate MoS2 in frequent MoS2 and quartz-MoS2 stringers, occasional quartz-MoS2 veins. Weak pyrite disseminated in matrix and occasional patches on fracture faces.
LS07-112	218.00	219.59	QFP	Same QFP unit as above, brecciated fault zone. Lots of gouge throughout
LS07-112	219.59	294.43	QFP	Same QFP unit as seen above fault zone. MoS2 weak to moderate, veins less common but stringers still very frequent. Core is more broken than previously. Calcite locally on fracture faces. Occasional pyrite on fracture faces
LS07-113	0.00	3.05	CASING	Case
LS07-113	3.05	9.97	VOLC	Medium gray to white with pinkish tint, volcanoclastic with some more massive volcanics, possibly ash tuff. Volcanoclastic could also be volcanic breccia. Fragments range in size from <1mm to 1.5cm, rounded and angular. Core is mostly broken until about 7.92, with much rusty (hematite?) weathering on fracture surfaces. MoS2 is weak to moderate with common stringers and occasional veins. Pyrite is weakly disseminated throughout core and in rare stringers, common patches on fracture faces.
LS07-113	9.97	21.65	ASTF	More massive pink-gray ash tuff with occasional sections of lighter creamy crystal tuff. Some volcanobreccia sections as @16.57-16.73. MoS2 is moderate in frequent stringers and occasional veins. Pyrite as in above unit, disseminated mostly only in massive pink-gray ash. Core is occasionally broken.
LS07-113	21.65	65.31	QFP	Rock is intermediate to QFP and flow-banded rhyolite. Faint occasional flow banding. Some gray fragments <1% possibly xenoliths up to 2.5cm. Moderate MoS2 in frequent stringers and occasional veins. Weak pyrite in rare stringers and patches on fractures. Often split along moderate angles (40-50^{o} CA), but with a high recovery. Splits are often in centres and parallel to quartz-MoS2
LS07-113	65.31	151.18	QFP	Pinkish gray mottled potassium altered QFP-Flow banded rhyolite. Transitions to unaltered unit as above. Some faint flow banding @55^{o} CA as @68.63. Gray blocky fragments (xenoliths) up to 3cm <3% of rock. MoS2 is weak to moderate, in frequent stringers ad occasional veins. Weak pyrite.
LS07-114	0.00	3.05	CASING	Case
LS07-114	3.05	46.08	QFP	Gray QFP, ~1.5% quartz eyes and 5% feldspar phenocrysts. Rock is highly fractures with many quartz stringers following the fractures. Core is regularly broken at ~45^{o} CA but with high recovery. MoS2 is weak to moderate in frequent stringers and occasional veins. Pyrite is weak in rare blebs, fracture coatings and occasional stringers. Some limonite and hematite on fractures, also possibly some Mn oxidation. MoS2 is fairly weak in stringers and veins
LS07-114	46.08	59.76	QFP	Mostly broken QFP unit. Many sections of soft gougy core as at 49.05-49.38. Some gray to white mottled sections, possibly irregular silicification or silica healing breccia. Much of the broken core has a slimey white sericite or argillic alteration/gouge, some calcite. MoS2 is increasing to moderate over the last unit at around 51.18, in frequent

				stringers, common veins and occasional fracture coatings. Some chloritic alteration as at 50.25
LS07-114	59.76	77.86	QFP	Light gray-white QFP with abundant possibly volcanic xenoliths, QFP breccia. Xenoliths vary from <1% to 95% of core in short segments. Rare broken and gougy sections. MoS2 is moderate to strong, pyrite is weak and usually seen as patchy fracture coatings or rare stringers. Som calcite locally on shear faces and possibly sericite.clay. Some chloritic alteration of quartz.
LS07-114	77.86	87.07	QFP	Same broken QFP as from 46.08 to 59.76. MoS2 is more moderate, pyrite still weak but usually moderate on fracture faces
LS07-114	87.07	125.36	QFP	Variable light to medium gray QFP. Colour changes due to level of silicification. High abundance of volcanic xenoliths as seen previously, probably torn from wall rock, can be again called QFP breccia. Core is often broken with occaiosnal soft crumbly sections. MoS2 is weak to moderate, commonly in stringer and veinlets and occasional veins. Clay alteration and sericite commonly on shears, occasionally with calcite. Pyrite is weak as occasional fracture coating and rare stringers.
LS07-114	125.36	143.09	QFP	Light gray-white QFP with faint flow banding or possibly orientation of later silicification @55^{o} CA but variable. Weak to moderate MoS2. Weak pyrite
LS07-114	143.09	147.05	QFP	Moderately silicified QFP unit as above. Many xenoliths as seen previously, referred to as QFP breccia. Xenoliths ~3%. Weak to moderate MoS2. Weak pyrite
LS07-114	147.85	151.18	QFP	Irregular wavy turbulent looking silicification of QFP rock, creamy pinkish in some lighter coloured bands. Weak MoS2, same amount of xenoliths as in above unit
LS07-115	0.00	6.10	CASING	Casing
LS07-115	6.10	13.19	BRXX	Greenish heterolithic breccia, some fragments up to 4 cm across, chloritized & oxidized in places. Couple of short intervals of what appears to be flow-banded rhyolite or poss. altered QFP with swirly texture. Sulphides commonly seen. Some sericitic alteration.
LS07-115	13.19	20.12	RHYL	Mixed felsic unit which appears in places, e.g. 14.80, to be a flow-banded rhyolite; elsewhere to be a QFP breccia (15.55); and others to be altered QFP. Some sections very fragmented. Spotty in places with diss. Py.
LS07-115	20.12	20.42	DYKE	Med-dark green dyke or breccia which includes triangular 2 cm fragment QFP. Some hematite.
LS07-115	20.42	25.12	VOLC	F grained gray greenish felsic volcanic with minor volcaniclastic intervals & some breccia. Fractured and alt. in places. Some significant Py veining. Py generally 5-15 %.
LS07-115	25.12	25.60	VOLC	Very broken core; possible faulting
LS07-115	25.60	28.90	QFP	Pale green porphyry, in part chloritized, with white feldspars and Qz eyes, some Si O_2 veining. This unit includes some breccia fragments so might have been explosive intrusive. Py perhaps 5 pc and some minor Mo as at 26.82 with thin stringer < 1 mm 50 º CA. Feldspars in porphyry are 2 mm across and whitish (albite?)

LS07-115	28.90	29.55	QFP	Rock type probably as above but core very broken, some Mo visible. Hematitic alteration and barren Qz stringers seen
LS07-115	29.55	35.30	QFP	Pale green to creamy-white QFP similar to previous, with abundant sericite. Core is very broken here but only minor gouge. Py is less significant. Small Qz stringers but these are barren
LS07-115	35.30	41.45	QFP	Very crushed and fragile core, probably indicating fault. Rock appears to be essentially same with rare sections that appear at first glance to be black Mo but on closer inspection is more likely crushed Fe sulphide (eg 36.57 and 41.05)
LS07-115	41.45	44.19	QFP	Pale greenish QFP as above
LS07-115	44.19	44.85	FAULT	Crushed and gouge core, likely fault-related
LS07-115	44.85	45.10	QFP	Pale green QFP. Evidence of barren Qz stock work, main vein 7 mm at 35 º CA. Py present.
LS07-115	45.10	46.65	FAULT	Very broken core. Fault zone
LS07-115	46.65	54.79	FAULT	This whole interval a probable fault zone. Even that which holds together is very sheared, sericitized. Also some chlorite alteration. Some PY but minimal-if any-Mo. Rock type is probably pale green QFP as above but very shattered and altered. Some barren Qz veins at 55.55, 30 º CA but also gouge there.
LS07-115	54.79	57.45	QFP	Pale green-yellow altered QFP as above. Chloritic, with some Qz veining. Py significant in places.
LS07-115	57.45	57.65	QFP	Broken core, clay and gouged rock. Faulting. Some of clay is calc.
LS07-115	57.65	93.39	QFP	QFP, frequently chloritized and invaded by silica stockwork. Which has fractured and healed the rock. Some of the Qz veins have Mo but this is still weak overall. Py frequently visible with some larger patches. Occasional bright green chlorite patches, but more typically it is altered feldspar and Qz phenocrysts adjacent to silica stockwork
LS07-115	93.39	107.30	VOLC	Fine grained gray-greenish andestic/rhyolite volcanics composition with breccia fragments of variable composition. In places has a pitted appearance due to chloritized and/or pyritized Qz-feldspar eyes. Some potassic alteration as shown by reddish feldspars. Mo occurrences extremely rare.
LS07-115	107.30	133.05	VOLC	F. gr. Gray-greenish rock is essentially same composition as above unit but breccia fragments are rare. Chlorite and Py pitting continues to be common with some of chlorite apparent ALT of biotite; Mo rare.
LS07-115	133.05	176.13	VOLC	Same f. gr. Greenish rock somewhat paler green. Occasional intervals with K-ALT (pink feldspars and sericites) Patchy appearance in intervals due to alteration. Py commonly diss, some veins. Infrequent Mo occurrences.
LS07-115	176.13	214.21	VOLC	Same rock but with more intense alteration, with abundant pinkish to red feldspars, some chlorite and pyrite. Occasional Mo occurrences. Becomes espy bright pink 200.45 to 213
LS07-115	226.42	233.05	VOLC	Very broken core and clay gouge in same rock type. Probably fault zone. Py probably more that 5%. Little Mo seen
LS07-115	233.05	237.10	VOLC	Green gray volcanic as above. Py 10-15 p.c. Into 15 cm interval broken core

LS07-115	237.10	238.00	VOLC	Pinkish K-alteration as seen before. Feldspars altered, some hematite and Py about 10-15%
LS07-115	238.00	252.60	vOLC	F gr-med.gr dark gray to black basaltic volcanics or dyke. Py-epidote patches common, some veins also, with Py ranging from 5-40%. Contact with previous unit is about 60º CA. Mafic minerals may include hornblende & augite. No Cpy or Mo seen
LS07-115	252.60	273.03	VOLC	F. gr.-med-gr med. Gray to greenish volcanic probably of andesitic composition. Possibly some tuffaceous sectons as at 258.85-259.10. Frequent epidotized and pyritized patches, with some Py veins. Some Mo veining. (see below)
LS07-115	273.03	274.60	DYKE	Black f gr mafic dyke, Py-epidote 5-10%
LS07-115	274.60	285.59	VOLC	Variable med gray to dark gray or greenish volcaniclastics and volcanics, chiefly lapilli tuff. Less Py and epidote than in previous sections but still probably up to 5% locally. Some weak Mo mineralization
LS07-116	0.00	3.66	CASING	Casing
LS07-116	3.66	5.59	LPTF	Med. Gray lapilli tuff, some reddish fragments (hematized) Fe oxides on fracture surfaces. Specks of Py
LS07-116	5.59	7.30	QFP	Qz-feldspar porphyry, first 45 cm brecciated, some flow banding visible, foliation about 30º Ca. rusty and occ. metallic Fe and possibly Mn oxides with dendritic pattern along mini-fractures in white-creamy QFP. Specks of Py
LS07-116	7.30	7.64	LPTF	Med gray lapilli tuff as first unit, some fragments look like flow banded QFP as seen above
LS07-116	7.64	17.37	QFP	QFP as above, and QFP breccia. Frequent Fe oxidation and possibly Mn and Fe carbonate. Breccia fragments and flow banding visible frequently. Highly altered in places with patchy appearance due to chloritization. Some Qz veins with Py but no Mo seen
LS07-116	17.37	17.60	QFP	Broken core
LS07-116	17.60	54.60	QFP	More typical QFP and QFP breccia in places, creamy to pale greenish colour, latter due mainly to chloritization. Some sections where flow banding is visible through less so than in previous unit. Some sections of broken core with clay ALT. Py seen occasionally. No visible Mo
LS07-116	54.60	84.90	VOLC	Medium to dark gray hornfelsed tuffs and volcanics of mainly andesitic composition. Some darker sections which might be basaltic dykes. Py widespread. Much of core in this unit is sheared and broken. Some Mo stringers starting to show up.
LS07-116	84.90	93.45	BRXX	Interval of crushed breccia healed by Qz and calcite, in some places vuggy with well formed calcite crystals. Calcite is white translucent to greenish. Locally sig. Py and some Mo visible possibly by lending a purplish tint to the matrix (though some at least is crushed and smeared py. Sig. lost core between 83.10 and 88.0
LS07-116	93.45	137.10	QFP	Pale green chloritic QFP as seen in Hole 115 – Mo occurrences weak to moderate. Some diss Py with frequent veining locally. Many Qz veinlets most barren of mineralization. Mo gen. occurs in Qz-Mo stringers 2-3 mm wide. Some K-alt in places with pink feldspars and sericite. Core generally more competent, though some broken sections.

LS07-116	137.10	164.70	QFP	Intense Qz stockwork with much injected silica as seen in Hole 115. Host rock is still QFP as above. Biotite & some feldspar commonly chloritized giving rock a pale green color. Py locally common. Mo is weak, though many small stringers.
LS07-116	164.70	180.60	QFP	More normal QFP, Qz stockwork petering out & colour is whiter, creamy colour. Py fairly common locally, weak Mo. Biotite & some feldspar chloritic.
LS07-116	180.50	199.62	QFP	Highly altered pink to pink-med. Gray rock. QFP or possibly felsic volcanic or tuff, similar to that seen in Hole 115. Where K-ALT has not turned the rock pink, it has a mottled patchy appearance due to chlorite ALT. Biotite is often hematitized as @ 183,80, as also seen in 115. Py fairly common, up to 10% in places. Occasional specks of chalcopyrite. No Mo seen. Some vuggy calcite veins up to 5 cm wide seen between 190 & 194. Some epidote. Rock generally very competent.
LS07-116	199.62	251.25	VOLC	Med.gray felsic volcanic or volcaniclastic, fine-grained & Si-rich. Speckled appearance commonly, due to chloritized biotite. Bedding or layering evident in some places. Occasional inclusions, some of which contain what appear to be broken veins of Mo-Qz. No other Mo seen. Py common locally, usually accompanied by epidote. Some intervals with pinkish K-ALT.
LS07-116	251.24	252.87	VOLC	K-ALT of biotite & feldspars, also hematite. As seen above.
LS07-116	252.87	253.97	FAULT	Probable fault zone. Very crushed & broken core, clay gouge. Rock type is K-alt volcanic as seen in previous unit.
LS07-116	253.97	254.50	VOLC	K-ALT to pink biotite & feldspar as above. Some Py
LS07-116	254.50	262.70	VOLC	Same f.gr, med. Gray seen 199.62-251.25. Some K-ALT & some dark inclusions as @ 257.30.
LS07-116	262.70	265.12	DYKE	Basic dyke, Py 10-15 %.
LS07-116	265.12	297.16	VOLC	Hornfelsed volcanics & tuffs, basaltic & andesitic in composition, Abundant Py, Pyrrhotite & epidote. Section with considerable chalcopyrite. Overall sulphides my total 5%. Some ALT of feldspars.
LS07-116	297.16	322.02	TUFF	Dark to med. Green hornfelsed tuff, mostly mafic in composition but some lighter, grayer, more felsic sections. Fragments very noticeable in places, up to 1,5 cm long. Py stringers, disseminations & veins common, up to 1 cm wide. No Mo seen. Very minor Cpy associated with Py. Rare K-Alt of feldspars. Epidote common, often associated with Py. Core very competent. Some weak magnetism due to Pyrr or magnetite.
LS07-116	322.02	338.27	TUFF	This interval could be included with above but generally lighter gray colour to about 329.0. Sections of white mottled crystal tuff previously seen as large fragments are increasingly common @ 331. Py-epidote combo still common. No Mo seen.
LS07-116	338.27	341.26	DYKE	Basaltic dyke. Abundant Py-epidote, contact @ 341.26 is 45 CA.
LS07-116	341.26	349.61	XLTF	Highly altered (epidote & Py) crystal tuff. From 346.40 to EOH core is very broken, possible fault. No Mo seen. (EOH)
LS07-117	0.00	3.05	CASING	Casing

LS07-117	3.05	7.17	QFP	Very weathered & fractured QFP with 1-2 mm Qz eyes abt 5% of white-creamy rock. Rusty limonite oxidation of disseminated Pyrite. Some fragments of country rock. No Mo seen, but @ 6.33 and 7.10, some diss. Blue-black mineral, possibly octagonal crystal form, non-magnetic, streak black to brownish black, resinous luster.
LS07-117	7.17	18.97	QFPB	QFP breccia, altered to medium gray as proceed down this interval. Weak Mo mineralization, occasionally in form of stringers with silica infusions. Core broken in many places. Py common, some of blue-black mineral observed above.
LS07-117	18.97	20.80	QFP	Gray QFP with occasional breccia fragments as @ 19.85. Weak Mo stringers, very thin.
LS07-117	20.80	29.90	QFPB	QFP breccia similar to previous but gray in colour. Py common. Mo stringers fairly common but thin and spaced widely apart.
LS07-117	29.90	54.48	VOLC	Mixed volcanics & volcaniclastics of mainly rhyolitic composition. Occasional breccia intervals & places where there is Qz-vein stockwork. Py common. Mo occurrences infrequent.
LS07-117	54.48	120.25	LPTF	Variable medium to dark gray lapilli tuff, with some finer grained tuff sections. Several sections with broken, gougy core due to faulting. Py common, hematite seen in several locales. Mo virtually absent with one notable exception. Where altered, tuff is generally lighter in colour.
LS07-117	120.25	121.15	TUFF	Fine-med. gr. Brownish, finely-banded sediment or tuff with layers of fragments 1-2 mm across that resemble rounded oolites. These are alternatively lighter in core with dark rim, or the reverse. Possibly tuff fragments that are altered but well-sorted & rounded. Bedding is 55-60 CA, with some manifolds. Rock does not react with HCl.
LS07-117	121.15	126.50	TUFF	Tuffs as above (54.48-120.45). No mineralization.
LS07-117	126.50	127.46	BRXX	Dark to medium gray Breccia
LS07-117	127.46	130.86	QFPB	QFP breccia. Some Py. No visible Mo. Core is quite fractured from here to 137.40, due to possible slippage.
LS07-117	130.80	152.10	QFP	QFP, locally some clay ALT & shearing. Py commonly disseminated giving surface of core a pitted appearance. Some intervals of breccia and occasional flow banding visible. No Mo.
LS07-117	152.10	157.10	QFPB	QFP breccia.
LS07-117	157.10	163.71	QFP	QFP, broken core in places, e.g. 159.40-160.18, and 163.10-163.48. Creamy to brownish gray. Some potassic ALT
LS07-117	163.71	167.92	QFP	Pink to rose-coloured potassic ALT of QFP
LS07-117	167.92	174.33	QFP	QFP, potassic Alt locally. No mineralization
LS07-117	174.33	187.90	BRXX	Heterolithic breccia, patchy appearance in places. K-Alt common, ranges in colour through creamy to pink-gray to medium gray. Only Mo seen are remnant Qz_mo veins @ 175.45 & possible Mo in Py stringer < 1 mm @ 177.0.
LS07-117	187.90	201.55	QFP	Creamy white to light gray QFP, some inclusions. Some sections have pitted surface due to diss. Py, e.g. 194.50-198. Very minor Mo seen. Some K-Alt.
LS07-117	201.55	213.06	QFP	Rhyolitic volcanic or possibly altered QFP, brecciated in places. Py fairly common. May be scattered minor Mo but difficult to distinguish.

LS07-117	213.06	241.06	QFP/QFPB	Mixed QFP & QFP breccia with heterolithic fragments. Py common with occasional pitted appearance as seen above. Some K-ALT. No Mo confirmed.
LS07-117	241.06	244.41	BRXX	Breccia with pink feldspar fragments, possibly from a granite, in a black-dark gray matrix. Abundant Py stringers, No Mo seen.
LS07-117	244.41	256.10	QFPB	Variable QFP breccia, creamy to gray. Some pinkish K-Alt as @ 249.90-250.40. One broken Mo fragment 1 cm by 2 mm wide @ 249.30.
LS07-117	256.10	260.60	QFP	QFP to rhyolite, creamy to pinkish hue, occasional inclusions. Flow banding at 257.60 is 40 CA.
LS07-117	260.60	263.75	FAULT	Probable fault. Crushed & broken core.
LS07-117	263.75	268.60	QFPB	QFP breccia, as above
LS07-117	268.60	274.15	QFP	QFP, occasional inclusions of country rock, diss. Py.
LS07-117	274.15	277.80	QFPB	QFP breccia, as noted above. First 80 cms is broken core.
LS07-117	277.80	278.10	FAULT	Healed fault breccia
LS07-117	278.10	286.85	QFP	QFP & occasional QFP breccia with inclusions of country rock, some Py, no Mo.
LS07-117	286.65	291.69	VOLC	Dark gray rhyolitic to andesitic volcanic & breccia. Some potassic Alt @ 286.93. Some Py, no Mo

APPENDIX D. SAMPLE NUMBERS AND MO ASSAY RESULTS
