---	----------

1. Summary

Between January and February, 2010 geophysical surveying was conducted to test, calibrate, and train on the BM8 Beep Mat system.

The Rox property is located 70 km south-southwest of Houston and is accessible by a series of well-maintained gravel roads. The property consists of 25 contiguous mineral tenures that cover more than 10 000 ha of land on NTS map sheets 93E/10, 11E, 14E and 15 in an area known as the Mosquito Hills, north of Tahtsa Reach.

The program was carried out by Brian Thompson of Briwen Ventures, Qualicum Beach, BC, for Lowprofile Ventures Ltd., the owner of the Rox property. The purpose was training on and calibration of the BM8 Beep Mat system in preparation for a Summer 2010 full-scale geophysical mapping program on the ROX property. The 2008 Quest-West airborne geophysical survey of the region indicated several targets of interest and the owner of the Rox claims intends to investigate these further, on the ground, with the Beep Mat.

Bedrock on the property consists primarily of fossiliferous marine sedimentary rocks, including lithic sandstones, feldspathic sandstones, greywackes and conglomerates, of the Middle Jurassic Smithers Formation. Regionally significant granitic intrusions of the late Cretaceous-Tertiary Bulkley intrusive suite cut the stratified rocks. Lavas and related rocks of the upper Cretaceous – Tertiary Ootsa Lake Group and Tertiary Endako Group locally mask the distribution of the older rocks.

2. Introduction and Terms of Reference

Lowprofile Ventures Ltd (Lowprofile) contracted Briwen Ventures of Qualicum Beach, BC to conduct small geophysical survey program over parts of the Rox property, focusing on the areas of known anomalies so as to train on and test the BM8 Beep Map system. It is understood that this report may be required for material disclosure. The author has toured the property previously and has also had a day in the field of working with the Beep Map system.

3. Property Description and Location

3.1 Accessibility and Infrastructure

The Rox property is located in the Omineca Mining Division, 114 kilometres south of Smithers and 70 kilometres south-southwest of Houston, in west-central British Columbia (Figure 1). The property is accessible via a series of well-maintained gravel roads, one of which is the main access road to the operating Huckleberry mine, located 23 km to the west of the property.

Directions to the Rox property are as follows: from Houston travel west on Highway 16 for approximately 4.5 km and turn left onto the Morice River Forest Service Road (FSR); travel south on the Morice River FSR to the 56 km marker and turn right onto the Nadina Main FSR and travel to the 89 km marker; turn left onto the Tahtsa Reach FSR--the north boundary of the Rox property crosses the Tahtsa Reach FSR at approximately the 90 km marker.

To reach the parking location for the current access point to Quest-West geophysical target area, after turning left at 89 km onto the Tahtsa Reach FSR, travel to 92.25 km then turn left and travel 10 kms. Turn right onto an unmarked FSR, travel 4.1 kms, then turn right onto an old logging

block spur road. Travel to the end of this rehabilitated road for the closest point to the target area and access for future prospecting and possible geochemical and geophysical surveys.

Smithers and Houston are each situated along Highway 16 and each community has a district population in excess of 10,000. Most services and supplies are available in these resource-based communities.

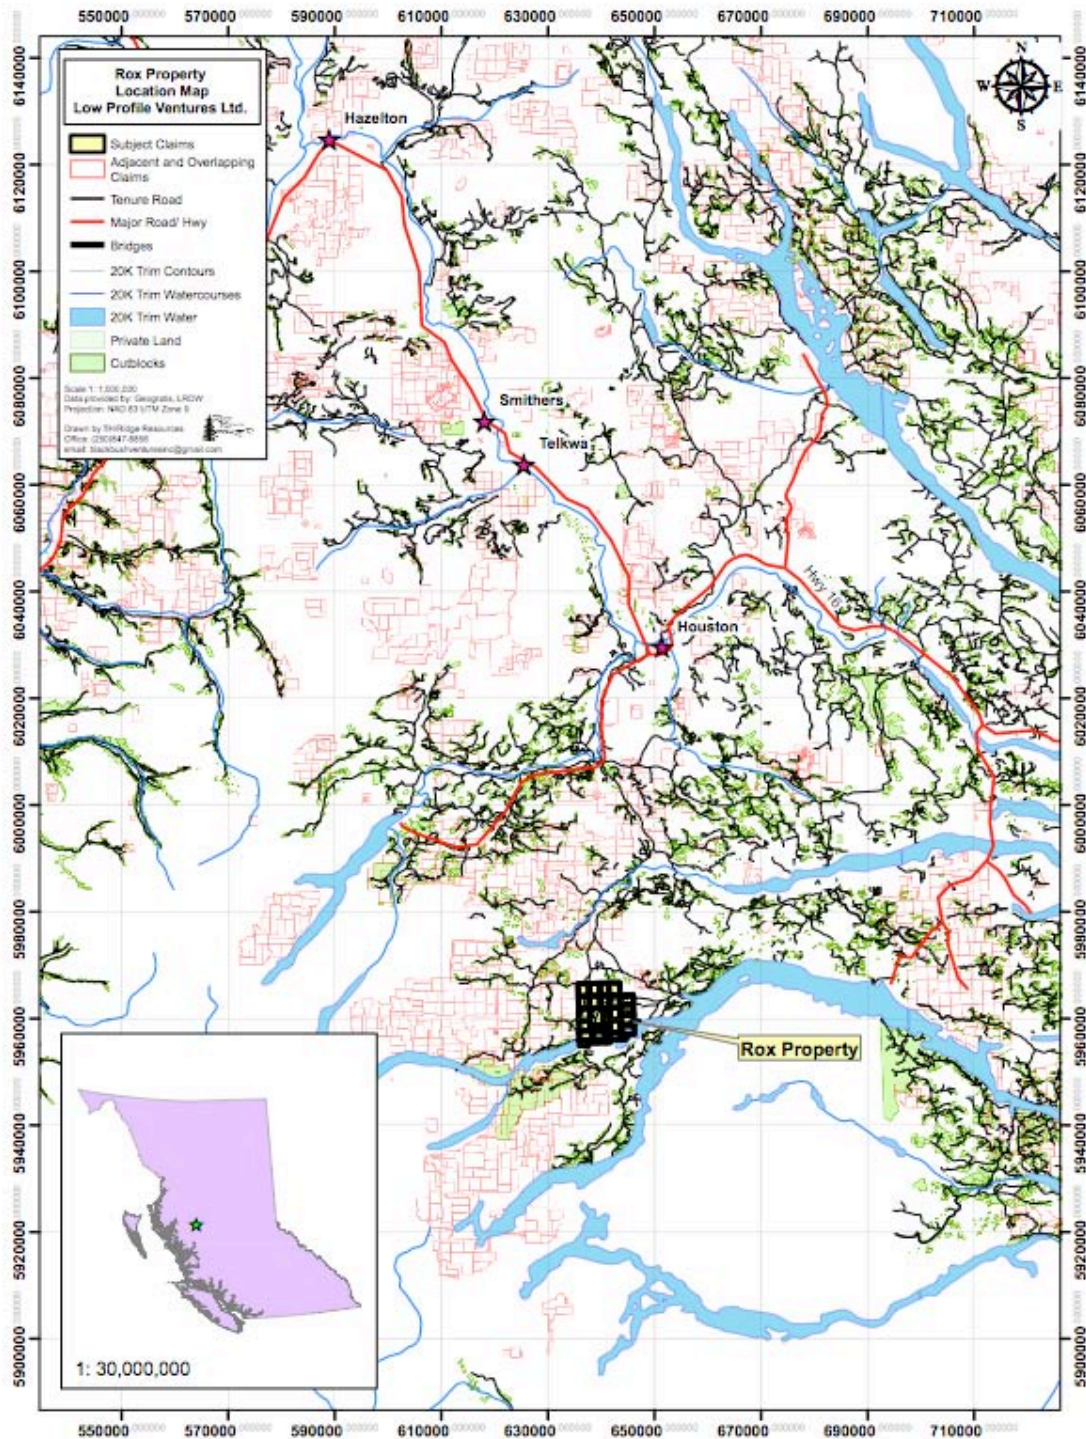

Figure 1. Rox Property Location Map.

3.2 Mineral Tenure Information

The Rox property is comprised of 25 contiguous mineral tenures (Figure 2). The claims cover 10,624.363 hectares of land on NTS map sheets 93E/10, 11E, 14E and 15. The centre of the claim block is located at latitude 54°46'39"N and longitude 126°51'39"W (NAD 83). All the individual claims are 100%-owned by Lowprofile Ventures Ltd. Table 1 gives mineral tenure information and status regarding the Rox claims.

Table 1. Mineral Tenure and Status for Rox Claims.

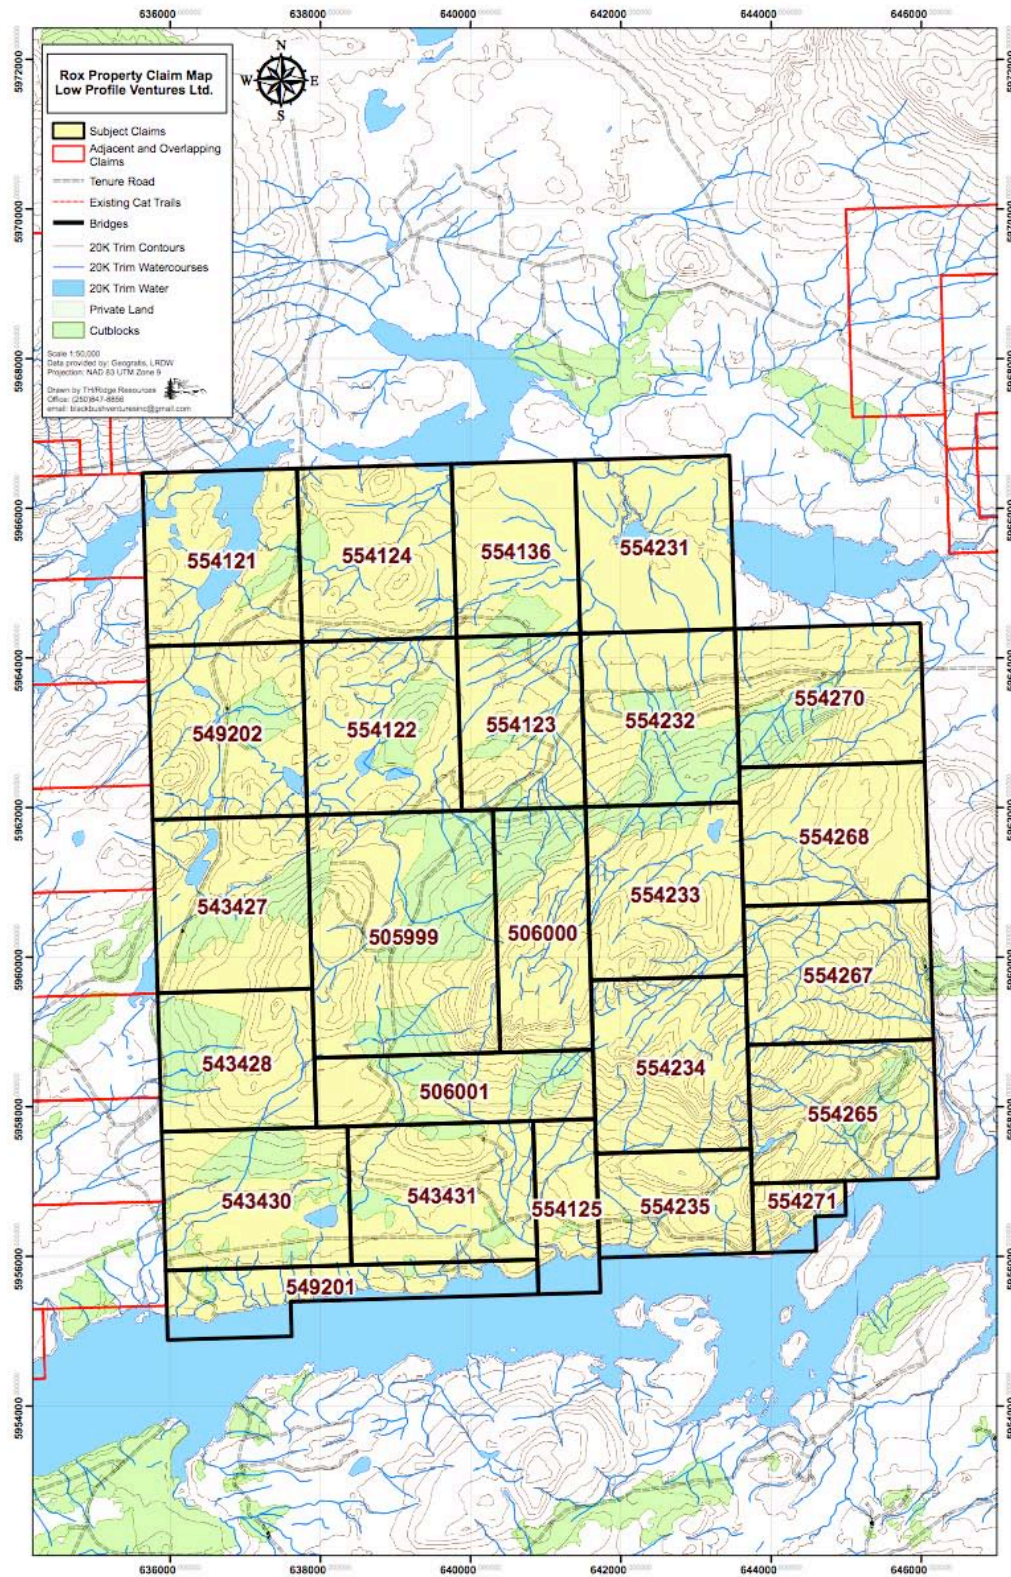

Figure 2. Rox Property Mineral Tenures.

3.3 Physiography and Climate

The Rox property is located near the western margin of the Nechako Plateau, the northernmost subdivision of the Interior Plateau (Holland, 1976). The property covers an area of relatively subdued topography, known as the Mosquito Hills, extending north from the shores of Tahtsa Reach to Horseshoe Lake. Elevations range from 888 m asl in the south to 1440 m asl in the centre of the property at Mosquito Crag. The area is well forested by thick stands of spruce and pine with thick undergrowth consisting of alder and devil's club. Swampy terrain occurs in patches throughout the central to northern portion of the property. Extensive glacial drift blankets most of the property and bedrock exposures typically occur along low ridges and along the margins of some drainages and road cuts.

Local climate is typical of the Northern Interior of British Columbia. Summer temperatures average a daytime high in the 20°C range with occasional temperatures reaching the low 30°C range. October through April sees average sub-zero temperatures with extreme lows reaching -30°C from November through March. Annual precipitation averages 50 cm including winter snowfall.

4. History

Relatively little recorded exploration has taken place in the area covered by the Rox claims. Recently however, several modest programs have examined small areas within the larger block of tenure. In November 1987, Noranda Exploration Company, Limited, assessed an area along the north shore of Tahtsa Reach, south of Mosquito Crag, and identified arsenopyrite-bearing shear zones (MacArthur R. and Maxwell, G, 1988). On the Rox 1 claim, prospecting by Gary Thompson in the late 1990s discovered pyrite in sheared and altered rock in a contact zone between diorite and sandstone (Discovery showing) and ~350 m to the west, pyrite-rich veinlets cutting sandstone (Central showing). A 0.5 m chip sample from the Discovery showing assayed 7.0 g/t Au and 19.7 g/t Ag, and a 1.0 m chip sample from the Central showing assayed 2.25 g/t Au and 8.4 g/t Ag (L'Orsa, 2005). Diamond drilling in 2002 and 2003 tested a zone of brecciated, silicified and mineralized sedimentary and felsic volcanic rocks on the Rox 1 claim (Ogryzlo, 2002 and 2003). The four short holes encountered sulphide-rich clay gouge and precious metal-bearing sulphide veinlets, evidence of either a porphyry, polymetallic vein or epithermal system (Ogryzlo, 2003).

A 3-D Induced Polarization survey was completed on the Rox 1 claim in 2004 (L'Orsa, 2005) and identified several linear and ovoid anomalies. Follow-up drilling in 2005 tested three chargeability highs and encountered narrow polymetallic veins with locally elevated gold and silver values within broad zones of disseminated pyrite consistent with a large hydrothermal system (L'Orsa, 2006).

In 2008, a short (six-day) bedrock mapping program was carried out by Allnorth Consultants Ltd. of Prince George, BC, encouraging further mapping and soil geochemistry be done on the Rox property.

In May, 2009, an small outcrop mapping program was completed by Gary Thompson, specifically focusing on the Rox 8 claim, and another limited outcrop mapping program took place over several days through June, July, August and September of 2009.

5. Geological Setting

5.1 Regional Setting

The Rox property is located within the Intermontane Tectonic Belt; a partly collisional tectonic belt comprised of a series of accreted terranes. The largest of these terranes is Stikinia, which underlies much of central British Columbia. Stikinia consists of a series of Jurassic, Cretaceous and Tertiary magmatic arcs and successor basins which unconformably overlie Permian sedimentary basement rocks (Monger et al., 1972; MacIntyre et al., 1989).

The Rox property is centred south of the Skeena Arch in an area underlain primarily by marine sedimentary rocks of the Middle Jurassic Smithers Formation (Duffel, 1959). There is little bedrock exposed, but typical rock types include lithic sandstones, feldspathic sandstones, greywackes and conglomerates. Belemnites and bivalves are a common feature of these rocks. Granitic intrusions of the Upper Cretaceous Bulkley intrusive suite cut the stratified rocks. The intrusions are part of a north-northwest belt of late Cretaceous –Tertiary granitic intrusions, some of which are known to be genetically related to significant porphyry deposits (Carter, 1981). Lying unconformably on, or in structural contact with the Jurassic pile, and masking the distribution of the older rocks, are basic to felsic flows of the Ootsa Lake Group and basic flows of the Endako Group (Foye and Osiaki, 1995).

5.2 Mineralization and Alteration

The region, or Tahtsa district (Seraphim and Holister, 1976), is very well mineralized and is host to a producing mine (Huckleberry copper-molybdenum mine), past producing mines (such as Emerald Glacier precious metal-base metal mine) and advanced porphyry copper-molybdenum prospects that have been the target of extensive exploration programs (such as Berg, Whiting Creek, Seel and Ox Lake). Porphyry systems in the Tahtsa district are post-accretion deposits that formed between 83 Ma (Huckleberry) and 49 Ma (Berg). The porphyry deposits are hosted by a range of rock types, but typically display peripheral propylitic alteration (including carbonate, chlorite and pyrite), and locally extensive biotite hornfelsing, that enclose core zones of silicic, potassic, sericitic and/or argillic alteration.

At the Rox property, laterally extensive deposits of till, locally extensive Tertiary volcanic cover, and the recessive nature of the rocks that comprise the Smithers Formation have resulted in a relative lack of bedrock exposure. As a consequence, there is little exploration history and very few mineral showings. Known showings occur immediately west and south of Mosquito Crag and have been described in previous assessment reports (Ogryzlo, 2002 and 2003).

Mineralization in the central part of the property consists typically of pyrite in narrow veins, stockworks, shears and limited zones of brecciation often accompanied by a gangue of drusy calcite and/or quartz and sometimes with traces of accessory sphalerite. Malachite has been recognized locally and chalcopyrite has been noted in at least one location on the Rox 1 claim. Arsenopyrite-bearing shears zones were noted on the north shore of Tahtsa Reach. Alteration is weak consisting of mainly local zones of chlorite, carbonate and pyrite typically restricted to veinlets, weak stockwork zones and narrow, discontinuous bands of breccias.

6. Exploration

6.1 Geophysical Surveying

6.1.1. Equipment

A Beep Mat BM8 was used for all surveying. From the BM8 manual:

“The Beep Mat is a simple and efficient electromagnetic prospecting instrument adapted to the search of outcrops and/or boulders containing conductive and/or magnetic minerals. It basically consists of a sleigh-shaped short probe and a reading unit. For prospecting, you pull the probe on the ground to be explored. The Beep Mat takes continuous readings while you walk and sends out a distinctive audible signal when detecting a conductive or a magnetic object in a radius of up to 3 meters. The Beep Mat directly detects and signals the presence of ores, even slightly conductive, containing chalcopyrite, galena, pentlandite, bornite and chalcocine. It also detects native metals (copper, silver, gold) as well as generally barren conductive bodies (pyrite, graphite and pyrrhotite), but which may contain precious ores such as gold or zinc (sphalerite), which are themselves nonconductive. Besides detecting conductors, the Beep Mat measures their intrinsic conductivity and their magnetic susceptibility (magnetite content). This helps geologists and geophysicists better interpret others geophysical and geological surveys.

The BM allows the use of a Mag sensor and the connection of a GPS. This combination allows the operator to survey large areas, to detect rapidly changing conductors, to find their localization and to record their values 10 times a second. A map of conductivity, magnetic susceptibility and magnetic total field can be done from these results. A second field operation to recognize the nature of conductors could be scheduled.”

For this particular survey, a snowmachine was used to tow the Beep Mat for the January dates. The equipment is light enough to easily drag behind a person when surveying during the summer season.

6.1.2. Survey Areas

Initial survey patterns were close to camp due to snowmachine difficulties (Figures 3 and 4). This gave the operator time to develop skills using the Beep Mat and familiarity with the sensor patterns. The area is also rich in glacially transported boulders, allowing the operator to make note of any anomalies for future follow-up.

The second set of survey patterns focused on the original discovery area (“Discovery Creek”) as well as to the south of this region over previously drilled ground, with the intent to set background levels for the equipment in preparation for future surveys. Next, the operator dragged the Beep Mat up stream from the initial discovery as the area is known to have mineralization in the creek bed, making an excellent testing area for the Beep Mat sensitivity levels.

The final area followed a logging spur road and crossed a small swampy section, again to confirm mineralization (road) and sensitivity/ability (swamp).

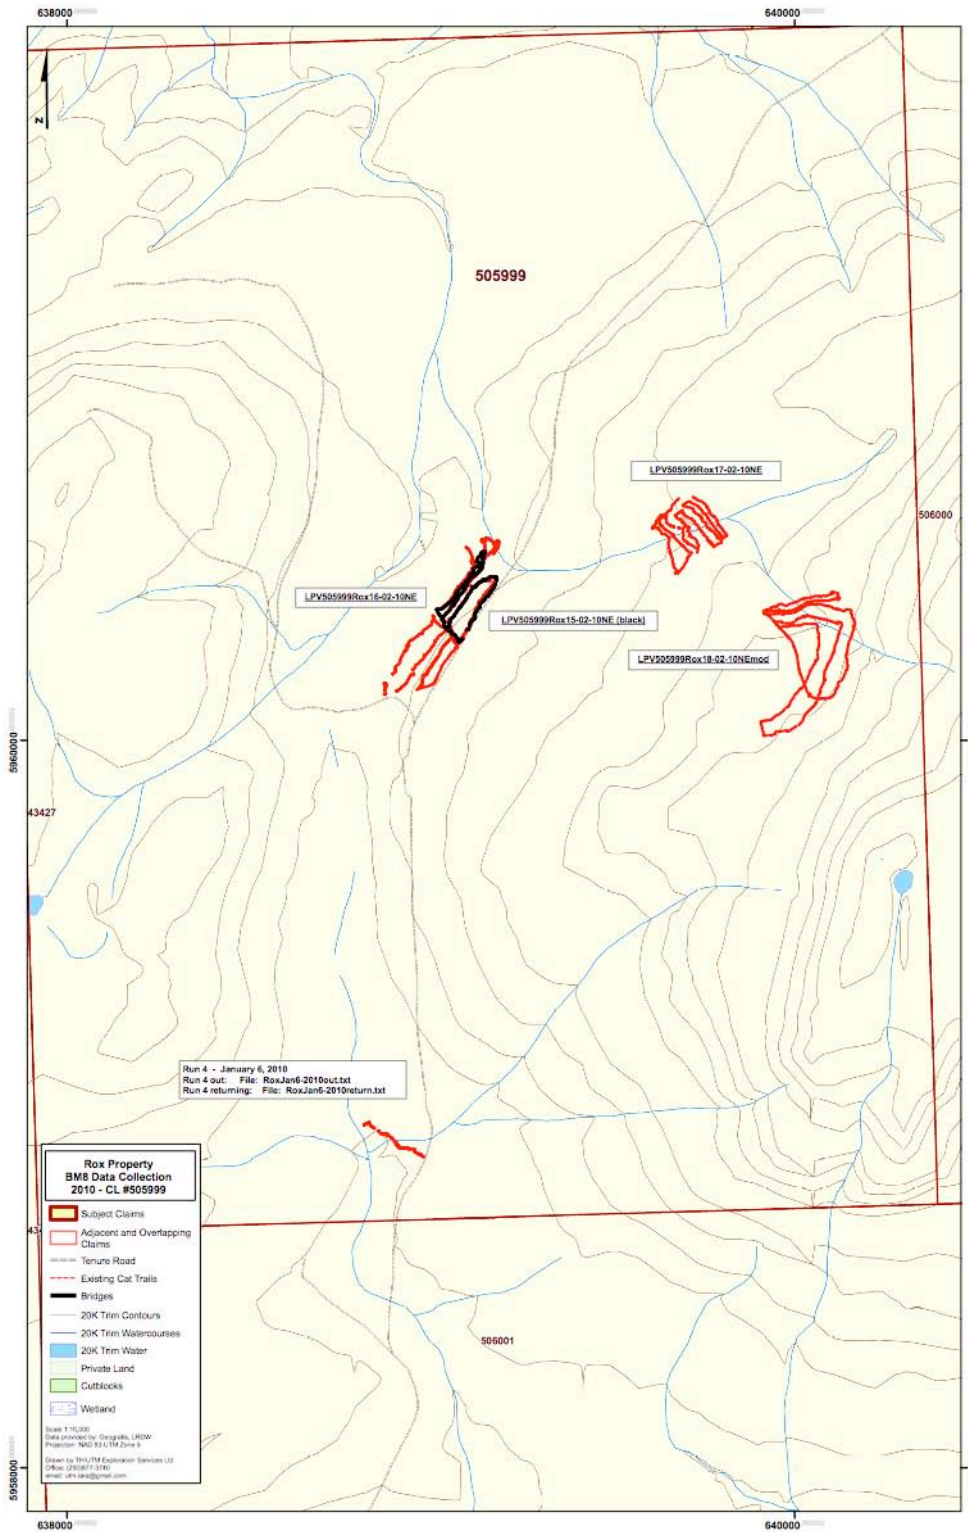

Figure 3. Beep Mat surveys for Jan 6 and Feb 15-18, 2010.

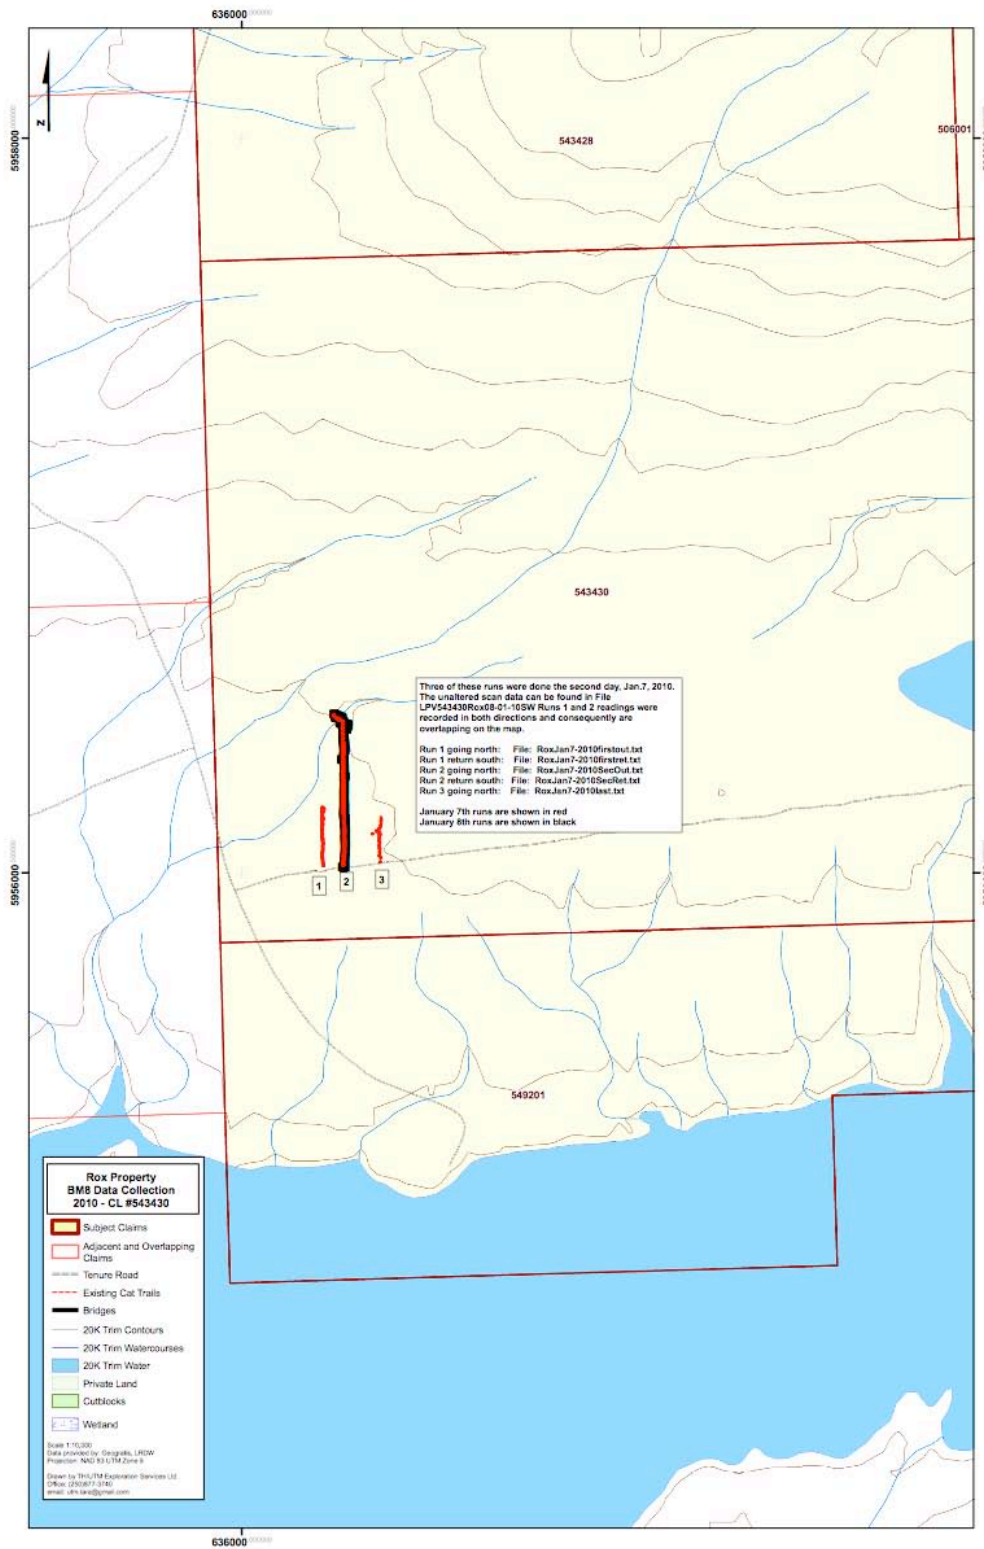

Figure 4. Beep Mat surveys for Jan 7-8, 2010.

7. Interpretation and Conclusions

The most important current area of interest in the Rox claim group results from the 2008 Quest-West Air Borne Geophysical Survey. The Beep Mat equipment will allow the Rox claims to be further examined on the ground, in more detail.

8. Recommendations

Continued prospecting and geological mapping of the property, particularly of the areas noted in by the Quest-West data, are highly recommended. On-the-ground geophysical work, tracing and expanding the Quest-West data, is also strongly encouraged. Samples should be collected and sent in for assaying to confirm mineral and alteration types present.

9. Statement of Costs – 2010 Geophysical Program

Exploration Work Type	Comment				Totals
Personnel					
	<i>Dates of Field Days</i>	<i>Hours</i>	<i>Rate</i>	<i>Subtotal</i>

11. Statement of Qualifications

Anastasia Ledwon of 37471 Hwy 16, Telkwa, British Columbia:

I graduated from the University of Victoria with a Bachelor of Science Degree in Earth and Ocean Sciences, With Honours, With Distinction (1997);

I have been practicing my profession as a geologist in mineral exploration continuously since 2005, and have worked as a geologist in other disciplines since 1997;

I am a Professional Geologist with the Association of Professional Engineers and Geoscientists of British Columbia, Licence #33898, and have been since September, 2009;

The observations, conclusions and recommendations contained in the report are based on the author's interviews with Gary Thompson and review of the data of the geophysical survey program completed by Brain Thompson of Briwen Ventures. The author made one visit to the claim site in 2009 but is not responsible for the data collected and prepared by others.

Anastasia Ledwon

549201

Three of these runs were done the second day, Jan.7, 2010.
 The unaltered scan data can be found in File
 LPV543430Rox08-01-10SW Runs 1 and 2 readings were
 recorded in both directions and consequently are
 overlapping on the map.

Run 1 going north: File: RoxJan7-2010firstout.txt
 Run 1 return south: File: RoxJan7-2010firstret.txt
 Run 2 going north: File: RoxJan7-2010SecOut.txt
 Run 2 return south: File: RoxJan7-2010SecRet.txt
 Run 3 going north: File: RoxJan7-2010last.txt

January 7th runs are shown in red
 January 8th runs are shown in black
