PROPERTY GEOLOGY KEYWORDS (lithology, age, stratigraphy, structure, alteration, mineralization, size and attitude):

The property lies within the Intermontane Belt of the Canadian Cordillera and is part of Quesnellia. Central Belt facies rocks of the Late Triassic Nicola Group underlie most of the property. These rocks consist mainly of augite and plagioclase-phyric basalt flows and associated breccias. No showings are known on the property, although a soil geochemical survey conducted in 2006 delineated a small molybdenum-antimony-lead anomaly.

## 1.0 SUMMARY

The Horn project consists of one cell mineral claim covering 500 hectares located in the Kamloops Mining Division. It is located approximately 12 kilometres east of Logan Lake in southern British Columbia and is owned and operated by Grant F. Crooker of Keremeos, BC.

The general area of Kamloops-Merritt has been the scene of intense exploration and mining activity for more than 100 years. The exploration culminated with the discovery and development of the bulk tonnage copper-molybdenum deposits at Craigmont, Afton and Highland Valley.

Exploration has been carried out in the vicinity of the Horn project since the late 1880's with seven mineral occurrences (Figure 3.0) having been documented. These include Bertha/Molly, Chatrandts, JHC, Rhyolite, Pom Pom, Plug and Meadow. Shaft sinking, trenching, drilling, prospecting and geological, geochemical and geophysical surveys have been carried out over the showings. Most of the old showings are related to copper mineralization. However the Plug and Meadow showings have yielded significant gold and silver values.

Late Triassic Nicola Group arc-volcanic rocks and sedimentary facies underlie the Horn property, most of which are central belt facies rocks that are mainly augite and plagioclase-phyric basalt flows and associated breccias.

During 1986 Western Resource Technologies Inc. carried out a stream sediment sampling survey in the Logan Lake area, part of which covered the Horn property. One drainage yielded stream sediment samples anomalous in gold (64 ppb), silver (1.7 to 2.0 ppm) and arsenic (21 to 35 ppm).

In 2006 the present owner of the Horn claim conducted stream sediment and soil sampling as a follow up to the 1986 survey. This stream sediment sampling gave one strongly anomalous (120 ppb) and one weakly anomalous (10 ppb) gold value. Both samples were collected from a northerly flowing stream in the southeast corner of the Horn claim.

Two lines of soil samples (1200N and 1400N) were collected in the area of the anomalous stream sediment samples from the 1986 survey. This soil sampling did not delineate any strongly anomalous gold values, however line 1200N between 1000E and 1350E delineated a strongly anomalous molybdenum-antimony-lead geochemical anomaly.

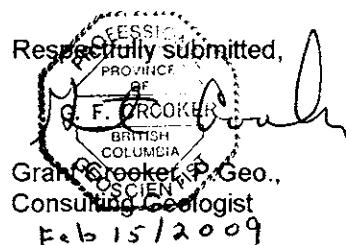

The 2008 work program consisted of additional soil sampling in the area of the 2006 molybdenum-antimony-lead soil geochemical anomaly. One line (1300N) of soil samples was collected north of line 1200N and three lines (900N, 1000N and 1100N) were collected south of line 1200N.

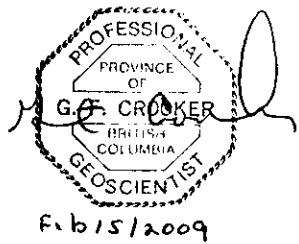

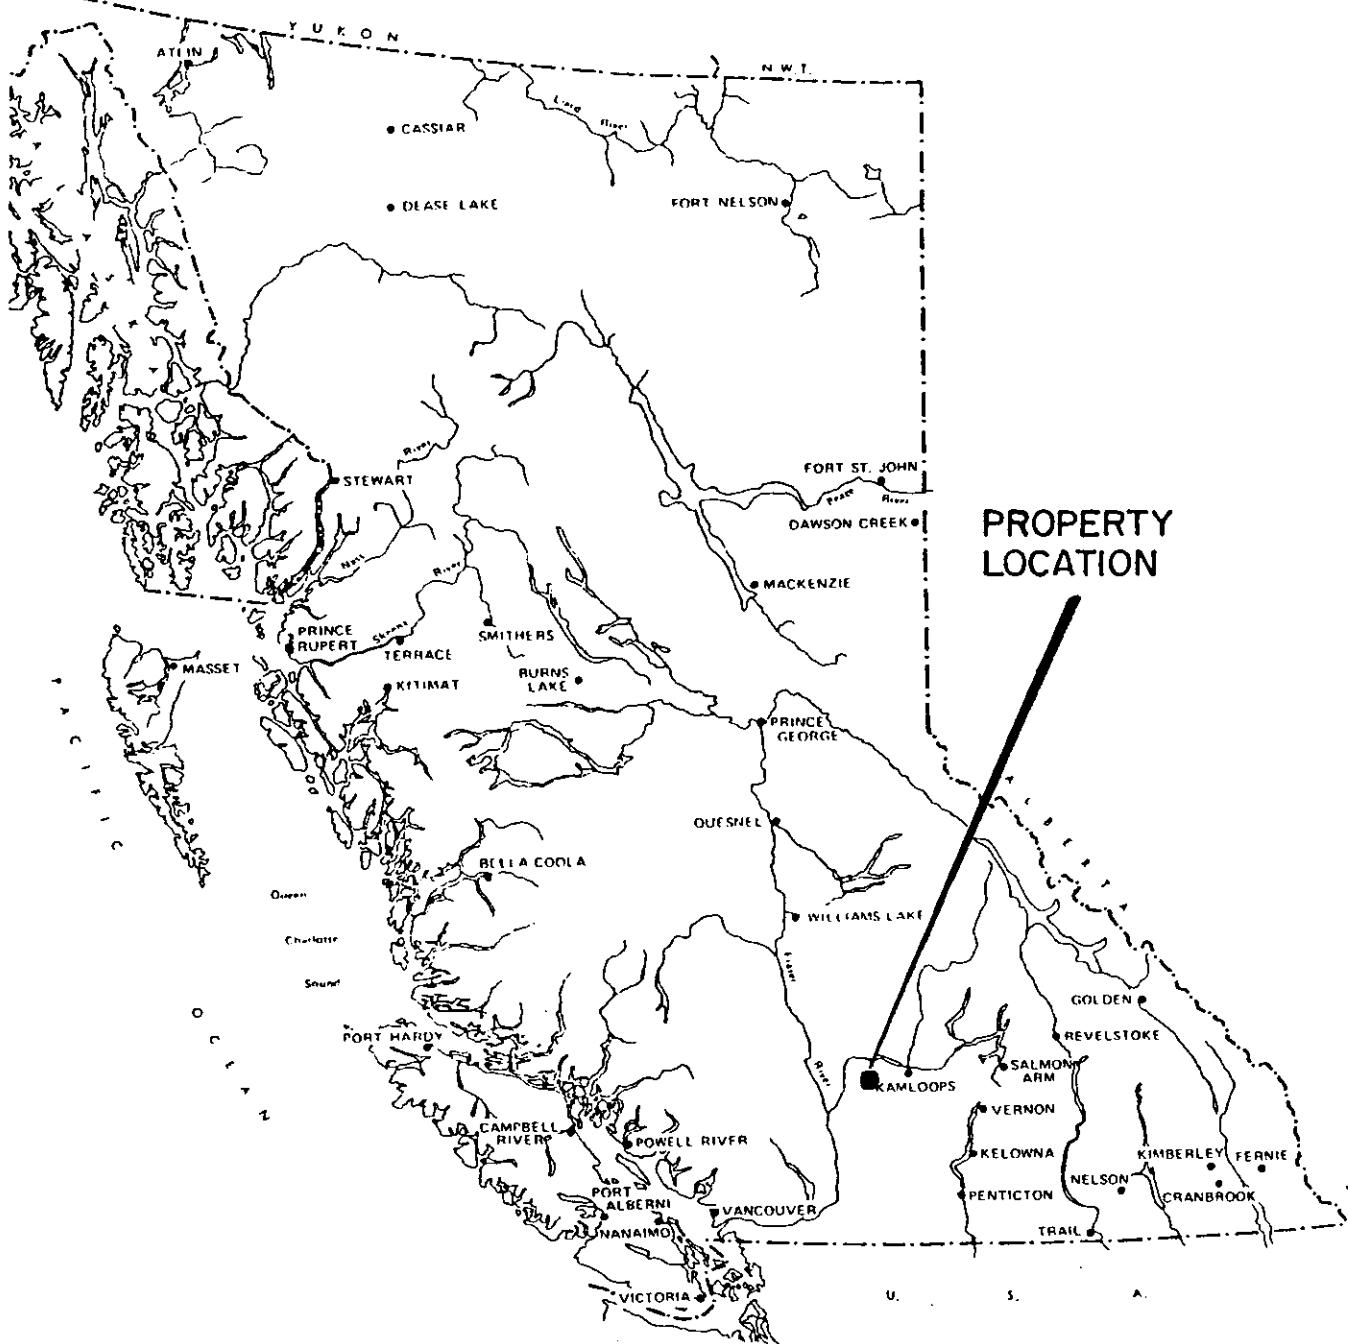

The following conclusions can be drawn from the 2008 work program:

- 1.1 The 2008 soil geochemical sampling along lines 900N, 1000N, 1100N and 1300N did not yield any anomalous molybdenum, antimony or lead geochemical values.
- 1.2 The 2008 soil sampling did not expand the molybdenum-antimony-lead soil geochemical anomaly outlined along line 1200N in 2006.

Recommendations are as follows:

- 1.1 Line 1200N should be resampled to determine if the molybdenum-antimony-lead anomaly outlined in 2006 is valid.
- 1.2 If the 2006 molybdenum-antimony-lead anomaly is valid, prospecting should be carried out to determine the cause of the anomaly.

## 2.0 INTRODUCTION

### 2.1 GENERAL

Field work was carried out on the Horn project by Grant F. Crooker, P. Geo. of GFC Consultants Inc. (owner and operator) during October of 2008.

The work program consisted of establishing grid lines and collecting soil geochemical samples over the grid.

### 2.2 LOCATION AND ACCESS

The property (Figure 1.0) is located approximately 12 kilometres east of Logan Lake in southern British Columbia and is centred at lies 50° 26' north latitude and 120° 40' west longitude (NTS 92I-7E).

The Surrey Lake Forest Access road provides access to the property. A rehabilitated logging road turns off the Surrey Lake road 500 metres south-west of Desmond Lake and cuts through the centre of the property, while numerous old four wheel drive roads access other areas.

### 2.3 PHYSIOGRAPHY

The property is located in the Interior Plateau of southern British Columbia. Topography is gentle to steep and elevation varies from 1220 to 1380 metres above sea level. Snowfall is not excessive and water is usually available from the creek and swamps.

Vegetation consists of swamps, open grassy meadows and forest-covered areas. The forested areas vary from aspen and spruce to jack pine and fir. Most of the pine forest has been killed by the Pine Beetle infestation and clear cut logging is being carried over some areas of the claim.

### 2.4 PROPERTY AND CLAIM STATUS

The Horn mineral claim (Figure 2.0) is owned by Grant F. Crooker of 2522 Upper Bench Road, Box 404, Keremeos, BC, V0X 1N0 and consists of one cell claim covering 500 hectares.

\* Upon acceptance of this report.

### 2.5 AREA AND PROPERTY HISTORY

The Kamloops-Merritt-Logan Lake area has been the scene of intense exploration activity over the past 100 years. This activity culminated with the discovery and development of the porphyry copper-molybdenum mines in the Highland Valley, the Craigmont mine near Merritt and the Afton mine near Kamloops, beginning in the 1960's. Small mines with good copper-gold values were worked south of Kamloops Lake in earlier days.

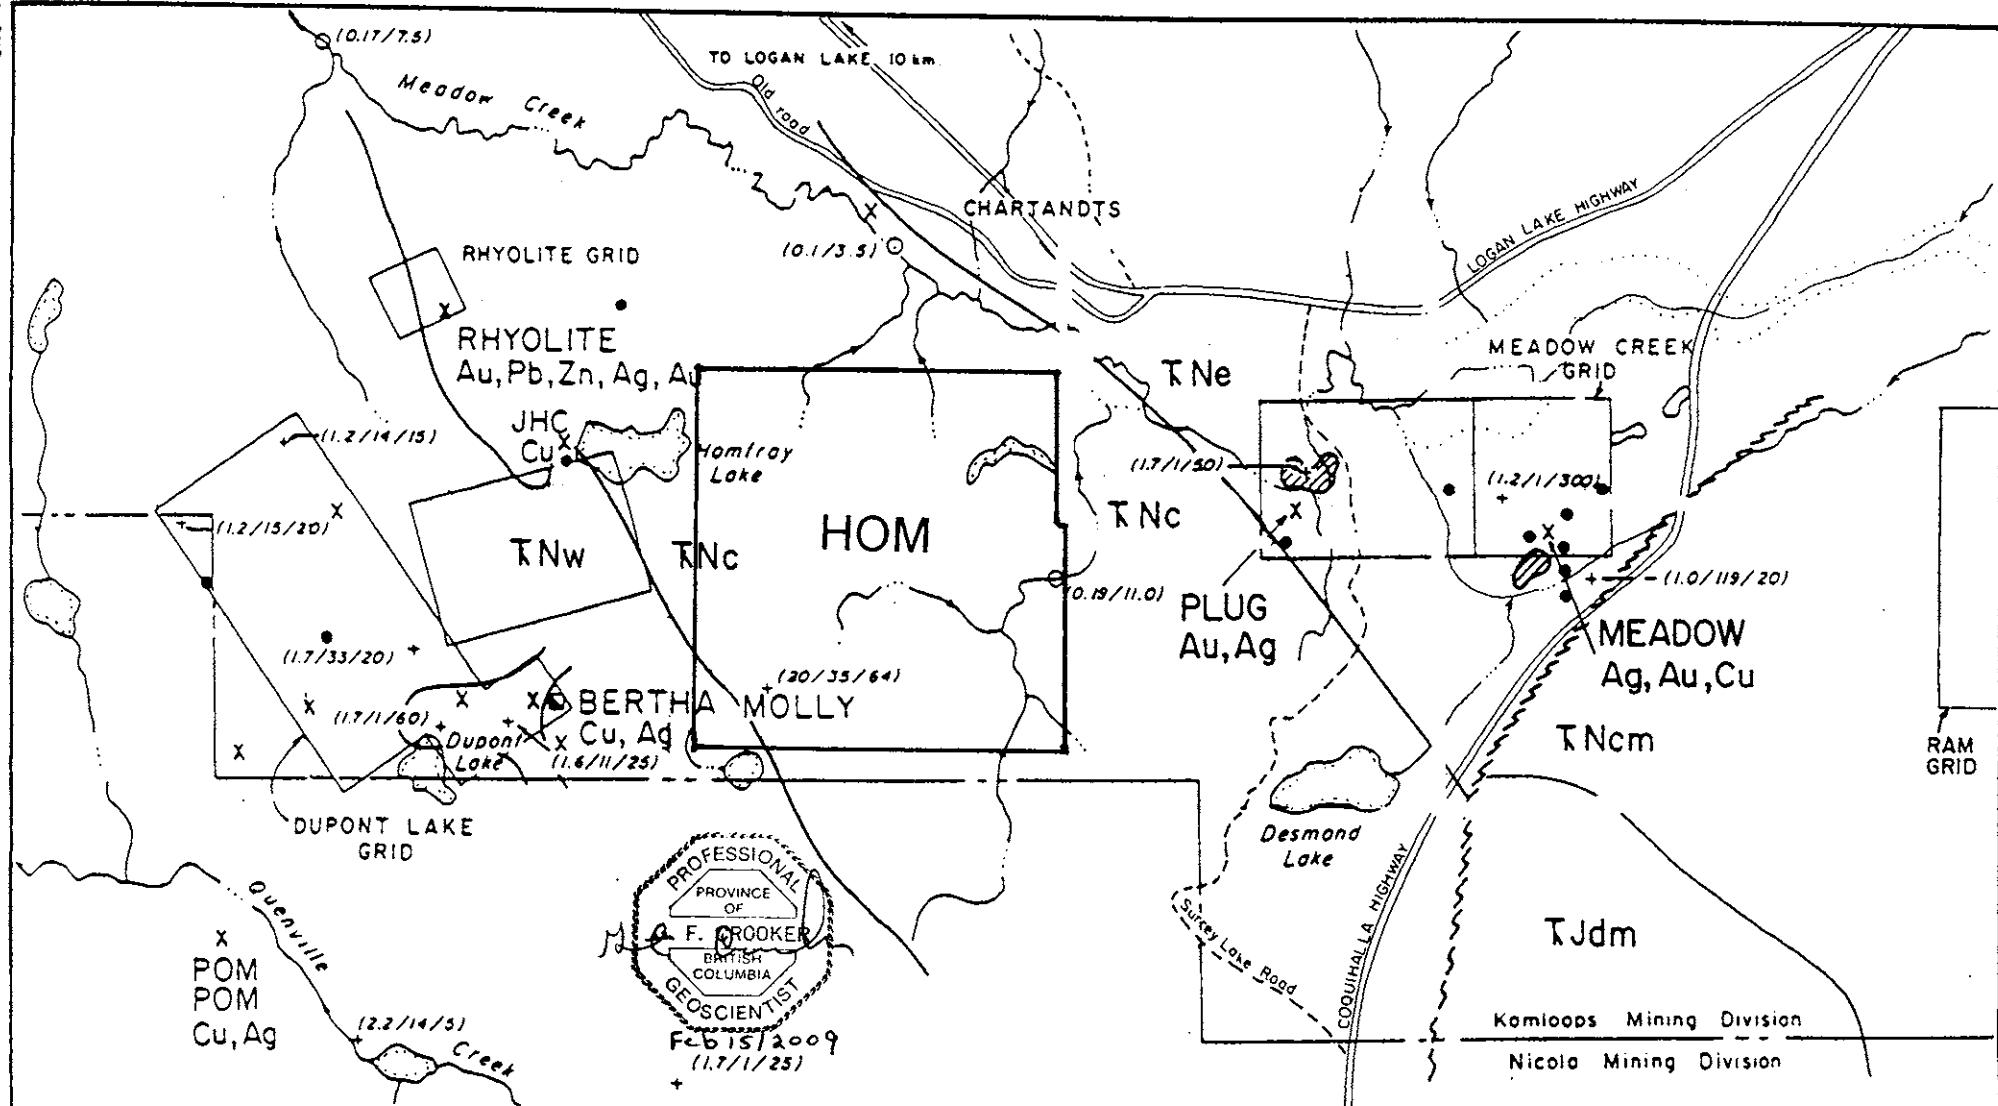

Prospecting and development has been carried out in the vicinity of the Horn property for almost 100 years, although no showings are known on the Horn claim. The documented showings near the property (Figure 3.0) are Bertha/Molly, JHC, Pom Pom, Chatrandts, Rhyolite, Plug and Meadow. Shaft sinking, trenching, drilling, prospecting, and geophysical and geochemical surveys have been carried out on the properties, and a brief summary of the showings is given below.

**FIGURE : 3.0**

### **Bertha/Molly Showing**

The Bertha/Molly showing was first staked in 1888 by Wright and Fletcher. A shaft was sunk on the main showing (No. 1 Showing) and lodes 3 feet to 4.5 feet in thickness were discovered. In 1928 Meadow Creek Mines worked the Number 1 Showing and a few tons of high-grade copper ore were sorted for shipment. Dunmore Mines Ltd. carried out road building, trenching and diamond drilling in 1954. A small mill was erected but the supergene copper minerals were not amenable to gravity concentration. Dunmore Mines drilled 17 diamond drill holes in 1957 and Hemsworth reported that the holes encountered only sparse mineralization.

Highbank Mines Ltd. and Consolidated Standard mines Ltd. acquired ground in the vicinity in 1972. Approximately 17 line miles of grid were established northwest of Dupont Lake to encompass Number 2 and 4 Showings. Soil geochemical and Induced Polarization surveys were conducted and two diamond drill holes totalling 750 feet were drilled to test IP anomalies flanking copper soil geochemical responses. Both holes encountered fracture related copper mineralization but the holes were not assayed and the claims were allowed to lapse.

### **JHC SHOWING**

Vanex Minerals Ltd. acquired claims covering the JHC showing in 1958. They conducted magnetic surveys and physical work under the direction of Hill, Stark and Associates, consulting Engineers. In 1959 Vanex drilled two holes in the JHC area:

#### **Hole No. 1**

This hole was located approximately 3000 feet north of Homfray Lake and was drilled vertically to a depth of 358 feet to test a magnetic high. The lower portion of the hole encountered a siliceous, altered grey-green rock with considerable pyrite. No assays were reported but the recommendation was made to extend the hole to 1000 feet.

#### **Hole No. 2**

This hole was located on the west shore of Homfray Lake and was drilled at minus 45 degrees to a depth of at least to 293 feet. Altered volcanic rocks were noted but no mineralization was reported and no reason given for drilling the hole.

Craigmont Mines Limited staked claims in the area of the JHC showing in 1970. A small survey consisting of geological mapping, geochemical sampling and magnetic and IP surveying was conducted. Two holes totalling 800 feet were drilled but the location and results of the drilling are unknown.

### **Pom Pom Showing**

Newmont Mining Corporation of Canada staked the Pom Pom claims in 1973 after copper mineralization grading 0.17% copper was discovered. A small grid was established and mapping, soil geochemical sampling, magnetic and IP surveying (one line mile) were conducted. Follow up investigations were not conducted.

### **Chatrandts Showing**

The Minister of Mines Report for 1916 describes the showing as consisting of several deep open cuts and a 40-foot long adit. The location is not well documented and no further information is available on the showing.

### **Plug and Meadow Showings**

In 1972 Texada Mines Ltd. conducted geological mapping, magnetic and IP surveying and soil geochemical sampling (copper, zinc and silver) on 14 line miles of grid covering the Plug and Meadow showings. The coincidental targets were percussion drilled with eight holes totalling 1400 feet.

The Plug showing is described as underlain by altered lapilli tuff, minor lenses of limey sediments and chloritic schist. Narrow hornblende and andesite sills cut the sedimentary and volcanic rocks. Carbonate-quartz-mariposite schist with a N 20° W strike and a steep easterly dip is in contact with the chloritic schist. One percussion drill hole tested the zone and encountered altered volcanic rocks with no visible mineralization.

The Meadow showing is underlain by chlorite-mica-feldspar schist and a pyritic quartz feldspar porphyry. Narrow hornblende and andesite sills cut the other rock types.

A five to ten-foot wide zone of quartz-mariposite schist (east-west strike, dip 75° south) occurs within the chlorite-mica-feldspar schist and contains minor silver bearing galena, sphalerite and chalcopyrite. During 1959 several AX diamond drill holes tested this zone, but the results are unknown.

From 1985 to 1988 Western Resource Technologies Inc. carried out work programs on the Rhyolite, Dupont Lake and Meadow Creek grids (Figure 3.0). A silt sampling program was carried out over all drainages covered by the WRT claims. Soil and rock geochemical sampling, prospecting and magnetic and VLF-EM surveys were carried out over the grids. Anomalous copper, lead, zinc, gold, silver and arsenic values were found in silt and soil samples. As well, a number of VLF-EM conductors and magnetic trends were found.

During 1996 and 1997 Goldcliff Resource Corporation conducted work programs on the Plug and Meadow showings. The 1996 program established a grid over most of the property and conducted soil geochemical sampling and VLF-EM and magnetic surveying over the grid. Silt geochemical sampling was also carried out on the major drainages on the property.

The 1997 work program consisted of trenching and percussion drilling of the Plug and Meadow showings. At the Plug showing, trenching discovered economically significant gold and silver values over a 10 metre strike length, related to a one to two metre wide, east-west striking, moderately south dipping shear zone. The shear zone yielded gold values ranging from 1.005 grams/tonne across 1 metre to 4.560 grams/tonne across 2 metres, and silver values ranging from 36.8 grams/tonne across 1 metre to 113 grams/tonne across 2 metres. Carbonate-quartz-mariposite alteration adjacent to the shear zone also yielded moderately to strongly anomalous gold and silver values. Gold values ranged from 0.20 grams/tonne across 1 metre to 20.78 grams/tonne across 0.65 metres, and silver values ranged from 6.2 grams/tonne across 0.50 metres to 84.8 grams/tonne across 1.5 metres.

Percussion drilling of the shear zone and carbonate-quartz-mariposite alteration yielded strongly anomalous gold and silver values. The interval from 10 to 40 feet (five foot sample intervals) yielded anomalous gold values ranging from 0.700 to 2.850 grams/tonne, and anomalous silver values ranging from 4.8 to 40.2 grams/tonne.

### **HOM CLAIM**

During 1986 Western Resource Technologies Inc. conducted a stream sediment sampling survey in the Logan Lake area, part of which covered the Hom claim. One drainage yielded stream sediment samples anomalous in gold (64 ppb), silver (1.7 to 2.0 ppm) and arsenic (21 to 35 ppm).

In 2006 the present owner of the Hom claim conducted stream sediment and soil sampling as a follow up to the 1986 survey. This stream sediment sampling gave one strongly anomalous (120 ppb) and one weakly anomalous (10 ppb) gold value. Both samples were collected from a northerly flowing stream in the southeast corner of the Hom claim.

Two lines of soil samples were collected in the area of the anomalous stream sediment samples from the 1986 survey. This soil sampling did not delineate any strongly anomalous gold values, however line 1200N between 1000E and 1350E delineated a strongly anomalous molybdenum-antimony-lead geochemical anomaly.

### 3.0 EXPLORATION PROCEDURE

#### 3.1 GRID PARAMETERS

- survey total -2.2 kilometres
- baseline direction north-south
- survey lines perpendicular to baseline
- survey line separation 100 metres
- survey station separation 25 metres
- stations marked with flagging and metal tags with grid coordinates
- lines established by compass and hipchain
- declination 19 degrees
- 1400N and 1000E located at UTM 10U, 665,382E and 5,590,044N
- UTM NAD 83

#### 3.2 GEOCHEMICAL SURVEY PARAMETERS

- survey total -68 soil samples collected
- 68 samples sent for analysis
- survey line separation 100 metres
- survey sample spacing 25 metres
- soil sample depth 10 to 20 centimetres
- samples taken from brown B horizon
- approximately 400 grams of material collected for each sample
- grid shown on Figure 3.0

The soil geochemical values for molybdenum were plotted on Figures 5.0 and the certificates of analysis listed in Appendix I.

#### 3.3 SAMPLE ANALYSIS

The soil samples were sent to Eco Tech Laboratory Ltd., 10041 Dallas Drive, Kamloops BC, V2C 6T4 for analysis. Laboratory technique for soil samples consisted of drying the samples and sieving to minus 80 mesh. Gold (30 gram sample, fire assay, atomic adsorption finish, results in parts per billion) and 36 element ICPMS analysis (Jarrel Ash 61E ICP, aqua-regia digestion) were carried out on the soil samples.

Eco Tech Laboratory Ltd. is ISO 9001 certified and Eco Tech assayers are certified by the British Columbia government. Resplit and repeat analyses were performed with excellent correlation to the original results.

## 4.0 GEOLOGY AND MINERALIZATION

### 4.1 REGIONAL GEOLOGY

The area of the property lies within the Intermontane Belt of the Canadian Cordillera and is part of Quesnellia. Late Triassic arc-volcanic rocks (Figure 4.0) and volcanogenic sedimentary rocks of the Nicola Group underlie the property.

The Nicola Horst lies approximately 3 kilometres east of the property and is a northerly trending block 40 kilometres long, entirely separated from the surrounding Nicola Group volcanic rocks by Tertiary normal faults. The Clapperton fault forms the west boundary fault of the Nicola Horst, and this Tertiary extensional fault may provide a conduit for mineralising solutions in the Logan Lake area.

### 4.2 CLAIM GEOLOGY

Late Triassic arc-volcanic rocks and sedimentary facies of the Nicola Group that have been divided into three belts on the basis of distinct facies and assemblages underlie or outcrop adjacent to the Hom property. These three belts have been named the western (TNw), central (TNc) and eastern (TNe) belts.

Central belt facies rocks that are mainly augite and plagioclase-phyric basalt flows and associated breccias underlie most of the property. Sub-volcanic intrusions of diorite and gabbro are also abundant. Eastern belt facies rocks that consists almost entirely of mafic augite-phyric volcaniclastic rocks, ranging from coarse breccias to fine wacke and siltstone lie northeast of the property. Western belt facies rocks that consist of a succession of calcalkaline, mainly plagioclase-phyric andesite flows and breccias, with lenticular interlayers of limestone and bedded volcaniclastic rocks lie southwest of the property.

FIG 4.0

## 5.0 GEOCHEMISTRY

### 5.1 SOIL GEOCHEMISTRY

Sixty-eight soil samples were collected along four grid lines (900N, 1000N, 1100N and 1300N) from the Hom claim. The samples were collected to determine the extent of a molybdenum-antimony-lead anomaly outlined on line 1300N in 2006. The samples were analysed for gold and by 36 element ICPMS.

#### **Molybdenum**

Molybdenum values ranged from 0.25 to 1.74 ppm (Figure 5.0) with background established at 0.59 ppm. None of the samples were considered anomalous.

#### **Antimony**

Antimony values ranged from 0.10 to 1.22 ppm with background established at 0.43 ppm. None of the samples were considered anomalous.

#### **Lead**

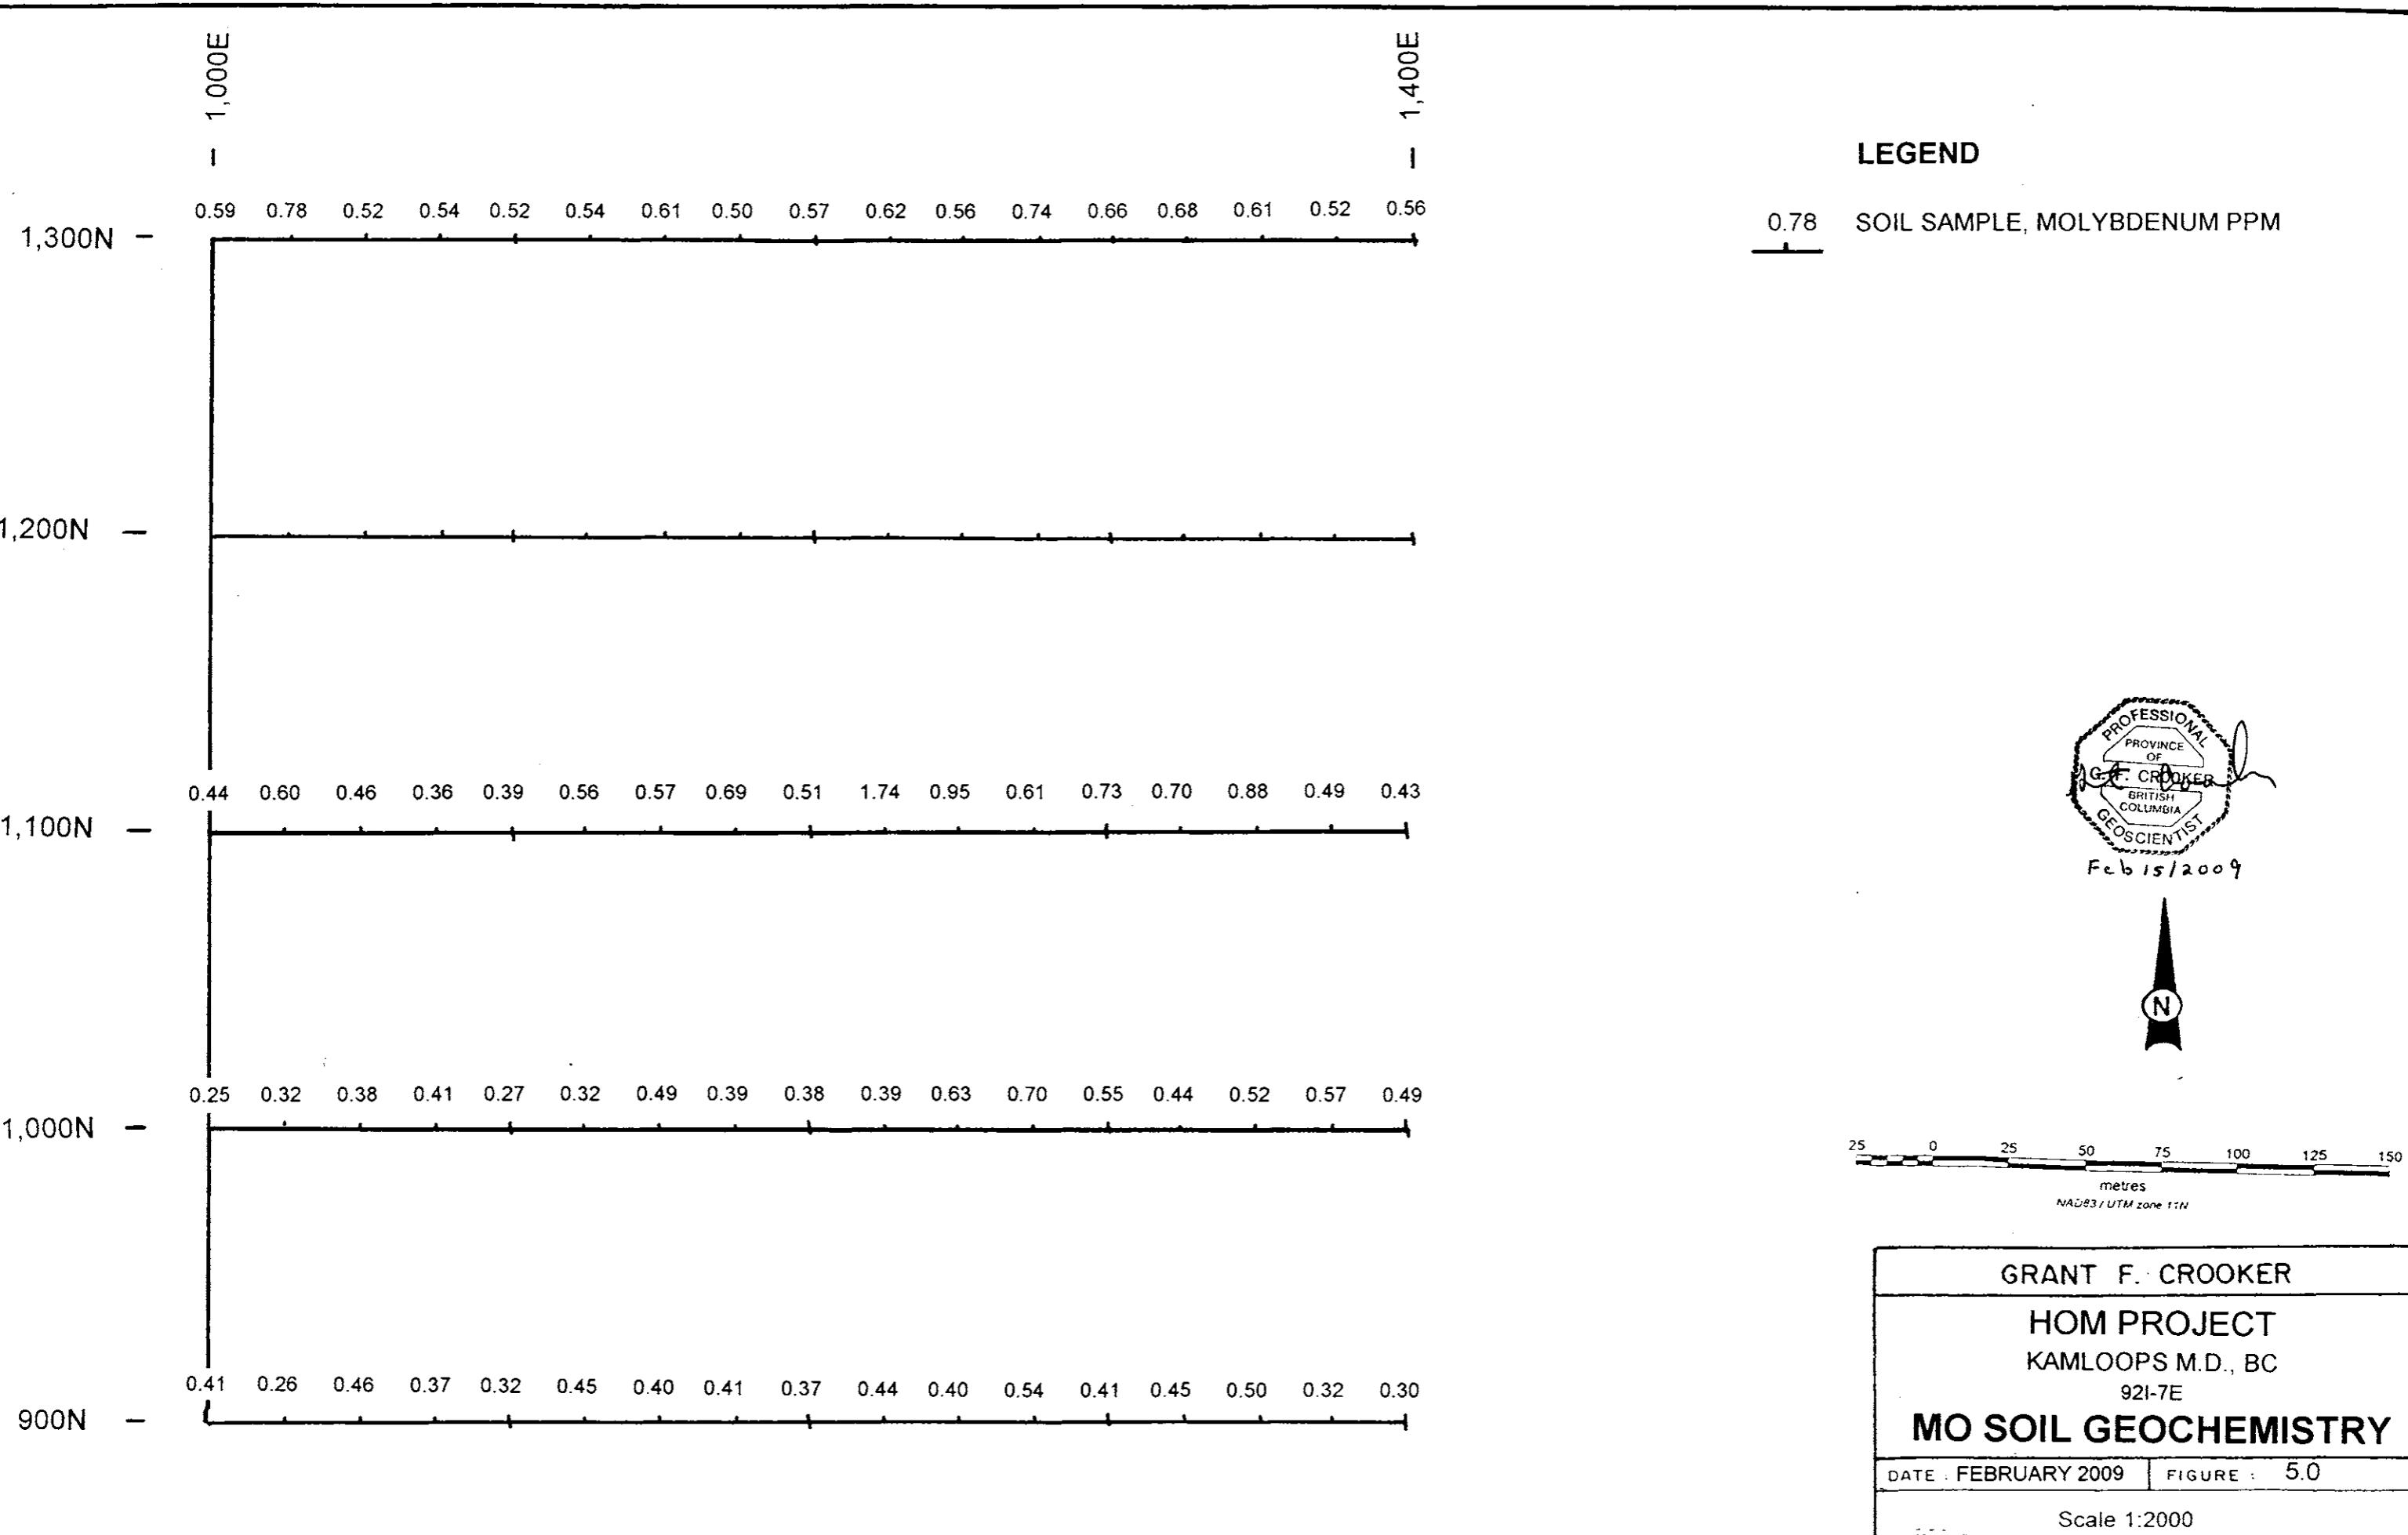

Lead values ranged from 3.25 to 10.18 ppm with background established at 8.72 ppm. None of the samples were considered anomalous.

#### **Copper**

Copper values ranged from 14.1 to 47.82 ppm with background established at 35 ppm. None of the samples were considered anomalous.

#### **Gold**

Gold values ranged from <5 to 20 ppb with background established at 5 ppb and anomalous values 20 ppb and greater. One sample at 1000N and 1175E was considered weakly anomalous.

## 6.0 CONCLUSIONS

- 6.1 The 2008 soil geochemical sampling along lines 900N, 1000N, 1100N and 1300N did not yield any anomalous molybdenum, antimony or lead geochemical values.
- 6.2 The 2008 soil sampling did not expand the molybdenum-antimony-lead soil geochemical anomaly outlined along line 1200N in 2006.

## 7.0 RECOMMENDATIONS

Recommendations are as follows:

- 7.1 Line 1200N should be resampled to determine if the molybdenum-antimony-lead anomaly outlined in 2006 is valid.
- 7.2 If the 2006 molybdenum-antimony-lead anomaly is valid, prospecting should be carried out to determine the cause of the anomaly.

Hill, L.H., (March 1959): Report Covering Geophysical and Physical Work on 71 Claims of Vanex Holdings, Meadow Creek Area, Kamloops Mining Division. AR# 266

Hill, L.H., (March 1959): Report on Geophysical Survey of Dunmore Mines Ltd, Meadow Creek Area, Kamloops and Nicola Mining Divisions. AR# 265

Hill, L.H., (June 1959): Report on Geophysical Survey of Lucky Jim Nos. 1, 2, 3 and 4, Kamloops Mining Division, for Vanes Minerals. AR# 228

Hogan, J.W., (July 1972): Geochemical Report, JIG and GJ Claims, Homfray Lake, BC, for Consolidated Standard Mines Ltd and Highhawk Mines Ltd. AR# 3763

McBeath, S., (November 1958): Report on Geophysical Survey of Sunshine 10, 11, 15 and 16 Mineral Claims, Kamloops Mining Division, for Vanex Minerals Ltd. AR# 234

National Geochemical Reconnaissance Survey (19081): 92 I Ashcroft BC, BC Ministry of Energy Mines and Petroleum Resources and Geological Survey of Canada.

Nordin, G. and DeLean, J., (October 1972): Magnetometer and Geochemical Report on the Plug Claims, Kamloops Mining Division on behalf of Texada Mines Ltd. AR# 4041

Scott, A. and Cochrane, D.R., (October 1972): Geophysical Report on an Induced Polarization Survey of the Plug Claims, Kamloops Mining Division on behalf of Texada Mines Ltd. AR# 4042

Sookochoff, L., (April 1979): VLF-EM and Magnetometer Report on the Homfray Lake Property, Kamloops Mining Division for Thunderbolt Resources Ltd. AR# 7268

Tough, T.R., (April 27 1972): Geological Report on the Homfray Lake Property, Kamloops Mining Division for Highhawk Mines Ltd. and Consolidated Standard Mines Ltd.

Tully, D.W., (April 1974): Magnetometer Survey and Preliminary Geochemical Soil Sample Work Program over the Max Claim Group for Host Ventures Ltd. AR# 4948

Ven Huizen, G.L., (February 1989): VLF-EM and Magnetometer Surveys on the Parl #1 Mining Claim for Gold Parl Resources Ltd. AR# 18563

White, G.E., (July 1972): Geophysical Report on an Induced polarization Survey on behalf of Highhawk Mines Ltd and Consolidated Standard Mines Ltd. AR# 3764

## 9.0 CERTIFICATE OF QUALIFICATIONS

I, Grant F. Crooker, of 2522 Upper Bench Road, PO Box 404, Keremeos, British Columbia, Canada, V0X 1N0 do certify that:

I am a Consulting Geologist registered with the Association of Professional Engineers and Geoscientists of the Province of British Columbia (Registration No. 18961);

I am a Fellow of the Geological Association of Canada (Registration No. 3758) and I am a Member of the Canadian Institute of Mining and Metallurgy and Petroleum;

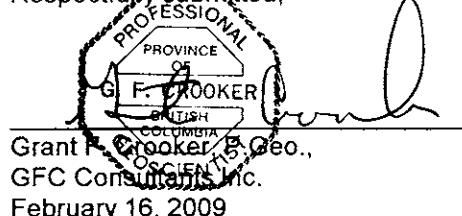

I am a graduate (1972) of the University of British Columbia with a Bachelor of Science degree (B.Sc.) from the Faculty of Science having completed the Major program in geology;

I have practised my profession as a geologist for more than 30 years, and since 1980, I have been practising as a consulting geologist and, in this capacity, have examined and reported on numerous mineral properties in North and South America;

I have based this report on field examinations within the area of interest and on a review of the technical and geological data;

I am the owner of the Hom Claim (514098)

Respectfully submitted,

**APPENDIX I**  
**CERTIFICATES OF ANALYSIS**

**APPENDIX II**  
**COST STATEMENT**

## **COST STATEMENT**

## SALARIES

Grant Crooker, Geologist  
October 21, 23, 24, November 15, 16, 22, 2008  
6 days @ \$ 600.00/day \$ 3,600.00

## **MEALS & ACCOMMODATION**

Grant Crooker –

Hotel 2 days @ \$ 100.00/day	200.00
Meals 2 days @ \$ 40.00/day	80.00

## **TRANSPORTATION**

Vehicle Rental (1996 Chev 3/4 ton 4 x 4)  
3 days @ \$ 75.00/day 225.00  
  
Gasoline 150.00

## **ANALYSES**

68 soil samples, 36 element ICPMS, gold (30 gram, FA, AA finish, results ppb) @ \$ 23.52/sample 1599.36

## SUPPLIES

**FREIGHT** 34.93
