APPENDICES

1. SUMMARY

A modest bedrock mapping program was conducted during six days in July and August, 2008, over limited areas of the Rox property. The Rox property is located 70 km south-southwest of Houston and is accessible by a series of well-maintained gravel roads. The property consists of 25 contiguous mineral tenures that cover more than 10 000 ha of land on NTS map sheets 93E/10, 11E, 14E and 15 in an area known as the Mosquito Hills, north of Tahtsa Reach. The program was carried out under the direction of Bob Lane (PGeo) of Allnorth Consultants Limited. The purpose was to map the bedrock and determine areas for follow-up exploration.

Bedrock on the property consists primarily of fossiliferous marine sedimentary rocks, including lithic sandstones, feldspathic sandstones, greywackes and conglomerates, of the Middle Jurassic Smithers Formation. Regionally significant granitic intrusions of the late Cretaceous-Tertiary Bulkley intrusive suite cut the stratified rocks. Lavas and related rocks of the upper Cretaceous – Tertiary Ootsa Lake Group and Tertiary Endako Group locally mask the distribution of the older rocks.

Limited recent exploration in the central and southern parts of the property has identified interesting showings that may relate to a broad hydrothermal system. The 2009 program covered areas of the property selected by Lowprofile Ventures that required more detailed mapping; the showings themselves were not re-examined.

Given the short duration of the program, additional bedrock mapping and soil geochemical sampling is recommended to better characterize and guide potential future work prior to any more advanced stage exploration activities.

2. INTRODUCTION AND TERMS OF REFERENCE

Lowprofile Ventures Ltd (Lowprofile) contracted Allnorth Consultants Limited to conduct a property-scale bedrock mapping program over selected areas of the Rox property.

It is understood that this report may be required for material disclosure. Prior to the field visit the author acquired and reviewed the historical information including published and unpublished reports and personal files summarizing previous exploration work on the property.

This report is supplemented by published and available studies that document bedrock mapping and geological fieldwork conducted by the Geological Survey Branch of the provincial British Columbia Ministry of Energy, Mines & Petroleum Resources.

3. PROPERTY DESCRIPTION AND LOCATION

3.1 Accessibility and Infrastructure

The Rox property is located in the Omineca Mining Division, 114 kilometres south of Smithers and 70 kilometres south-southwest of Houston, in west-central British Columbia. The property is accessible via a series of well-maintained gravel roads, one of which is the main access road to the operating Huckleberry mine, located 23 km to the west of the property.

Directions to the Rox property are as follows: from Houston travel west on Highway 16 for approximately 4.5 km and turn left onto the Morice River Forest Service Road (FSR); travel south on the Morice River FSR to the 56 km marker and turn right onto the Nadina Main FSR and travel to the 89 km marker; turn left onto the Tahtsa Reach FSR--the north boundary of the Rox property crosses the Tahtsa Reach FSR at approximately the 90 km marker.

Smithers and Houston are each situated along Highway 16 and each community has a district population in excess of 10,000. Most services and supplies are available in these resource-based communities.

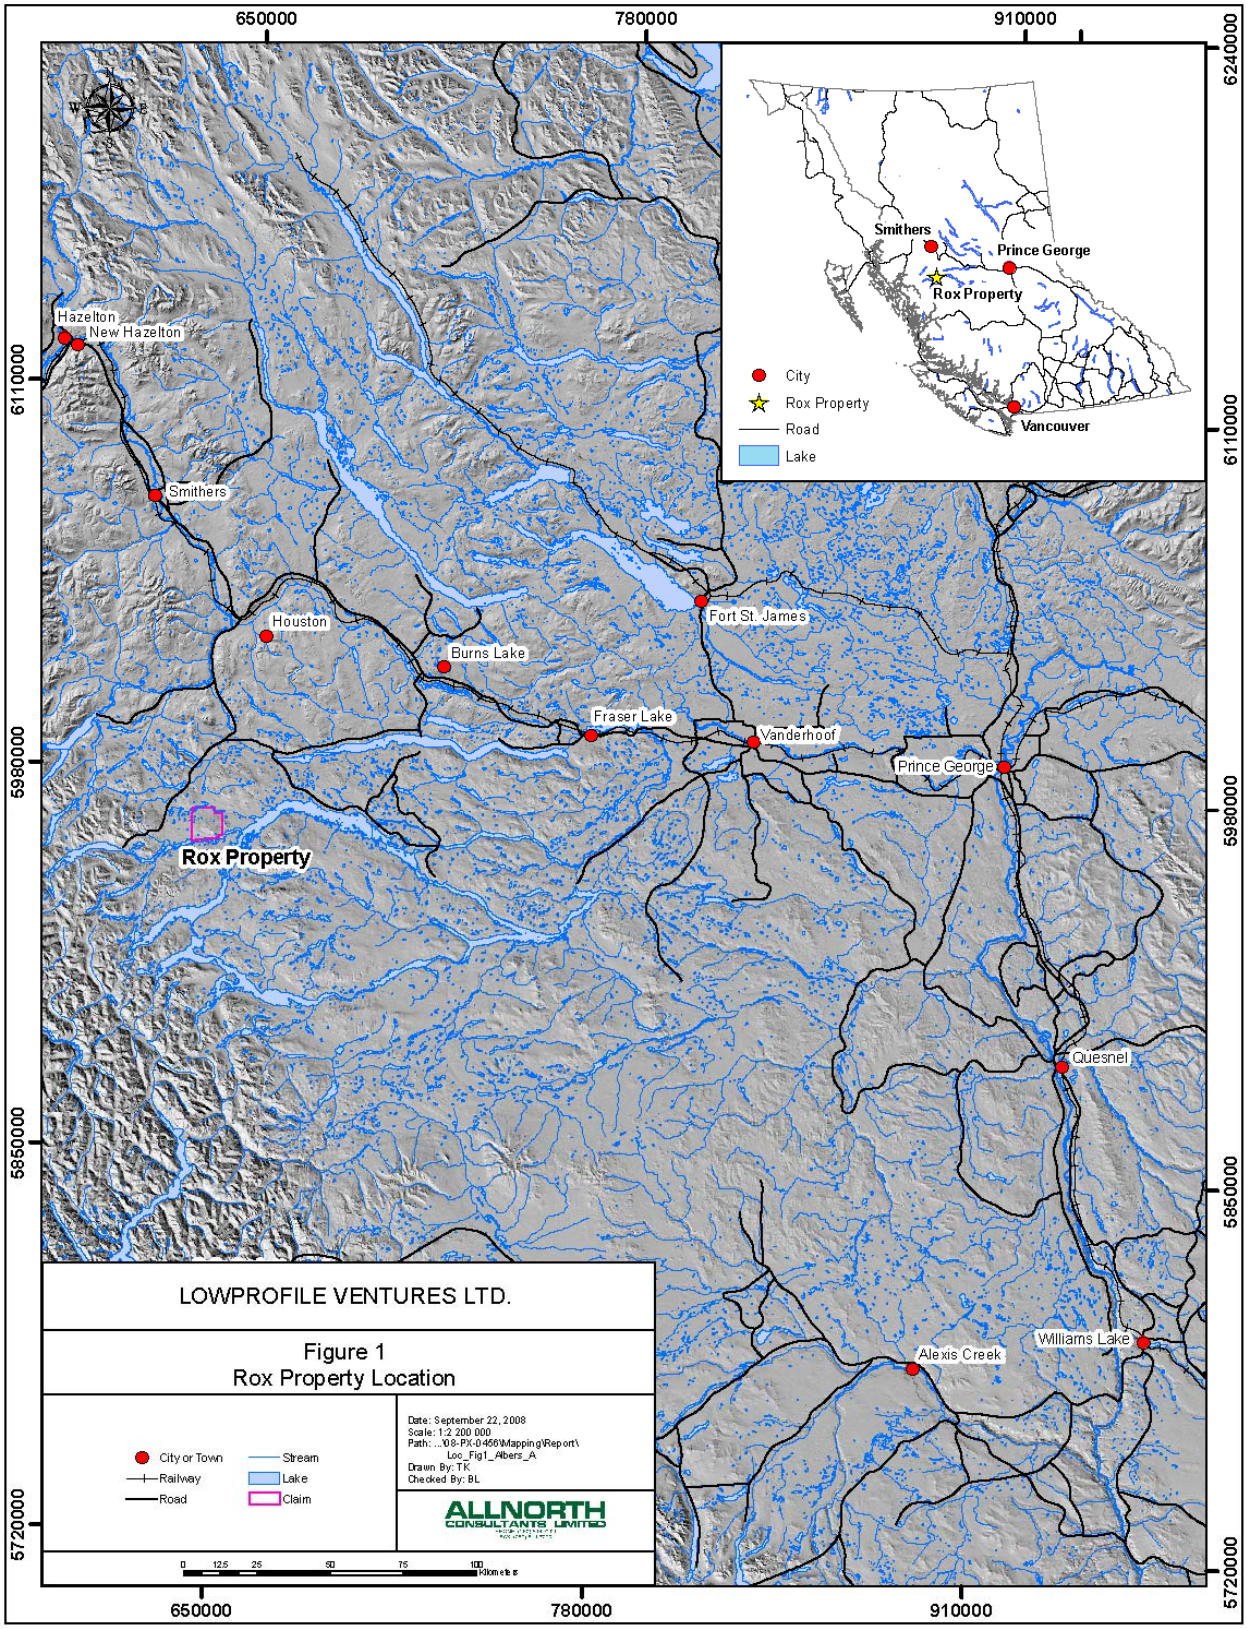

Figure 1: Rox Property Location.

3.2 Mineral Tenure Information

The Rox property is comprised of 25 contiguous mineral tenures. The claims cover 10,624.363 hectares of land on NTS map sheets 93E/10, 11E, 14E and 15. The centre of the claim block is located at latitude 54°46'39"N and longitude 126°51'39"W (NAD 83). All the individual claims are 100%-owned by Lowprofile Ventures Ltd and their anniversary dates are listed in Table 1.

Table 1: List of Mineral Tenures and Status (as of September 10, 2008)

Tenure Number	Tenure Type	Claim Name	Owner	Map Number	Good To Date	Status	Area
505999	Mineral		216293 (100%)	093E	2010/oct/27	GOOD	802.68

						Total	10624.363

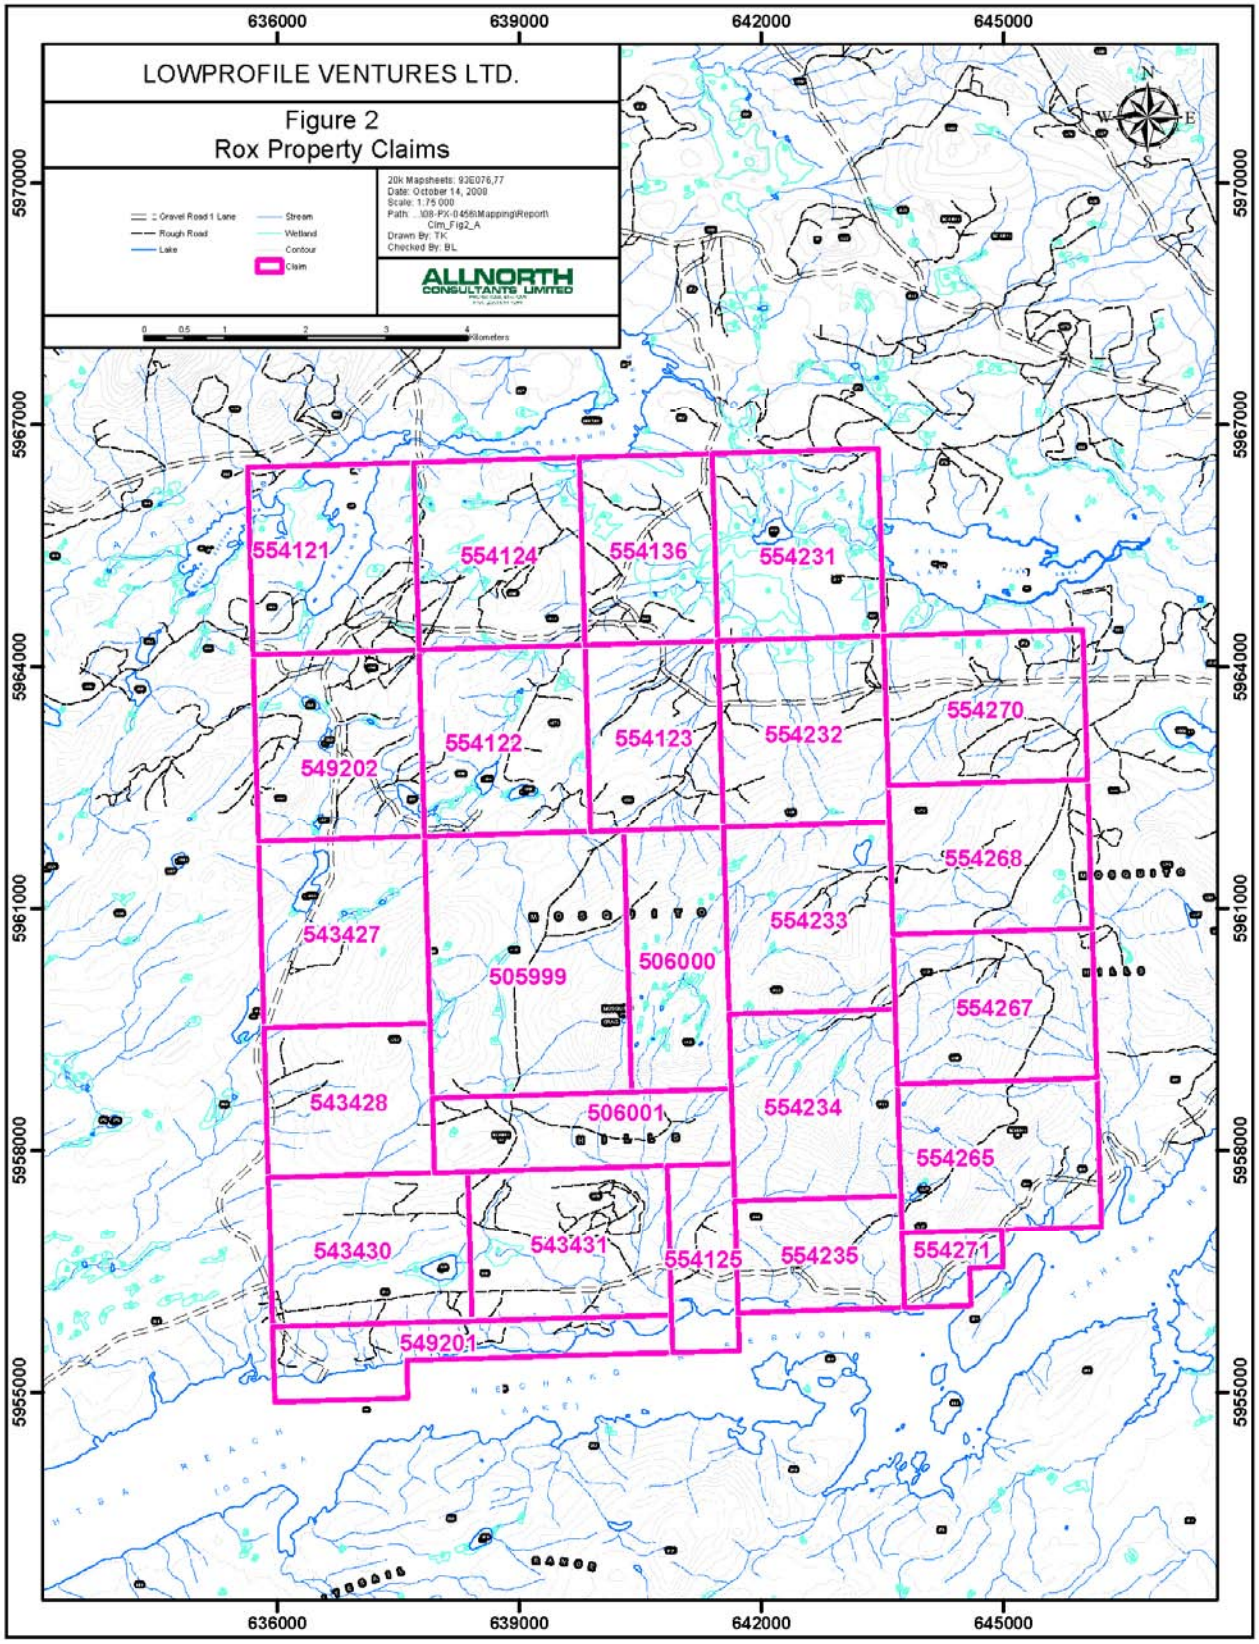

Figure 2: Rox Property Mineral Tenure.

3.3 Physiography and Climate

The Rox property is located near the western margin of the Nechako Plateau, the northernmost subdivision of the Interior Plateau (Holland, 1976). The property covers an area of relatively subdued topography, known as the Mosquito Hills, extending north from the shores of Tahtsa Reach to Horseshoe Lake. Elevations range from 888 m asl in the south to 1440 m asl in the centre of the property at Mosquito Crag.

The area is well-forested by thick stands of spruce and pine with thick undergrowth consisting of alder and devil's club. Swampy terrain occurs in patches throughout the central to northern portion of the property. Extensive glacial drift blankets most of the property and bedrock exposures typically occur along low ridges and along the margins of some drainages and road cuts.

Local climate is typical of the Northern Interior of British Columbia. Summer temperatures average a daytime high in the 20°C range with occasional temperatures reaching the low 30°C range. October through April sees average sub-zero temperatures with extreme lows reaching -30°C from November through March. Annual precipitation averages 50 cm including winter snowfall.

4. HISTORY

Relatively little recorded exploration has taken place in the area covered by the Rox claims. Recently however, several modest programs have examined small areas within the larger block of tenure. In November, 1987, Noranda Exploration Company, Limited, assessed an area along the north shore of Tahtsa Reach, south of Mosquito Crag, and identified arsenopyrite–bearing shear zones (MacArthur R. and Maxwell, G, 1988). On the Rox 1 claim, prospecting by Gary Thompson in the late 1990s discovered pyrite in sheared and altered rock in a contact zone between diorite and sandstone (Discovery showing) and ~350 m to the west, pyrite-rich veinlets cutting sandstone (Central showing). A 0.5 m chip sample from the Discovery showing assayed 7.0 g/t Au and 19.7 g/t Ag, and a 1.0 m chip sample from the Central showing assayed 2.25 g/t Au and 8.4 g/t Ag (L'Orsa, 2005).

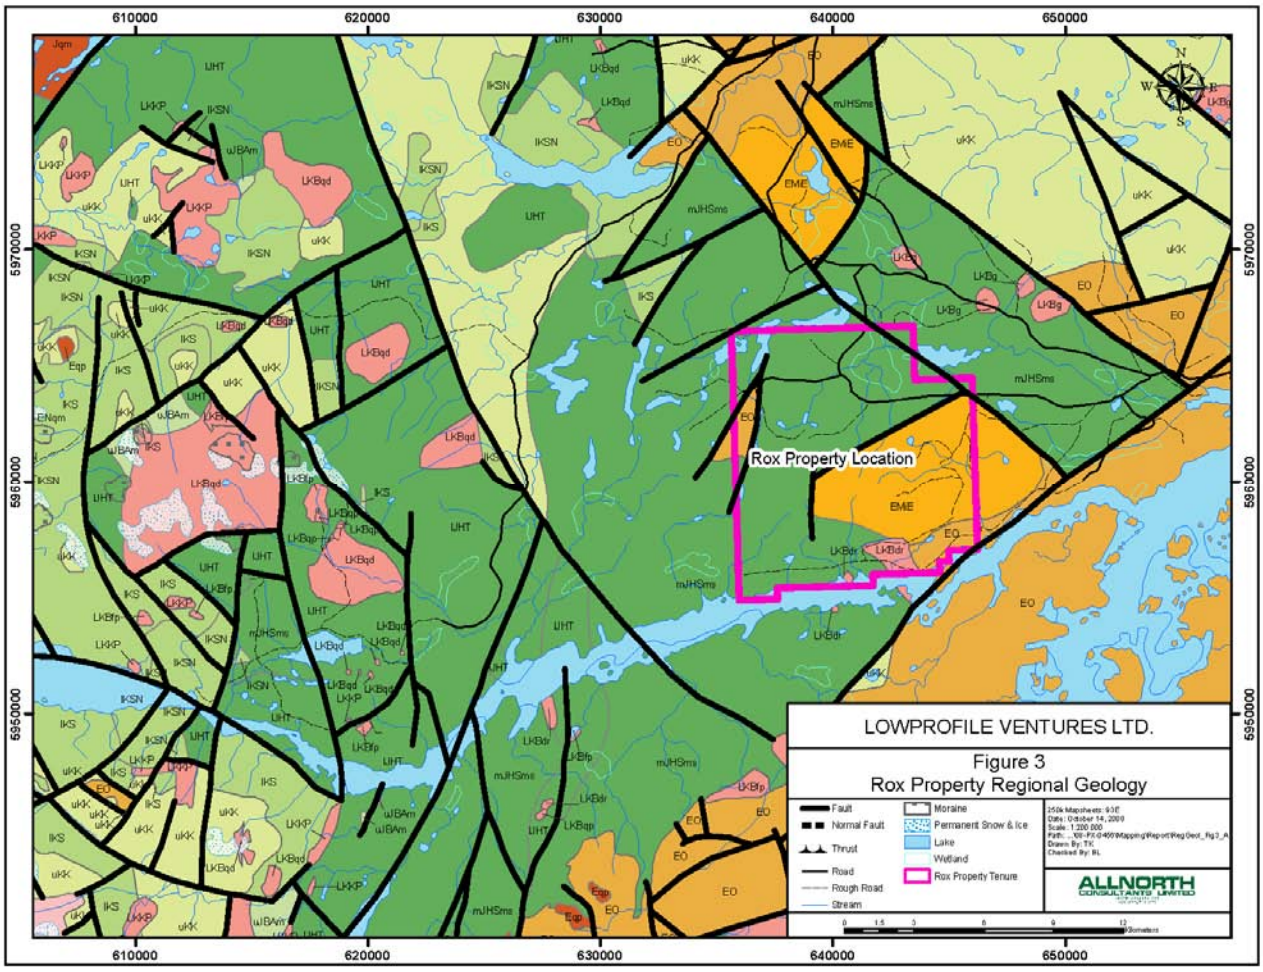
Diamond drilling in 2002 and 2003 tested a zone of brecciated, silicified and mineralized sedimentary and felsic volcanic rocks on the Rox 1 claim (Ogryzlo, 2002 and 2003). The four short holes encountered sulphide-rich clay gouge and precious metal-bearing sulphide veinlets, evidence of either a porphyry, polymetallic vein or epithermal system (Ogryzlo, 2003). A 3D Induced Polarization survey was completed on the Rox 1 claim in 2004 (L'Orsa, 2005) and identified several linear and ovoid anomalies. Follow-up drilling in 2005 tested three chargeability highs and encountered narrow polymetallic veins with locally elevated gold and silver values within broad zones of disseminated pyrite consistent with a large hydrothermal system (L'Orsa, 2006).

5. GEOLOGICAL SETTING

5.1 Regional Setting

The Rox property (Figure 3) is located within the Intermontane Tectonic Belt; a partly collisional tectonic belt comprised of a series of accreted terranes. The largest of these terranes is Stikinia, which underlies much of central British Columbia. Stikinia consists of a series of Jurassic, Cretaceous and Tertiary magmatic arcs and successor basins which

unconformably overlie Permian sedimentary basement rocks (Monger et al., 1972; MacIntyre et al., 1989).



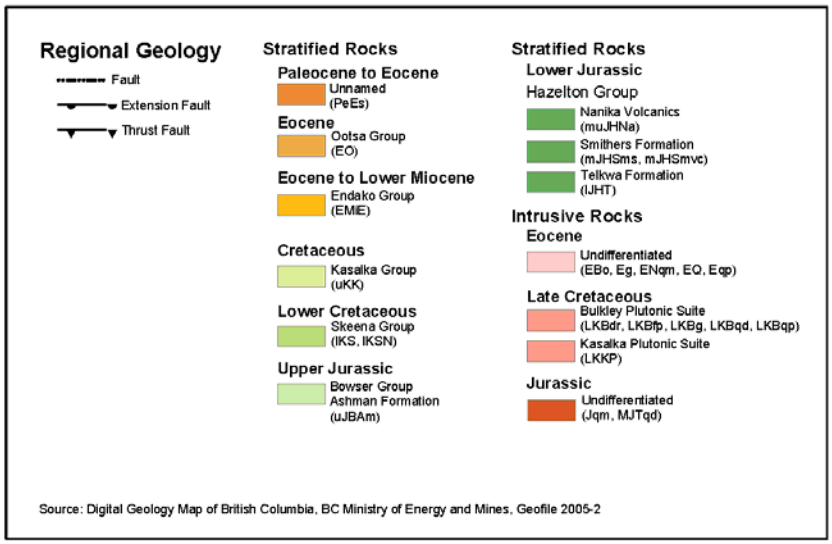


Figure 3: Regional Geology of the Tahtsa Reach area.

The Rox property is centred south of the Skeena Arch in an area underlain primarily by marine sedimentary rocks of the Middle Jurassic Smithers Formation (Duffel, 1959). There is little bedrock exposed, but typical rock types include lithic sandstones, feldspathic sandstones, greywackes and conglomerates. Belemnites and bivalves are a common feature of these rocks.

Granitic intrusions of the Upper Cretaceous Bulkley intrusive suite cut the stratified rocks. The intrusions are part of a north-northwest belt of late Cretaceous –Tertiary granitic intrusions, some of which are known to be genetically related to significant porphyry deposits (Carter, 1981). Lying unconformably on, or in structural contact with the Jurassic pile, and masking the distribution of the older rocks, are basic to felsic flows of the Ootsa Lake Group and basic flows of the Endako Group (Foye and Osiaki, 1995).

5.2 Mineralization and Alteration

The region, or Tahtsa district (Seraphim and Holister, 1976), is very well mineralized and is host to a producing mine (Huckleberry copper-molybdenum mine), past producing mines (such as Emerald Glacier precious metal-base metal mine) and advanced porphyry copper-molybdenum prospects that have been the target of extensive exploration programs (such as Berg, Whiting Creek, Seel and Ox Lake). Porphyry systems in the Tahtsa district are post-accretion deposits that formed between 83 Ma (Huckleberry) and 49 Ma (Berg). The porphyry deposits are hosted by a range of rock types, but typically display peripheral propylitic alteration (including carbonate, chlorite and pyrite), and locally extensive biotite hornfelsing, that enclose core zones of silicic, potassic, sericitic and/or argillic alteration.

At the Rox property, laterally extensive deposits of till, locally extensive Tertiary volcanic cover, and the recessive nature of the rocks that comprise the Smithers Formation have resulted in a relative lack of bedrock exposure. As a consequence, there is little exploration history and very few mineral showings. Known showings occur immediately west and south of Mosquito Crag and have been described in previous assessment reports (Ogryzlo, 2002 and 2003).

Mineralization in the central part of the property consists typically of pyrite in narrow veins, stockworks, shears and limited zones of brecciation often accompanied by a gangue of drusy calcite and/or quartz and sometimes with traces of accessory sphalerite. Malachite has been recognized locally and chalcopyrite has been noted in at least one location on the Rox 1 claim. Arsenopyrite-bearing shears zones were noted on the north shore of Tahtsa Reach.

Alteration is weak consisting of mainly local zones of chlorite, carbonate and pyrite typically restricted to veinlets, weak stockwork zones and narrow, discontinuous bands of breccias.

6. EXPLORATION

6.1 Property Bedrock Mapping

A small property-scale bedrock mapping program took place during six days in July and August (July 23, August 11-13 and August 23) in 2008. The mapping team was comprised of Diana Benz and Sheri Burt (P.Geo.) and assistants Amber Marko and Brian

Kornichuk. The author spent one day on the property (August 1) examining bedrock exposed in several road-cuts and completing one short traverse in the central area of the property. Because of the limited duration of the program only a small portion of the vast Rox property was mapped (Figures in pocket). The areas covered were mapped at 1:10,000 scale. Access to the areas was provided by a series of old logging roads and trails.

Bedrock on the property consists primarily of fossiliferous, shallow water marine sedimentary rocks of the Middle Jurassic Smithers Formation. The sediments typically strike north-northwest and dip moderately to steeply to the northeast. Regionally significant granitic intrusions of the late Cretaceous-Tertiary Bulkley intrusive suite cut the stratified rocks. Lavas and related rocks of the upper Cretaceous – Tertiary Ootsa Lake Group and Tertiary Endako Group locally mask the distribution of the older rocks.

The Smithers Formation consists of coarse-grained lithic sandstones, feldspathic sandstones, greywackes and conglomerates. The rocks are typically pale to medium grey to greenish-grey and thin to thick bedded. They weather cream to pale brown colour. Because of the limited size of many outcrops, bedding is not always apparent, but where noted it is consistent with the regional trend of the Smithers Formation. Overall alteration is weakly developed and locally consists of calcite+/-pyrite veinlets, sometimes with quartz and/or epidote-chlorite, limited zones of 2-3% disseminated pyrite and irregular patches of epidote confined to the matrix.

Several exposures of quartzite(?) were mapped in the southwest part of the claim group. These were not observed by the author, but it is suspected that they are arenaceous sandstones and part of the Smithers Formation. They have been left “unassigned” on the bedrock map (in pocket).

The Ootsa Lake Group consists of aphanitic basalt and andesitic rocks. The basalts are dark grey to black, locally with a micro-porphyritic texture defined by 1mm plagioclase laths and sub-rounded grains of pale green olivine. Variations of the unit are vesicular and/or amygdaloidal. The andesitic rocks are medium to dark grey and greenish-grey and consist of flows and minor tuffaceous units. Andesite flows are characterized by medium to dark grey and greenish-grey, medium to fine igneous rock consisting mostly of plagioclase feldspar.

A poorly lithified conglomerate, comprised of fist-sized subangular clasts of Smithers Formation lithologies, and cut by a flow-banded rhyolite dyke, was encountered in the approximate centre of the property. It is interpreted to be a basal unit of either the Ootsa Lake Group or Endako Group.

A small stock of crowded plagioclase-hornblende porphyry is exposed in a road cut just north of Tahtsa Reach in the southeast corner of the claim block. The intrusion is cream-coloured and punky-weathering, breaking down readily into small gravel-sized pieces. It is grey-green on fresh surface with pale green (sausseritized?) subhedral plagioclase and strongly chlorite-altered hornblende and biotite. Overall, the unit is dioritic in composition and is suspected to be part of the Bulkley suite of intrusions.

6.2 Rox Quarry Detailed Mapping

6.2.1 Introduction

A rock quarry in the central part of the Rox property was mapped on August 11, 2008, to characterize the bedrock and to describe the sulphide mineralization

observed during reconnaissance prospecting. The quarry measures approximately 160 m in length and approximately 80 m in width.

6.2.2 Methodology

The quarry was mapped at a 1:200 scale using GPS, chain with 1 m intervals, measuring tape and compass for control. The average error of the GPS points ranged from 4 m to 8 m. Grab samples were taken of shear and breccia zones containing 5% or more visible sulphides. All geological features were digitally rendered to within an accuracy of 2 metres. The methodology is described as follows:

- Document and mark the first GPS point, in averaging mode, at the most northwestern extent of the area of interest and fix the hip chain to that point. Note the Zone, Datum, Easting, Northing and Accuracy in metres.

- Walk directly east, using a compass, for 20 metres to create the first grid intersection. Ensure the hip chain is straight and as horizontal as is possible. Mark this point with orange flagging, label the flagging as Grid Point 1 and tie the flagging around a rock, tree, or picket.

- Continue in the same direction, marking grid intersections until the northeastern extent of the area of interest is reached. Document and mark this point as the second GPS point, in averaging mode, and note the Easting, Northing and Accuracy in metres.

- Turn 90° and walk directly south, using a compass, for 20 metres to the next grid intersection point. Mark this point with orange flagging tied around a rock, tree, or picket and continue in the same direction as before, marking grid intersection points.

- Check all new intersection points with the established intersection points to ensure accuracy and move the new intersection points as required.

- Continue creating a grid until the area of interest is covered and there are 4 GPS points at the 4 furthest extents.

- Create a small reference map showing the grid, an arrow pointing North, the location of the 4 GPS points and number the grid squares for reference while mapping (e.g. 1, 2, 3, 4 ...).

- Draw in geological details in the field notebook using the grid lines on the paper as a scale for mapping the features. Use 1 page to represent one square in the grid and draw in the features to scale, Measure the distance and azimuth from the grid intersections to accurately document features within the square. Document each square's number on each page, according to the reference map created, and the location of a GPS point if present.

- Transfer the geological details to the D-sized grid paper. Create the legend on the map. Create a Word file (.doc) of the notes describing the geological

features and label them, as required, on the map and in the Word file. Include the final legend in the Word file.

6.2.3 Lithology, Alteration and Structure

The rock quarry is dominated by light grey fossiliferous siltstone that weathers to pale grey and locally an orange-brown. The siltstone is generally thickly bedded and contains dark grey rip up clasts of mudstone. Belemnites and bivalves are a characteristic feature of this unit. Subordinate lithologies observed at the rock quarry include: arkosic sandstone, limestone, dacitic tuff and andesitic lapilli tuff. A narrow 'trachyte' dyke cuts the marine sedimentary package.

The arkosic sandstone was observed as patchy exposure throughout the quarry. The sandstone is typically very carbonaceous with wavy, undulating hematite stringers and zones throughout the unit.

Dacitic tuff occupies the centre portion of the quarry. This tuff is light grey and very fine grained with 15% of the matrix composed of sparry calcite. The andesitic lapilli tuff is similar to the dacitic tuff, but exhibits pervasive hematite staining. This tuff also is very fine grained with 15% of the matrix composed of sparry calcite. The tuff appears to have a brecciated texture on the weathered surface but this is localized to one patch and is thought to be large lapilli (2 cm to 10 cm in size). One shear zone is present and contains trace amounts bornite and chalcopyrite.

Two small exposures of 'trachyte' dyke occupy the western portion of the quarry. The dyke is pale blue on the weathered surface and has a bright blue-green fresh surface. The matrix is fine grained and shows pervasive chlorite replacement and hematite in the form of maroon patches and stringers. The dyke has chilled margins; 1-cm wide calcite veinlets cut the dyke at its northern extremity.

Carbonatization in the form of veins, oxidation in the form of hematite staining within the matrix and as banding, and occasional propylitic alteration in the form of chlorite veins are present to varying degrees throughout the siltstone unit. Narrow stockwork zones comprised of calcite occur locally following a strike of 062°. Small sulphide-bearing shear zones occur in various areas of the quarry. The shears typically strike from 140° to 165° and dip 20°E. Sulphide mineralization within the shear zones consists of pyrite with possible chalcopyrite and/or bornite and manganese oxide. Blocky open joints are the dominant structure and typically strike at 336° with dips of 22°E to 26°E. A 2 m wide zone of calcite-healed siltstone breccia is located in the southwest corner of the quarry. A zone of increased carbonatization and calcite veining occupies the northern boundary of the brecciated zone. One small reverse fault was observed striking 020° and dipping 32°E, in the northwest corner of the quarry. Slickensides were visible along the fault plane.

6.3 Rock Geochemistry

Eight representative grab samples were selected for analysis, but only two were submitted for analysis. Sample 659682 was taken at station RXSB002 and returned values of 2435 ppm Cu and 2.7 ppb Au. Sample 659690 was taken at station RXBL008 and was not anomalous. Sample stations are shown on the bedrock maps (in pocket) and a summary of the geochemical results are listed in Appendix B. Six

grab samples collected from the rock quarry late in the project were not submitted for analysis due to budget constraints.

Table 2: Rox Quarry Detailed Notes

Code	Lithology	Description
A	Siltstone	Carbonate-rich ~10%; hard (>7); massive; light grey siltstone with dark grey rip up clasts of mudstone with soft sediment deformation ~2%; orange-brown weathered surface; stockwork calcite veining - hairline to 3.5 cm wide with typical strike of 062^0; nonmagnetic; no visible sulphides; rare tube worm casts present
A1	Siltstone	Contact with overburden strikes 339°; area of increased veining strikes 060^0
A2	Siltstone	Blocky open joints; oxidized maroon in colour; patchy and pervasive in ~90% of the area
A3	Siltstone	Blocky open joints strike 164° and 236°; undulating shear along bedding planes strike 182° and dip 22° SW
A4	Siltstone	Pervasive carbonatization and oxidation (maroon patches); blocky open joints strike 336° and dip 26° E and 336° with a dip of 22° E; <1% hematite patches
A5	Siltstone	Large 40 mm chlorite vein strike 280° dip uncertain; area of increased veining
A6	Siltstone	Reverse fault 020°; slickensides present; calcite vein with rusty orange limonite on surface
A7	Siltstone	Mainly rubble; oxidization and carbonatization alteration
A8	Siltstone	Patchy oxidization (maroon patches); same carbonatization; rare <<1% weathered sulphides (limonite); veining parallel to bedding ~3% and 1 mm to 10 mm in width
A9	Siltstone	Patchy oxidation; same carbonatization; decreased veining towards the NW (near to road)
A10	Siltstone	Shear zone 142° dip 40° E; very weathered; pockets of calcite within fine grained matrix (boudins?)
A11	Siltstone	Patchy oxidation alteration; carbonatization continues
A12	Siltstone	Shear crenulated; small mm sized calcite nodules ~10% within shear; no visible sulphide mineralization but limonite is present on the weathered surface; siltstone is darker grey and carbonatization has decreased to 5%
A13	Siltstone	Increased oxidization (maroon colour) ~20%
A14	Siltstone	Light grey; with limonite coating
A15	Siltstone	Light grey; no visible oxidation; no visible carbonatization

A16	Siltstone	Shear zone 60 mm; lower edge 8 mm granular with clasts of carbonate (calcite); banded light grey-dark grey; <1% sulphides below shear in siltstone; top margin 5 mm is light green (chlorite); hematite present in patches both above and below the shear; patchy oxidation
A17	Siltstone	Increased pervasive oxidation 20% and patchy calcite ~5%
A18	Siltstone	Fine grained; maroon; calcite clasts within matrix 10%; blocky open joints; shear zone crenulated strike 160° and dip 20° E; siltstone below shear shows bivalves, belemnites and fossilized wood(?); siltstone above shear very maroon (oxidized 20%)
A19	Siltstone	Maroon (oxidized 20%); massive; fibrous minerals light grey to almost black (actinolite?) replacement of some fossils (<1%); shear 130 mm; no visible sulphides mineralization
A20	Siltstone	Shear mineralized; top siltstone shows evidence of sulphide weathering; increase in veining; <1% 8-mm wide veinlets parallel bedding
A21	Siltstone	Very dark grey siltstone; hairline boxwork veinlets like in A except thinner (mm to 4 mm) and at 4%; patchy hematite
A22	Siltstone	Maroon; very large (4 cm) carbonate veins aligned with bedding strike; sandstone patches; no visible mineralization
B	Hydrothermal Breccia	Large 2 m wide strip of hydrothermal carbonate (calcite) brecciated clasts of siltstone (~50 mm); zone of increased carbonatization by sandstone contact
Td	Trachyte Dyke	Blocky open joints strike 322° and dip 32° E; bright blue green fine grained matrix (chlorite) with maroon patches (propylitic alteration); hematite stringers ~10%
C1	Trachyte Dyke	Pale green weathered dyke; chill margins; very fine grained; large 10 mm carbonate veins cut dyke as well as hematite stringers
aSa	Arkosic Sandstone	Very carbonaceous; hematite stringers <1%; zoned ~10 mm by siltstone sandstone; wavy, undulating contact
Dt	Dacitic Tuff	Light grey, very fine grained with calcite spars ~2 mm across and at 15%
At	Andesitic Lapilli Tuff	Very oxidized maroon in colour; very fine grained with calcite spars (same as Dacitic Tuff); appears brecciated on weathered surface but only in one patch; shear zone is mineralized with bornite and chalcopyrite; nonmagnetic; no visible sulphides above or below shear

6.4 Soil Geochemical Survey

A reconnaissance soil geochemical survey was conducted south and southeast of Skinny Lake in the northwest corner of the property. Sixty soil samples were collected to coincide with one of the areas covered by bedrock mapping. Sampling took place on approximate 200-metre centres using compass, hip chain and GPS for control. The samples were taken from the B soil horizon where possible, placed in standard kraft soil

bags and air dried. The samples were analyzed for 36 elements (aqua regia, ICP-MS) by Acme Analytical Laboratories Ltd of Vancouver, BC.

The small geochemical survey produced disappointing results. The highest copper value was 51.4 ppm Cu and the highest gold value was 2.6 ppb Au. None of the values from the 2008 survey reached threshold values of 70 ppm Cu and 10 ppb Au used for a previous survey on the property (L'Orsa, 2005). Values for lead and zinc were also very subdued with highs reaching only 19.9 ppm Pb and 212 ppm Zn. The results for copper and gold are plotted on Figure 5 (in pocket).

7. DATA VERIFICATION

All the reconnaissance rock and soil samples, collected during the 2008 field season, were selected, sealed and shipped to Acme Analytical Laboratories in Vancouver, BC. All the rock samples were selected by Allnorth geologists, and duplicated as a representative hand sample for future reference. The soil samples were collected by an experienced prospector under the employ of Lowprofile Ventures.

Due to the small number of reconnaissance rock samples submitted for analysis (2), no certified references were analyzed. Individual samples were labeled, placed in plastic sample bags, sealed and stored at a secure facility in Houston, BC. The samples were delivered via carrier to Acme Laboratory in Vancouver, BC. All samples were crushed, pulverized and the resulting sample pulps were analyzed. The remaining coarse reject portions of the samples remain in storage at the Acme Labs storage facility in Vancouver. The samples were analyzed using the Acme Labs assay procedure 1DX-15, a 1:1:1 Aqua Regia Digestion with an ICP-MS finish. The reader is referred to http://www.acmelab.com for details of these analytical procedures and the assay certificates are located in Appendix C: Certificates of Analysis.

8. INTERPRETATION AND CONCLUSIONS

The limited bedrock mapping program provided additional information on the distribution of the prospective Middle Jurassic Smithers Formation (Hazelton Group) on the Rox property. Alteration is not wide-spread, nor well-developed. However, weakly developed calcite-epidote+/-chlorite accompanied by pyrite either on fractures, in veinlets or as disseminations, locally with traces of copper mineralization, suggests that potential exists for a buried porphyry system.

9. RECOMMENDATIONS

Exploration should continue and focus on expanding the previously identified "Discovery" and "Central" showings where a spatial relationship exists between diorite, altered Smithers Formation country rock, structure and mineralization. Exploration should consist of thorough prospecting and detailed mapping and sampling with the intent to determine controls on mineralization and targets for more detailed follow-up. A 3-4 week program is recommended at an estimated cost of $94,000.

10. STATEMENT OF COSTS – 2008 PROGRAM

Exploration Work type	Comment				Totals
Personnel (Name) / Position	**Field Days (list actual days)**	**Days**	**Rate**	**Subtotal**	
Bob Lane	August 1	1	$750.00	$750.00	
Diana Benz	August 11-13 & 21	4	$425.00	$1,700.00	
Amber Marko	August 1, 11-13 & 21	5	$325.00	$1,625.00	
Brian Kornichuk	July 20, 22, 23 August 11, 13 & 14	6	$325.00	$1,950.00	
Sheri Burt	July 20, 22 & 23	3	$675.00	$2,025.00	
				$8,050.00	**$8,050.00**
Office Studies					
Diana Benz	Project Preparation	1.00	$425.00	$425.00	
Amber Marko	Project Preparation	1.25	$325.00	$406.25	
Sheri Burt	Project Preparation	0.25	$675.00	$168.75	
Bob Lane	Project Management	1.00	$750.00	$750.00	
Brian Kornichuk	Project Preparation	1.25	$325.00	$406.25	
Ben Brown	Base Mapping	1.00	$488.00	$488.00	
				$2,644.25	**$2,644.25**
Geochemical Surveying	**Number of Samples**	**No.**	**Rate**	**Subtotal**	
Acme Labs	1 Rock	1.0	40.95	$40.95	
Acme Labs	60 Soils	60.0	18.35	$1,101.00	
Acme Labs	1 Rock	1.0	$27.48	$27.48	
				$1,169.43	**$1,169.43**
Other Operations		**No.**	**Rate**	**Subtotal**	
Lowprofile Exploration	Mobilization/demobilization, camp setup, project management, transportation and prospecting services	1.0	$6,641.78	$6,641.78	
Lowprofile Exploration	Mobilization/demobilization, camp setup, project management, transportation and prospecting services	1.0	$10,601.52	$10,601.52	
				$17,243.30	**$17,243.30**
Transportation		**No.**	**Rate**	**Subtotal**	
Travel to Field (wages - B. Lane)	July 31, August 1	0.75	$750.00	$562.50	
Travel to Field (wages - D. Benz)	August 10	0.50	$425.00	$212.50	
Travel to Field (wages - A. Marko)	July 29 & August 10	1.00	$325.00	$325.00	
Travel to Field (wages - S. Burt)	July 24	0.50	$675.00	$337.50	
Travel to Field (wages - B. Kornichuk)	July 24 & August 10	1.00	$325.00	$325.00	
Kilometres	Rental Truck (Field Crew)	650	$0.65	$422.50	
Kilometres	Truck 98 (Bob Lane)	641	$0.65	$416.65	
Daily Rate	Truck 83 (Field Crew)	7	$50.00	$350.00	
				$2,951.65	**$2,951.65**
Accommodation & Food	**Rates per day**				
Bob Lane - Houston Motor Inn	July 31	1.00	$77.22	$77.22	
Field Crew - Houston Motor Inn	July 20 - August 14	1.00	$912.38	$912.38	
Field Crew - Meals & Groceries	July 20 - August 14	1.00	$967.23	$967.23	
				$1,956.83	**$1,956.83**
Miscellaneous					
Field Supplies (consumables)	July 20 - August 14	1.00	$49.59	$49.59	
Trim & Ortho for Base Maps	Trim & Ortho for Base Maps	1.00	$946.00	$946.00	
Assessment Report Compilation	Compiled by Allnorth	1.00	$4,500.00	$4,500.00	
				$5,495.59	**$5,495.59**
TOTAL Expenditures					**$39,511.05**

11. COST ESTIMATE

Proposed Budget for Follow-up Program

Exploration Work type					Totals
Personnel (Name) / Position		**Days**	**Rate**	**Subtotal**	
Geologist (PGeo)		25	$550.00	$13,750.00	
Geological assistant		25	$250.00	$6,250.00	
Prospector		25	$400.00	$10,000.00	
Assistant		25	$250.00	$6,250.00	
				$36,250.00	**$36,250.00**
Office Studies					
Project Preparation	Research & preparation for field	3.00	$350.00	$1,050.00	
				$1,050.00	**$1,050.00**
Geochemical Surveying		**No.**	**Rate**	**Subtotal**	
Soil Samples		300.0	25	$7,500.00	
Rock Samples		200.0	35	$7,000.00	
				$14,500.00	**$14,500.00**
Other Operations		**No.**	**Rate**	**Subtotal**	
Camp Establishment	Mobilization/demobilization, camp setup	2.0	$2,000.00	$4,000.00	
				$4,000.00	**$4,000.00**
Transportation		**No.**	**Rate**	**Subtotal**	
4x4 pickup 1	100/day	25.00	$100.00	$2,500.00	
4x4 pickup 2	100/day	25.00	$100.00	$2,500.00	
Fuel	100/day	25.00	$100.00	$2,500.00	
				$7,500.00	**$7,500.00**
Accommodation & Food	**Rates per day**				
100 person-days	120 person days, camp lodging and meals	100.00	$120.00	$12,000.00	
				$12,000.00	**$12,000.00**
Miscellaneous					
Field Supplies (consumables)	Bags, tags, etc, misc equipment	1.00	$1,000.00	$1,000.00	
Maps		1.00	$500.00	$500.00	
Assessment Report		1.00	$5,000.00	$5,000.00	
				$6,500.00	**$6,500.00**
SUBTOTAL					**$81,800.00**
Contingency (10%)					**$8,180.00**
GST (5%)					**$4,090.00**
TOTAL					**$94,070.00**

13. STATEMENT OF QUALIFICATIONS

I, Robert (Bob) A. Lane, of 2606 Carlisle Way, Prince George, B.C., do hereby certify that:

1. I visited the Rox property on August 1, 2008.
2. I authored the assessment report with the assistance of Diana Benz.
3. I graduated from the University of British Columbia in 1990 with a M.Sc. in Geology.
4. I am a Professional Geoscientist (P.Geo.) registered with the Association of Professional Engineers and Geoscientists of British Columbia, license #18993, and have been a member in good standing since 1992.
5. From 1990 until present I have been continuously employed as a geologist in mining and mineral exploration sector.

Dated at: PRINCE GEORGE the 10 day of NOVEMBER 2008.

Robert (Bob) A. Lane, P.Geo.
Allnorth Consultants Limited

Rox Field Mapping Stations

Station ID	Description	Lithology	Lithology Code
RXAM001	as per RXBL004	Conglomerate	Cg
RXAM002	as per RXBL004	Conglomerate	Cg
RXAM006	Large calcite vein, brecciated siltstone on either side and within the vein itself; no apparent sulphides; approximately 10 cm wide vein	Siltstone	Sl
RXAM007	Siltstone, dark grey to green with calcite veins throughout mm to 5 cm wide; highly altered dike cutting siltstone light green coloured; calcite vein cutting all of the above features; weathered surface has areas of iron oxidation; no apparent sulphides; calcite veins 1 cm to 2 cm wide with brecciated siltstone throughout	Siltstone	Sl
RXAM008	Siltstone with calcite veins mm-cm wide; small amounts of hematite present; sulphides present, pyrite; soil is very orange in this area; blebs of K feldspar present	Siltstone	Sl
RXAM009	Sediments, siltstone with fossils present, bivalves; shear zone, filled with calcite and sulphides, pyrite; iron oxide staining and hematite staining on weathered surface; shear zone 164/45 E NE	Siltstone	Sl
RXAM010	Sandstone with sulphides present in shear zone; shear zone mineralized with pyrite in association with calcite; calcite precipitate on surface; shear zone 159/35 E	Volcanic Sandstone	Sa
RXAM011	Siltstone with a small layer of hornfels on top; shear zone filled with mudstone 164/36 E NE; iron oxide and manganese staining on weathered surface; fossils are present in sediments; in places a sandstone layer on top of siltstone later	Siltstone	Sl
RXAM012	Control Point 1		
RXAM013	Control Point 2		
RXAM014	Control Point 3		
RXAM015	Control Point 4		
RXAM016	Control Point 5		
RXBL001	At rock quarry; fossiliferous lithic wacke with significant volcanic component; vague bedding defined by consistent orientation of fossils (belemnites; also bivalves); medium to thick bedded grey-maroon colour to grey green, smooth to mottled in appearance; narrow sandstone interbeds cm scale with 30-100 cm silt- mudstone beds; cut by a plagioclase porphyry dike; brown - dark maroon hornfels along dike; back of pit is minor zone of calcite healed breccia	Siltstone	Sl
RXBL002	Sandstone; massive weathering and brown; grey fresh surface	Volcanic Sandstone	Sa
RXBL003	Conglomerate; subangular fist sized clasts of volc seds; oc located just inside trees at a sudden break in slope; estimated trend of 085	Conglomerate	bCg
RXBL004	Conglomerate, just further along; breccia blocks with fabric defined by long axis of tabular clasts	Conglomerate	bCg
RXBL005	Conglomerate, approximately 8 m across and 25 m long	Conglomerate	bCg
RXBL006	Rhyolite; large angular blocks; cream coloured with 1 mm quartz eyes and rare flakes of biotite; directly above is bedrock of matrix supported breccia; note angular clasts of mudstone.	Rhyolite	Rh
RXBL007	Plagioclase porphyry, greenish to maroon; aphanitic microcrystalline matrix, trace pyrite; plagioclase phenocrysts to 4 mm with some vague flowbanding; possible dike	Andesitic Plagioclase Porphyry	Ap
RXBL008	Sandstone/siltstone with heavy volcanic component; rare belemnites	Volcanic Sandstone	Sa
RXBL009	very punky, cream weathering, grey fresh surface; crowded plag-hbl porphyry, very rare quartz grains, chloritized mafics, paleauss. plags; common xenoliths up to 3 cm	Diorite	Di
RXBL010	Brownish-black, aphanitic, almost glassy, microporphyritic basalt; common <0.5mm, aligned plag laths and rare <1mm pale green trans olivine; rare agate; concoidal fracturing; strongly magnetic	Basalt	Ba

Rox Field Mapping Stations

Station ID	Description	Lithology	Lithology Code
RXDB001	Outcrop; 15 m tall; strike 183 dip 7W; very fine grained maroon matrix with sub rounded clasts of quartz ~2% and 1-2 mm plus clasts altered to chlorite ~2% and 3-4 mm; conglomerate; massive; no visible sulphides; weathered surface bumpy like conglomerate; chlorite also found in matrix <1%; hematite replacement of some ~1% of clasts as well	Conglomerate	Cg
RXDB002	Same as RXDB001 except no hematite or chlorite and ~3% carbonate patches ~1 mm and short 3 mm hairline stringers	Conglomerate	Cg
RXDB003	Same as RXDB001; edge of swamp; maroon and chlorite patches with carbonate patches ~7% and 8 mm	Conglomerate	Cg
RXDB003B	Extension of RXDB003	Conglomerate	Cg
RXDB003C	Extension of RXDB003	Conglomerate	Cg
RXDB004	Same as RXDB001 except epidote present instead of chlorite replacement; by old road	Conglomerate	Cg
RXDB005	Outcrop by old logging road; same as RXDB003	Conglomerate	Cg
RXDB006	Same s RXDB001	Conglomerate	Cg
RXDB007	Same as RXDB003 except epidote shear present with hematite banding within shear aligned with strike and a vertical dip(?)	Conglomerate	Cg
RXDB008	Outcrop Side of main logging road; dark greyish green to dark brown fine grained matrix; bedding visible (siltstone) wavy; black chlorite visible outcrop face slickensided in some areas <1% along bedding planes; epidote present within matrix; shears present (2 visible) strike along bedding planes; weathered surface light orange to greenish black; veins horizontal to bedding planes 2 mm carbonates (calcite)	Siltstone	Sl
RXDB008B	Extension of RXDB008	Siltstone	Sl
RXDB008C	Extension of RXDB008	Siltstone	Sl
RXDB008D	Extension of RXDB008 except not as intensely altered also has a darker rusty weathered surface	Siltstone	Sl
RXDB009	Outcrop in clearcut; estimated coordinates; same as RXDB008 except increase in veining ~4% along strike and at sub 90 degree angles and very stringy with branches interweaving along vein strike direction; veins weathered to talc(?) on weathered surface possible epidote veins(?); another outcrop 3 m by 2 m ~ 10 m north of this outcrop	Siltstone	Sl
RXDB010	Moss covered treed knoll in clearcut off main road; same as RXDB008 except magnetic in patches; shiny iridescent patches of goethite on weathered surface	Siltstone	Sl
RXDB011	Small outcrop on old logging road; patchy outcrop exposures in 20 m area; dark greenish grey fine grained matrix; goethite weathering on surface light orange to white weathered surface; siltstone bedding is wavy and mini-faulted; veining along bedding planes ~1% and hairline carbonate veins; visible chalcopyrite ~1 mm; black metallic minerals (chalcocite?) found within veins ~5%; flagged where saw sulphides	Siltstone	Sl
RXDB012	Scratched with a knife; weathered surface grey to light orange; fresh surface is greenish grey; magnetic; fine grained matrix with yellow vitreous translucent minerals non carbonate (andesine?) ~3% and 2 mm; blocky joints 030 dip 85 SE; no visible sulphides; very weathered surface skin of ~25 mm	Andesite Crystal Tuff	At
RXDB012B	Extension of RXDB012	Andesite Crystal Tuff	At
RXDB012C	Extension of RXDB012	Andesite Crystal Tuff	At

Station ID	Description	Lithology	Lithology Code
RXDB012D	Extension of RXDB012; south side of road; visible magnetite crystal ~2 mm; also rare dark magnetic vein hairline <1% (magnetite?); extends to 100 m of mouth of river; estimated coordinates	Andesite Crystal Tuff	At
RXDB013	Same as RXDB012D; with visible magnetite; joints strike 328 and dip 80 NE; ~20 m wide and 30 m tall; large joint in outcrop face strike 048 dip 70 SE	Andesite Crystal Tuff	At
RXDB014	Same as RXDB012D; open joints strike 303 dip 80 NE	Andesite Crystal Tuff	At
RXDB014B	Extension of RXDB013	Andesite Crystal Tuff	At
RXDB015	Same as RXDB012D except hematite present in matrix ~1%; blocky open joints strike 262 dip 80 N	Andesite Crystal Tuff	At
RXDB015B	Extension of RXDB015	Andesite Crystal Tuff	At
RXDB015C	Extension of RXDB015	Andesite Crystal Tuff	At
RXDB015D	Extension of RXDB015	Andesite Crystal Tuff	At
RXDB016	Same as RXDB012D	Andesite Crystal Tuff	At
RXDB016B	Extension of RXDB016	Andesite Crystal Tuff	At
RXDB016C	Extension of RXDB016	Andesite Crystal Tuff	At
RXDB017	Same as RXDB012D except smaller phenocrysts (andesine?) ~1 mm and at 2% also decreased magnetite <<1%	Andesite Crystal Tuff	At
RXDB017B	Extension of RXDB017	Andesite Crystal Tuff	At
RXDB017C	Extension of RXDB017	Andesite Crystal Tuff	At
RXDB018	Same as RXDB012D except larger 3-4 mm andesine(?) phenocrysts; extremely weathered powdery and breaks into individual grains; small side slope on road	Andesite Crystal Tuff	At
RXDB018B	Extension of RXDB018; 2 m tall	Andesite Crystal Tuff	At
RXDB019	Dark grey fine grained matrix with ~25% phenocrysts (augite?) and mm to 5 mm; andesitic pyroxene (augite) porphyry; magnetic; magnetite <1% and sub mm disseminated throughout matrix and rarely <1% associated with phenocrysts; weathers dark orange to tan with a 'granular' weathered surface; broken outcrop on side of road ~10 m by 8 m; no visible sulphides, veining or alteration; very weathered surface shows phenocrysts weather white , partial weathering is black	Andesitic Plagioclase Porphyry	Ap
RXDB020	Same as RXDB019; 10 by 5 m	Andesitic Plagioclase Porphyry	Ap
RXDB021	Same as RXDB019; site of mini core samples; 10 m by 5 m	Andesitic Plagioclase Porphyry	Ap
RXDB022	Brick red to light orange weathered surface; small amoeboidal patches of translucent (clear), hard (7), light green to blue mineral on weathered surface and in fresh rock (chalcedony?) ~10% appears vuggy in matrix 3-4 mm; blocky open joints strike 018 dip 64 W; fine grained light grey matrix; andesite flow	Andesite Flow	Af
RXDB022B	Extension of RXDB022 except magnetite present <1% and 1 mm; area ~5 m SW which has <<1% phenocrysts yellowish and no visible chalcedony amygdules	Andesite Flow	Af
RXDB023	Outcrop on side slope by road ~100 m wide and 10 m tall with talus sloped to road; blocky open joints strike 042 dip 65 E; very fine grained dark grey andesite tuff; strongly magnetic magnetite sub mm and disseminated <1%; <1% visible phenocrysts (light yellow; vitreous, transparent, hard (7), euhedral) (andesine?); light orange to brick red weathered surface; no visible sulphides	Andesite Crystal Tuff	At
RXDB024	Very dark grey to black fine grained; massive; strongly magnetic; dark grey weathered surface; conchoidal fracture surfaces; disseminated sub mm dark metallic minerals present (magnetite) ~1%; possible hornfels since next to intrusive	Basalt	Ba

Rox Field Mapping Stations

Station ID	Description	Lithology	Lithology Code
RXDB024B	Extension of RXDB024	Basalt	Ba
RXDB025	Same as RXDB024; rare <1% hematite veining/coating along fracture surfaces; 4 m by 12 m high	Basalt	Ba
RXDB026	Coarse grained green euhedral (microcline?, or propylitic alteration?) intrusive ~10% K feldspar and 15% biotite; blocky open fractures strike 169 dip 66 W; 10 m wide by 5 m tall; syenite/monzonite	Diorite	Di
RXDB027	Same as RXDB026; spotty outcrop exposure to RXDB026B	Diorite	Di
RXDB027B	Extension of RXDB027	Diorite	Di
RXDB028	Same as RXDB024; sheen to fresh surface; bedding visible as light tan and dark bands ~3mm and curved	Basalt	Ba
RXDB029	Greenish grey weathered surface rare limonite <1%; greenish grey fresh surface; fine grained; ~20% carbonates (calcite); no visible sulphides; nonmagnetic; 3m by 1 m by old road cut; rare 2% augite phenocrysts; andesitic crystal tuff; too weathered to find joints	Andesite Crystal Tuff	At
RXDB030	Grey to light orange weathered surface; light grey fine grained fresh surface; same as RXDB029; large ~10 mm rounded soft (<<3) chalcocite nodules ~2%; few carbonates ~2% (calcite) in matrix; <<1% sub mm pyrite associated with calcite spars, some are vuggy and stained dark; nonmagnetic; hematitic weathering along fractures ~2 mm	Andesite Crystal Tuff	At
RXDB030B	Extension of RXDB030B; old sample site	Andesite Crystal Tuff	At
RXDB031	Light bluish grey fine grained matrix; weathered surfaces light rusty orange and appears granular and bedded; bedding strike 190 dip 60 E; carbonates present (calcite) ~2%; pyrite visible sub mm and 5%; nonmagnetic	Andesite Crystal Tuff	At
RXDB032	Upper 1 m is sandstone, massive, no visible carbonates, no visible bedding, 30% plagioclase (microcline?) greenish tinge and dark green areas (augite?); lower is dark green to light green, very magnetic, massive, chlorite ~25%, ~5% magnetic, 1 mm with ~5% calcite, calcite veining ~2 mm <<1% strike 087 with near vertical dip, andesitic crystal tuff; no visible sulphides in either	Volcanic Sandstone	Sa
RXDB033	Brownish orange weathered surface (limonite); light greenish grey fresh; carbonates (calcite) ~5% and spars; pyrite sub mm disseminated <<1%; next to felsic dike the wall rock is very dark grey with ~30% calcite nodules and stringers and spars; both nonmagnetic; by old DDH; no visible joints	Andesite Crystal Tuff	At
RXDB034	Greyish green fresh surface; 1% chalcopyrite disseminated 1 mm; nonmagnetic; ~2% carbonates (calcite) in matrix and patches ~10 mm by 15 mm; massive; weathered reddish orange in patches ~5% of rock face	Andesite Crystal Tuff	At
RXDB035	Light to dark grey fine grained matrix with visible crystals (augite, 2 mm and 2%); ~1% carbonates (calcite); <1% pyrite cubes disseminated in matrix; nonmagnetic	Andesite Crystal Tuff	At
RXDB036	Very dark grey; very fine grained like the wallrock in RXDB033; with carbonate veins and same as greyish green in andesitic tuff in RXDB033; same 'baked' rock in area but no visible dike	Andesite Crystal Tuff	At
RXDB037	Maroon andesitic tuff; chlorite and epidote replacement of phenocrysts ~2% and 2 mm; ~20% carbonates (calcite); rusty orange weathered surface; maroon and green clasts/phenocrysts in fresh surface (hematite and chlorite replacement); 3 m by 1 m	Andesite Crystal Tuff	At
RXDB038	Green, easily weathered fresh surface; <<1% pyrite clump ~2 mm; weathered surface appears pebbly; massive; ~2% carbonates (calcite) patches an spars; occasional 1% patches on weathered surface of rusty orange limonite; chlorite replacement of some clasts/phenocrysts ~3%	Andesite Crystal Tuff	At
RXDB039	Same as RXDB008; except no visible movement or epidote; just rare 1% calcite veins hairline; no visible sulphides; not sure of bedding strike	Siltstone	Sl
RXDB040	Quarry; same as RXDB038	Andesite Crystal Tuff	At

Rox Field Mapping Stations

Station ID	Description	Lithology	Lithology Code
RXDB040B	Extension of RXDB040	Andesite Crystal Tuff	At
RXDB040C	Extension of RXDB040	Andesite Crystal Tuff	At
RXDB040D	Extension of RXDB040	Andesite Crystal Tuff	At
RXDB040E	Extension of RXDB040	Andesite Crystal Tuff	At
RXDB041	1 m wide swath of sandstone; ~30% quartz angular to subrounded and 2 mm; trend strike 148 exposure	Volcanic Sandstone	Sa
RXDB041B	Extension of RXDB041	Volcanic Sandstone	Sa
RXSB001	Basalt; dark brown to black; some vesicles; some amygdules filled with calcite; also few quartz veins/inclusions; nonmagnetic; no visible sulphides	Amygdaloidal Basalt	Ba
RXSB002	Brecciated Basalt; minor malachite staining; no visible sulphides; abundant quartz in veins (malachite is on quartz); amygdules filled with calcite and quartz; vesicles	Amygdaloidal Basalt	Ba
RXSB003	Basalt; calcite filled amygdules and empty vesicles	Amygdaloidal Basalt	Ba
RXSB004	Basalt; vesicular; rounded weathering on outcrop; hard to get fresh surface; non magnetic	Amygdaloidal Basalt	Ba
RXSB005	Dark maroon to dark brown/black andesite; no visible vesicles; no apparent phenocrysts; abundant quartz in matrix	Andesite Flow	Af
RXSB006	Andesite; dark grey; siliceous with patches of breccia and abundant chlorite in matrix; nonmagnetic; abundant carbonate	Andesite Flow	Af
RXSB007	Andesite; crystalline/very siliceous; few chlorite patches; rare disseminated sulphides with malachite specks adjacent; some reddish hematite staining; dark maroon grey; occasional flash of crystal face visible - hornblende and pyroxene; directly above to the South is Amygdule Basalt; amygdules are filled with calcite which are sometimes rimmed or replaced with chlorite; nonmagnetic	Andesite Flow	Af
RXSB008	Basalt; vesicular	Amygdular Basalt	Ba
RXSB009	Light green; very siliceous; non calcareous	Quartzite	Qz

Rox Field Mapping Stations

Station ID	Description	Lithology	Lithology Code
RXSB010	Brecciated Quartzite; breccia; abundant quartz/chert clasts; hard to get fresh sample; clasts <5 cm; at west end, there is dark mafic matrix and most clasts are whitish quartz to chert-like	Quartzite	Qz
RXSB011	Brecciated Quartzite; breccia; most clasts are quartz; some with chlorite replacement; possible trend of 010 with a vertical dip; minor calcite in matrix and maybe in clasts	Quartzite	Qz
RXSB012	Looks like almost pure quartz - pinkish beige; very hard	Quartzite	Qz
RXSB013	Chert/Quartz- beige with some hematite staining	Quartzite	Qz
RXSB014	Same quartz/chert with hematite	Quartzite	Qz
RXSB015	Same quartz/chert with hematite	Quartzite	Qz
RXSB016	Same quartz/chert with hematite	Quartzite	Qz
RXSB017	Brecciated Quartzite; breccia	Quartzite	Qz
RXSB018	Brecciated Quartzite; breccia	Quartzite	Qz
RXSB019	Brecciated Quartzite; breccia	Quartzite	Qz
RXSB020	Same quartz/chert with hematite	Quartzite	Qz
RXSB021	Quartzite	Quartzite	Qz
RXSB022	Basalt; vesicular; amygdules of calcite	Amygdaloidal Basalt	Ba
RXSB023	Basalt; hard to get fresh surface; very weathered	Amygdaloidal Basalt	Ba
RXSB024	Sandstone; fine to medium grained; mostly quartz grains; occasional flecks of biotite; calcareous cement; nonmagnetic	Quartzose Sandstone	Sa
RXSB025	Breccia - volcanic clasts not like quartz breccia seen previously; clasts are mainly of aphanitic andesite and some porphyry; clasts are angular up to 5 cm; abundant manganese (goethite?) on fracture planes; slightly magnetic; green -(chlorite?)-clasts; matrix is dark maroonish	Andesite Breccia	Ab
RXSB026	Breccia - on weathered surface angular clasts of aphanitic andesite and basalt stick out as though matrix has been weathered away; chlorite and epidote along fractures; magnetic; quartz veining and fracture fill with some associated hematite; minor calcite	Andesite Breccia	Ab
RXSB027	Basalt with chlorite filled amygdules; nonmagnetic; minor calcite	Amygdaloidal Basalt	Ba
RXSB028	Basalt; hard to get fresh surface; very weathered	Amygdaloidal Basalt	Ba
RXSB029	Dark brownish grey; siliceous; andesite with some sections brecciated - red (hematite) and green (epidote/chlorite) angular clasts; nonmagnetic	Andesite Flow	Af

CERTIFICATES OF ANALYSIS

ACME ANALYTICAL LABORATORIES LTD.
1020 Cordova St. East Vancouver BC V6A 4A3 Canada
Phone (604) 253-3158 Fax (604) 253-1716
www.acmelab.com

Client: **Lowprofile Exploration**
P.O. Box 704
Houston BC V0J 1Z0 Canada

Submitted By: Gary Thompson
Receiving Lab: Canada-Vancouver
Received: August 07, 2008
Report Date: September 08, 2008
Page: 1 of 2

CERTIFICATE OF ANALYSIS VAN08008074.1

CLIENT JOB INFORMATION

Project: Lund/Rox
Shipment ID:
P.O. Number 08-PX-0454
Number of Samples: 10

SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage
DISP-RJT Dispose of Reject After 90 days

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status
R150	9	Crush, split and pulverize rock to 200 mesh		
1DX	10	1:1:1 Aqua Regia digestion ICP-MS analysis	0.5	Completed

ADDITIONAL COMMENTS

CLIENT JOB INFORMATION

Project:	WT/LT/ROX
Shipment ID:	
P.O. Number	08-PX-0454
Number of Samples:	17

SAMPLE DISPOSAL

STOR-PLP	Store After 90 days Invoice for Storage
DISP-RJT	Dispose of Reject After 90 days

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status
R150	16	Crush, split and pulverize rock to 200 mesh		
1DX	17	1:1:1 Aqua Regia digestion ICP-MS analysis	0.5	Completed

CLIENT JOB INFORMATION

Project: Rox
Shipment ID:
P.O. Number
Number of Samples: 60

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status
SS80	60	Dry at 60C sieve 100g to -80 mesh		
Dry at 60C	60	Dry at 60C		
1DX	60	1:1:1 Aqua Regia digestion ICP-MS analysis	0.5	Completed
DIS-RJT	60	Warehouse handling / Disposition of reject
