

## APPENDIX D

### Geochemical Analyses and Assay Certificates

Table 1 shows all ICP data for the drill core samples integrated with logged lithology. A few samples crossed lithologic intervals and are repeated.

Table 2 shows whole rock data including REE analyses for samples across the entire compositional range of lithologies. The data is organized by SiO<sub>2</sub> concentration and various type lithologies of skarn and magnetite are colour coded.

Geochemical Assay Certificates as received: VAN08011367, VAN08011565, VAN08011566, VAN08011638, VAN08011755, VAN09000104, VAN09000110, VAN09000602

Table 1

ICP Data Integrated with lithology intervals

Redford - Brynnor

Table with 30 columns (A-AY) and 33 rows of data. Each row represents a sample with fields for ID, lithology description, and ICP analysis results across elements A through AY.

Table 1

ICP Data Integrated with lithology intervals

Redford - Brynnor

Table with 34 columns (A-AY) and 609 rows. Each row contains sample ID, lithology description, and 33 numerical values. Many values are highlighted in green.

Table 1

ICP Data Integrated with lithology intervals

Redford - Brynnor

Table with columns A through AY and rows 610 through 696. Each row contains sample ID, coordinates, lithology description, and 27 numerical data points. The table is densely packed with data.

Table 1

ICP Data Integrated with lithology intervals

Redford - Brynnor

Table with columns A through AY and rows 697 through 783, containing ICP data and lithology descriptions.

Table 1

ICP Data Integrated with lithology intervals

Redford - Brynnor

Table with 48 columns (A-AY) and 48 rows (871-907). Each row contains ICP data points for a specific lithology interval. Columns include numerical values and categorical labels like 'M1', 'G', 'D3', 'L2', 'M2', 'S2', 'V1'. The data shows various chemical concentrations across different lithological units.

Table 2 Redford - Brynno.

Table with 109 rows and 65 columns. Columns include Hole ID, ACME Tag, and various chemical elements (SiO2, Al2O3, Fe2O3, MgO, CaO, Na2O, K2O, TiO2, P2O5, MnO, Cr2O3, Ni, Sc, LOI, Sum, Ba, Be, Co, Cs, Ga, Hf, Nb, Rb, Sn, Sr, Ta, Th, U, V, W, X, Y, Zr, La, Ce, Pr, Nd, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, TOTC, TOTIS). Rows contain numerical data for each element and a lithology column.

## CERTIFICATE OF ANALYSIS

VAN08011367.1

### CLIENT JOB INFORMATION

Project: REDFORD  
Shipment ID:  
P.O. Number  
Number of Samples: 188

### SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT Store After 90 days Invoice for Storage

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Logan Resources Ltd.  
1640 - 1066 Hastings St. W.  
Vancouver BC V6E 3X1  
Canada

CC: Peter George

### SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status
R150	187	Crush split and pulverize drill core to 200 mesh		
3B	25	Fire assay fusion Au by ICP-ES	30	Completed
4A&4B	15	Whole Rock Analysis Majors and Trace Elements	0.2	Completed
1EX	187	4 Acid digestion ICP-MS analysis	0.25	Completed

### ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only. All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only.

\*\* asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

## CERTIFICATE OF ANALYSIS

VAN08011565.1

### CLIENT JOB INFORMATION

Project: REDFORD  
Shipment ID: #2  
P.O. Number  
Number of Samples: 177

### SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT Store After 90 days Invoice for Storage

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Logan Resources Ltd.  
1640 - 1066 Hastings St. W.  
Vancouver BC V6E 3X1  
Canada

CC: Peter George

### SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status
R150	176	Crush split and pulverize drill core to 200 mesh		
3B	59	Fire assay fusion Au by ICP-ES	30	Completed
4A&4B	26	Whole Rock Analysis Majors and Trace Elements	0.2	Completed
1EX	176	4 Acid digestion ICP-MS analysis	0.25	Completed
7TD	15	4-acid Digestion ICP-ES Finish	0.5	Completed

### ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only. All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only.

\*\*\* asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CERTIFICATE OF ANALYSIS

VAN08011566.1

CLIENT JOB INFORMATION

Project: REDFORD  
 Shipment ID: #3  
 P.O. Number  
 Number of Samples: 146

SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
 STOR-RJT Store After 90 days Invoice for Storage

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Logan Resources Ltd.  
 1640 - 1066 Hastings St. W.  
 Vancouver BC V6E 3X1  
 Canada

CC: Peter George

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status
R150	146	Crush split and pulverize drill core to 200 mesh		
3B	69	Fire assay fusion Au by ICP-ES	30	Completed
4A&4B	21	Whole Rock Analysis Majors and Trace Elements	0.2	Completed
4B Full Suite	1	LiBO2/Li2B4O7 fusion ICP-MS analysis	0.2	Completed
1EX	146	4 Acid digestion ICP-MS analysis	0.25	Completed
7TD	15	4-acid Digestion ICP-ES Finish	0.5	Completed

ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.  
 All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only.  
 "\*\*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

Client: **Logan Resources Ltd.**

1640 - 1066 Hastings St. W.  
 Vancouver BC V6E 3X1 Canada

Submitted By: Rita Chow  
 Receiving Lab: Canada-Vancouver  
 Received: December 15, 2008  
 Report Date: February 03, 2009  
 Page: 1 of 5

**CERTIFICATE OF ANALYSIS**

**VAN08011638.1**

**CLIENT JOB INFORMATION**

Project: REDFORD  
 Shipment ID: 5  
 P.O. Number  
 Number of Samples: 95

**SAMPLE DISPOSAL**

STOR-PLP Store After 90 days Invoice for Storage  
 STOR-RJT Store After 90 days Invoice for Storage

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Logan Resources Ltd.  
 1640 - 1066 Hastings St. W.  
 Vancouver BC V6E 3X1  
 Canada

CC: Peter George

**SAMPLE PREPARATION AND ANALYTICAL PROCEDURES**

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status
R150	71	Crush split and pulverize drill core to 200 mesh		
3B	36	Fire assay fusion Au by ICP-ES	30	Completed
4A&4B	15	Whole Rock Analysis Majors and Trace Elements	0.2	Completed
1EX	71	4 Acid digestion ICP-MS analysis	0.25	Completed

**ADDITIONAL COMMENTS**

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only. All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. \*\* asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

## CERTIFICATE OF ANALYSIS

VAN08011755.1

### CLIENT JOB INFORMATION

Project: REDFORD  
Shipment ID: 7  
P.O. Number  
Number of Samples: 67

### SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT Store After 90 days Invoice for Storage

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Logan Resources Ltd.  
1640 - 1066 Hastings St. W.  
Vancouver BC V6E 3X1  
Canada

CC: Peter George

### SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status
R150	67	Crush split and pulverize drill core to 200 mesh		
3B	4	Fire assay fusion Au by ICP-ES	30	Completed
4A&4B	3	Whole Rock Analysis Majors and Trace Elements	0.2	Completed
4A	3	LiBO2/Li2B4O7 fusion ICP-ES analysis	0.2	Completed
1EX	67	4 Acid digestion ICP-MS analysis	0.25	Completed
7TD	6	4-acid Digestion ICP-ES Finish	0.5	Completed

### ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only. All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only.

\*\* asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

## CERTIFICATE OF ANALYSIS

VAN09000104.1

### CLIENT JOB INFORMATION

Project: REDFORD  
Shipment ID: #6  
P.O. Number  
Number of Samples: 70

### SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT Store After 90 days Invoice for Storage

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Logan Resources Ltd.  
1640 - 1066 Hastings St. W.  
Vancouver BC V6E 3X1  
Canada

CC: Peter George

### SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status
R150	70	Crush split and pulverize drill core to 200 mesh		
3B	6	Fire assay fusion Au by ICP-ES	30	Completed
4A&4B	4	Whole Rock Analysis Majors and Trace Elements	0.2	Completed
4A	2	LiBO2/Li2B4O7 fusion ICP-ES analysis	0.2	Completed
1EX	70	4 Acid digestion ICP-MS analysis	0.25	Completed
7TD	7	4-acid Digestion ICP-ES Finish	0.5	Completed

### ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only. All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only.

\*\*\* asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

## CERTIFICATE OF ANALYSIS

VAN09000110.1

### CLIENT JOB INFORMATION

Project: REDFORD  
Shipment ID: 4  
P.O. Number  
Number of Samples: 140

### SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT Store After 90 days Invoice for Storage

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Logan Resources Ltd.  
1640 - 1066 Hastings St. W.  
Vancouver BC V6E 3X1  
Canada

CC: Peter George

### SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status
R150	140	Crush split and pulverize drill core to 200 mesh		
3B	72	Fire assay fusion Au by ICP-ES	30	Completed
4A&4B	18	Whole Rock Analysis Majors and Trace Elements	0.2	Completed
1EX	140	4 Acid digestion ICP-MS analysis	0.25	Completed

### ADDITIONAL COMMENTS

G7TD-Fe for samples overlimit to come.

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only. All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only.

\*\* asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

# CERTIFICATE OF ANALYSIS

# VAN09000602.1

## CLIENT JOB INFORMATION

Project: REDFORD  
Shipment ID: #8  
P.O. Number  
Number of Samples: 6

## SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT Store After 90 days Invoice for Storage

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Logan Resources Ltd.  
1640 - 1066 Hastings St. W.  
Vancouver BC V6E 3X1  
Canada

CC: Peter George  
Hardolph Wasteney

## SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status
R200	6	Crush split and pulverize drill core to 200 mesh		
3B	6	Fire assay fusion Au by ICP-ES	30	Completed
4A&4B	6	Whole Rock Analysis Majors and Trace Elements	0.2	Completed
1EX	6	4 Acid digestion ICP-MS analysis	0.25	Completed

## ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only. All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only.

“\*\*” asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

# Hydrological Assessment of the Brynnor Pit Lake and Draw Creek Watershed

## ***Introduction and Terms of Reference:***

This report has been prepared to address concerns about the potential effects of diamond drilling within the Brynnor pit lake on the hydrology of the streams and aquifers in the area. Logan Resources Ltd holds mineral claims covering an area of 10,842 hectares in the area extending from Toquart Bay to Kennedy Lake on the west coast of Vancouver Island and centred at UTM, NAD 83, Zone 10 coordinates 318 200 E by 5 435 700 N and referred to as the Redford Property (Figure 1). In the fall of 2008 the company completed a 7000 m drilling program to delineate magnetite orebodies inferred to exist east of the Brynnor open pit on the basis of technical data available in the library of the BC EMPR in Victoria. Previous work on the property by the company included airborne geophysical surveys and a soil geochemical survey.

Currently the company is considering a further diamond drilling program not only to continue delineation of magnetite resources near the areas drilled in 2008, but also to explore resources remaining under the floor of the Brynnor open pit. To undertake the pit exploration it has been proposed by the author to drill from a barge floating on the pit lake.

The specific concern of this report is the elevated arsenic concentrations and low dissolved oxygen levels in the pit lake water discovered by a preliminary environmental assessment completed by Chatwin Engineering of Nanaimo in 2008.

The Author, Hardolph Wasteneys Ph.D., P.Geo., supervised the 2008 drilling program on-site from November 15 to December 21 and February 18 to 20<sup>th</sup>, 2009 and has been contracted by the company to undertake the proposed 2009 drilling program. This report has been prepared with reference to data from the Chatwin EA report, a technical report on the magnetite mineral resource prepared prior to the 2008 drilling by Peter George, P.Geo. consulting geologist, company exploration data, and the author's observations.

## ***Physiography:***

The Brynnor pit lake is located about 3 km south of Kennedy Lake near the headwaters of the Draw Creek - Maggie Lake - Maggie Creek drainage basin that drains 8 km south into Toquart Bay (Figure 1).

The drainage divide between the Draw Creek basin and Kennedy Lake is about 1 km upstream to the northwest above the confluence of Draw Creek and its tributary Redford Creek. The headwaters of Draw Creek and Redford Creek both lie in small lakes within broad relatively low relief uplands at elevations of ca. 350 m bordered by precipitous slopes of Redford and Draw Mountains. The upland basins drain cover an area of about 15 sq. km and an additional 5 sq. underlies steep surrounding alpine slopes. The two ca 750 m mountains form a north-south ridge with a precipitous west aspect that continues south to the eastern shores of Maggie Lake. The terrain west of the Draw Creek is more moderate rising over 3 km to 723 m Mt Dawley and other unnamed peaks to the south.

Draw Creek flows through a moderate relief U-shaped valley to Maggie Lake, which is 3 km downstream of the pit lake and has a surface elevation of 30 m. Maggie Lake drains via the Maggie River through a low relief area of glacial and alluvial sediments to the Pacific Ocean at Toquart Bay.

The pit lake surface is at an elevation of about 70 m asl with an estimated bottom at a depth of 120 m or about 50 m below sea level. It is separated from Draw Creek by a low ridge identified as a dam structure on the old Noranda maps.

As noted in the Chatwin EA report the project area is located within the Coastal Western Hemlock Submontane Very Wet Maritime subzone and is subject to rainfalls in excess of 3 meters annually. The area has been extensively logged and is presently covered by a mix of second growth cedar and hemlock.

Flow rates in Draw Creek vary between 1 and 10 cubic meters per second (cms) with highest flow being in the winter rainy season. The headwaters of Draw Creek above the Brynnor pit likely receive as much as 60 M cubic metres per year of rain resulting in an average flow rate of 2 cms..

## ***Geology***

The geology of the immediate area is dominated by plutonic rocks of the Jurassic Island Plutonic Suite consisting mainly of granodioritic rocks (Figure 2). These rocks intrude and envelope Upper Triassic Karmutsen Group mafic marine volcanics and stratigraphically overlying Quatsino Formation sedimentary rocks that represented a transition from submarine to emergent marine conditions during the Middle Triassic within the Wrangellian Terrane island arc complex. Bonanza Group volcanic rocks, locally preserved, are consanguinous with the Island Plutonic Suite and as such are considered the surface volcanic expression of the Jurassic igneous complex that formed above a subduction zone under the Vancouver Island arc. Cenozoic intrusions of the Clayoquat Plutonic Suite related to later subduction after accretion of the Wrangellian Terrane to North America in turn cut all of these rocks. Dykes cutting the volcanic and sedimentary rocks of the Karmutsen and Quatsino Fms can be assigned to the Island or Clayoquat Plutonic Suite by the presence or absence of skarn alteration respectively.

The Quatsino Fm rocks are preserved as roof pendants, isolated masses of surficially deposited metamorphosed strata enveloped by batholithic scale intrusive rocks, within the granodioritic intrusions. The Quatsino formation strata have been extensively metasomatized by the hydrothermal fluids that emanated from the crystallizing magmas and which have resulted in the zoned pyroxene-garnet skarns and massive magnetite bodies. The skarns commonly replace the contact between tuffaceous argillite and recrystallized limestones proximal to intrusive plutons within a zone of extensive dyking by rocks of dioritic composition. The source of the iron in the skarns is late fluids of crystallization in mafic plutonic rocks.

The supracrustal rocks of the Quatsino and Karmutsen Formations were deformed principally by intrusions of the Island Plutonic Suite that eventually enveloped them. Subsequent deformation has been mainly of a brittle nature along discrete faults that traverse the region. The youngest faults strike NW and have normal displacement caused by tectonic stresses related to terrane accretion along the west coast fault. N-S trending faults with minor strike slip and normal offset are more apparent inland, but the ridgeline trend of Redford Mtn is characteristic of the topographic expression of the N-S faults. The strike of Cenozoic dykes at Brynnor is mainly E-W indicating an extensional phase of deformation prior to the more recent block faulting along the NW-SE trending faults.

The permeability of the rocks in the area is principally related to fault and fracture networks. Karst features are commonly developed in the carbonate rocks of the Quatsino Formation limestones throughout much of Vancouver Island and caves have been reported in the immediate Brynnor area. Probably, caves would be in Quatsino limestone or marbles and localized along fault zones. Although local parts of the Quatsino limestone at Brynnor were intensively fractured during intrusion of dykes related to skarn formation in the Jurassic, the limestones were recrystallized into marbles or replaced by calc-silicate mineral assemblages rendering them impermeable. Most of the other rock types in the area, granitoids, argillites and mafic volcanic have low porosities and permeabilities because of their crystalline nature or very fine grain size.

## ***Historical Workings***

The Brynnor Iron Mine was operated by Noranda between 1962 and 1968 extracting massive magnetite that was hauled by road to Toquart Bay where it was crushed, magnetically concentrated and loaded onto deep sea freighters. Waste rock stripped from above the magnetite orebody in the open pit was piled in dumps south of the pit in an area that now covers 30 hectares bounded on the east by Draw Creek and to the south by a westerly tributary that enters Draw Creek about 1 km south of the pit. Tailings from the crushing and concentrating operation were deposited on the shore of Toquart Bay near the separation facilities.

The waste rock lithologies include limestone, recrystallized limestone and marble, various intermediate composition dyke phases and various skarn facies that formed with the magnetite orebody. The rock was extracted directly from the pit by blasting and forms angular chunks with a size ranging from sand to cobbles. Much of this rock is considered environmentally benign as it has very low sulphide contents and a very high acid-neutralizing potential. Several million tonnes of this broken rock was extracted from the dumps and shipped to Washington State for aggregate uses.

The Toquart Bay tailings apparently form part of a beach that is currently used as a launch site by kayakers heading to the Broken Island Group and by campers at a nearby popular camp ground. No environmental issues have been identified with the tailings which likely consist of iron rich garnet, pyroxene, epidote and calcite, minerals which were observed in intimate contact with the magnetite in drill core.

Noranda planned to mine deeper sections of the orebody to the east of the present pit by underground mining and by 1964 had developed a 3 compartment shaft to a depth of 856 feet ( 261 m) with stations on the 400 (122 m), 600 (183 m) and 750 (229 m) foot levels accessed by a headframe located south of the pit at an elevation of ca. 90 m a.s.l. Underground development on the lower levels consisted of 2000 m of drifts and 300 m of raises. Dewatering facilities consisted of a 900 cubic metre water sump and two 4.5 cubic meter per hour pumps established on the 750 foot level. The drifts run generally to the east of the shaft under Draw Creek and were used for delineation drilling of the deeper orebodies, but development work was halted in 1967 after a 7 month strike. Open pit mining continued until late 1968.

## ***Hydrology***

The present level of the pit lake is static at 70 m elevation. Inflows to the lake consist of a minimum of

about 300,000 cubic meters per year of direct rainfall, assuming 3 m of rain over the ca. 9 hectare area of the pit, plus an unknown amount of groundwater flow and runoff from the high area to the west. Draw Creek and a westerly tributary south of the pit border this ca. 40 hectare potential pit groundwater recharge area. Based on the shape of the land surface, runoff and groundwater are estimated to amount to an additional inflow of perhaps 1.2 M cubic meters so that the lake receives approximately 1.5 M cubic meters per year.

The pit lake is estimated to contain about 10 M cubic metres of water based on its surface area and the assumption of a roughly conical shape to depth of 120 meters. The volume of water above the chemocline identified between 15 and 30 m depth is roughly 1.3 M cubic metres which is similar to the volume of estimated annual inflow although it cannot be deduced to be the cause of chemocline depth in the lake.

Outflows from the lake must balance with the inflows less a small amount for evaporation. No direct conduits are known from the pit and no significant homogenous aquifers exist in the plutonic and metasomatically altered rocks surrounding the pit lake. Groundwater outflows from the pit must be conducted by fractures in the rocks and possibly through the dam that separates the pit from Draw Creek.

The effect of the underground workings on groundwater flow in the area may be significant given that they run east of the pit possibly crossing several fracture zones and permeable faults. There is no known direct connection to the pit lake, and other than the historical combined 9 cubic metre/ hour capacity of the Noranda pumping facilities, there is no record of underground geology or hydrology from which to judge their effect. The easterly magnetite bodies are separated from the pit orebodies by a fault that has a surface trace just east of the pit. This, or a similar fault, was encountered in the 2008 drilling program in drill holes north of the development drifts and caused a loss of water pressure when it was drilled into at ca. 300 m depth (or greater than 200 m below sea level). Thus, it is probably a permeable zone and acts as a groundwater aquifer albeit vertically oriented and parallel to the Draw Creek valley.. Groundwater entering fracture networks east and south of the pit probably flows into the underground workings which are at sub sea level depths of 110 and 140 m and which would allow rapid interconnection to other fault and fracture networks under the creek valley. The outflow through the road bed at the north end of the pit cannot be estimated.

Draw Creek flow rates are recorded varying between 1 and 10 c.m/s near the Brynnor pit. These rates are in accord with the probable amount of rainfall received in the ca. 20 sq km upland catchment area of Draw and Redford Creek which is estimated at 60 M cubic metres, less some amount for evapo-transpiration and corresponding to an average of 2 cms in Draw Creek. The probable outflow from the pit estimated in this report to presently occur is about 1.5 M cubic metres annually which accounts for about 2.5% of the flow downstream of the pit lake and a ca. 40:1 dilution of pit lake water. Accepting a concentration of 0.13 mg/l As in the pit water, dilution by 40:1 results in a 0.003 mg/l As concentration which is similar to the average of measurements taken from Draw Creek water samples downstream of the pit (see Figure 3).

### ***Sources of arsenic in groundwater in the Draw Creek basin***

The Chatwin EA report documented concentrations of arsenic in the waters of the pit lake that are suspected to increase with depth and correlate with decreased levels of dissolved oxygen. A zone of rapid decline in dissolved oxygen and oxidation-reduction potential was identified between 15 and 30

meters depth that is concluded to form a chemocline in the water column. The anoxic conditions below the chemocline combined with neutral pH in the lake promote the solubility of arsenic. Arsenic levels in Draw Creek were also shown to increase abruptly downstream from the pit from ca. 0.0002 mg/l to ca. 0.001 mg/l and it could be inferred in the absence of other evidence that this increase is caused by outflows from the pit lake.

The report also infers that the arsenic in the pit lake is caused by dissolution of arsenian sulphides in the pit walls and by groundwater inflow from what is referred to as tailings, in fact waste rock, south of the pit. However, it is the author's opinion that there is insufficient evidence to fully accept this inference since there is no information available on the chemistry of groundwater from the highland west of the pit and further that there is a considerable bedrock divide between the pit lake and the broken waste rock dumps favouring direct runoff into Draw Creek. Moreover, water flowing through the waste rock would be highly oxygenated in contrast with the anoxic conditions of the pit water. The waste rock contains mainly marble and silicate rocks with minor inclusions of magnetite ore not likely sources of arsenic. Followup work to resolve some of this ambiguity would entail water sampling of tributaries to Draw Creek that enter it within the zone of elevated arsenic downstream of the pit lake and perhaps runoff from the base of the waste dumps.

No direct information is available on the chemistry of groundwater in the region, but results of a reconnaissance soil geochemical survey conducted by Logan in the spring of 2008 to discover copper and gold mineralization show a widespread arsenic anomaly corresponding to the parts of Draw Creek that display elevated arsenic. The soil sampling methodology and analytical techniques known as MMI (Mobile Metal Ion) has been shown to be less subject to dispersion than conventional total digestion analysis, but requires ICP-MS analysis at the ppb level. Results are expressed as response ratios (signal/background). Arsenic was analysed in the soil samples as a pathfinder element associated with various types of copper and gold mineralization and results are available for it along with Cu, Au, Ag, Sb, Fe, Co, Pb, Zn and Mo throughout the Redford Claim property.

The arsenic anomalous zone (Figure 4) underlies much of the area west of Draw Creek between the highland west of the Brynnor pit lake to Maggie Lake and across Draw Creek 2 km south of the pit up the flanks of Redford Mountain. This anomaly has exploration significance in indicating locations in which arsenic-bearing mineralization occurs in bedrock beneath the soil cover. Although the results are not quantifiable in terms of a relationship to groundwater or stream chemistry they do suggest ambiguity in the source of the elevated arsenic zone in Draw Creek because the upstream limit of the arsenic soil anomaly coincides with the increase in arsenic levels in Draw Creek. The area of the soil anomaly continues to Maggie Lake, but no other streams were sampled for comparison with Draw Creek. In other words arsenic is endemic to the bedrock of the area and probably causes naturally high levels in groundwater with variability depending on rock composition and other unknown parameters. Anecdotal data on groundwater was observed by Logan geologist and members of the Toquat FN elsewhere on the claim area where water flowing from a core hole drilled on a gold mineralization target tested positive for elevated arsenic.

Geochemical parameters that enhance the dissolution of arsenic in water include anoxic conditions and neutral pH, both evident in the pit waters. The prevalence of carbonate minerals in the pit bedrock would raise pH of the water to neutral levels, exotic organic matter would strip out oxygen, and a lack of circulation in the pit water would prevent surface oxidation and preserve a chemocline all contributing to conditions ideal for high dissolved arsenic. Arsenic can be removed by sorption onto ferrous oxyhydroxides that precipitate by oxidation of dissolved  $\text{Fe}^{2+}$ . Anoxic groundwater containing

dissolved iron may be oxidized at the surface resulting in rusty surface stains as the iron precipitates by oxidation. Similar effects may occur underground where anoxic groundwater mixes with meteoric water and coprecipitating dissolved arsenic. Rusty springs along the banks of Draw Creek noted in the Chatwin survey report may be indicative of ferrous iron-rich anoxic groundwater oxidizing as it reaches the surface and precipitating ferric oxyhydroxides.

## **Conclusions**

The objective of the proposed barge drilling program is to explore magnetite resources under the Brynnor pit by arrays of near vertical diamond drill holes. Groundwater flows through steeply dipping fracture networks and faults through much of the region including the the pit area and these are cross cut by historical underground workings. Any further cross communication between fracture sets by drilling will have a negligible effect compared to the existing mine tunnels. Barge drilling on the pit would not enhance drainage into Draw Creek as there are no district-scale confined aquifers within the area available to be pierced by the drill holes.

The pit lake is at a steady state level and there must be a significant annual outflow to balance the rain and surface runoff inflows into the pit. Although it is probable that pit water accounts for some or all of the increased arsenic concentrations measured in Draw Creek downstream from the pit, the levels measured in Draw Creek are within the standards for aquatic life.

Given that the pit lake has groundwater outflows precautions will be taken to prevent contamination of the pit water by fuel or oil that might pass through the rock dam to Draw Creek. Suitable precautions would include secure fuel transfer systems and floating containment berms. Drill cuttings and insoluble drill muds (bentonite etc) would settle into the lake and are not considered by the Author to have any deleterious effect on the pit lake or potential to be released into Draw Creek.

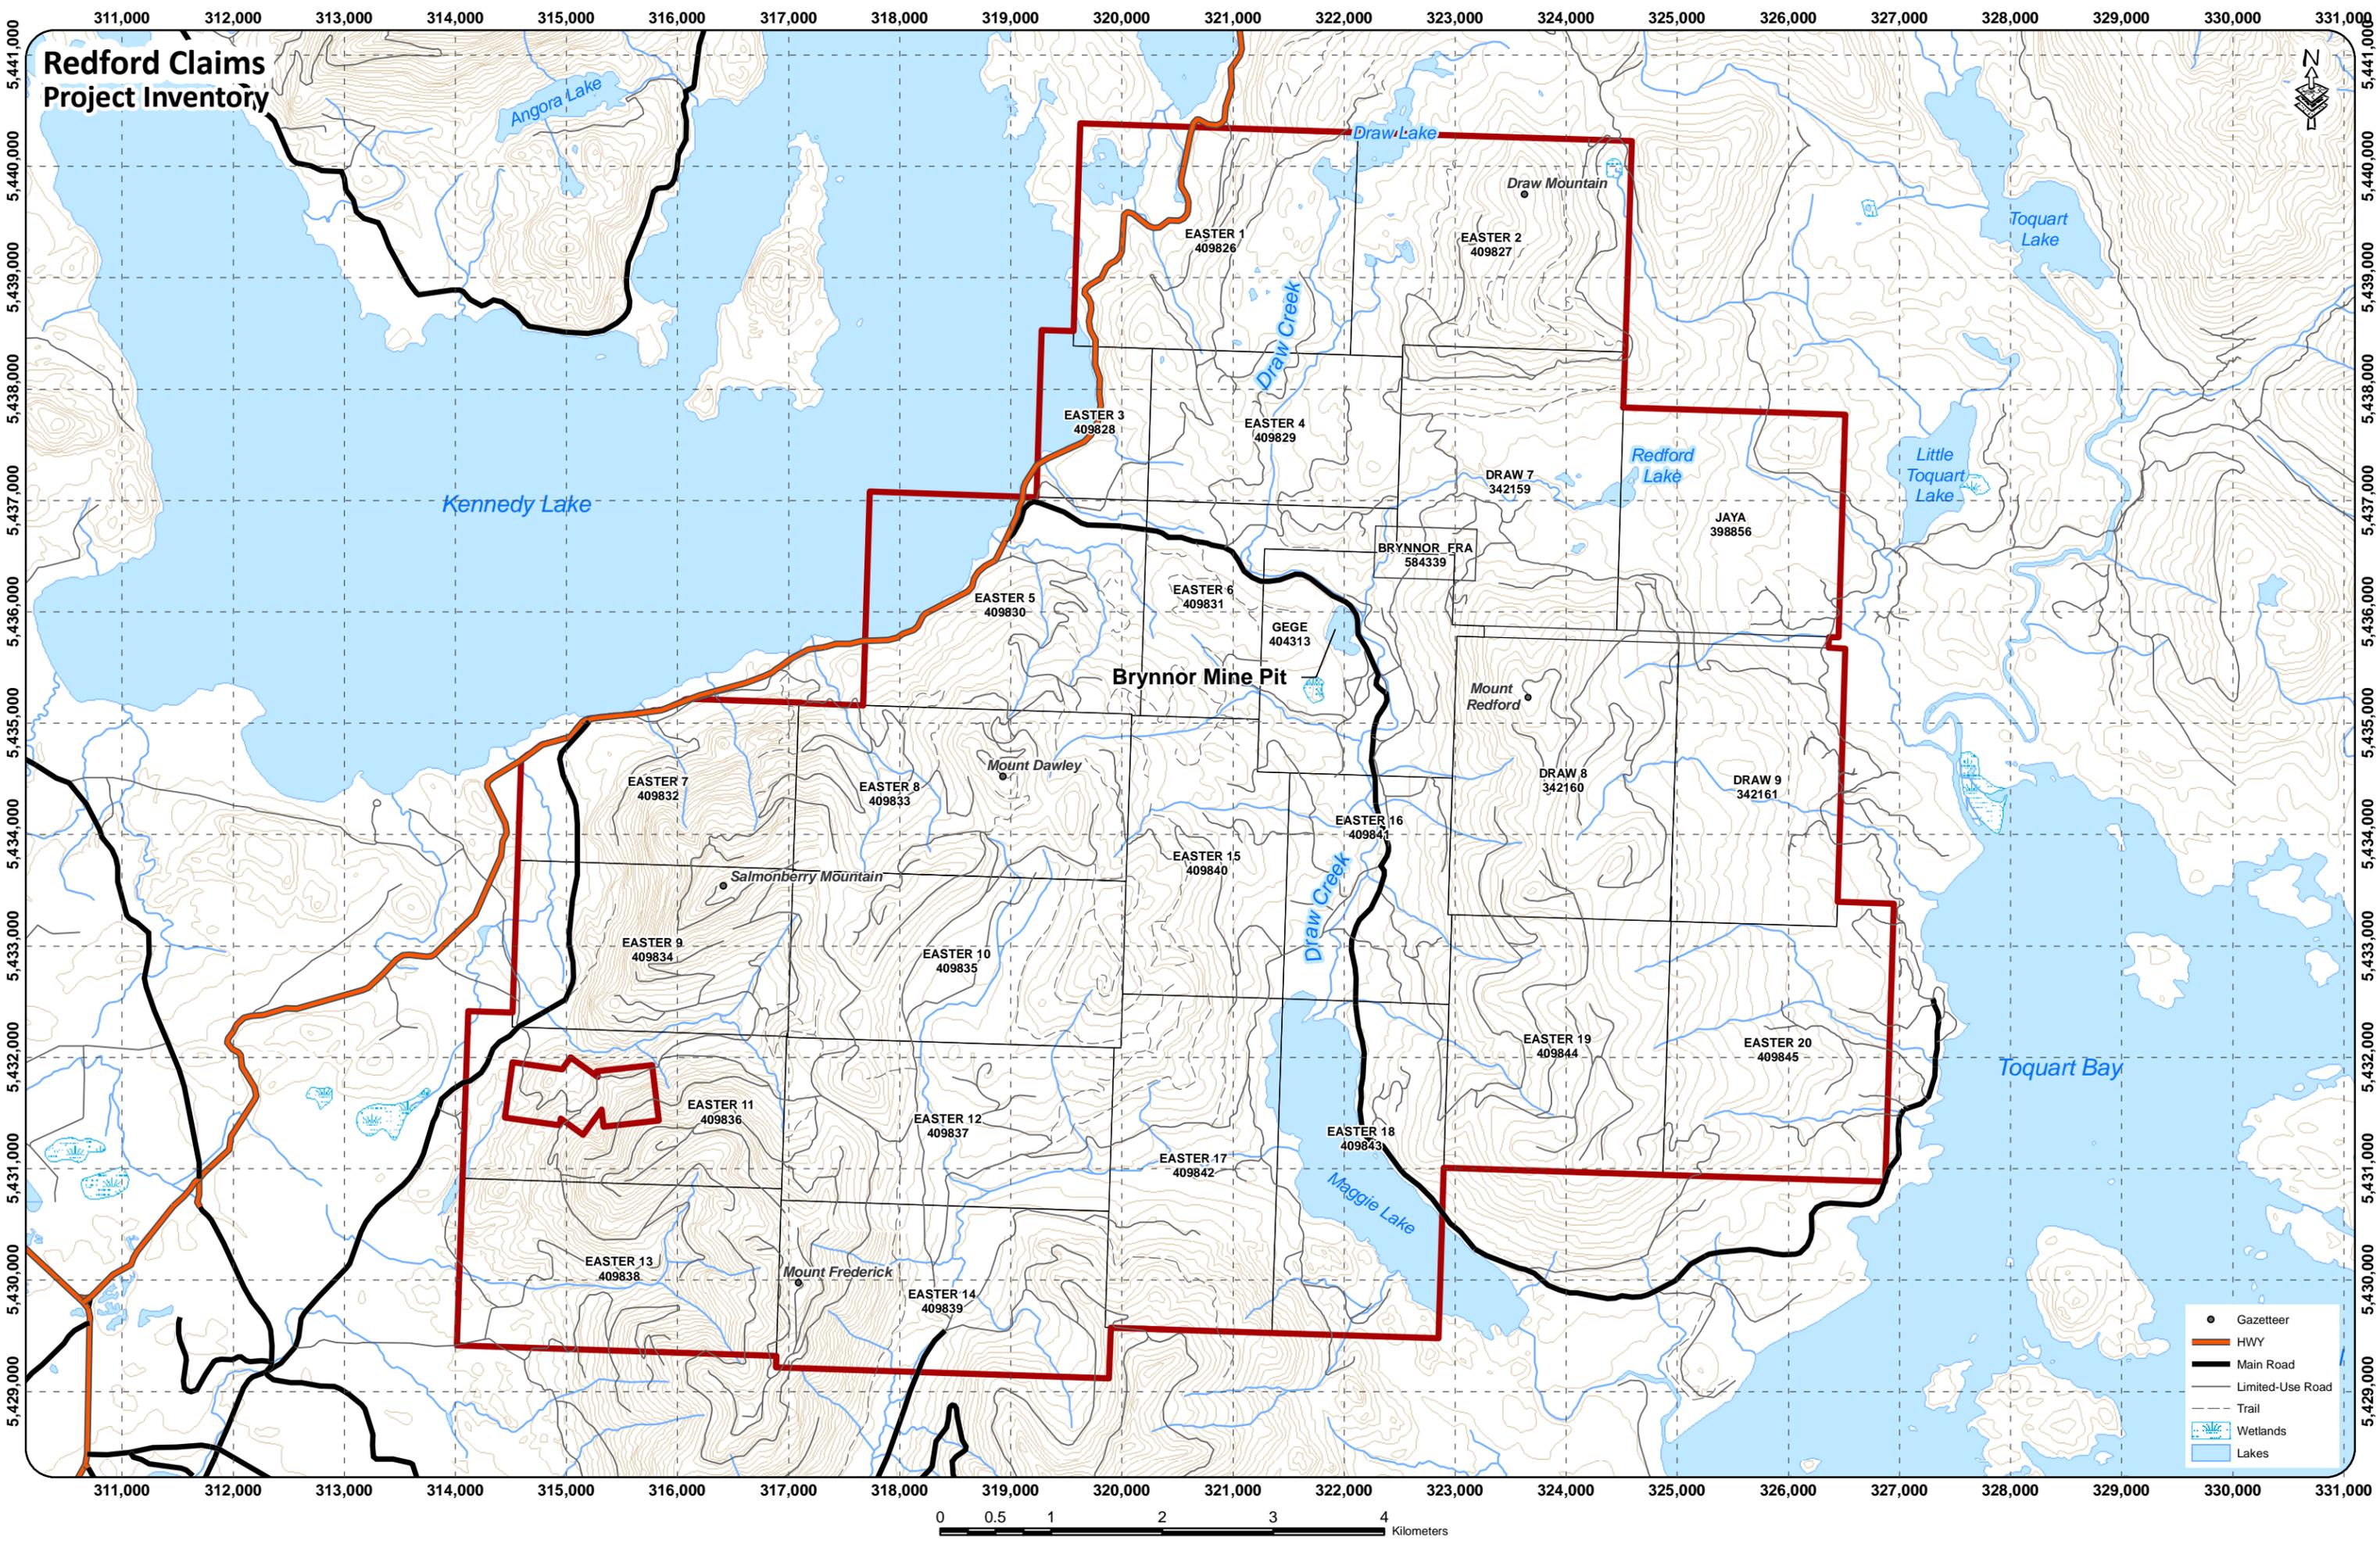

Further studies on the pit water are proposed during the drilling program to understand better the geochemistry of the pit lake and if possible the geochemistry of groundwaters in the area of the arsenic soil anomaly. The studies planned, in consultation with Alan Martin of Lorax Environmental Services, include thorough resampling of pit waters to assess potential for in situ As resorption onto ferric oxyhydroxides with oxidation of pit water. If the levels of dissolved ferrous iron are high and the economic prospects warrant further development, an aeration system would be designed and installed to reoxygenate the pit water with the objective of oxidizing the ferrous iron resulting in coprecipitation of arsenic by adsorption onto ferric oxyhydroxides. These compounds would settle out of the water column reducing the dissolved arsenic levels possibly to levels acceptable to potential receiving environments.

## 1.0 INTRODUCTION

Chatwin was retained by Mr. Daithi MacGearailt of Logan Resources Ltd. (Logan) for a preliminary Environmental Assessment (EA) and Water Quality Study within the Brynnor Iron Ore Mine located on the Redford iron ore mining property near Toquart Bay. Logan Resources Ltd is a mineral exploration company that specialized in acquiring, exploring and advancing early-stage Canadian mineral properties.

The study area is located on the west coast of Vancouver Island near Toquart Bay, southeast of the Town of Ucluelet BC and approximately 3km south of the Alberni-Tofino Highway. The study site was an active iron ore mine from 1962-68 known as the Brynnor Mine owned by Noranda Inc. Chatwin understands that Logan staked a claim in 2004 for the site and is now conducting a feasibility study of the mine to determine its current economic value and its potential for re-opening.

Significant features of the Redford property include a deactivated open pit quarry (Cadillac Lake) and a mine tailings area. The quarry has subsequently filled with water and is known as Cadillac Lake. Baseline water quality information collected within the property will be used to determine the need for environmental mitigation measures and/or an Environmental Protection Plan (EPP) to be implemented prior to the start of any new mining operations for the site.

A site location map for the Redford Property has been included as Figure 1. A selection of photographs taken during the environmental study has been included in this report as Appendix A.

### 1.1 Objectives

The objectives of the environmental assessment are to:

- 1) Determine whether leachate from the Brynnor iron ore quarry and tailings area is having a negative impact on water quality within surrounding streams.
- 2) Determine baseline water quality conditions for Draw Creek, Redford Creek and within the Brynnor Iron Ore Quarry (Cadillac Lake).
- 3) To determine the feasibility of draining Cadillac Lake and the potential for negative effects to occur from discharging water from the quarry lake into Draw Creek.

All water samples were submitted directly to North Island Labs in Courtenay, BC (Federal and Provincial Accredited Water Quality Testing Laboratory) in order to meet a 24 hour delivery protocol. Water quality results were compared against *Federal and Provincial Water Quality Criteria for the Protection of Aquatic Life*.

## 2.0 SCOPE OF WORK

The scope of work to complete the study is as follows:

### Task 1 Water Sampling Program Preparation

Acquisition of water sample bottles, coolers and water sampling equipment to conduct sampling of creeks and Brynnor Quarry, locally known as Cadillac Lake.

### Task 2 Field Sampling

Collection of baseline water quality measurements and eleven water sample sets in total within the study area analysed for the following parameters: total metals, dissolved metals, sulphides, pH, acidity, conductivity, alkalinity and anions.

### Task 3 Water Quality Analysis

Eleven water sample sets submitted to North Island Laboratories for analysis. Water samples were kept cool and transported to the lab immediately after collection in order to meet the 24 hour sample analysis protocol.

### Task 4 Map Production

Production of a site map identifying the water quality sample locations to identify their use as long-term monitoring stations.

### Task 5 Report Preparation

Completion of an Environmental Assessment Report documenting water quality sampling results for the study. The report will also comment on the water quality conditions found at each station and the potential for adversity on the existing health of the aquatic ecosystems and the downstream extent of influence. Additional comments will be provided on the proposed de-watering of Cadillac Lake, potential impacts to receiving environments from the discharge and disposal of the lake water, the use of detailed mitigation measures to ameliorate impacts to the receiving environment, and/or the need to carry out additional studies.

## 3.0 METHODOLOGY

Two methodologies were used to complete the water sampling program, one for Cadillac Lake and one for the streams. The sampling methodologies are as follows:

### 3.1 Cadillac Lake Sampling

Chatwin used a small inflatable boat with a portable depth sounder and GPS to measure the depth of the lake and to identify and record a suitable sampling location. Three

water sample sets were collected using a Beta Bottle Water Sampler at the following depths in order to capture vertical stratification of chemistry within the lake: 2m, 15m and 30m. The vertical depth of each water sample was first determined by vertically profiling and recording temperature, conductivity, pH, total dissolved solids, and ortho-phosphate in the water column using a YSI QS water meter fitted with a 30m long cable. Vertical profiling of the lake was completed at 5m intervals and narrowed to 1m where significant changes in measured parameters were detected.

### 3.2 Stream Samples

Water samples were also collected at seven sample stations along Draw Creek and at one sample station in the upper reaches of Redford Creek. The locations of the water sample stations were selected based on their close proximity to Cadillac Lake and the old iron ore tailings site and suspected leachate drainage paths. Baseline water quality data was also collected at each station using a YSI QS water meter. Measure water quality parameters included temperature, conductivity, pH, total dissolved solids, and ortho-phosphate. Water samples were collected and sent to North Island Labs for analysis of the following parameters: total metals, dissolved metals, sulphides, pH, conductivity, alkalinity and anions.

All water sampling points were marked using a Garmin GPSMAP 60 Cx handheld GPS to record the positions of the stations for long-term monitoring. A map illustrating water sampling locations within the Redford Property has been included as Figure 2.

## 4.0 SITE DESCRIPTION

The Toquart Bay study area is located within the Regional District of Alberni Clayoquot, within the northwest area of Barclay Sound on the West Coast of Vancouver Island. Toquart Bay is accessed by the Toquart Main forest service road from Highway 4 near Kennedy Lake. Toquart Bay is a remote area of the Wet Maritime Coastal Forest, with steeply sloping mountains which rise sharply from the ocean to approximately 650m. The area is drained by three major river systems, Toquart River, Draw Creek and Maggie River.

Evidence of past and current clear-cut logging is evident throughout the valley. The area of the subject mine is located on the valley floor between Mount Redford and Mount Dawley approximately 4 km from the Highway 4 intersection. The deactivated quarry pit and the main tailings area are located approximately 200m south of the quarry and west of Draw Creek. The Toquart Main bisects Draw Creek and the quarry and tailings area.

Redford Creek is a tributary of Draw Creek and converges with Draw Creek immediately across the road from the quarry. Draw Creek has a maximum flow rate of 9.92m<sup>3</sup>/s with a mean flow rate of 0.98m<sup>3</sup>/s (Chatwin 2000). It flows south into Maggie Lake located 3.5km downstream of the quarry. Maggie River flows from Maggie Lake into Toquart Bay. Draw Creek is the main receiving environment for any surface runoff or groundwater that might travel off-site from the mine area.

The resident population of the area is limited to the small First Nation Village at Macoah, and the seasonal recreational village of Salmon Beach. The Toquart Bay Forest Recreation Camp

Site is located at the end of Toquart Road and next to the Colson Forest Log Sort and has become a main destination point for boaters and kayakers accessing Barkley Sound. Salmon Beach and the forest recreation site are heavily used during the summer months. Toquart main logging road provides the only vehicle access to these sites.

## 5.0 ENVIRONMENTAL SETTING

The following is an overview of the biophysical, social and cultural resources of the study area.

### 5.1 Physical Resources

The physical resources of the region are inter-related and are influenced by the surficial geology, topography, climate and drainages of the surrounding environment. These physical attributes are described as follows:

#### 5.1.1 Topography

The study area is characterised by steep sloping hillsides, and with exposed bedrock outcrops. Several small drainages exist in the study area. These drainages form parent streams for several first and second order tributaries that form topographical depressions along steep hillsides. Past logging operations and high elevation road building resulted in the mass erosion and infilling of several streams within the area.

#### 5.1.2 Climate

The study area is located within the Coastal Western Hemlock Submontane Very Wet Maritime subzone (CWHvm1). The CWHvm1 is the most extensive biogeoclimatic unit in the Vancouver Forest Region and occurs along windward slopes on both sides of Vancouver Island. The elevational limits extend from sea level to approximately 600m.

The region is classified as having a wet, humid climate with cool summers and mild winters featuring relatively little snow. Growing seasons are long, although precipitation is high, it can vary considerably from lower values in local rain shadows to highest values where air masses loft over steep mountains. Temperatures are moderate, varying from -2 to -3 C<sup>0</sup> in the winter to 25-30 C<sup>0</sup> in the summer. The area is notorious for its high rainfall, records have shown an excess of 3000 mm of precipitation annually. Typically the rain-fall is highest during winter months, with an ocean fog prevalent during the summer (*Green and Klinka, 1994*).

### 5.1.3 Land/Soil

The soil types for the Draw Creek area include Hooper soils along the floodplain area from Maggie Lake to Kennedy Lake and Sprise soils within the upper elevations of valley slopes.

Hooper soils have developed in deep, sandy gravelly fluvial, fluvio-glacial and/or marine deposits. Slopes are usually less than 5% and range in elevation from sea level to 600m. Hooper soils are well to moderately drained.

Sprise soils have developed in cobbly and/or rubbly, sandy, colluvial or morainal soil deposits, less than 1m thick overlying intrusive bedrock. Soils are well drained and typically consist of cobbly, gravelly or very gravelly loam sand. Bedrock is normally encountered between 50-100 cm from the surface (*Chatwin 2005*).

### 5.1.4 Geology

This area of the Toquart region is underlain by a series of sedimentary, volcanic and intrusive rocks that form part of the Wrangellia series, a large geological terrain. The sedimentary limestones of the Quotsino Formation and volcanic rocks of the Karmutszen Formation and Bonanza Group dominate the area. Basic intrusive rocks of the West Coast Complex and Sooke Intrusion cross-cut earlier sedimentary and volcanic rock. The geological contacts in the Toquart area are parallel to sub-parallel to the West Coast Fault. The West Coast Fault, to the west of Toquart, is an important active fault marking the contact of two large geological terrains. Various hot springs (such as Hot Springs Cove) are located along the West Coast Fault (*Chatwin, 2005*).

### 5.1.5 Species-at-Risk

The Species-at-Risk Act (SARA) is designed to prevent or reduce the likelihood of wildlife species becoming extinct or extirpated and to provide for the recovery and management of endangered, threatened and species of special concern as a result from harm by human activity. Provisions of SARA include prohibiting the taking or possession of listed species and the damaging or destruction of their residence and critical habitat.

A request for occurrence records of rare or endangered plant and animal species for the study area with the British Columbia Conservation Data Centre (BC CDC) resulted in no records of species occurrence identified within the project area.

A review of the BC CDC Species and Ecosystems Explorer database within the Vancouver Island – South Island Forest District and CWH biogeoclimatic sub-zone resulted in the identification of eight red-listed and six blue-listed species. Most of these species are associated with intact old growth forest environments, marine environments or open grassland habitats.

A copy of the BC Species and Ecosystem Explorer Database List of species considered at Risk within the coastal western hemlock, south island forest district is included as Appendix B.

The following includes a description of sensitive species that are likely to be found within the study area.

**Warty Jumping-slug (*Hemphillia glandulosa*) - Blue-listed**

This species occupies moist forests from young seral stages to old growth and from low to mid-elevations (COSEWIC 2003b). It is often found in forested riparian areas along creeks or rivers. Moist forest floor conditions appear to be more important than forest age or type. Required microhabitat features include coarse woody debris, pockets of deep leaf litter, or other moist shelter sites such as provided by root-masses of sword ferns.

**Western Screech-Owl *kennicottii* subspecies (*Megascops kennicottii kennicottii*) - Blue-listed**

In Canada, the species occurs only in British Columbia. The *kennicottii* subspecies occurs along the coast of British Columbia, including Vancouver Island, but excluding the Queen Charlotte Islands. Along the southeasternmost coast of Vancouver Island and the southwestern portion of the mainland, the population of Western Screech-owl *kennicottii* subspecies appears to be low and likely decreasing. The owl seems to be relatively common, and perhaps stable, on Vancouver Island (away from the southeastern coast) and through much of the remaining coastal area. The Western Screech-owl is found in quite varied habitats throughout its range: semi-open woodlands, treed suburban areas, and even cactus deserts. Within Canada, the owl is found in lower elevation forested areas, frequently close to water. The forest type and proportion of coniferous to deciduous trees may vary.

**Red-legged Frog (*Rana aurora*): Blue-listed**

Their range extends from southwestern British Columbia, including Vancouver Island, south along the coast of the United States to northwestern Baja California and Mexico. Their habitat is generally in or near the quiet permanent waters of streams, marshes, ponds and other quiet bodies of water. The frogs are sometimes found in damp woods and meadows some distance from water, especially during wet weather. The streams and wetted areas within the study site likely support populations of red-legged frog.

## **5.2 Biological Resources**

The following section includes a review of vegetation, wildlife and fisheries resources within the study area.

### 5.2.1 Flora (Vegetation)

Vegetation found within the Toquart Bay region is indicative of the Southern Very Wet Hypermaritime variant of the Coastal Western Hemlock biogeoclimatic zone (CWHvh1). The CWHvh1 zonal forests are dominated by western hemlock (*Tsuga heterophylla*), and amabilis fir (*Abies amabilis*), and to a lesser extent western redcedar (*Thuja plicata*). Major understorey vegetation commonly includes red huckleberry (*Vaccinium parvifolium*), Alaskan blueberry (*Vaccinium alaskaense*) and a well developed moss layer consisting of step moss (*Hylocomium splendens*) and lanky moss (*Rhytidiadelphus loreus*). The herb layer is sparse and includes minor amounts of deer fern (*Blechnum spicant*), five-leaved bramble (*Rubus pedatus*), bunchberry (*Cornus canadensis*) and queen's cup (*Clintonia uniflora*) (Green and Klinka, 1994).

### 5.2.2 Wildlife

The study area supports populations of large animal species such as black bear (*Ursus americana*), cougar (*Felis concolor*) and black-tailed deer (*Odocoileus hemionus columbianus*). Numerous streams, lakes, small forested wetlands and shallow bays along the marine foreshore are expected to provide habitat for foraging wildlife species such as American mink (*Mustela vison*), ermine (*Mustela erminea*), marten (*Martes americana*), river otter (*Lutra canadensis*), raccoons (*Procyon lotor*), as well as several small shrews and voles, and bat species.

Upland birds commonly found within the study area include chestnut-backed chickadee (*Parus rufescens*), winter wrens (*Troglodytes troglodytes*), Steller's jay (*Cyanocitta stelleri*), nuthatches (*Sitta Canadensis*), northern flicker (*Colaptes auratus*), and northwestern crow (*Corvus caurinus*). The forest community likely supports habitat suitable for various owls and hawks, including barred owls, western screech owl, great horned owl and potentially northern goshawk. Northern goshawk are identified as red-listed or threatened. The red-listed seabird, the marbled murrelet (*Brachyramphus marmoratus*) are considered as nationally threatened. This seabird nests in old growth forest stands. The upper Toquart River, and Lucky Creek watersheds are known to support a high density of murrelets (Burger, A and B. Schroeder, 2003). The watersheds in the study area may support populations of red-legged frogs recognized as blue-listed or rare.

### 5.2.3 Fish Habitat

A search of the provincial Fishwizard database indicates Draw Creek, Redford Creek and Maggie Lake support populations of salmonids. Redford Creek supports populations of coho salmon (*Oncorhynchus kisutch*) and steelhead salmon. Draw Creek supports populations of chum salmon (*Oncorhynchus keta*), coho salmon, rainbow trout (*Oncorhynchus mykiss*) and steelhead. Maggie Lake supports populations of Chinook salmon (*Oncorhynchus tshawytscha*), coastrange sculpin, coho salmon, cutthroat trout (*Oncorhynchus clarki*), dolly varden (*Salvelinus malma*), rainbow trout, sockeye salmon

(*Oncorhynchus nerka*) and steelhead. Dolly varden are blue-listed or considered rare by the British Columbia Conservation Data Centre (BCCDC). Escapement counts of steelhead salmon in Draw Creek have reduced significantly over historical numbers likely due to resource development within the surrounding watershed (Fishwizard, 2008). Maggie Lake provides important rearing refuge for juvenile steelhead salmon. A copy of the Fishwizard reports has been included in Appendix C.

No fish are known to exist within Cadillac Lake. A bathymetric survey of the lake during the water quality study indicates the lake to exceed 120m in depth. Water quality profiling during the survey identified water quality conditions to decrease rapidly with depth and to be toxic to fish survival.

## 6.0 RESULTS

### 6.1 Cadillac Lake Water Quality

Results of water quality sampling taken to a depth of 30m in Cadillac Lake indicated a clear vertical change in water chemistry with significant changes at approximately 15m and 20m below the surface. Changing water quality parameters included dissolved oxygen (DO), pH, conductivity, total dissolved solids (TDS), and oxidation reduction potential (ORP). Measurements of DO decreased significantly from 11.5mg/L at 1.0m; 11.4mg/l at 15.6m; to 0.4mg/L at 24m, respectively. Significant changes in ORP was also observed within depth from 194.3mV at 1m; 81mV at 15.3m; 204mV at 20m and -34.4mV at 24m.

The rapid drop in DO and ORP between 16m and 24m likely indicated the presence of a chemocline in the quarry lake resulting from poor circulation of the water column at depth and bacterial stripping of oxygen during oxidation. The depth of the quarry lake far exceeds the surface area resulting in poor nutrient and oxygen mixing, and significant stratification of the water column. Baseline water quality data for Cadillac Lake has been included in this report as Table 1. Graphed baseline water quality parameters for Cadillac Lake have been included as Figure 3a to 3f. Small fluctuations in water quality parameters measured within the water column may be the result of contacting narrow stratified layers of inflowing groundwater.

Lab results of water samples taken at approximately 1m, 15m, and 30m indicated a consistent increase in concentrations for several measured parameters. Parameter included alkalinity ( $\text{CaCO}_3$ ), fluoride, sulphate, conductivity, arsenic, barium, boron, calcium, magnesium, manganese, molybdenum, nickel, silicon, sodium, strontium, titanium, and sulphide. However, these parameters did not exceed British Columbia Water Quality Guidelines for Aquatic Life (BCQG). A comparison of water quality sample analysis results for Cadillac Lake against BC Provincial and Federal water quality guidelines for aquatic life is included in Table 2. A copy of the North Island Lab water sample results has been included as Appendix D.

Water sample parameters found to exceed the BCQG from the quarry included fluoride and arsenic. Provincial standards (guidelines) for aquatic life include 0.2mg/L for

fluoride and 0.005 mg/l for arsenic. Fluoride concentrations at 30m were found to match provincial standards, while concentration of Arsenic were found to exceed provincial standards at all three measured depths and to increase substantially with depth. Concentration of arsenic was measured at 0.179 mg/l at 1m (surface) and 0.13 mg/l at 30m or five times the acceptable standard. A sulphurous odour was present when retrieving water samples collected at 15 and 30m. It is expected that these parameters further increase in concentrations with increased depths of the lake.

## 6.2 Draw Creek and Redford Creek Water Quality

Redford Creek #1 (RC#1) and Draw Creek #1 (DC#1) identified as control sites were located well upstream of suspected mine workings in order to determine baseline water quality parameters. DC#2 is located upstream of Cadillac Lake and is most likely above the influence of the mine workings area. DC #3-7 are located downstream of the mine area within the area of expected influence. Baseline water quality parameters for Draw Creek and Redford Creek have been included as Table 3.

The only parameter to exceed BCQG from water samples collected at seven sample stations in Draw Creek and one station in Redford Creek was aluminum. Minor increases in aluminum were found at sample station DC#1 (0.13mg/L) and DC#2 (0.141mg/L) opposite Cadillac Lake. The minor increase in aluminum is likely natural present within the system of maybe a mineral exposure from forest clearing activities further upstream in the watershed.

A comparison of water sample collected along Draw Creek and below DC#1 indicated concentrations of aluminum, titanium and uranium decreased sequentially as you moved downstream and away from the tailings area. Parameters found to increase in concentration in water samples collected in a downstream direction included arsenic, calcium, magnesium, silicon and strontium. Manganese, molybdenum and sulphate were found to increase in concentrations below DC#5 which is located immediately downstream of the mine tailings area. Iron staining was observed along the sandy creek banks and when excavating coarse substrates in the middle of the stream at DC#5 (see Appendix A). A comparison of water quality sample analysis results for Draw Creek and Redford Creek against BC Provincial and Federal water quality guidelines for aquatic life is included in Table 2. A copy of the North Island Lab water sample results has been included as Appendix D.

## 7.0 DISCUSSION

### *Cadillac Lake:*

Water quality parameters found in Cadillac Lake such as arsenic, metals and sulphates are consistent with water quality sampled from other deactivated iron ore mine workings (*Rietkerk, 2007*) (*Limerick, Ryan, Brown and Comp, 2005*). A number of sampled parameters from the lake were found at concentrations elevated over water quality found at most stream sample stations, including pH, alkalinity, conductivity, fluoride, sulphate, arsenic, barium, boron, calcium, cobalt, magnesium, manganese, molybdenum, nickel, silicon, sodium, thallium, and sulphide. Concentrations for nitrate, aluminum, copper, iron, phosphorus, titanium and zinc

sampled for Cadillac Lake were found at concentrations lower than concentration for DC#1 and RC#1. The remainder of the parameters were the similar between the lake and the control samples.

While the sampling program was limited to the analysis of water quality conditions within the upper 30m of the lake, it is likely that concentrations of arsenic, fluoride, sulphide/sulphate far exceed acceptable water quality standards at deeper depth to a level that is highly toxic to fish, zooplankton and benthic communities. Anoxic oxygen conditions within the lake also eliminate the lake to support most, if not all limnetic fish communities. Arsenic in the presence of low oxygen, and a low redox potential from concentrated sulphur oxides are all of particular concern. If the lake was to be drained and its water directed into Draw Creek, the potential for impacts to benthic invertebrate communities and fish would be a major concern.

Arsenic, a minor constituent of sulphide ore deposits, likely reaches high concentrations in the lake with exposure to sulphides from the exposed quarry wall and from groundwater seepage coming from the tailings area (Ripley, E, R. Redmann et al. 1996). While many organisms can tolerate high arsenic concentrations in the environment and many accumulate it, accumulation may pose a risk for organisms at higher trophic levels. Arsenic exposure to fish can be toxic primarily through accumulation via diet. Benthic communities fed upon by fish readily accumulate metals in the environment. Elevated concentrations of arsenic in fish are known to cause degenerative changes in livers thus reducing growth and survival of juvenile trout in laboratory tests (Woodward, D. and W. Brumbaugh et al. 1994).

#### *Draw Creek:*

With the exception of aluminum, the water quality in Draw Creek meets standard for aquatic life. Aluminum was found to exceed guidelines in the control sample DC#1 and DC#2. It also exceeds the level of aluminum in Cadillac Lake and is therefore assumed to be ambient in the watercourse. However, there does appear to be some evidence to suggest the mine workings are affecting water quality in Draw Creek with the increase of arsenic, calcium, magnesium, silicon, strontium, manganese, molybdenum and sulphate downstream of the mine area. A borehole drilled close to Draw Creek immediately down gradient from Cadillac Lake and the tailing area during the drilling investigation of the property resulted in breaking into the local aquifer. A strong sulphurous odour was detected during the release of ground water from the borehole. As such, there is a potential for water from the quarry to be leaching into the groundwater table and Draw Creek from karst fractures.

The increase of manganese, molybdenum and sulphate below DC#5 may also be explained by its location immediately downstream of what appears to be a tributary of Draw Creek that goes underground immediately adjacent to the mine tailings area. It is probable that the tributary is directing runoff from the mine tailings into draw creek through ground water flow. In addition, the sandy stream bank at DC#5 shows extensive staining from iron oxide deposition at a bend in the watercourse. Draw Creek is known to support a health population of coho salmon, chum salmon and a depressed but stable population of steelhead salmon (Fishwizard, 2008). If the mine were to re-open, there is the potential for increased contamination of Draw Creek through this underground tributary.

#### *Treatment Measures:*

Arsenic toxicity and methods of arsenic removal from water are dependent on its speciation. Arsenic occurs in groundwater frequently in trivalent arsenic (arsenite) and pentavalent arsenic (arsenate) oxidation states. Arsenite is about 60 times more toxic than arsenate. Chemical characteristics such as pH and redox potential determine the arsenic speciation in groundwater. Arsenite is most prevalent under reduced, anoxic conditions, while arsenate is most common in oxidised conditions. Arsenite carries a neutral charge at typical pH ranges for natural water; it therefore does not thermodynamically interact with other elements making it difficult to remove from water via adsorption onto metal oxides or other treatment processes. Above pH 8.0, arsenite will dissociate into various negatively charged ionic forms at natural pH ranges, making this state more reactive to treatment processes (*Rietkerk, November 2007*).

When arsenite is a large percentage of total arsenic, an initial oxidation step must take place in order to convert arsenite to arsenate. Technologies available to complete this conversion use ozone, chlorine, hydrogen peroxide, manganese oxide, iron oxide or manganese dioxide. Once conversion to arsenate is complete, the arsenic is removed by one or more treatment options. Technologies available include ion exchange, activated alumina, reverse osmosis, modified coagulation/filtration, and modified lime softening (for water with pH >10.5), electrodialysis reversal and oxidation/filtration (for water with 20:1 iron: arsenic ratio). Iron-based adsorbents have also been developed for removal of arsenic from water (*Rietkerk, November 2007*).

## **8.0 RECOMMENDATIONS**

The Ministry of Energy Mines and Petroleum Resources is responsible for approving all project proposals for mines and mineral exploration in British Columbia. The Mining and Minerals Division collects and processes applications and works with various other government organizations, notably the Environmental Assessment Office, throughout the approval process. The reopening of the Redford mine will require an Approval with respect to the *Mines Act* R.S.B.C 1996, c. 293 (*Mines Act*) and its accompanying Health, Safety and Reclamation Code for Mines in British Columbia (Code). Completion of a full British Columbia Environmental Assessment Act (EAA) Report will be required as a primary component of the Approval application.

If the re-opening of Brynnor Mine requires Cadillac Lake to be drained, a water treatment system will be required to remove arsenic, fluoride and potentially sulphides/sulphates. Oxygenation of the water will also be required prior to release into Draw Creek. The water treatment system should be designed and installed by a suitable qualified consulting company to meet guidelines as determined by The BC Ministry of Energy, Mines and Petroleum Resources. Water quality discharged to the creek should meet the British Columbia Water Quality Guidelines for Aquatic Life and or the Canadian Water Quality Guidelines for Aquatic Life at a predetermined rate suitable to protect fish habitat.

Additional recommendations are as follows:

- The completion of a LC50 toxicity testing program to determine lethality limits of waste water from Cadillac Lake on fish. Toxicity testing to be done by a certified laboratory familiar with provincial and federal requirements for water quality standards; .
- Further detailed water sampling to pinpoint discharge sources from the quarry and/or tailings area;
- Investigate the potential to intercept the underground creek above the tailings area at a surface flow location and redirect it around the tailings site; and
- Hydrological assessment to determine the appropriate discharge rate to drain treated water from Cadillac Lake into Draw Creek.

## **9.0 CLOSURE**

This preliminary environmental assessment and water quality report has been completed in accordance with generally accepted biological practices. No other warranty is made, either expressed or implied. Chatwin trusts that the information provided in this report meets your requirements. Any questions regarding information provided in this document, please contact the undersigned at (250) 753-9171.

Respectfully submitted,

**CHATWIN ENGINEERING LTD.**

## Stream Report

If you would like to print this page use [CTRL+P] on your PC or [Command+P] on your Mac.

### Reference Information:

<b>Name:</b>	DRAW CREEK
<b>Watershed Code:</b>	930-233800-94100
<b>Waterbody Identifier:</b>	00000ALBN
<b>Stream Length:</b>	10.34 km
<b>Stream Order:</b>	3
<b>Stream Magnitude:</b>	11
<b>Map:</b>	Zoom to this waterbody

### Species Present:

Chum Salmon, Coho Salmon, Rainbow Trout, Steelhead

**Note:** The above list represents the species recorded in the Fisheries Data Warehouse and should NOT be considered a comprehensive list. The distributions should also be considered incomplete at this time.

### Named Tributaries:

REDFORD CREEK

### Obstructions:

### Salmon Escapements:

## Lake Report

If you would like to print this page use [CTRL+P] on your PC or [Command+P] on your Mac.

### Reference Information:

**Name:** MAGGIE LAKE  
**Region:** Vancouver Island & Knight Inlet  
**Watershed Code:** 930-233800  
**Waterbody Identifier:** 01778ALBN  
**Elevation:** 31 m  
**Mapsheet Number:** 092C14  
**UTM Zone:** 10  
**UTM Easting:** 323591  
**UTM Northing:** 5429579  
**Map:** Zoom to this waterbody

### Species Present:

Chinook Salmon, Coastrange Sculpin (formerly Aleutian Sculpin), Coho Salmon, Cutthroat Trout, Dolly Varden, Rainbow Trout, Salmon (General), Sculpin (General), Sockeye Salmon, Steelhead

**Note:** The above list represents the species recorded in the Fisheries Data Warehouse and should NOT be considered a comprehensive list. The distributions should also be considered incomplete at this time.

### Named Tributaries:

DRAW CREEK, MAGGIE RIVER

## Stream Report

If you would like to print this page use [CTRL+P] on your PC or [Command+P] on your Mac.

### Reference Information:

**Name:** REDFORD CREEK  
**Alias:** BEDFORD CREEK  
**Watershed Code:** 930-233800-94100-37200  
**Waterbody Identifier:** 00000ALBN  
**Stream Length:** 3.38 km  
**Stream Order:** 1  
**Stream Magnitude:** 1  
**Map:** [Zoom to this waterbody](#)

### Species Present:

Coho Salmon, Steelhead

**Note:** The above list represents the species recorded in the Fisheries Data Warehouse and should NOT be considered a comprehensive list. The distributions should also be considered incomplete at this time.

### Obstructions:

### Salmon Escapements:
