1.0 INTRODUCTION

This report summarizes the exploration activities conducted on the Premier Gold Property (PGP) by Ascot Resources Ltd during the 2009 field season. The PGP has a long history of exploration and mining beginning in 1904 and includes the Silbak-Premier Mine and the Big Missouri Mine, as well as many smaller showings and prospects. From 1988 to 1996 Premier Gold produced 3,039,680 tons grading 0.085 oz./t gold and 1.67 oz/t silver. Current proven and probable reserves for Premier Gold are 313,916 tons grading 0.257 oz/ton gold and 1.345 oz/ton silver (Internal Memorandum prepared by Westmin Resources, 1997).

Ascot Resources Ltd acquired the property from Boliden Ltd under the terms of an option agreement dated June 12, 2009. The area held by Ascot Resources is part of the Stewart Mining Camp, one of the more prolific gold camps in BC, and includes the formerly producing Silbak-Premier and Big Missouri Mines. Additionally, Ascot has an option on the 3060.3 ha Dilworth Property just north of and adjacent to the Premier Property. The combined Silbak-Premier and Big Missouri Properties (Premier Property) are comprised of 37 mineral claim, 3 mining leases and 170 crown grants with a total area of 7442.63 ha (see Tables 1 and 2).

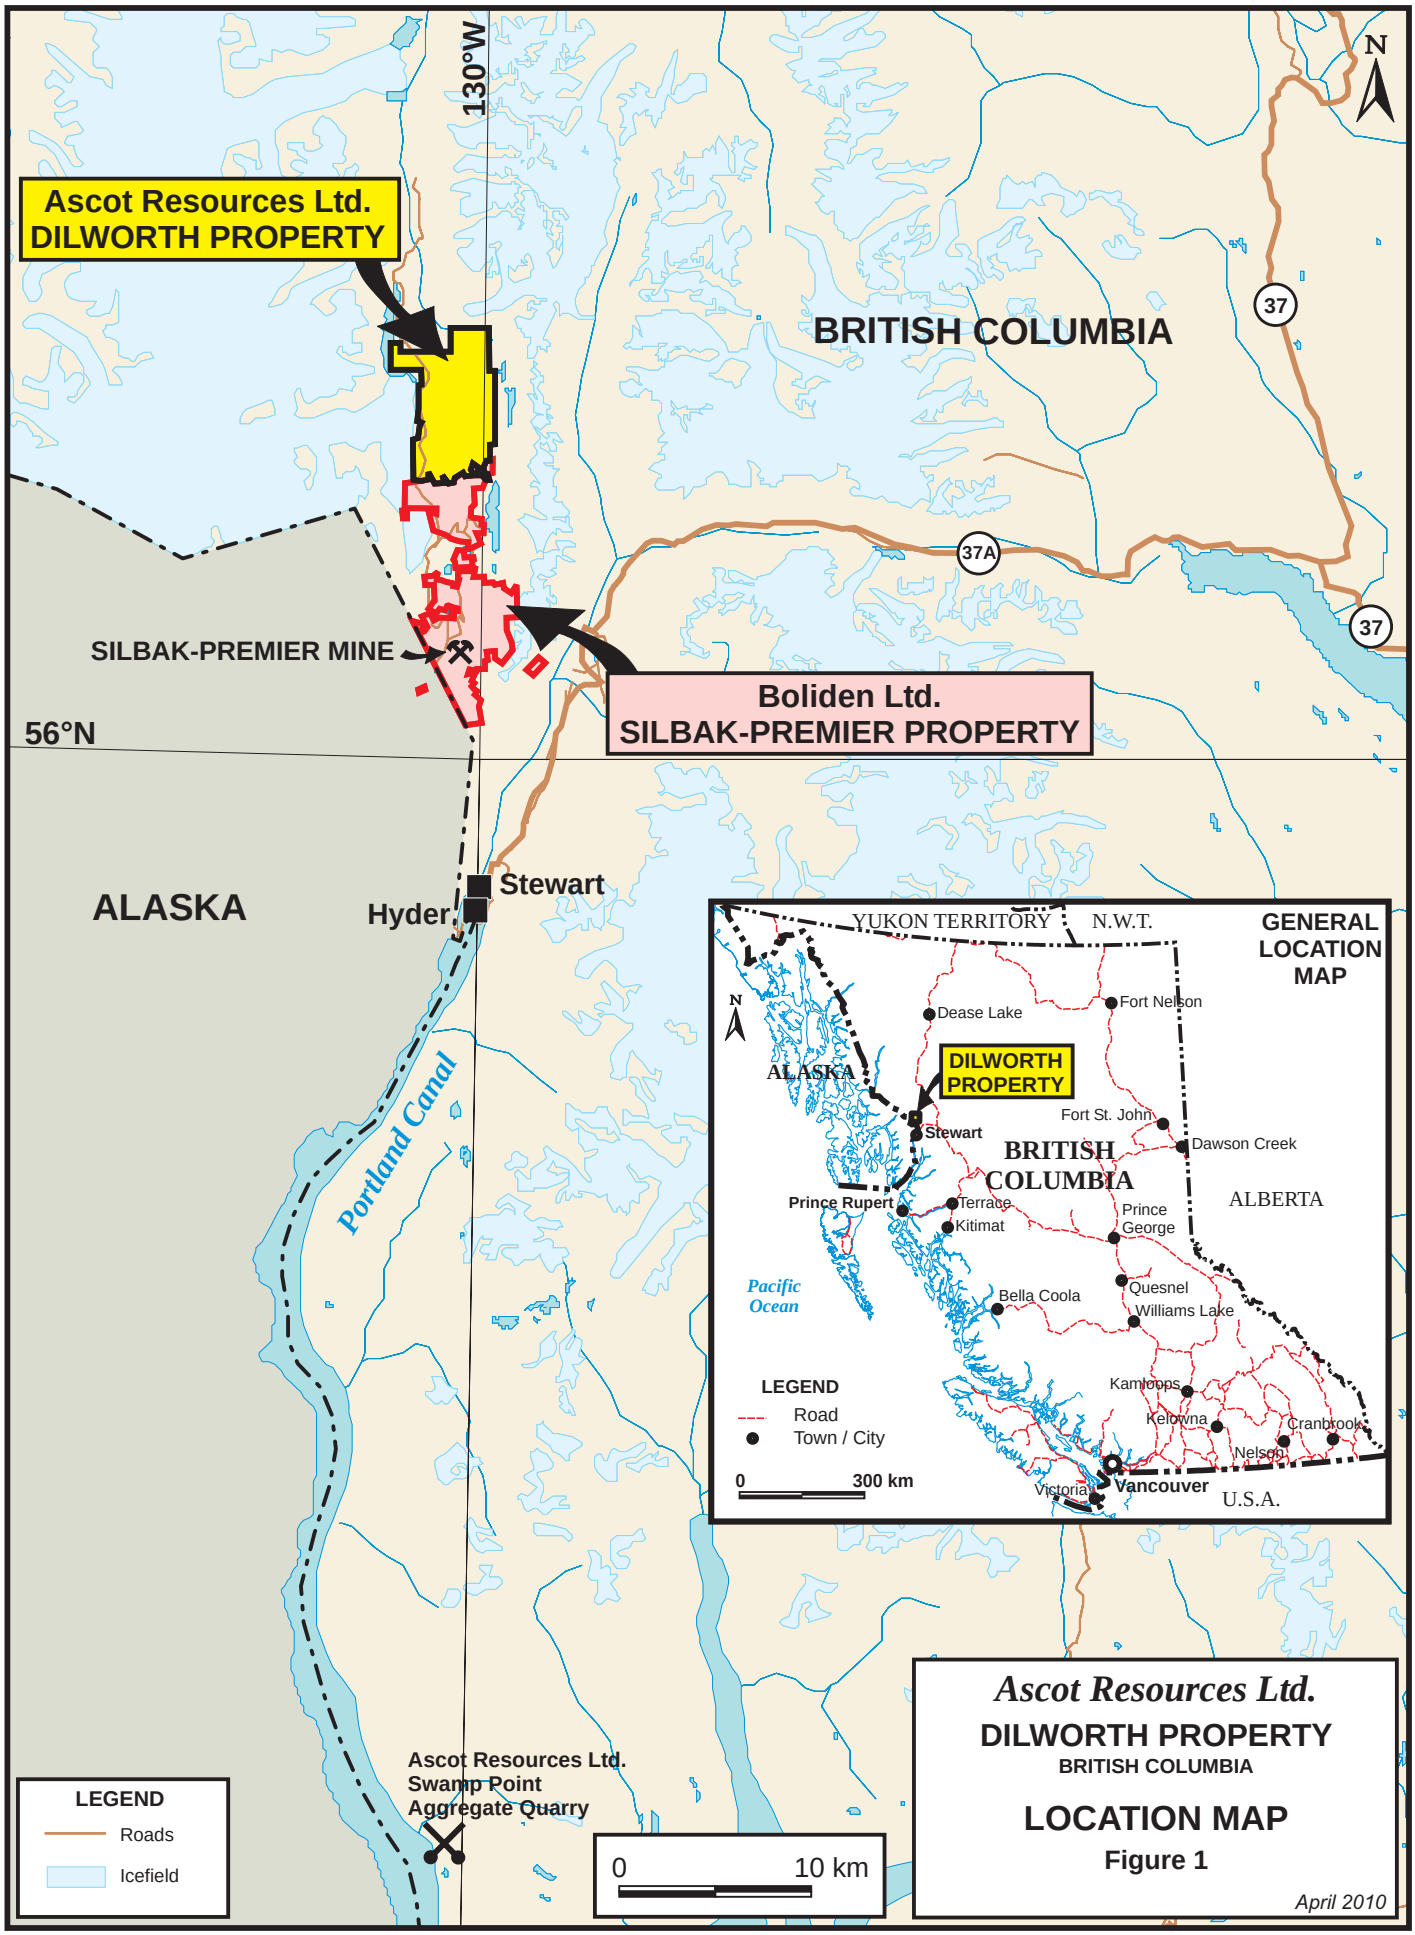

Operations on the property commenced on June 13, 2009 after the completion of an option agreement between Ascot Resources Ltd (Ascot) of Vancouver, BC and Boliden Limited of Boliden, Sweden. Drilling was conducted on the property from Jun 30 to Oct 16, 2009 with the completion of the field component on Oct 21, 2009. The final samples were shipped to Assayers Canada, the assay lab for the duration of the project. The program consisted of diamond drilling, chip and prospecting samples with much of the chip sampling on pre-existing trenches. The program included 7465.3m of BQ diamond drill core, 4629 core samples and 792 trench and grab samples. Field operations ceased on Oct 21, 2009. The program was designed to confirm the results of previous operators and to better understand the distribution of gold around the property.

2.0 LOCATION AND ACCESS

The Property is located along the eastern margin of the Coast Mountains, in northwestern British Columbia near the town of Stewart, BC. Stewart, and nearby Hyder, Alaska are situated at the head of the Portland Canal, a 115 km long fjord that marks the boundary between the Alaskan Panhandle and northwestern British Columbia. The south boundary of the property is marked by the Canada-US border. The town of Stewart provides many services including fuel, groceries, lodging, helicopter, a reliable work force, and also includes a deep-sea port with loading facilities. Currently there is no power to the Premier Mine due to a blown transformer near the mill although the lines and infrastructure are intact.

The Silbak-Premier Mine is situated at the southern end of the property, 13 km north of Stewart, with the property stretching an additional 13 km to the north. Mount Dilworth at 1660+m is the highest point in the area, located near the northern edge of the property, and 25 km from Stewart. Coordinates for the Silbak-Premier area are Latitude 56 4'N, Longitude 130 1'W, and for the Big Missouri area are 56 7'N, 130 1'W. The area is covered by BCGS mapsheets 104B.010/020 and 104A.001/011.

The Granduc Road provides easy access to the southern portion of the property where Boliden Ltd maintains a small maintenance camp. The Granduc Road continues up the western edge of

the property. The Premier Mine, Big Missouri and Granduc (also known as the Canada Wide) Roads provide access through the central portion of the property, with old roads and quad trails providing additional access to almost every other part of the property. The Big Missouri Road slowly gains elevation as it heads north, following Cascade Creek, and ends at the Province Zone along Big Missouri Ridge at 1060m.

A washout on the Granduc Road below the Premier Mine near the end of July necessitated use of a helicopter to supply material to the drill sites. Prism Helicopters maintains a summer base in Stewart, and was used throughout the program for drill moves and to supply equipment to the drill.

3.0 PHYSIOGRAPHY AND VEGETATION

The Property encompasses a wide variation in elevation and vegetation types. The lower parts of the property are to the west at the Salmon Glacier and Salmon River where elevations extend below 200m. The south flowing Cascade Creek, which bisects almost the entire length of the property and whose valley creates a large, elongate bowl, joins the Salmon River just after the Creek crosses the Canada-US border. Bear Ridge is a large elongate ridge to the east of the property and marks the height of land in the area, and Mount Dilworth to the north of the Property creates a prominent topographic feature. The terrain is variable from gently rolling and undulating to more rugged with local steep areas including cliffs and deep gullies.

The lower elevations contain stands of Hemlock with thick low brush. Upper elevations contain a carpet of heather but are mostly barren of trees and other shrubs, exposed outcrop is scattered through the area. Small lakes and ponds dot the area with the water supplied by melting snow that locally lasts into August.

4.0 CLAIM INFORMATION

The PGP, comprising the Silbak-Premier and the Big Missouri Properties are comprised of 37 mineral tenures, 3 mining leases and 170 crown granted mineral claims covering a gross area of 7442.63 ha. All claims are owned by Boliden Ltd and lie within the Skeena Mining Division. The location of the property and mineral claims are shown in Figures 1 to 2. The details of the mineral claims that comprise the PGP are listed in Table 1 and 2, and summarized in Table 3.

Ascot Resources Ltd acquired its interest in the property from Boliden Limited under the terms of an option agreement dated June 12, 2009 (Execution date), granting Ascot Resources Ltd. of Vancouver, BC the non-exclusive right and option to conduct exploration and development on the property subject to additional terms listed in the agreement. Upon signing of the agreement, Ascot is required to make payment to Boliden Ltd in the amount of $100,000, within 10 days of the signing of the option deal and prior to every anniversary of the execution date while the option remains in force, and a final payment of $20,000,000 on or before the Closing date of October 1, 2012. The conditions to exercise the option are the completion of money transfers as listed above, plus Ascot must exercise its option to purchase the mineral claims of the Dilworth Property under the 2007 option agreement. Upon completion of the option Boliden Ltd retains a 1% NSR and the first right to purchase any 'base-metal concentrate(s) produced from the Property or from ore extracted therefrom.'

5.0 HISTORY

The Premier Gold Property is part of the Stewart mining camp, an area that has experienced over 100 years of exploration and is ranked as one of the best gold producing areas in British Columbia. The first report of activity in the area was a survey by the United States Army Core of Engineers in 1896. Prospectors first arrived in the area in 1898 when a group trekked inland from the head of the Portland Canal to Meziadin Lake in search of placer gold. Their search failed, and with prospectors passing through the area from the Klondike, started the influx of settlement into the area. The post office was established in 1905 by two brothers, John and Robert Stewart who had great visions for a prosperous mining town, the townsite of Stewart was incorporated in 1907. By 1910, the population of Stewart had almost reached 2000, but with much speculation by the end of the year Stewart experienced a population high with over 10,000 people. However the population dropped rapidly to less than two dozen people during the First World War, and during the winter of 1917/1918 only three people remained in the town. The population has continually varied.

The oldest claim in the area, the Big Missouri deposit located 8km north of Premier, was staked in 1904 and from 1927 to 1942 produced 847,612 tons of ore using underground mining methods. Today the Big Missouri deposit includes the Golden Grown, Province, S1, Dago, Unicorn, Rambler, Martha Ellen, Northstar and Creek Zones. Dago and the S1 were mined with open pit mining methods by Westmin Resources Ltd, the operators prior to Boliden Ltd. Plans have been proposed for the development of the Province, Northstar and Martha Ellen zones but with the exception of a small pit at the Province, little work has been completed.

The Indian Mine was located in 1910 on Indian Ridge, 5 km north of Premier. Most of the ore was produced in 1952 and transported by a two mile aerial tramline to be concentrated at the Premier Mill. The Indian Mine closed in 1953 due to low metal prices.

The largest producer from the property, the Silbak-Premier Mine first discovered in 1910 by Charles Bunting and William Dilworth, produced 7.3 million tons of gold-silver-lead-zinc-copper ore almost continuously from 1918 to 1968, with minor amounts from 1976 to 1979, and again from 1989 to 1996. Original production was from underground mining methods. Westmin Resources Ltd (formerly Western Mines Ltd) acquired the Big Missouri property in 1978 from Tournigan Mines Ltd and then the Silbak-Premier property in 1982. The consolidation of the Premier Mining Camp was a major advance in the history of the PGP and helped allow Westmin to bring the Premier Mill to operation in 1989. Westmin acquired a 100% interest in Premier and Big Missouri plus partial interest in the Indian and Silver Butte mines.

Westmin Resources Ltd. conducted extensive exploration from 1979 to 1996 on the combined Big Missouri and Silbak-Premier properties. From 1988 to 1989 a new 2000 ton per day mill facility was constructed and was in production from 1989 to Dec 1996 when the mill permanently closed due to low metal prices. In addition to the Premier Pit, the S1 and Dago zones were also mined using open pit mining methods. The Property has been under care and maintenance since closure in 1996.

From 1989 to 1996 Premier Gold produced 3,039,680 tons grading 0.085 oz./t gold and 1.67 oz/t silver. At the time of the mill closure in 1996, the property contained 350,140 tonnes of ore grading 7.19 g/t gold, 37.7 g/t silver and 1.6% zinc. See Minfile 104B 054 for a detailed production report for the Silbak-Premier Mine. Table 4 (below) contains a non-NI 43-101 compliant summary of reserves for the Premier Gold Property.

Table 4, Premier Gold Reserves (summarized from Table 1-1 Premier Gold - Fact Sheet, Westmin Resources Internal Memorandum, 1997).

Premier Gold Mine	Tons	Au (oz/ton)	Ag (oz/ton)
Published Reserve after 1996 Drilling Program			
Proven and Probable	313,916	0.257	1.345

Undrilled Premier Resource (1995)	858,100	0.231	NC
Total Reserves and Resources	2,835,952	0.129	-
Production			
1918-1987	5,599,029	0.331	7.117
1988-1996	3,039,680	0.085	1.670
Total	8,638,709		

* The 1996 Westmin Resource for Premier Gold included a 50% interest in the Kansas Zone that is not included in this table. This is reflected in the tons but gold grades have not been adjusted.

NC - not calculated

Note: calculations are historic in nature and do not conform to current NI 43-101 regulations. Results have not been verified.

6.0 GEOLOGICAL SETTING

6.1 Regional Geology (largely from Ray, 2008, after Alldrick, 1993)

The Stewart Mining camp is situated on the east side of the Coast Plutonic Complex within Stikinia, an accreted early Jurassic island-arc complex. Further to the east and outside the property area, post-accretionary sedimentary rocks of the Bowser Lake Group uncomformably overlie the volcanic sequences of Stikinia. Stikinia is comprised of the Stuhini/Takla Group and the Hazelton Group which together make up the Stikine assemblage (Monger, 1977). The Stuhini/Takla Group is a Late Triassic volcanic and sedimentary rock sequence of Carnian to Norian age that encircle the Bowser Basin. The Stuhini Group comprises pyroxene-porphyritic basalts to basaltic andesites, bladed feldspar porphyry volcaniclastic rocks and derived sedimentary rocks. The Takla Group consists of pyroxene and pyroxene-feldspar-porphyritic flows grading laterally to distal sedimentary facies, overlain by feldspar-porphyritic volcanic rocks with proximal volcaniclastic sedimentary facies.

The volcanic sequences of the Hazelton Group are comprised largely of a thick succession of andesites with minor interbeds of siltstone. The andesites typically lack bedding structures which created confusion amoung geologists as to orientations and facing directions.

The Post-Hazelton Bowser Lake Group comprises a thick sequence of Middle Jurassic to Upper Jurassic sedimentary and rare volcanic rocks. The type area lies northeast of the study area. Chert-pebble conglomerates are diagnostic of the base of the group and these are overlain by shale, siltstone and intraformational conglomerates.

6.2 Property Geology

6.2.1 Volcanic Sequence

The Stewart Mining Camp is dominated by a package of sedimentary, volcanic and tuffaceous rocks of the early Jurassic Hazelton Group. These rocks consisting of calcalkaline basalt to rhyolite and derived volcaniclastic sedimentary rocks, are the main host to mineralization in the area. The Hazelton Group has been separated into the following formations and members, listed in Table 5 below (after Alldrick, 1993):

Table 5. Stratigraphy of the Hazelton Group:

Salmon River Formation:
- Middle to Upper Jurassic
- thick sequence of complexly folded, colour-banded tuffaceous siltstone and lithic wackes (siltstones, mudstones and limestones)
- Base marked by rhyolite, chert, and carbonate lenses

Mount Dilworth Formation:
- Tuffs and ignimbrites

Betty Creek Formation:
- Middle Toarcian to Middle Bajocian
- Volcanic and sedimentary members
- bright red and green volcaniclastic sedimentary rocks with intercalated andesitic volcanic flows, pillow lavas, chert and carbonate lenses

Unuk River Formation:
- predominantly andesitic sequence of lava flows, pyroclastic rocks and

epiclastic and clastic sedimentary rocks
- Members:
    - Premier Porphyry
    - Upper Andesite
    - Upper Siltstone
    - Middle Andesite
    - Lower Siltstone
    - Lower Andesite

6.2.2 Intrusive Units

Two suites of intrusive units occur in the area. The Lower Jurassic Premier Porphyry and the Eocene Portland Canal dyke swarms.

The Texas Creek Plutonic suite in the Stewart area coincides with a period of increased igneous activity in the Canadian Cordillera and is interpreted as coeval subvolcanic magma chambers to Early Jurassic island-arc volcanic complexes. Within Stikinia, Early Jurassic plutons are relatively small, and interpreted as the source of Hazelton volcanics. The calc-alkaline Texas Creek suite is represented by batholiths and stocks of distinctive coarse-grained hornblende granodiorite that contain potassium feldspar megacrysts.

The Early Jurassic phase included emplacement of Texas Creek granodiorite suite, which resulted in the Texas Creek Batholith and the Summit Stock. As well as these larger bodies, the Texas Creek phase also produced the Premier Porphyry flows at the top of the Unuk River Formation, as well as dykes, sills and small intrusive bodies that were presumably feeders for the overlying flows/dykes. These minor bodies have been variously termed the "Texas Creek Dykes", "potassium feldspar porphyry", "two-feldspar porphyry" or "Premier Porphyry". This economically important suite appears to be spatially and genetically related to the Zn-Pb-Ag-Au mineralization at both the Silbak Premier Mine and the Silver Coin deposit. In places it is characterized by widely scattered Potassium-Feldspar megacrysts, up to 2cm long, together with plagioclase phenocrysts set in a fine-grained matrix. The unit is most easily identified by the megacrystic feldspars, but different phases of the same unit can be very fine grained with very rare coarse phenocrysts. This can make identification of the unit difficult. This fine grained phase of the unit is seen just north of the S1 pit, and along the Big Missouri Ridge in the Unicorn area.

Within Stikinia, small high-level Eocene plutons and dykes mark a period of widespread intrusive activity. Regionally these intrusive phases resulted in large bodies such as the Hyder Batholith and Boundary Stock, which range compositionally from granite to tonalite to granodiorite. This Eocene phase also resulted in a varied suite of dykes that are widespread throughout the mining camp, although two notable dyke swarms are recognized. The Mount Welker (also referred to as Hyder) swarm is SE-NW trending and lies approximately 9km south of Ascots property. Further north part of the E-W to ESE striking Portland Canal dyke swarm lies along the southern boundary of Ascot's adjacent Dilworth Property from where it passes westwards across the Salmon River Valley. Compositionally, this multiphase swarm includes rocks of the dacite-granodiorite, latite, andesite, lamprophyre and quartz porphyry rhyolite composition, many of which are seen on Ascot's property.

6.3 Lithology

To be consistent with previous work, Ascot geologists adopted the four-character Geolog rock codes established by Westmin Resources Ltd. which are included in the drill logs, see Appendix B. An earlier number-letter code is also included although the number sequence does not represent the order of the rock sequence. Codes are used below after the equivalent rock term in the format (Westmin lithology-Westmin Geolog code) and are also included in the drill logs.

The mudstone unit encountered along the Granduc Road may represent the Lower Siltstone Member of the sequence with the majority of the drilling in the Middle or Upper Andesite Member of the Unuk River Formation. Premier Porphyry was intruded into the Andesites at the top of the sequence. Contacts in the Unuk River Formation are gradational and the top of the Unuk River Formation is located just to the east of Unicorn-S1. Further east is a thin sliver of the Betty Creek Formation although this unit was not encountered in drilling. Continuing east and up-section are rhyolite-latites of the Mount Dilworth Formation (3-R3XX), and the middle to upper Jurassic sedimentary rocks of the Salmon River Formation (2-R2XX), in faulted contact with the Bowser Lake Group (11-BAXX). The Silver Tip showings and workings are located near the contact of the Bowser Lake Group argillites and siltstones with the Hazelton Group volcaniclastics. See also Figure 3 and Table 5.

Andesitic rocks vary in texture and alteration, but are the most common rocktype encountered during drilling. The typical form are medium to dark green, fine grained unaltered (9a-AXXX) to weakly porphyritic (9fp-AFPX) although these appear bleached where hydrothermally altered. Other varieties include andesitic flows (9f-AFXX), tuffs (9t-ATXX), and lapilli tuffs (9Lt-ALXX). Siliceous altered varieties were interpreted as chert tuffs (9c-CXXX) or siliceous breccias (9cx-CBXX) although the silicification is now interpreted as a secondary process. This is a large sequence which generally lacks bedding so it is difficult to know exactly where these are in the stratigraphy.

The common intrusive rocks that cut the andesites are termed Premier Porphyry (7-PIXX) and are considered to be the source for mineralizing fluids. These are of dacitic composition but include a variety of subtypes. Premier Porphyry is pale to medium greenish in colour with a fine grained matrix, potassium feldspar phenocrysts are often euhedral in outline and up to 2cm across with smaller rounded plagioclase phenocryst scattered through the matrix. Another variety of poorly-recognized Premier Porphyry observed in the Big Missouri area has a darker grey coloured groundmass and plagioclase phenocrysts up to 0.5cm across. The most common types contain phenocrysts of feldspar and hornblende (7a-PIPX) but other varieties are mineralized vein (7v-VMXX), and siliceous breccia (7s-QBXX). Some large bodies of Premier Porphyry have been recognized, but smaller dykes and sills with a fine grained matrix (7-PIXX) and feldspar phenocrysts varying from 1-2mm up to over 3cm may also represent part of this intrusive suite.

The main focus for exploration has been quartz breccias and quartz vein breccias (7s-QBXX). These units represent silica flooding, silicification and quartz stockwork and although originally interpreted as a sedimentary horizon of cherty tuff, they are now considered to be a secondary process of quartz alteration of andesites. While the interpretation has changed this does not lessen the significance of this unit. Instead of being discrete horizons, the quartz breccias may be discontinuous and have no preferred orientation adding additional complications for exploration.

Later stage intrusives are found north of Martha Ellen including swarms of Eocene Portland Canal Dykes (21-D/XX), and Tertiary Andesite and Diorite Dykes (22-D/AX). Another set of swarms related to the Portland Canal Dykes, termed the Hyder Dykes, are observed south of the Silbak-Premier Mine. The Portland Canal and Hyder Dykes have a composition varying from latite to dacite, are commonly leucocratic and aphanitic to very fine grained. The Andesite Dykes (22-D/AX) are massive and generally uniform with a medium to dark green groundmass.

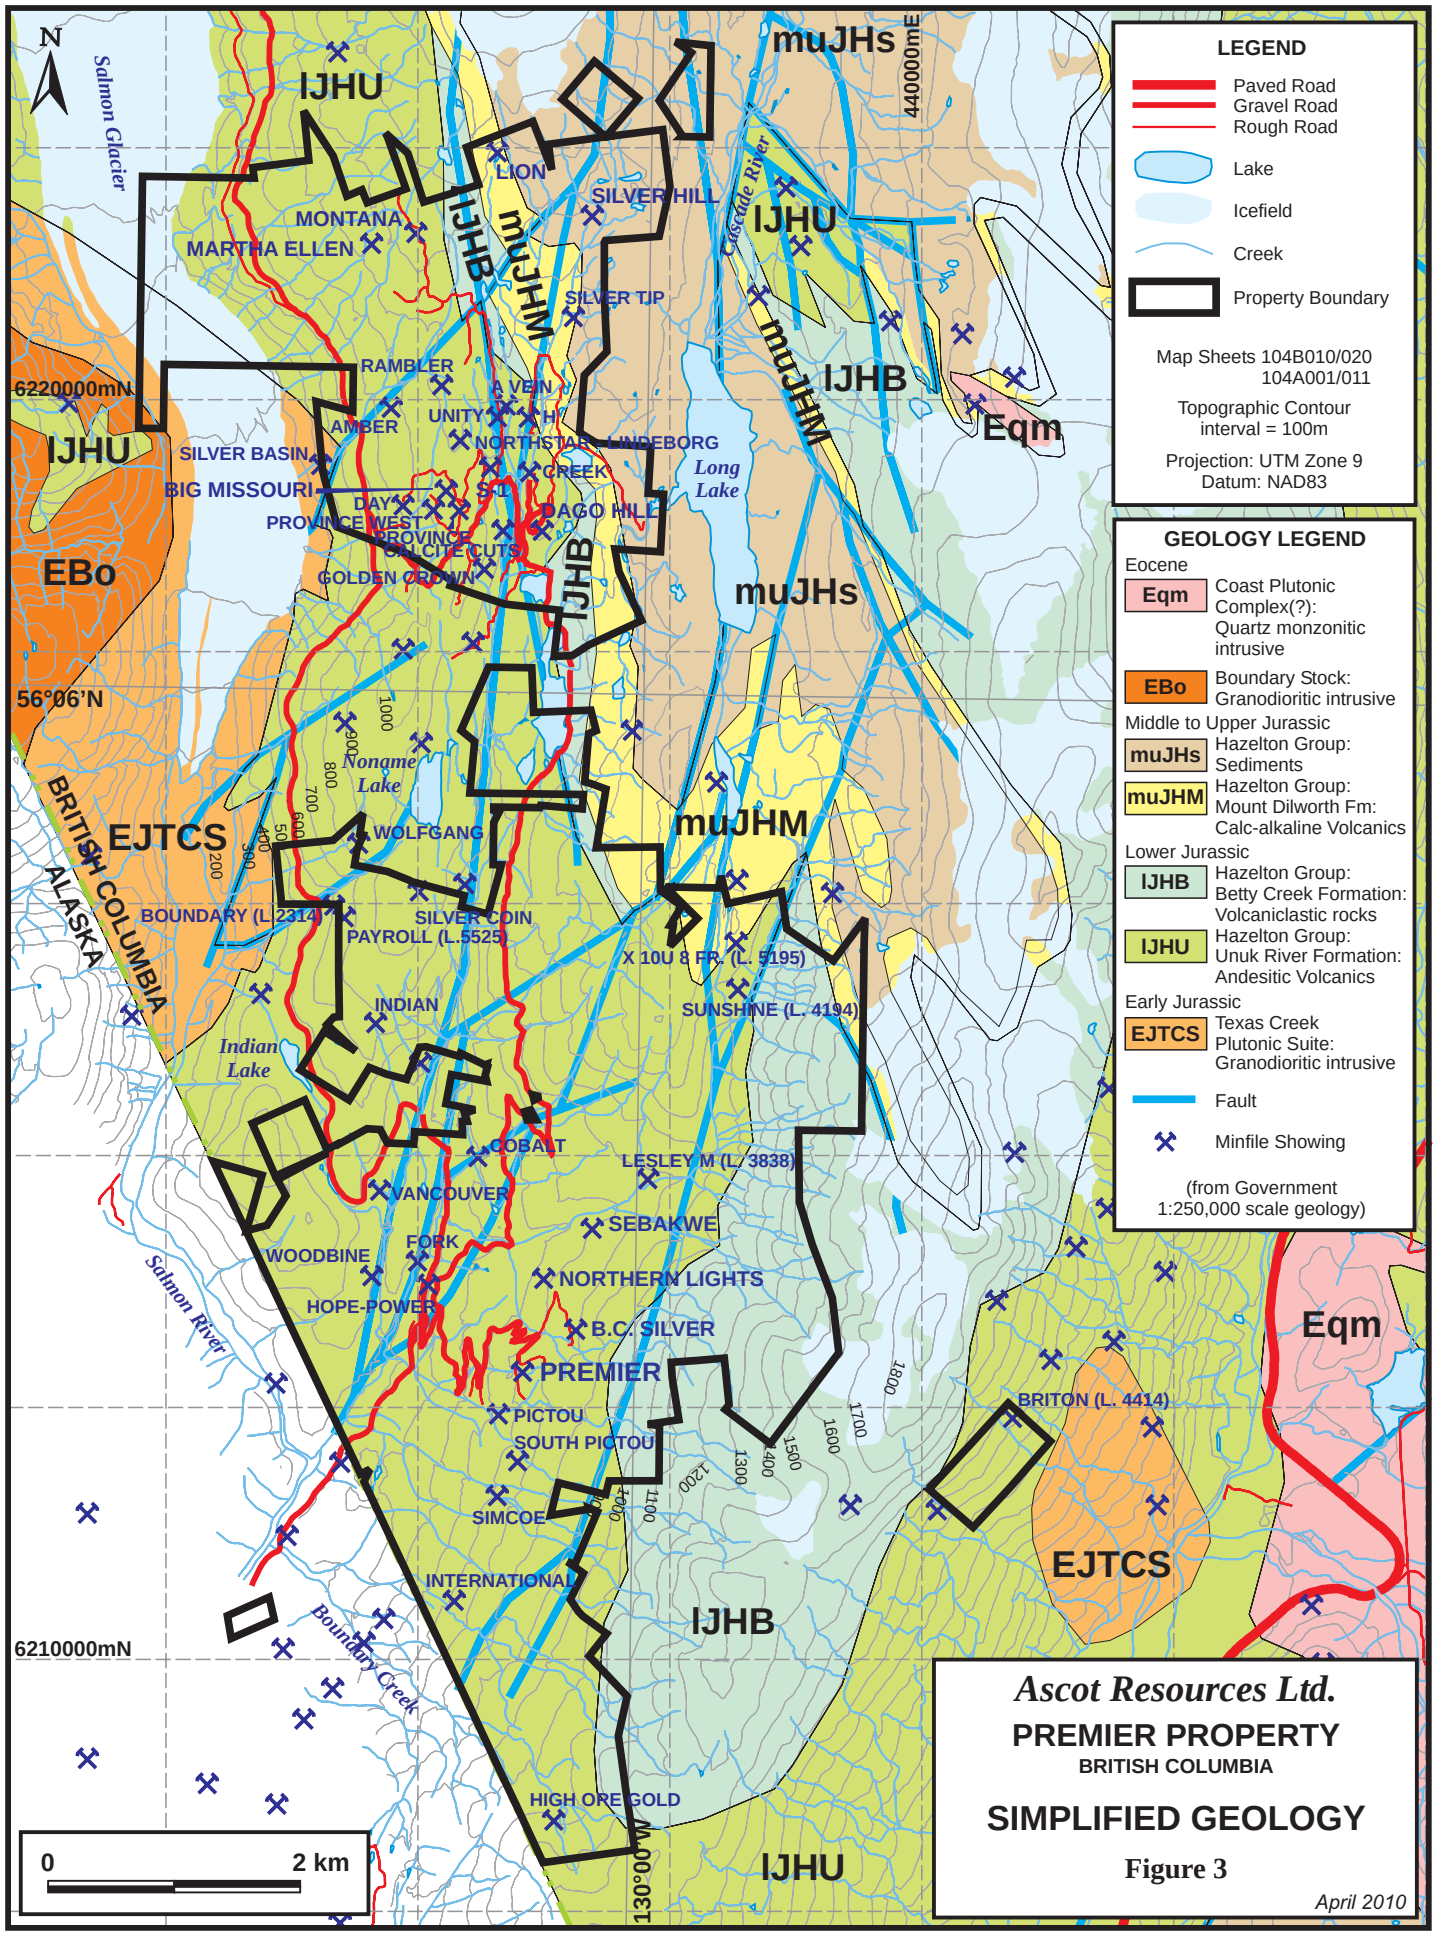

6.4 Alteration and Mineralization

Various styles of alteration are recognized with local quartz veining and stockwork being very prominent at the surface. Other types typically recognized include pervasive silicification, quartz veins, stockwork and stringer zones, pervasive sericitization, and calcite veining and replacement. Pyrite mineralization appears related to quartz veins and zones of intense silicification with base metals observed as sulphides of sphalerite and galena. Silver is often present in small amounts. Gold and silver have low background levels throughout the system as can be seen in the assay results. The economic zones at Silbak-Premier are large quartz veins/silicification. Large quartz veins so far have not been identified at Big Missouri, exploration is targeting areas of strong quartz stockwork, chalcedony and sulphide mineralization especially base metals.

6.5 Structure

The property is largely comprised of a thick package of homogeneous andesitic tuffs and flows which lack reliable bedding or layering. This created confusion among early geologist as the true orientation and facing direction of the various units were unknown. Regional mapping by Alldrick (1993) and others indicate that the entire Hazelton Group package between the Salmon valley and Mount Dilworth was a north to NW striking steeply east dipping succession that younged to the east. Thus the Unuk River Formation is believed to be the oldest Hazelton Group rocks in the area, being overlain in turn to the east by the Betty Creek, Mount Dilworth and Salmon River Formations (see Table 5). These rocks on the east side of the Salmon Glacier occupy the west limb of a large synformal fold whose steeply inclined NNW trending axis passes beneath the Mount Dilworth icefield. This large F1 structure belonged to a phase of regional-scale folding that resulted in large open folds in the volcanics and tight to isoclinal structures in the less competent sedimentary rocks (Alldrick, 1993). It was for the most part accompanied by greenschist facies metamorphism.

Later multiphase extension led to sets of E-W to SE trending fractures that were subsequently filled by various dyke phases, including the Mount Welker (Hyder) and Portland Canal Dyke swarms. This pre-and syn-Eocene extension was presumably related to movement along deep structures in the basement beneath the younger Hazelton Group cover rocks.

7.0 SURFACE SAMPLING

The surface sampling program ran concurrently with the drilling program and consisted of 786 1 meter chip samples, and 26 grab samples. Analytical data for these samples is presented in Appendix E, and analytical procedures are presented in Appendix F along with assay certificates. Table 6 summarizes the more significant chip samples, and Table 7 summarizes the grab samples, shown below. Trench and chip samples do not represent true thicknesses. Microsoft Excel was used to record and summarize all data. A more detailed description of results for the various zones is included with the discussion on drilling results in Section 8.0 Drilling. Chip and grab sample locations are shown on Figures 4a and 4b.

Table 6. Significant Chip Sample Intersections (not true width):

Area	Sample	Width (m)	Au (g/t)	Ag (g/t)

8.0 DRILLING

The exploration program began on June 13 with drilling commencing on Jun 30/09 and continuing until Oct 16/09. Final crew shift was Oct 21 when the last shipment of samples was sent to Assays Canada Ltd in Vancouver. Crews stayed in Stewart where most personnel lived and a warehouse was used for gear storage and core logging. The town also provided fuel, food and lodging facilities for the non-resident crews. The field site (Premier Mill area) is a 30 minute drive up the Granduc Road with the furthest road access point at the S1 pit at the end of the Big Missouri road, about 1 hour from Stewart. Additional areas were accessed by quad or helicopter. At the end of operations 7465.30m of BQ diamond drill had been drilled. Drill hole locations and traces are shown on Figures 4a and 4b, cross-sections with geology and assay results are shown on Figures 5-36. Table 8 is a summary of drill hole information, and Table 9 is a summary of the significant drill intersections.

Ascot Resources Ltd purchased its own diamond drill that was used for the duration of the summer program. The drill rig was operated by company drillers, who also lived in Stewart. Prism Helicopters of Stewart used an MD500 (Hughes 500) helicopter to move the drill and material about the property. Ascot personnel constructed 16 x 16 foot wooden pads for the drill, which was moved by Prism Helicopters but access to the site for crew changes could be done with trucks or quads.

Drill core was transported to a secure warehouse in Stewart where the core was logged geotechnically (RQD) and geologically. Geotechnical logging included conversion of blocks to metres and the recording of core recovery, RQD length (>10cm), fracture count and photographing all core in groups of three boxes once the geologist had completed logging. For core logging, blanks, standards and duplicates were randomly inserted into the sample sequence roughly every 20th sample and sample tags were placed at the beginning of every sample interval. A hydraulic core splitter was used to split samples and the split sample was placed in clear poly ore bags with the sample tag and sealed with a zap-strap. Sealed samples were placed in woven poly rice bags and shipped to the assay lab in Vancouver, BC by commercial freight carrier. The remaining piece of core was placed back in the wooden core box and transported to the Premier Mill site at the end of the program for permanent storage. Microsoft Excel was used to record all data including drill logs.

8.1 3RD Zone/Premier Pit

Due to snow conditions at the higher elevations, the 2009 program was started in the Premier Pit where existing permits allowed early access. Eleven holes (P09-001 to 011) were drilled from five pads constructed along the access ramp at the bottom of the Premier Pit. Targets were designed to confirm the previous results of Westmin Resources, and to test for the possible extension of additional resources below the existing pit. Most drill holes were oriented at an azimuth of 045, perpendicular to long axis of the pit. Figures 5 to 9 show the drill results in cross-sections.

Sulphide mineralization consists of fine grained pyrite with occasional sphalerite/galena hosted in a quartz-vein breccia. Host rocks are andesites with Premier Porphyry (feldspar porphyry) in close proximity. Except for P09-005, all holes encountered gold-bearing quartz veins with individual results varying from 1.46g/t over 2.0m in P09-006, to 18.28g/t over 7.70m in P09-002 (see Table 9 for additional results). Results show continuity of the vein system both in length and grade.

Drill holes P09-001 to 002 on Figure 05 encountered a 4m wide sub-vertical quartz, breccia silicified zone approximately 40m below the ground surface (bottom of Premier Pit). The zone contains strong silica alteration with up to 15% pyrite and fine grained to clots of variable sphalerite, galena, and chalcopyrite. This zone is also observed to the east in drill holes P09-

003 and 004 (Figure 06) although with a smaller zone and lower grades. Drill hole P09-005 (Figure 06) was drilled opposite to the rest of the holes (azimuth = 225°) and was targeting quartz veining on the pit wall observed behind the drill. The hole encountered 1.42g/t over 1.0m, otherwise the hole was unproductive. Drill hole P09-006 (Figure 07) was drilled to the southwest, parallel to the length of the pit. Similar to 005, this hole was targeting quartz veining in the pit wall and was unproductive.

Drill holes P09-007 to 009 (Figure 8) and P09-010 to 011 (Figure 09) were step-outs to the west from the initial holes. All holes were successful, with P09-007 to 009 encountering a high-grade zone including 45.49g/t over 1.0m in P09-007, and with P09-010 to 011 encountering a wide but lower grade zone of 2.34g/t over 16.35m. Further exploration of this area is recommended after a careful review of all previous Westmin results.

8.2 Hope-Power Zone

The Hope-Power Zone is located adjacent to the former Westmin Maintenance Shops near the junction of the Premier Mine Road with the Granduc Road. Surface sampling yielded good results including the re-sampling of an old trench on the Hope Zone (see Table 6). Drill holes 012 to 014, and 018 to 019 targeted the Power Zone, while holes 015 to 017 targeted the Hope Zone, all located within the same area. Figures 10 to 12 summarize the drill holes in cross-section.

Holes 012 to 014 yielded good results with one intersection in P09-013 of 7.68g/t over 3.0m; this demonstrates the continuity of the flat-lying Power Zone vein over 60m. Drill hole P09-013 also identified minor silicification and mineralization below the Premier Porphyry body that opens up the lower contact to additional exploration. In the past, only the upper contact had been explored. Drill holes P09-012 and 014 also yielded short intersections of mineralization although the intensity of sulphides and silicification were lower with corresponding lower gold grades. Results in drill holes P09-015 to 017 were low with the best intersection in P09-015 (1.65g/t Au over 0.79m). Drill holes 016 and 017 encountered silicification but the length and grades were low. Holes 018 and 019 yielded no significant results, and assay values were often below detection limits. It may be that some of the drill holes were planned with too large of a step-out from known occurrences; tighter spacing and close control on targets may be necessary to further define the zones. The main Hope Zone samples on the Granduc Road cut, is likely cut off at depth by a shallow lying shear zone. This theory was illustrated by Westmin Resources and Ascot's drilling appears to support the model.

8.3 Loui's Showing

Situated in a road-cut along the Big Missouri Road, just beyond the crusher, a strong sulphide-bearing vein was found in outcrop. An excavator was used to expose the vein which was visible for over 10m along the edge of the road. Orientation of the vein was variable but appeared to be dipping gently to the east into the hillside. Surface sampling results were excellent with the best 1m chip sample yielding 16.44g/t Au, 647.9g/t Ag, 0.18% Cu, 24.00% Pb, and 0.98% Zn. Other samples also had good results and showed the vein extending for at least 10m in outcrop.

One drill hole (P09-020, see Figure 13) was done from a setup along the road just above the showing but did not yield any significant results. It was later proposed that the vein may be flat lying, and after drilling through thick overburden and road fill the rest of the hole was already

below the mineralization. Fabrics in the rock indicate a variable orientation although there is a predominant flat lying occurrence. Rocktypes encountered in core were a mix of feldspar porphyry and andesite. Several locations in the hillside above the showing have been found and may be used in subsequent programs for drill setups.

8.4 S1 Pit

Drill holes P09-021 to P09-023 in the S1 pit were proposed to follow-up excellent chip sampling results along the north wall of the pit. Previous work by Westmin indicated a flat-lying system and with encouraging results from chip sampling there is potential for expansion along the north wall. Three holes were proposed from one pad to confirm the results and to provide a better orientation of the mineralization. The S1 system appears to be part of several parallel north-northwesterly trending mineralized zones including the Unicorn, Northstar, Rambler and Province. These zones are all part of the larger Missouri Ridge topographic feature, see Figure 4a. Altered andesite observed at the surface contains variable pyrite to 5% with abundant chalcedonic quartz.

The majority of the rock encountered in drill core was poorly altered andesite, with rare Feldspar Porphyry. While there were occasional results >0.50g/t, generally most assay results were low, <0.20g/t. However one intersection in P09-022 yielded significant results. At 45.18m is a thin veinlet of visible gold hosted within a 1-3mm thick quartz vein, a weighted average yielded 15.25g/t over 3.0m. Results indicate this to be a flat lying veinlet although similar to the Westmin interpretation, fabrics (foliation/jointing) on the east side of the pit appear to roll upwards as the flat lying fabrics in the middle of the pit become moderately westerly dipping along the east wall. This may be due to the proximity of a large fault that has been mapped along the east of the pit and coincides with Cascade Creek.

8.5 Northstar Zone

A series of four holes (P09-023 to 027, Figures 16 to 19) were done in a north-south line along the axis of the Big Missouri ridge, all drilled to the east. One additional drill hole (P09-028, Figure 20) was done from the most southerly site, drilling to the west to target surface mineralization. The Northstar holes, in addition to the Province, Unicorn and Rambler were planned as a widely spaces fence to test the continuity of mineralization from surface to depth and along a roughly north-south trend following the zones. Old trenches and workings are scattered throughout this area including the Big Missouri underground workings at the southern end of the Big Missouri ridge. Previous drilling was shallow and defined a small open pit that was historically planned to be mined along with the Province Pit, and the Martha Ellen. The 2009 deep holes were designed to tie surface mineralization with shallow deposits and also test for additional mineralization at depth.

Assay results indicate decent gold mineralization including at depth, see Table 9 and Figures 16 to 20. Drill hole P09-024 observed on Figure 16 encountered a small zone of 8.36g/t over 2.85m at 99.0m depth. Rocks in the drill hole are varieties of andesite with the mineralization hosted in a quartz breccia vein. Several more silicified zones were encountered although gold grades were low (<0.36g/t). A small low-grade zone was encountered in P09-025 with 2.20g/t over 2.70m at 70.60m at a silica flooded contact between a Porphyritic Andesite and a more massive Andesite. Another silicified zone occurred at 210.68m although gold grades in this zone were negligible. This hole was shut down prematurely due to poor rock conditions and

nearing the limit of the drill hence the drill hole never reached its intended target. It ended in a breccia zone although the target was to test what was beyond the breccia (fault?) zone. Drill hole P09-026 did not yield any large intersections although there is a large low grade zone, 1.06g/t over 15.00m at 186.0m hosted in an interval of strong silicification along with fine pyrite, and trace sphalerite and galena. There was a silicified zone higher in the hole similar to P09-024 and 025 although there were no reports of sphalerite or galena and the gold values at this depth in P09-026 were low (<0.66g/t). Minor silicification was reported elsewhere although there were no quartz-breccia zones. In drill hole P09-027, several silicified zones with minor base-metal sulphides were encountered that may correlate with zones observed elsewhere in the area. These zones yielded 1.79g/t over 7.18m at 32.82m, 6.45g/t Au over 0.50m at 122.0m, and 5.00g/t over 6.00m at 182.50m.

Drill hole P09-028 was located at the same site as P09-027, the drill rig was turned to an azimuth of 225° to target an old trench near the last drill pad (see Figure 20). This drill hole yielded 2.60g/t over 12.00m at 23.50m down the hole, and18.01g/t over 0.50m at 61.00m down the hole.

All holes yielded encouraging results although either grades or intervals were low. Rocks encountered during drilling were typically some form of andesite and no varieties of Feldspar Porphyry were noted in the logs. Silicification was minor. With variable grades, long distances between holes, and variable depth of occurrence it is difficult to correlate these intersections at this time. It is likely that there are several parallel vein systems along the Big Missouri Ridge. The grades and interval widths warrant additional exploration in this area, especially in relation to the connection between the surrounding zones. Due to the wide drill hole spacing, vein orientation is still uncertain as the models of a shallowly west dipping system or steeply vertical system both fit. The quartz stockwork and quartz breccia zones that host the mineralization are not clearly oriented in the core. Tighter drill spacing will help tie these zones together. This area has great potential and should be explored further.

8.6 Province Zone

The Province Zone is on the southeastern flank of the Big Missouri Ridge above the old Big Missouri underground mine workings. It is part of a line of zones that includes the Northstar, Rambler, and Unicorn. The Province was planned to be mined as a shallow pit by Westmin Resources. It was modeled as a shallow flat lying feature sub-parallel to the Big Missouri workings below. At the time the mineralization in the area was accepted to be stratigraphically controlled and dipping shallowly to the west. All historical holes were short and did not test the area between the Province surface showings, and the Big Missouri deposit below. The 2009 drilling was designed to test this area.

The two holes in the Province zone (P09-029 and 030) were drilled to the east on section with old surface trenches, see Figures 21 and 22 for cross-sections. Trench sampling and prospecting yielded some significant results, including 2.47g/t Au over 11m in a trench (Prem-09-33) near drill hole P09-029. A maximum value of 24.04g/t Au over 1m was from another trench just to the west, and still in line with drill hole P09-029.

Results from hole P09-029 were generally low although there were some excellent results near the base, 50.51g/t Au over 11.00m at 186.90m that included 179.97g/t Au over 3.0m at 192.9m and 499.30g/t over 1.0m from a small strung-out veinlet of gold-bearing quartz. Several silicified zones were encountered from 184.0-206.2m although only the one had any significant results.

The results from drill hole P09-030 were significantly lower with sporadic mineralization over sometimes long lengths, 0.56g/t Au over 30.00m from 218.0-248.0m and one moderate result of 3.30g/t Au over 2.0m at 224.0m. This drill hole ended in a major fault zone. The presence of significant mineralization in the tested area could suggest that mineralization is not stratigraphically controlled, but rather steeply dipping and structurally controlled. The area is prospective for high grades and a deep mineralized zone.

8.7 Martha Ellen-Montana Zone

Previous mapping has defined a large body of Premier Porphyry along a south-facing ridge to the north of the Rambler zone termed Martha Ellen, see Figure 4a. The Martha Ellen Zone is located to the west and the Montana zone to the east of the Premier Porphyry body. Drill holes were designed to test for mineralization at both the east and west sides of the contact between the Porphyry and Hazelton Group Andesites. It was proposed that the Porphyry body may be bowl-shaped and hence there may be mineralization in the andesite below the Porphyry between the Martha Ellen and Montana zones. After drilling the porphyry body appears to be an irregular steeply dipping unit. Mineralization is generally weak gold with hundreds of ppm silver, and is hosted within the porphyry and the volcanics proximal to the contact.

Gold results from Montana were poor although assay results indicated minor silver, 0.35g/t Au and 112.75g/t Ag over 4.0m from 54.0-58.0m in hole P09-034. Drill hole P09-035 had no significant results with most samples below detection limits. Both these holes were drilling under an area of intense quartz stockwork and veining. Some surface trench samples had low gold but elevated silver values, 0.25g/t Au and 129.3g/t Ag over 1m in Prem-09-75, and 0.76g/t Au and 605.6g/t Ag over 1m in Prem-09-76.

Reporting from north to south, the most northerly drill hole, P09-036 (Figure 27), targeted some old surface showings and yielded 14.43g/t Au over 0.64m at 145.75m, and 1.61g/t Au over 0.89m at 179.0m; other results were negligible. Surface sampling from this area yielded some excellent results; see the results from trenches Prem-09-78 to 82 in the table in Figure 4a. Subsurface assay results do not appear to coincide with surface results although the drill hole ended underneath the surface showings and did not test the full extend of the silicified zone. If mineralization is dipping to the west this hole was not long enough to test for the mineralization observed at the surface although the hole depth was getting close to the maximum for the drill. A closer collar location may be more appropriate in this early stage of exploration.

Drill hole P09-031(see Figure 23) along with holes 032 and 033 (Figure 24) were drilled at the southwest corner of the Premier Porphyry and yielded variable results with low grades over short intervals. The maximum value in P09-031 is 1.91g/t Au over 2.0m at 198.0m, and the largest intersection is 0.35g/t Au over 12.0m at 174.0m. The rest of the results were short intersections. P09-032 and 033 were drilled from the same setup, with 032 drilled to the southwest (azimuth = 240°) and 033 drilled vertically. P09-032 had only one hit of any significance, 20.56g/t Au (Fire Assay) and 145.7g/t Ag over 0.34m at 100.39m. Assay results for hole P09-033 were low with only one interval of any significance, 0.89g/t Au over 7.0m from 103.0-110.0m. Although there is often strong quartz veining and stockwork observed at the surface, the silicification in drill core is poor along with poor sulphide mineralization. Minor sporadic pyrite was observed but sphalerite and galena were not noted.

Westmin Resources calculated a small resource for Martha Ellen and the area is still very prospective. Additional drilling and mapping in the area is recommended.

8.8 Silver Tip Zone

Prospecting and chip sampling found a base-metal-bearing sulphide vein along a stream gully above the old Silver Tip underground workings. Chip samples yielded low gold values although elevated silver, lead and zinc were present. Two holes (P09-038 and 039, see Figures 29 and 30) were drilled 30 degrees either side of north to target the thin vein (<1.0m true thickness) which appeared to be dipping to the south. Gold values were low as they were in surface samples although results indicated elevated silver, lead and zinc grades, see analytical results in Appendix D. The only significant results were 3.01g/t Au, >200.0g/t Ag, 2362 ppm Pb, and 4365ppm Zn over 0.40m at 75.90m in P09-038, and 1.27g/t Au, >200.0g/t Ag, 6185g/t Pb, and 4943ppm Zn over 0.50m and 10.01g/t Au over 1.0m at 44.40m in drill hole P09-039. All other results were low. These mineralized intervals correspond to small sulphide-bearing quartz veins hosted in the upper part of Premier Porphyry intrusive units. The significance of the high gold value of 10.01g/t Au is uncertain as the silver and base-metal values are low for this sample, trace galena, chalcopyrite and pyrite were observed. The strong presence of base-metal sulphides may indicate a higher part of the system. Mineralization was hosted in porphyritic and felsic dykes, below the contact with the overlying siltstones (Betty Creek Formation).

8.9 Rambler Zone

Three holes spaced 300m apart in a north-south line were drilled on the west side of the Big Missouri ridge. All holes were drilled to the east and yielded low results. Drill hole P09-037, the most northerly, drilled underneath a surface showing of strong silicification and quartz stockwork and just south of small adit. Several chip/trench samples in the vicinity of P09-037 contained minor gold (max 1.51g/t Au), however silver results were high, max = 6321g/t Ag in trench Prem-09-73. The best result from P09-037 is 2.93g/t Au over 1.21m at 62.79m, which is hosted at the top of an altered andesite adjacent to a Premier Porphyry intrusive; sporadic sphalerite was also noted. The high silver values observed at surface were not seen in the samples from drill core.

Drill holes P09-043 and 044 encountered some long intervals of low grade, 0.57g/t over 15.60m at 121.40m in 043, and 0.87g/t over 32.90m at 214.30m in 044. A higher grade sample was found in P09-043 which encountered 6.65g/t over 1.00m at 234.70m. Rocktypes encountered included varieties of altered andesites and feldspar porphyry with mineralization hosted in quartz breccia.

The three Rambler holes were targeting under the Big Missouri Ridge to test the western limits of mineralization. Mineralized showings and quartz stockwork and flooding are observed throughout the Big Missouri Ridge. All holes were successful as low-grade intersections were encountered in all holes indicating this area is still in the mineralized system, and there is potential for a parallel system to the Northstar and Unicorn mineralization.

8.10 Unicorn Zone

Trenches in the Unicorn Zone yielded negligible results, but several grab samples and some former underground workings indicate the presence of a gold-bearing system. Another fence of east-west drill holes were laid out from north to south to test for mineralization at depth with

assay results from drilling indicating some small high-grade zones plus some potentially larger zones. The holes were spaced roughly 100 meters apart and wide alteration zones were intersected in three of the holes indicating a large system. In P09-042, 10.62g/t over 1.58m was encountered, as well as 1.32g/t over 55.50m in P09-040. Drill hole P09-041 was the furthest to the north and while results were lower than the other two, it still indicates the presence of mineralization. Results include 1.29g/t over 1.0m at 19.0m and 0.73g/t over 0.79m at 219.21m. Host rocks are altered andesites with strong silicification and quartz stockwork. Sulphides are pyrite with minor and variable sphalerite observed within the zones. Drill hole P09-041 may be too far north, or off the trend of mineralization. From P09-040 and 042, mineralization was encountered to the northwest in the Rambler and this is also in line with the Martha Ellen further to the northwest. This trend may indicate the focus for future exploration.

The Big Missouri Ridge including the Province, S1, Northstar, Unicorn, and Rambler Zones is very prospective and should be explored further. Surface sampling yielded good results, (see Tables 6 and 7) and this was supported by diamond drilling. A small high-grade zone in the Province Zone (drill hole P09-029) indicates there is still much potential for this area. The wide spacing does not allow for an investigation of the continuity of the system but this is something that should be investigated further, with tighter spacing of drill holes.

8.11 Golden Crown Zone

The Golden Crown Zone is located above Hog Lake and the former mill site of the Big Missouri Mine. Several old underground workings are situated below the drill site. Surface samples in strongly mineralized rock near the entrances to the adits yielded several low-grade intervals (1.0-2.0g/t Au) over short intervals of up to 2.0m in chip sampling. Drill holes P09-045 and 046, both seen on Figure 34, were drilled easterly. Results include 6.02g/t Au over 1.00m at 17.60m and 1.09g/t Au over 4.0m in P09-045, and 2.76g/t over 6.63m at 127.37m in P09-046. These narrow, low-grade intersections were encountered in both holes and may represent a steep westerly dipping stockwork zones. Rocktypes encountered were varieties of andesites with minor quartz veins/flooding marking the mineralized zones.

8.12 Granduc Mudstones

Rust stained mudstones exposed in outcrop along the Granduc Road became of interest when a prospecting sample yielded 136.70g/t Au, 867.0g/t Ag, 4.87% Pb, and 3.61% Zn (see Table 7), and was followed by chip sampling, which yielded 24.67g/t Au over a 3.0m interval (see Table 6). Sampling was done across mudstones adjacent to the footwall of a felsic dike. Two drill holes, the last of the season, were done to test for mineralization in the subsurface. The best intersection in P09-047 is 0.36g/t Au over 2.0m at 58.0m; other results are poor. P09-048 encountered 1.17g/t Au over 1.0m at 92.0m and several additional 1.0m results around 0.5g/t Au however most results were poor (see Figures 35 and 36). It is uncertain about the stark difference between surface and subsurface results, although this may be due to structural complexities, spotty mineralization along the dyke contact, or a combination of structural controls along the contact. The mudstones are an excellent host for gold mineralization, so this small showing should be followed-up on with mapping, soil and surface sampling, and if warranted possibly more drilling.

9.0 CONCLUSIONS

The 2009 drilling and trenching program at the Premier Gold Property was successful as it confirmed the previous results of Westmin Resources and also indicated additional areas of mineralization. Drilling known reserves, including the Premier Pit, the Hope zone, and the Power zone indicate this area still has the potential to host additional reserves. Limited time was spent drilling the zones proximal to the Premier Area since it is largely understood relative to the outlying areas. A resource is defined for much of the existing underground and nearby area, although, eventually further drilling will be required to expand and define the known resource.

The drill program on the Big Missouri Ridge from Province to Unicorn indicates the potential for a large system with good results through most of the area including some high gold intersections. Gold mineralization occurs in quartz stockwork, healed quartz breccias, quartz veining and silicified andesites. The relationship between gold and the Premier Porphyry in this area is not known as the Premier Porphyry was not always encountered in drill core. Trenching and prospecting on the surface yielded good results and drilling indicates mineralization continues to depth, up to 200m down hole. The presence of wide low grade zones coupled with narrow bonanza zones indicates at least 2, possibly several, mineralizing events. It is likely the different events have utilized the same general structural features. The area is structurally complex, but the possibility that several phases of gold mineralization exist in these structures, should be kept in mind for further exploration.

Westmin Resources had calculated a small resource for the Martha Ellen Zone and this area should be investigated further. There is a large body of Premier Porphyry between Martha Ellen and Montana although only a small area has been investigated in detail. The geometry of the porphyry body is still uncertain and it is possible there are other ore bodies similar to the Martha Ellen at other locations along the porphyry contact. Mineralization in the Premier Mine area is largely within the Porphyry body while the Martha Ellen is hosted in the andesites. The presence of mineralization within the Porphyry and externally in the andesites, increases the exploration possibilities greatly. Alteration and textures observed in the rocks make this entire area prospective.

10.0 RECOMMENDATIONS

Recommendations for ongoing work on the Silbak-Premier/Big Missouri properties include:

1. Comprehensive data compilation of Westmin Resources and other historic data. This would include scanning and data entry of drill logs and assays, trenching results, prospecting, soil sampling, and mapping. All data should be entered in digital format and put into a GIS system for manipulation and interpretation. As additional work is performed, it should be added to the combined database to keep the data current and to allow for better interpretation and limit repetition.

2. Follow-up on significant results from the data compilation. Early-stage exploration techniques such as prospecting, reconnaissance mapping and soil sampling should be conducted in the areas surrounding the Big Missouri ridge.

3. Mapping of target areas, including Martha Ellen/Montana, Dago-Creek, A-Vein (adjacent to Unicorn), Silver Tip, and the Big Missouri Ridge (Province/Northstar/Unicorn/Rambler area).

4. Drilling – follow-up on good results from 2009 program to include:
- determining the structural orientation of units and mineralization
- tighter spacing of drill holes, especially around Northstar, Unicorn and Province zones, to determine extent of zones and mineralization.
- investigate new areas as discovered.

5. Underground mapping where there is access to gain better control on contacts and structural orientations.

6. Prospect and sample below the Granduc Road near Martha Ellen where the claims extend to the west. Prospect the eastern contact of the Hazelton volcanics and into the sediments of the Betty Creek Formation.

7. The main focus should be the Big Missouri Ridge as this area has the greatest potential for a large tonnage deposit. Other areas should be investigated as time permits.

8. No work was done on the adjoining Dilworth Property in 2009, but the promising results from the 2008 exploration program should be followed up on. At the very least the soil grids should be expanded and tightened, and stream sediment samples in the northeast corner of the property should be followed up with prospecting and mapping.

14.0 STATEMENT OF QUALIFICATIONS

For: **Leif T. Bjornson** of 304-1932 West 1st Avenue, Vancouver, BC, V6J 1G6, hereby certify that:

I graduated from Carleton University with a Bachelor of Science Degree (Highest Honours) in Geology and Physical Geography (2000);

I graduated from Carleton University with a Master of Science Degree in Structural Geology (2003);

I have been practicing my profession as a geologist in mineral exploration and mining continuously since 2003;

I am a fellow in good standing with the Geological Association of Canada;

I am a member in good standing with the Society of Economic Geologists;

I am a registered member in good standing as a Professional Geoscientist with the Association of Professional Engineers and Geoscientists of British Columbia;

The observations, conclusions and recommendations contained in the report are based on field examinations, personal surveying and the evaluation of results of the exploration program completed by the operator of the property.

_____

Leif T. Bjornson, M.Sc., P.Geo.

For: **Susan Deane** of 1832 Butte St, Rossland, British Columbia, V0G 1Y0 hereby certify that:

I graduated from the University of British Columbia with a Bachelor of Science Degree in Geology (2000);

I have been working as a geologist, independently consulting or as an employee, for the last 10 years;

I have practiced as a geologist in Alaska, Nunavut, The Northwest Territories and British Columbia for the last 10 years;

I was the project geologist on the 2009 exploration program on the Premier Gold Property;

The observations, conclusions and recommendations contained in the report are based on field examinations, personal surveying and the evaluation of results of the exploration program completed by the operator of the property.

_____

Susan Deane, B.Sc..

APPENDIX A

LIST OF ASSAY CERTIFICATES

List of Assay Certificates:

File Number	Date Of Certificate	Number of Samples	Sample Type	Analytical Procedure
9V-0667-RA	Jun 4, 2009	18	Rock	Au by FA, Ag from ICP Solution
9V-0667-RJ	Jun 4, 2009	18	Rock	Multi-element ICP-AES

0.00	3.66	OVB	CAS	**Casing**																					
3.66	8.43	7a	PIPX	**Porphyry** - Pale to medium green coloured, medium grained with a weak alteration. Moderate quartz veins. Rock is under road, broken up. One piece contains fracture fill galena but overall sulphides are poor.																131681	9.77	11.00	1.23	0.03	5.2
				Lower contact broken																131682	11.00	12.50	1.50	<0.01	2
																				131683	12.50	14.00	1.50	0.07	2.7
8.43	9.77	9a	AXXX	**Andesite** - Dark green coloured, fine grained, and brecciated. Weak porphyritic texture. Strong crackle breccia texture with narrow microfractures surrounding mm-scale clasts.																131684	14.00	15.50	1.50	0.09	3.9
				Lower contact fairly sharp.																131685	15.50	17.00	1.50	0.03	4.7
																				131686	17.00	18.50	1.50	0.01	2
9.77	39.44	7a	PIPX	Porphyry - Pale greenish coloured, medium grained, with a variable crackle breccia texture producing subangular clasts up to 5cm across and sometimes defining a weakly aligned fabric, 45 tca. Strong disseminated to fracture pyrite observed in matrix. Rock is bleached from top of unit then becomes weaker after 24.35m. Rare galena.			1							10						131687	18.50	20.00	1.50	0.01	0.7
				9.77-24.35 - Bleached, quartz-sericite alteration.			2													131688	20.00	21.50	1.50	0.01	0.7
				24.35-39.44 - Weak alteration			1													131689	21.50	23.00	1.50	0.02	1.1
																				131690	23.00	24.35	1.35	0.23	4.9
39.44	55.51	9a	AXXX	**Andesite Volcanic Breccia** - Medium green to black coloured, rounded fragments to 4cm comprising fine grained andesite. Core of fragments are lighter coloured (sericite?) with darker rims. Altered fsp give a prominent porphyrytic texture. Matrix is fine grained with the appearance of small shear bands 45 tca. Several small mafic dykes. Small veinlets of pyrrhotite and galena/sphalerite, 45 tca, up to 5mm thick plus disseminated to small blebs of pyrite. Matrix-rich at top of unit wth a mix of fine to medium grained material, becomes more matrix-poor with depth becoming more of a crakle breccia at base. Flattened clasts 45 tca.															131691	BLANK			<0.01	<0.1
				50.15-50.39 - Mafic dyke, very fine grained, pale greenish coloured.																131692	STD	PM 405		0.28	0.8
				54.29-54.42 - Mafic dyke, as above.																131693	24.35	25.94	1.59	0.03	1.3
				55.05-55.51 - Mafic dyke, as above																131694	25.94	27.50	1.56	0.04	1.5
				Lower contact is intrusive marked by mafic dyke at base, change in alteration below dyke.																131695	27.50	29.00	1.50	0.01	1
																				131696	29.00	30.50	1.50	0.02	2.3

55.51	84.46	9a	AXXX	**Andesite** - altered. Pale greenish, fine grained with a weak breccia texture and moderate crackle breccia texture. Minor clasts of dark coloured andesite similar to unit above along with short intervals of darker coloured breccia. Fsp crystals are flattened and define a fabric 45 tca, with alteration at a variable angle to fabric. Rock becomes darker with depth with a noticeable change around 72.0m. Minor quartz veinlets, following fabric and less commonly cross-cutting. Several inclusions of small fsp prophyry clasts. Sulphides observed as narrow fracture fill bands, 45 tca, to 4mm thick but they are rare.															131697	30.50	32.00	1.50	0.04	1.7
				Lower contact is faulted, 75 tca with gravel-sized fragments of quartz/calcite and a weathered chlorite(?) mush.	Lct	75														131698	32.00	33.50	1.50	0.02	1.9
																				131699	33.50	35.00	1.50	0.03	3.8
84.46	98.48	7a	PIPX	**Porphyry** - Medium to dark green coloured, medium grained, with a fine grained groundmass. Prominent white rounded fsp crystals to 2mm across. Minor quartz veinlets up to 3mm thick typically 45 tca and cutting across fabric but also irregular creating a crackle breccia appearance. Weak fabric at top, becomes stronger and shallower (=30 tca) with depth.																131700	35.00	36.50	1.50	0.01	0.8
				91.80-92.00 - Sulphide vein ~5mm thick 45 tca with fracture fill pyrrhotite and pyrite. Po crystals up to 3mm.										1			3			131701	36.50	38.00	1.50	0.02	0.9
				93.02-93.12 - Quartz vein. Minor blebs of pyrite.					5					2											
				Lower contact marks a change in rocktype and increased brecciation below.																131702	38.00	39.44	1.44	0.01	0.6
																				131703	BLANK			<0.01	<0.1
98.48	118.33	9a	AXXX	**Andesite** - Pale to medium green coloured, fine grained with a prominent fabric, 45 tca. Fabric may be a shear fabric? 50 tca at 106.0m, 40 tca at 114.0m. Minor disseminated pyrite. Weak sericite altered crackle breccia texture with quartz veins up to 5mm thick, aligned with fabric but also variable.			1							1						131704	STD	PM 427		3.77	1.5
				100.89 - Fault, gravelly with weathered host rock for up to 2cm either side.	Fault	45														131705	39.44	40.44	1.00	0.16	3.2
				105.01 - Fault, gravelly and with a chlorite altered fabric. Crumbly for up to 10cm either side.	Fault	50														131706	40.44	41.44	1.00	1.43	18.6
				116.96 - Fault, mud slip, 50 tca. Weathered and mushy below.																131707	41.44	42.44	1.00	0.07	3.3
				116.96-117.84 - Porphyry, as below.																131708	42.44	43.44	1.00	0.01	0.6

0.00	26.75	9a	AXXX	**Andesite** - Dark green coloured, fine to medium grained and variably bleached over short intervals. Moderate quartz stockwork with most veins 45 tca. Bladed hornblende up to 5mm aligned 60 tca. Minor white coloured rounded fsp create a weak porphyritic textrue. Minor disseminated pyrite in host with additional pyrite + occassional sphalerite associated with quartz stringers. Increasing alteration over last 50cm above intrustive contact.				2	2					5		0.1				131793	0.00	1.50	1.50	<0.01	0.3
				10.80-11.12 - Fault, fractured with gravel-gouge at 10.95, mm's thick approx 45 tca.																131794	1.50	3.00	1.50	<0.01	0.1
				20.37-21.62 - Andesite, Dark coloured, fine grained, unaltered andesite with chilled contacts. Same as andesite at 26.75-32.38m.																131795	3.00	4.50	1.50	<0.01	<0.1
				Lower contact sharp, 25 tca.	Lct	25														131796	4.50	6.00	1.50	<0.01	<0.1
																				131797	6.00	7.50	1.50	<0.01	0.6
26.75	32.38	22c	D/AP	**Andesite, unaltered** - Dark coloured, fine to medium grained with a weak fsp porphyritic texture and minor calcite filled amygdules. Prominent fracturing 20 tca.																131798	7.50	9.00	1.50	0.03	0.5
				Lower contact, unit becomes altered at base, with inclusion of altered andesite below. Contact is a little indistinct.																131799	9.00	10.50	1.50	<0.01	0.5
																				131800	10.50	12.00	1.50	<0.01	0.2
32.38	34.51	9a	AXXX	**Andesite** - Light coloured, fine to medium grained with a very strong quartz flood. Quartz comprises majority of unit. Small blebs of fracture fill pyrite.				3	5					2						131801	12.00	13.50	1.50	<0.01	1
				Lower contact marks an end to quartz flood.																131802	13.50	15.00	1.50	0.19	6.8
																				131803	15.00	16.50	1.50	0.12	5.4
34.51	43.83	22c	D/AP	**Andesite, unaltered** - same as 26.75-32.38. Inclusion of pyrite-bearing, altered andesite, 43.51-43.63m.																131804	16.50	18.00	1.50	0.36	3.5
				Lower contact is chilled over 30cm.																131805	18.00	19.50	1.50	0.26	3.2
																				131806	19.50	20.37	0.87	0.16	1.1
43.83	51.58	9a	AXXX	**Andesite** - Altered and mineralized, dark coloured, fine to medium grained andesite. Variably bleached with strong quartz stockwork. Disseminated and small blebs of pyrite throughout plus fracture fill sphalerite and galena, weakens after 49.0m. Breccia texture over 50cm at top.				3	3					10	0.1	0.5				131807	20.37	21.62	1.25	<0.01	<0.1
				45.18 - gold vein, 65 tca, 1-3mm thick in quartz vein.															VG	131808	21.62	22.50	0.88	<0.01	0.9
				43.83-49.00 - Darker coloured rock with strong cubic pyrite to 1mm.										20	1	3				131809	22.50	24.00	1.50	0.34	3
				Lower contact, faint.	Lct	10														131810	24.00	25.50	1.50	1.15	4
																				131811	25.50	26.75	1.25	0.13	2.8
51.58	59.92		7 PIXX	**Porphyry** - Unit is similar in appearance to 43.83-51.58m but with medium grained rounded fsp crystals to 3mm giving a prominent porphyritic texture and a medium blue-grey colour. Locally strong quartz stockwork.																131812	26.75	27.28	0.53	0.04	0.7

From	To	Lith	Code		Type	Angle	Sericite	Qtz Stk	Si Flood	Bitumen	Chlorite	Epidote	Fe Ox	Py	Gn	Sph	Po	Cpy	Other		From	To	Width		
0.00	15.51	9a	AXXX	**Andesite** - Green-grey coloured, medium grained, with a weak and variable alteration (alteration fronts?). Minor quartz veins, various angles tca. Fine disseminated pyrite. Minor oxidation on fracture surfaces.										3						131869	0.00	1.50	1.50	<0.01	<0.1
				13.00-15.51 - Quartz stockwork.				3												131870	1.50	3.00	1.50	<0.01	<0.1
				Lower contact sharp.	Lct	40														131871	3.00	4.50	1.50	<0.01	<0.1
																				131872	4.50	6.00	1.50	<0.01	<0.1
15.51	21.54	22a	D/AP	**Andesite Dyke** - Grey coloured, medium grained with abundant plag fsp and hornblende with 20% fine grained matrix. Minor mm-scale quartz-calcite filled amygdules. No sulphides observed.																131873	6.00	7.50	1.50	0.01	<0.1
				19.54-21.54 - Second dyke, chill margin at 19.64m.																131874	7.50	9.00	1.50	0.01	<0.1
				Lower contact sharp.	Lct	75														131875	9.00	10.50	1.50	<0.01	<0.1
																				131876	10.50	12.00	1.50	<0.01	<0.1
21.54	38.45	9a	AXXX	Andesite - Dull blue-grey coloured, and fine to medium grained. Weathered over 5cm at top adjacent to dyke.																131877	12.00	13.50	1.50	0.04	9.2
				21.54-31.19 - Abundant pyrite, blebs										10						131878	13.50	15.00	1.50	0.13	6.3
				23.82-24.32 - Layered chalcedony veins with wavy contacts 20 tca. Blue calcite at contacts. Actual thickness ~10cm.															131879	15.00	15.51	0.51	0.09	3.5
				25.52 - Mud slip, 45 tca.	Mud slip	45														131880	15.51	16.50	0.99	<0.01	<0.1
				31.19-38.45 - Quartz-calcite stockwork, fine disseminated pyrite (5%) plus as fracture fill (2%).				5						7						131881	16.50	18.00	1.50	<0.01	<0.1
																				131882	18.00	19.64	1.64	<0.01	<0.1
38.45	74.90	9a	AXXX	Andesite - Pale blue-tannish coloured, fine to medium grained with minor quartz veins and short intervals of quartz stockwork. Slightly darker near top of unit. Quartz-sericite alteration, moderate and variable, weak near top, becomes stronger ~51.0m. Locally strong quartz but over short (<1m) intervals.			2	2	2											131883	19.64	21.00	1.36	0.03	<0.1
				Lower contact marks a change in alteration, irregular.																131884	21.00	21.54	0.54	0.01	<0.1
																				131885	21.54	22.50	0.96	0.43	0.8
74.90	81.83	9a	AXXX	Andesite - Similar to above but with strong quartz-sericite alteration. Fine grained and tan coloured. Strong white to colourless quartz stockwork creates a breccia texture with angular to subangular clasts. Minor disseminated pyrite with locally strong blebs to fracture fill but overall low.			2	4	2					2						131886	22.50	23.84	1.34	0.28	2.3
				76.31-76.73 - Strong quartz flood with cavities filled with tiny well formed quartz crystals. Interesting 8-sided, yellow mineral in cavity at 76.35m.				3	5										131887	23.84	24.32	0.48	0.05	2.2
				Lower contact is sharp, along quartz-filled fractures, no prefered orientation.																131888	24.32	25.50	1.18	0.14	1.3
																				131889	25.50	27.00	1.50	0.92	1.1

125.65	198.50	9a	AXXX	**Andesite - (flow? tuff?)**grey green fine grained andesite. Grainy texture. With moderate quartz calcite stockwork throughout with some stockwork as breccia veining with angular fresh andesite clasts in matrix supported quartz calcite. 1% fine disseminated pyrite throughout with increased concentrations locally. Moderately chloritic. Weakly bleached silicified sections and locally fine veinlets with fine red brown sphalerite and traces of galena.				3	1		3			1						132520	36.80	37.80	1.00	0.46	3.8
				175.8-178.1 - 50% white and creamy yellow quartz carbonate veining irregular but roughly low angle to core axis. .5% pyrite as medium to carse grained clusters. Looks like earlier white quartz calcite veining cut by later quartz yellow carbonate veining.	qtz cb vns	20		3						0.5						132521	37.80	38.80	1.00	0.17	6.1
				182.8-183.2 - 50% quartz calcite veining with medium to coarse grained pyrite clusters up to 10% locally.				3						5						132522	38.80	40.80	2.00	0.02	0.2
				186.4-187.7 - intermittent grey chert veins a few cm's wide, and about 6 over the interval. Irregular orientations.				3												132523	40.80	42.80	2.00	<0.01	<0.1
				190.5- 198.5 few fine quartz calcite veinlets with fine red brown sphalerite as fine seams and spots and fine traces of galena. Overall trace sphalerite and galena.											0.1	0.1				132524	42.80	43.80	1.00	0.39	7.5
				Lower contact is a bit arbitraty, but defined by presence of larger (or larger?) fragments in andesite groundmass.																132525	43.80	45.80	2.00	1.01	13
																				132526	45.80	46.80	1.00	0.02	0.5
198.50	223.00	9Lt	ALXX	**Lapilli tuff -** grey green grainy textured tuff with sub-rounded to angular clasts up to 5cm. Clasts are abundant in area and common in others. Generally weakly bleached with increased silicification and sericite as indicated. Weakly chloritic throughout.Weak to strong quartz calcite stockwork throughout. 4% disseminated fine to medium grained pyrite.				2	3	2		2			4						132527	46.80	48.80	2.00	0.07	1.6
				Stockwork is of several stages, with the latest appearing to be few cm wide white and bluey grey quartz calcite veins that cut across other stockwork, silicification.																132528	48.80	50.80	2.00	0.06	1.1
				218.65-223.00 - strong quartz and quartz calcite stockwork, and quartz brecciation of andesite. Grey greenish andesite. Calcite is commonly blueish in colour. Quartz stockwork commonly at moderate to high angel to core axis, while quartz calcite veining at low to moderate angels to core axis. Strong fine disseminated pyrite mostly in host up to 7%, 1% fine wispy red brown and pale sphalerite, trace galena. Sulfides associated mainly with early stockwork and brecciation.				1	4	4		2			7	0.1	1				132529	50.80	52.80	2.00	<0.01	0.2
																				132530	77.00	78.65	1.65	<0.01	0.3

Depth (m)				DESCRIPTION - LITHOLOGY	STRUCTURE		ALTERATION (1-5 = v wk-v stg)							MINERALIZATION (%)						Sample No.	Interval (m)			Au g/t	Ag g/t
From	To	Lith	Code		Type	Angle	Sericite	Qtz Stk	Si Flood	Bitumen	Chlorite	Epidote	Fe Ox	Py	Gn	Sph	Po	Cpy	Other		From	To	Width		
223.00	231.60	9t	ATXX	**Andesite Tuff with 50% black argillite beds/bands within tuff. -**grey green fine grained tuff beds alternating with 5-20cm wide aphanitic black agrillite beds. Bedding variable from 80 tca to 40 tca over 1 meter. Moderate quartz and quartz calcite stockwork and moderate to strong silicification thoughout with juicier zones as indicated. Some late quartz calcite veining cutting bedding at roughly 90 degrees, and earlier stockwork and silicification (some breccia) appears to follow bedding more. 4% disseminated pyrite mostly in andesite beds and stockwork and silicification.																							
								3	3		2			4						132531	78.65	79.22	0.57	0.34	4.4
				224.5-226.3 - strong silicification as brecciation, and strong quartz and quartz calcite stockwork. Some blueish coloured calcite veining. 7% pyrite finely disseminated and as coarser clots, .5% fine seams of red brown sphalerite, trace galena.				4	4		2			7	0.1	0.5				132532	79.22	81.00	1.78	<0.01	<0.1
				228.15-228.8 - quartz calcite breccia and veining. Breccia is crackly in silicified argillaceous rock. Quartz caclite veining is distinctly running along core axis here. Some crackle texture in argillitic andesite has formed fine parallel seams of calcite a mm or two apart cutting earlier stockwork at ~90 degrees.				3	4										132533	87.50	88.86	1.36	<0.01	<0.1
				231.5 - black argillite here is cut by silica flooding. Silica has strong pyrite. Contacts with silica are sharp, a bit irregular, and 30-70 tca.																132534	88.86	90.45	1.59	0.01	0.7
																				132535	90.45	92.50	2.05	0.01	0.8
231.60	267.68	9t	ATXX	**Andesite -** mixed unit of lapilli, fine grained to grainy andesite, weakly porphyritic sections, small amygduoidal sections. Overall this looks like a mixed lapilli, but clasts may be large. Grey green, moderately chloritic, moderate stockwork throughout, moderately silicified throughout with stronger silicified zones as indicated. 3% pyrite disseminated as medium grained sub-hedral crystals. Towards end of hole (last 6 meters is brecciated, sericitic, blocky, and last meter is strong black fault gouge with white quartz calcite veining and bleached sericitic andesite chunks in the veining. Very brittle and sheared here.																							
								3	3		2			3						132536	92.50	93.50	1.00	0.01	1.3
				231.60-240 - strong silicification and stockwork, quartz breccia cut by quartz stockwork and later quartz calcite stockwork. 5% disseminated pyrite, .5% sphalerite as fine orange veinlets and spots, trace galena.				4	4		2			5	0.1	0.5				132537	93.50	94.50	1.00	0.01	0.3
				243.3 - few cm wide red brown irregular sphalerite veining associated with quartz stockwork voer 15 cm. Overall 3% sphalerite				3	3							3			132538	109.20	111.20	2.00	0.09	1.3
				258.5-267.68 - sericite alteration and brecciation increasing towards end of hole through this section. Rock is pale beige bleached with fine dark seams between sericitic clasts (patches?). Fine quartz/yellow carbonate stockwork throughout. About 20% of this zone argillaceous. 2% fine disseminated pyrite. Several fault gouge seams in this unit at moderate to high angles to core axis.										2						132539	111.20	112.20	1.00	0.09	1.2
				266.35-267.68 - strong argillaceous fault gravel and gouge with white quartz calcite veining with angular clasts of argillite and beige bleached sericitic andesite (or argillite?) in veining. **Major fault Zone.**																132540	112.20	114.20	2.00	0.09	3.2

0.00	1.52	OVB	CAS	**Casing**																					
1.52	73.27	7b	PIKX	**Plagioclase Porphyry** - Medium grained rounded plag crystals with a fine grained groundmass, blue-grey coloured with <5% subhedral fsp phenos up to 1cm across and minor hornblende. Minor quartz veinlets typically at a high angle tca, up to 2mm thick. Unit is fairly homogeneous. Minor fine grained disseminated pyrite.										1						132620	BLANK			<0.01	<0.1
				36.84-73.27m - Minor white coloured quartz veins 5-15cm thick, along with increased quartz veinlets.																132621	1.52	2.00	0.48	0.01	0.7
				43.75-46.77m - Weakly hornfelsed and minor disseminated pyrite.	Qtz vn	60			1					3						132622	2.00	4.00	2.00	0.03	1
				67.41-73.27m - Darker coloured with an increasing hornfelsed texture to quartz vein at lower contact.					1											132623	4.00	6.00	2.00	<0.01	1.2
				73.27m - Lct, sharp, high angle tca.																132624	6.00	8.00	2.00	0.02	0.9
																				132625	8.00	10.00	2.00	0.01	1
73.27	74.34	7s	QBXX	**Quartz-Carbonate Vein** - White coloured, course grained. Sharp contacts with minor chunky chlorite over 15cm in quartz-carbonate. Fabric observed with flattened quartz-carbonate aligned 45 tca.							1									132626	10.00	12.00	2.00	0.02	1.3
				74.38m - Lct 65 tca, sharp.																132627	12.00	14.00	2.00	0.01	0.7
																				132628	14.00	16.00	2.00	0.01	0.6
74.34	84.13	7a	PIPX	**Porphyry, silica-flooded, hornfelsed** - Similar to porphyry above but with a moderate silica flood and weakly hornfelsed. Brown to grey coloured, fine to medium grained, with flattened fluidal clasts and a dark coloured, fine grained wispy matrix, moderately brecciated.					2					5						132629	16.00	18.00	2.00	<0.01	0.3
				84.13m - Lct gradational, increasingly clastic with decreasing porphyry.																132630	18.00	20.00	2.00	<0.01	0.6
																				132631	20.00	22.00	2.00	0.01	1.1

84.13	98.35	9z	AXXZ	**Quartz Vein Andesite Breccia** - Rock is blue-grey coloured, fine to medium grained with abundant quartz veins/veinlets. Andesite clasts are elongate, angular with an irregular somewhat fluidal form. Matrix locally comprising up to 40% of rock is light white coloured and fine grained. Two stages of quartz are recognized, a light buff coloured stage with minor fine pyrite, cross-cut by a white coloured course grained stage up to 1cm thick. Later stage does not appear to be associated with pyrite. Quartz veinlets create a moderate crackle breccia texture, approx with ca, but also at a high angle; silica alteration of host is weak. Later quartz veins have no preferred orientation. Minor stringers to blebs of sphalerite; blebs to 0.5cm and disseminated pyrite																							
								5	1					10		0.5				132632	22.00	24.00	2.00	0.02	1.8
				89.69-89.93m - Dyke, buff coloured, very fine grained. Cts 35 tca.																132633	24.00	26.00	2.00	<0.01	0.4
				97.55-98.35m - Strong quartz flood.				5												132634	26.00	28.00	2.00	<0.01	0.2
				98.35m - Lct marks a sharp decrease in quartz and brecciation.																132635	28.00	30.00	2.00	<0.01	<0.1
																				132636	30.00	32.00	2.00	<0.01	<0.1
98.35	227.74	9a	AXXX	**Andesite** - Dark green-grey, fine grained, weakly porphyritic and locally brecciated. Small blebs and minor disseminated pyrite throughout. Minor quartz veinlets subparallel tca, some up to 1cm but typically 2-3mm. Minor occurrence of subrounded andesite volcanic clasts with a very fine grained matrix.																						
														2						132637	32.00	34.00	2.00	<0.01	<0.1
				98.35-102.41m - Hornfelsed and altered. Minor silicification and small blebs of pyrite, rare sphalerite.				2						5						132638	34.00	36.00	2.00	<0.01	0.5
				102.01m - Small blebs of sphalerite aligned in quartz vein.																132639	36.00	36.84	0.84	0.01	0.4
				108.05m - Small blebs of sphalerite aligned in quartz vein.																132640	STD	PM427		3.54	1.5
				139.16-142.54m - Silicified. Strong silicification with several megacrystic quartz-rich veins at a high angle tca (40 tca). Minor chunky chlorite.					3					3						132641	36.84	38.00	1.16	<0.01	0.4
				140.91-141.52m - Plagioclase porphyry intrusive. Light coloured medium grained, sharp contacts at 30 tca.																132642	38.00	40.00	2.00	0.01	<0.1
																				132643	40.00	42.00	2.00	<0.01	<0.1

0.00	5.79	OVB	CAS	**Casing**																					
5.79	11.78	7a	PIPX	**Silicified Plagioclase Porphyry** - Pale greenish coloured irregularly shaped matrix, with 7%, euhedral 3mm long slightly elongate white coloured plag phenos. Lct contains abundant 1mm euhedral pyrite over 2cm next to contact. Fine disseminated pyrite throughout. Minor quartz veinlets at various angles, with thin alteration halos. Faint breccia appearance to matrix but with no prefered orientation and subrounded clasts.				2	5		2			3						132757	5.79	7.00	1.21	0.03	11.4
				Lct sharp, 15 tca.																132758	7.00	8.00	1.00	0.01	5.5
																				132759	8.00	9.00	1.00	0.01	3.8
11.78	18.69	9x	ABXX	**Brecciated Plagioclase Porphyry** - Dark coloured with a fine grained chlorite altered matrix and rounded clasts containing prominent 2-3mm plag phenos. Fine disseminated pyrite throughout. Plag phenos are locally up to 15%. Plag Porphyry clasts are flattened with a slight fluidal shape, and oriented close to ca.				1	1		4			3						132760	BLANK			<0.01	<0.1
				Lct is gradational, appears as an alteration front.																132761	9.00	10.00	1.00	0.02	7
																				132762	10.00	11.00	1.00	0.3	24.9
18.69	20.59	7s	QBXX	**Silicified Plagioclase Porphyry** - Same as 5.79-11.78m. Slight brown hue to rocks in middle of unit (sericite).			1	1	5		2			3						132763	11.00	11.78	0.78	0.02	28.6
				Lct is sharp, 25 ca.																132764	11.78	13.00	1.22	0.03	14.3
																				132765	13.00	14.00	1.00	0.04	15.6
20.59	48.44	7s	QBXX																						
				Plagioclase Porphyry, Brecciated - Dark coloured, fine grained groundmass with prominent white 1mm, rounded plag phenos occurring within irregular shaped clasts. Rest of matrix is medium green coloured, very fine grained, and chl/ep altered with faint plag phenos. Later weak breccia texture from weathering and alteration. Minor quartz veins to 3mm thick, and weak quartz crackle breccia. Fabric is at a shallow angle tca. Fine disseminated pyrite throught with small blebs observed in quartz veins.					3		2			2						132766	14.00	15.00	1.00	0.07	11.6
				46.0-48.44 - Rusty weathered fracture, little weathering. Oriented with ca.																132767	15.00	16.00	1.00	0.05	14.4
				Lct is gradational, marked by a weakening of brecciation																132768	16.00	17.00	1.00	0.04	22.9
																				132769	17.00	18.69	1.69	0.01	5
48.44	57.62	7a	PIPX	**Plagioclase Porphyry** - Similar to above but more homogeneous, none to weak chlorite alterated matrix.					2		1									132770	18.69	19.69	1.00	0.18	5.4
				55.6-57.62m - Increasing silicification					3											132771	19.69	20.59	0.90	0.01	1.7
																				132772	20.59	22.00	1.41	<0.01	0.6

57.62	57.94	7s	QBXX	**Quartz Breccia** - Short interval with fine grained white coloured matrix mixed with 50% subangular fine grained quartz clasts up to 0.7cm across. Contacts are sharp, about 50 tca. Minor disseminated pyrite.				1	4					1						132773	22.00	24.00	2.00	<0.01	0.6
				Lct sharp.	Lct	50														132774	24.00	26.00	2.00	<0.01	0.6
																				132775	26.00	28.00	2.00	<0.01	0.3
57.94	69.62	7a	PIPX	**Plagioclase Porphyry** - Similar to 20.59-48.44m but with weaker chlorite alteration and brecciation. Variable fine disseminated pyrite but minor. Plag porphyry texture is weak with a strong siliceous and sericite alteration of matrix, plag phenos are faint. Rock overall is dark brown grey coloured. Minor quartz veinlets.				1	3		2			1						132776	28.00	30.00	2.00	<0.01	0.5
				Lct is gradational, marked by a decrease in chlorite alteration.																132777	30.00	32.00	2.00	<0.01	0.4
																				132778	32.00	34.00	2.00	0.01	0.5
69.62	100.39	7a	PIPX	**Plagioclase Porphyry** - Dark brown-grey coloured with a fine grained matrix and prominent white coloured rounded, plag phenos to 2mm.																132779	34.00	36.00	2.00	<0.01	0.4
				72.0-73.0 - Fractured rock with 1-5cm long angular chips.																132780	STD	PM427		3.59	1.5
				85.0-86.0 - Fractured rock with angular chips.																132781	36.00	38.00	2.00	<0.01	0.5
				98.0-98.6m - Shallow angle quartz-carbonate vein, 10 tca. Minor chunky sphalerite-galena at uct. True thickness is ~15cm.					2											132782	38.00	40.00	2.00	<0.01	0.5
				Lct is sharp, 50 tca.	Lct	50														132783	40.00	42.00	2.00	0.02	0.5
																				132784	42.00	44.00	2.00	0.03	0.3
100.39	100.73	7s	QBXX	**Quartz-Carbonate Vein** - Strong white coloured, coarse grained quartz-carbonate vein in medium grained, chlorite altered plagioclase porphyry. Strong pyrite-sphalerite mineralization as 2-4mm angular blebs. Sphalerite is a dark rusty-brown colour.	Vein	50			3		1			10		10				132785	44.00	46.00	2.00	0.01	0.6
				Lct is sharp, 55 tca.																132786	46.00	47.00	1.00	<0.01	0.6
																				132787	47.00	48.44	1.44	<0.01	0.5
100.73	126.54	7a	PIPX	**Plagioclase Porphyry, silicified** - Pale brown-tan coloured, fine to medium grained rock with a moderate wispy breccia textrure. Weak quartz-carbonate stockwork. Minor rounded plag feldspar phenos to 3mm. Fine disseminated pyrite throughout. Locally strong fabric (silica stringers) 20 tca.			1							5						132788	48.44	50.00	1.56	0.03	0.6
				116.42-118.14m - Siliceous fine grained and with a dark brown colour. Fine disseminated pyrite. Prominent subhedral, pinkish fsp to 3mm, comprising 5%.				3	4					5						132789	50.00	52.00	2.00	0.01	0.5
				117.42-126.54m - Strong hydrothermal brecciation. Abundant fine dark coloured matrix with irregular shaped clasts.																132790	52.00	54.00	2.00	0.01	0.2
				124.84-124.86m - Gougey-gravelly fault, strong weathering, 20 tca.																132791	54.00	55.62	1.62	0.02	0.6
				Lct marks a fault below.																132792	55.62	56.62	1.00	0.02	0.5
																				132793	56.62	57.62	1.00	0.01	0.5
126.54	127.85	7a	PIPX	**Plagioclase Porphyry, Faulted** - As above but broken up chips and chunks with gravel-gouge over short intervals up to 2cm thick. Gravelly section orientation is variable from parellel to shallow angle tca. Weak weathering.																132794	57.62	57.94	0.32	0.45	1.6
				Lct faulted.																132795	57.94	58.94	1.00	0.01	0.4
																				132796	58.94	60.00	1.06	<0.01	0.3

Depth (m)				DESCRIPTION - LITHOLOGY	STRUCTURE		ALTERATION (1-5 = v wk-v stg)							MINERALIZATION (%)						Sample No.	Interval (m)			Au g/t	Ag g/t
From	To	Lith	Code		Type	Angle	Sericite	Qtz Stk	Si Flood	Bitumen	Chlorite	Epidote	Fe Ox	Py	Gn	Sph	Po	Cpy	Other		From	To	Width		
127.85	130.68	7a	PIPX	**Plagioclase Porphyry, silicified** - As above (100.73-126.54m). Pale brown-tan colour, fine grained with strong silica alteration. Minor disseminated pyrite.				3	4					5						132797	60.00	62.00	2.00	0.01	0.4
				Lct is fractured. Abrupt change in rocktype and alteration.																132798	62.00	64.00	2.00	<0.01	0.6
																				132799	64.00	66.00	2.00	<0.01	0.5
130.68	154.14	21d	D/DI	**Late-stage Dyke** - Dark coloured, medium to course grained, with prominent subhedral minerals in groundmass. Abundant mafic minerals give a dark colour to rock. Top of unit is chilled beginning about 133m and gradational towards uct and includes rounded fsp crystals with a white centre and pink coloured rims. Top 50cm is lightly tan coloured next to contact (alteration front) then grades to darker coloured dyke. Rest of unit is uniformly unaltered including lower contact. Groundmass contains course grained pale green coloured, rounded fsp to 4mm long, and black bladed needles of hornblende to 5mm.														132800	STD	PM405		0.29	0.7
				140.0-141.5m - Rusty weathering fracture with a rough surface oriented with ca.																132801	66.00	68.00	2.00	<0.01	0.4
				Lct sharp, intrusive, 45 tca																132802	68.00	69.62	1.62	0.02	1.7

0.00	2.13	OVB	CAS	**Casing**																					
2.13	15.27	7a	PIPX	**Plagioclase Porphyry, Silicified** - Dull grey coloured, fine to medium grained with locally prominent white coloured, rounded plag phenos but typically siliceous with a faint alignment of fabrics at 45 tca. Fine disseminated pyrite with strong silica alteration.				3	4					5						132848	2.13	3.05	0.92	<0.01	7.3
				3.05-3.99m - Quartz vein breccia. White coloured, course grained.																132849	3.05	3.99	0.94	0.04	73
				10.23-10.33m - Weathered at a gravelly fault. Rusty for 1m either side.																132850	3.99	5.00	1.01	<0.01	14
				10.33-14.57m - Weak silica alteration. Weak breccia, medium grained with abundant plag phenos.				1	2											132851	5.00	6.00	1.00	<0.01	2.8
				14.57-15.27m - Strong siliceous alteration with blebs of pyrite.				3	5					7						132852	6.00	7.05	1.05	<0.01	5.9
				Lct is an alteration contact, 45 tca, but fairly sharp.																132853	7.05	8.00	0.95	<0.01	4.5
																				132854	8.00	9.00	1.00	0.06	6.3
15.27	51.56	7a	PIPX	**Plagioclase Porphyry, Altered** - Dark grey-green coloured, with a fine grained matrix and abundant 2-3mm rounded white coloured plagioclase phenos. Rock is weakly broken up. Quartz-chlorite? alteration has produced a weak breccia texture with subangular PP fragments alinged 45 tca, with a green coloured, fine to medium grained matrix. Minor disseminated pyrite.				1	2					1						132855	9.00	10.33	1.33	0.18	16.5
				17.85-18.62m - Fault, with strong chlorite alteration over 30cm at top, a gravel zone at 10tca in middle with chips and chunks below. Minor weathering.																132856	10.33	10.83	0.50	0.29	4.2
				28.10-28.23m - Dyke, very fine grained, black in centre with greenish coloured chill margins.	Dyke	60														132857	10.83	12.00	1.17	0.03	3.2
																				132858	12.00	13.00	1.00	<0.01	2.8
51.56	71.25	7a	PIPX	**Plagioclase Porphyry, Quartz-sericite altered** - Pale tan-brownish coloured, with a fine grained matrix and 1-2mm subrounded white to tan coloured fsp phenos. Minor pyrite. Moderate but variable quartz-sericite alteration. Quartz stockwork veinlets are variable orientation but commonly at 45 tca. Alteration weakens after 66.3m.			2	1	3					1						132859	13.00	14.57	1.57	<0.01	5.1
				55.24-56.13m - Chunky Quartz Vein, light coloured, course grained, poor sulphides.																132860	STD	PM405		0.27	0.7
				68.20 - Clay altered fault zone, <1cm thick, 10 tca, filled with mush.																132861	14.57	15.27	0.70	<0.01	1.8
				Lct marks a change in alteration	Lct	45														132862	15.27	16.00	0.73	<0.01	0.9
																				132863	16.00	17.00	1.00	<0.01	0.7

Depth (m)				DESCRIPTION - LITHOLOGY	STRUCTURE		ALTERATION (1-5 = v wk-v stg)							MINERALIZATION (%)						Sample No.	Interval (m)			Au g/t	Ag g/t
From	To	Lith	Code		Type	Angle	Sericite	Qtz Stk	Si Flood	Bitumen	Chlorite	Epidote	Fe Ox	Py	Gn	Sph	Po	Cpy	Other		From	To	Width		
71.25	83.88	7a	PIPX	**Plagioclase Porphyry** - Pale green coloured, fine to medium grained. Alteration creates a weak to moderate breccia texture with 2-5cm, dark coloured, med grained subangular 'clasts' within a finer, green matrix. Prominent fsp phenos in clasts, faint in matrix. Some clast boundaries appear sharp. Moderate quartz-carbonate stockwork with veins at 45 tca, weakens with depth. Minor pyrite.				2	1					0.5						132864	17.00	17.85	0.85	<0.01	0.7
				Lct is gradational, alteration front.																132865	17.85	18.62	0.77	<0.01	3.3
				74.4-74.6m - Weakly fractured.																132866	18.62	20.00	1.38	0.02	3.5
																				132867	20.00	22.00	2.00	0.07	2.1
83.88	100.93	7a	PIPX	**Plagioclase Porphyry** - Dark green-grey coloured, with a fine to medium grained matrix and prominent 1-2mm rounded, white coloured fsp phenos. Rock has a faint brown hue, possibly from quartz-sericite alteration. Poor sulphides.			1	1	2											132868	22.00	24.00	2.00	<0.01	1.9
				83.88-93.0 - More altered, moderate quartz-carbonate stockwork.			1	3	4											132869	24.00	26.00	2.00	<0.01	1.2
				93.0-100.93 - Weakly altered, less green.																132870	26.00	28.00	2.00	<0.01	0.7
				Lct is sharp, 90 tca.	Lct	90														132871	28.00	30.00	2.00	<0.01	0.6
																				132872	30.00	32.00	2.00	<0.01	1
100.93	111.84	7a	PIPX	**Plagioclase Porphyry, Silicified** - Pale green-grey coloured, fine to medium grained groundmass with chunky white quartz. Strong silicification (and sericite?) alteration of groundmass with faint outline of fsp phenos. Minor irregular, cream coloured cross-cutting veinlets. Mineralization consists of pyrite, sphalerite and some galena, as small blebs and up to irregular fracture fill chunks over 5cm long. Galena is a little more spotty.			2	3	4					5	5	2				132873	32.00	34.00	2.00	<0.01	1.4
																				132874	34.00	36.00	2.00	0.59	22.3
111.84	125.12	7a	PIPX	**Plagioclase Porphyry, Quartz-sericite altered** - Variable dark grey to pale brownish coloured, fine to medium grained matrix with locally prominent white coloured, 1-2mm rounded fsp phenos. Minor quartz-carbonate veinlets with weak quartz crackle breccia. Prominent fabric orientation (banded appearance), 45 tca. Strong silicification, poor to weak sulphides.			2	1	4					1						132875	36.00	38.00	2.00	0.01	5.1
				Lct is wavy, intrusive with dyke below.																132876	38.00	40.00	2.00	0.01	3
																				132877	40.00	42.00	2.00	<0.01	1.5
125.12	185.67	9a	AXXX	**Plagioclase Porphyry** - Medium grey-green coloured and fine to medium grained. Slightly darker at top to 136.0m and with fine quartz microfractures, two sets perpendicular to each other. Most of unit is weakly siliceous altered with faint breccia 'clasts' and a locally moderate fabric oriented 45 tca. Locally moderate pyrite but poor mineralization overall.					1											132878	42.00	44.00	2.00	<0.01	3.7
				125.12-125.74m - Green coloured, fine grained dyke, Lct 30 tca.																132879	44.00	46.00	2.00	<0.01	1.6
				130.80-131.53m - Green coloured, fine grained dyke, Lct 25 tca.	Dyke	25														132880	BLANK			<0.01	<0.1
				132.51-133.35m - Green coloured, fine grained dyke, Lct 20 tca.																132881	46.00	48.00	2.00	0.13	23.1
				147.0-149.0m - Moderate fracture fill pyrite in brecciated rock, weakly aligned 45.										5						132882	48.00	50.00	2.00	<0.01	2.3
				154.10-155.12m - Chunky Quartz Vein, Light coloured, course grained. Abundant quartz at base. No sulphides observed.																132883	50.00	51.56	1.56	0.07	35.4
				182.10-184.59m - Weak brecciation, with wispy chlorite filled microfractures.				1						1						132884	51.56	52.00	0.44	<0.01	1.6
				184.59-185.67m - Minor sulphides and quartz veining.				3						2						132885	52.00	54.00	2.00	0.01	24.8

				Lct, rocks become fractured and altered below.																132992	32.00	34.00	2.00	0.02	2.2
																				132993	34.00	36.00	2.00	<0.01	0.7
77.18	89.74	7s	QBXX	**Plagioclase Porphyry, Brecciated/Silicified** - Similar to 65.93-70.94 but with stronger quartz and brecciation. Medium grey coloured, fine to medium grained clasts containing variable weak to strong porphyrytic texture of small rounded plag phenos. Stockwork matrix is light coloured, and quartz-rich with no preferred orientation. Quartz-chlorite veins cross-cut other fabrics. Weak to moderate sericite alteration throughout with strong silicification. Minor fine grained disseminated plus minor fracture fill pyrite. Rock is weakly broken up.																						
							2	5	3		2			2						132994	36.00	38.00	2.00	<0.01	0.3
				79.0-82.0 - Weaker silicification and brecciation.			1	3	2		2			2						132995	38.00	40.00	2.00	<0.01	0.4
																				132996	40.00	42.00	2.00	<0.01	0.6
89.74	130.49	7a	PIPX	**Plagioclase Porphyry, unaltered** - As above, 13.35-65.94. Short intervals of weak silicification and brecciation. Prominent 1-2mm rounded plag phenos with sparse euhedral Kfsp phenos to 6mm. Rock is a dull blue-grey colour and fairly uniform with some weak alteration. Locally moderate chlorite.																						
								1	3					1						132997	42.00	44.00	2.00	0.02	1.5
				94.64-95.02m - Pale green coloured, fine grained dyke with sharp contacts, 65 tca																132998	44.00	46.00	2.00	<0.01	1.3
				103.98-104.56m - Brecciated with chunky quartz and hornblende-chlorite alteration. Minor pyrite.				3	5		2			2						132999	46.00	48.00	2.00	0.04	13.4
				Lct is altered PP below.																133000	BLANK			<0.01	<0.1
																				133001	48	50.00	2.00	<0.01	3.6
130.49	163.28	7a	PIPX	**Plagioclase Porphyry, altered** - As above (13.35-65.94m) but variably altered. Bleached at top of unit, around 146.0m grades to darker alteration till end of unit. Plag phenos not as prominent especially in areas of strong bleaching. Weakly brecciated with quartz-filled microfractures. Minor pyrite observed with quartz-filled microfractures. Becomes more plag crystal-rich in last 157-																						
																				133002	50.00	52.00	2.00	<0.01	4.4
				135.59-135.76m - Prominent fine grained quartz-rich fabric (shear?) 60 tca.																133003	52.00	54.00	2.00	<0.01	1.6
				130.49-146.0m - Bleached, with fracture fill pyrite in quartz-filled fractures.																133004	54.00	56.00	2.00	0.5	178.3
							3		2					3						133005	56.00	58.00	2.00	0.19	47.2
				145.0-150.0m - Prominent hornblende crystals, to 4mm long.																133006	58.00	60.00	2.00	<0.01	6.3
				146.0-163.25 - Dark coloured, chl/bio alteration with strong graphite on fracture surfaces.																133007	60.00	62.00	2.00	<0.01	3.1
				157.0-163.25 - Becomes more plag crystal-rich and with larger crystals, up to 4mm.																133008	62.00	64.00	2.00	0.15	59.3
				Lct abrupt change in alteration (and rock?), 60 tca but broken.	Lct	60														133009	64.00	65.93	1.93	<0.01	6

36.00	60.84	7a	PIPX	**Plagioclase Porphyry, altered** - Fine grained rock producing a variable dark grey-black to green-tannish colour. Lighter coloured subrounded clasts often appear with the darker material as a matrix. Plagioclase crystals are rounded to subhedral, and often with faint boundaries. Strong fracture fill pyrite.			3		4		2			7						133140	STD	PM427		3.61	0.8
				Lct is marked by an intrusion below.																133141	24.00	26.00	2.00	<0.01	<0.1
																				133142	26.00	26.61	0.61	<0.01	<0.1
60.84	70.57	22c	D/AP	**Dyke** - Medium to dark grey coloured, fine grained becoming more medium grained in the middle of unit. Crystals are not very distinct. Chilled margin over 2cm at top. Little to no alteration.																					
																				133143	26.61	28.00	1.39	<0.01	1.5
				67.21-68.39m - Altered plag Porphyry as 36-60.84m.																133144	28.00	29.09	1.09	<0.01	1.6
																				133145	29.09	30.54	1.45	<0.01	<0.1
70.57	74.80	22c	D/AP	**Dyke** - Dark green-grey coloured, medium grained groundmass with 2-3mm subhedral hornblende and 1-2mm, faint to distinct, euhedral fsp crystals. Minor fracture fill pyrite. Several white coloured, 3mm thick, quartz-calcite veins, 40 tca. Rock is weakly bleached and crystal-rich with 25% fsp and hornblende.					2					0.5						133146	30.54	32.00	1.46	<0.01	0.5
				Lct sharp, intrusive with contact 40 tca.	Lct	40														133147	32.00	33.30	1.30	<0.01	2.3
																				133148	33.30	34.86	1.56	<0.01	<0.1
74.80	76.42	22c	D/AP	**Dyke** - Same as 60.84-70.57m.																133149	34.86	36.00	1.14	0.03	12.7
				Lct sharp, intrusive 55 tca.	Lct	55														133150	36.00	38.00	2.00	<0.01	3.6
																				133151	38.00	40.00	2.00	<0.01	2.5
76.42	77.69	22c	D/AP	**Dyke** - Same as 70.57-74.80 but slightly browner in colour (quartz-sericite alteration?).			1		3					1						133152	40.00	42.00	2.00	0.02	1
				Lct, slightly wavy, about 65 tca, with alteration at base over <1cm.																133153	42.00	44.00	2.00	<0.01	1.7
																				133154	44.00	46.00	2.00	<0.01	1.1
77.69	78.87	7s	QBXX	**Quartz Vein Breccia** - Chunky white coloured quartz-rich clasts in a tan coloured (sericite) fine grained, matrix. Fragments are subrounded including abundant 2mm sized pieces in matrix. Host appears to be highly altered version of unit below. Quartz appears banded with fabric 30 tca. Minor fracture fill pyrite in matrix.			2	2	5					1						133155	46.00	48.00	2.00	0.02	5.3
				Lct marks a sharp decrease in quartz.																133156	48.00	50.00	2.00	0.01	6.6
																				133157	50.00	52.00	2.00	0.01	5.9
78.87	81.47	22c	D/AP	**Dyke** - Similar to 70.57-74.80. Highly altered near top creating a light tannish-grey colour, becoming darker green coloured with depth. Top has faint appearance of hornblende with strong siliceous alteration and some quartz bands. Hornblende become more prominent with depth, euhedral and up to 6mm long, faint outline of plag with a fine to medium grained texture of groundmass.																							
																				133158	52.00	54.00	2.00	<0.01	1.2
				Lct is sharp, 45 tca with no chilled margin.	Lct	45														133159	54.00	56.00	2.00	<0.01	2.6
																				133160	STD	PM405		0.28	0.6
81.47	82.61	22c	D/AP	**Dyke** - Short section, fine grained and dark grey coloured with weak chilled margins over 2cm.																133161	56.00	58.00	2.00	<0.01	2
				82.33-82.47m - Inclusion of altered dyke as 78.87-81.47m.																133162	58.00	60.00	2.00	<0.01	4.7
				Lct sharp, intrusive at 55 tca.	Lct	55														133163	60.00	60.84	0.84	<0.01	0.7

Depth (m)				DESCRIPTION - LITHOLOGY	STRUCTURE		ALTERATION (1-5 = v wk-v stg)							MINERALIZATION (%)						Sample No.	Interval (m)			Au g/t	Ag g/t

82.61	102.04	7a	PIPX	**Plagioclase Porphyry** - Dull blue-grey coloured, fine to medium grained matrix with abundant 2mm subhedral to euhedral fsp phenos. Very minor fsp to 10mm. Weak alteration and brecciation over last 50cm above lct. Minor quartz-carbonate veins 1mm thick, fine pyrite observed associated with veins and disseminated through unit. Some thicker veins appear to have quartz-sericite rims, with quartz-carbonate core, and weakly vuggy in centre.																133164	60.84	62.00	1.16	<0.01	<0.1
								1						2						133165	62.00	64.00	2.00	<0.01	<0.1
				Lct intrusive with dyke below, rock is weakly broken up.																133166	64.00	66.00	2.00	<0.01	<0.1
																				133167	66.00	67.21	1.21	<0.01	<0.1
102.04	107.94	22a	D/AX	**Dyke** - Tan coloured (quartz-sericite) and fine grained at top of unit with sharp change in alteration at 104.99m to dark green-black coloured, fine to medium grained tuffaceous looking rock. None to weak alteration below 104.99m. Minor quartz veins including a vein bx at 104.17, containing fine grained quartz and 1mm rims of tan coloured quartz-sericite?; weakly vuggy.																133168	67.21	68.39	1.18	<0.01	1
				102.04-104.99m - Strong quartz-sericite alteration with fine grained rock. Poor pyrite.			4		4					0.5						133169	68.39	70.00	1.61	<0.01	<0.1
				104.17-104.27m - Quartz vein breccia, minor inclusions of host rock.					5											133170	70.00	70.57	0.57	<0.01	<0.1
				104.27-104.68m - Inclusion of Plagioclase Porphyry.																133171	70.57	72.00	1.43	<0.01	0.8
				104.99-107.94m - Unaltered dyke.																133172	72.00	74.00	2.00	<0.01	0.6
				Lct sharp intrusive with weak chilled margin over 3cm.	Lct	75														133173	74.00	74.80	0.80	<0.01	0.6
																				133174	74.80	76.42	1.62	<0.01	<0.1
107.94	157.25	7a	PIPX	**Plagioclase Porphyry** - Dull blue-grey colour with a fine to medium grained groundmass and 1-2mm rounded to subhedral fsp cyrstals. Minor quartz filled fractures, at various angles and minor 2mm subhedral hornblende. Faint quartz crackle breccia texture, and minor pyrite as small fracture fill blebs. Unit is fairly uniform with short altered sections as listed below.																							
														3						133175	76.42	77.69	1.27	<0.01	1.5
				131.24-131.29 - Quartz vein, fine grained 40 tca with cross cutting quartz-sericite vein. Quartz alteration 20cm and 60cm below. No pyrite observed															133176	77.69	78.87	1.18	<0.01	2
				131.07-131.92 - Quartz alteration halo for vein above.			2		4											133177	78.87	79.36	0.49	<0.01	3.5
				137.01-137.41m - Quartz-sericite breccia with alteration and strong bleaching of rock. Fabric ~15 tca. Fracture fill pyrite similar to rest of unit.			4	5	5					2						133178	79.36	81.47	2.11	<0.01	1.1
				140.53-141.06m - Quartz-sericite breccia with moderate fine pyrite. Strong alteration but weak breccia.			3	3	4					5						133179	81.47	82.61	1.14	<0.01	<0.1
				142.94-143.46m - Quartz-sericite breccia with breccia over 5cm near top then decreasing intensity with depth into crackle breccia. Moderate to strong alteration with several mm-scale pyrite veinlets.																					
							3	5	4					5						133180	BLANK			<0.01	<0.1
				Lct is gradational, marked by a change in alteration.																133181	82.61	84.00	1.39	<0.01	0.5
																				133182	84.00	86.00	2.00	<0.01	0.2

0.00	3.04	OVB	CAS	**Casing**																					
3.04	33.09	7a	PIPX	**Plagioclase Porphyry** - Dull blue-grey coloured, fine grained, with 2mm subrounded, white coloured plag crystals and minor white subhedral Kfsp <1cm. Minor sporadic hornblende, weakly aligned 45 tca. White to light tan coloured, fine grained, quartz (+sericite) veinlets to 2mm thick, minor to 10cm, typically 45 tca. Variable weak quartz crackle breccia. Minor fracture fill pyrite.			1		1					2						133299	3.04	4.00	0.96	0.04	0.7
				Lct is sharp change in texture with quartz-matrix below.																133300	BLANK			0.01	<0.1
				11.89-12.15m - Fractured rock																133301	4.00	6.00	2.00	0.03	1.1
																				133302	6.00	8.00	2.00	0.04	1.3
33.09	43.31	7s	QBXX	**Porphyritic Maroon breccia/flow** - Dark maroon green-grey coloured, medium grained grainy looking matrix with prominent and abundant rounded plag phenocrysts. Matrix is green-grey coloured in short intervals, and appear to be associated with quartz veins and silicification. Clasts are up to 4cm across, subangular and maroon coloured with a strong plag porphyritic texture with euhedral to subhedral phenocrysts up to 3mm. Minor pyrite occuring as small fracture fill blebs. Strong crystal-rich porphyritic texture.																						
								1	3					1						133303	8.00	10.00	2.00	0.03	1.2
				33.09-33.33m - Quartz-matrix breccia with irregular shaped clasts. Strong siliceous alteration.				5												133304	10.00	12.00	2.00	0.17	3.3
				Lct is sharp intrusive contact.	Lct	20														133305	12.00	14.00	2.00	0.01	0.2
																				133306	14.00	16.00	2.00	<0.01	<0.1
43.31	53.98	22b	D/AN	**Dyke** - Medium green coloured, fine grained to grainy texture and weakly porphyritic with faint plagioclase to 1mm. Slightly magnetic. Locally strong quartz and quartz-sericite crackle breccia through most of unit. Minor disseminated pyrite.																133307	16.00	18.00	2.00	<0.01	<0.1
				50.4m - Rusty weathering fracture, 20 tca with strong oxidation 10cm either side.																133308	18.00	20.00	2.00	0.02	0.2
																				133309	20.00	22.00	2.00	0.02	1.4
53.98	78.81	7s	QBXX	**Porphyritic Andesite, Breccia/Flow** - Similar to 33.09-43.31m. Dark green-grey coloured, with abundant subangular to subrounded clasts to 3cm. Matrix is fine grained to grainy and is often altered and bleached. Clasts have sharp boundaries and contain a plag porphyritic texture becoming more uniformly plag porphyry after 67.60m. Rock is more maroon coloured near top, becomes more uniformly green after 60.0m. Rare occurence of quartz veins, some at top of unit and below fault.																						
																				133310	22.00	24.00	2.00	0.13	3.3
				53.98-63.50m - Moderate breccia texture.																133311	24.00	26.00	2.00	0.03	1.1
				63.5-67.6m - Very strong brecciation with prominent clasts.																133312	26.00	28.00	2.00	<0.01	0.5

Depth (m)				DESCRIPTION - LITHOLOGY	STRUCTURE		ALTERATION (1-5 = v wk-v stg)							MINERALIZATION (%)						Sample No.	Interval (m)			Au g/t	Ag g/t

				67.6-78.81m - Massive, minor breccia clasts. Prominent porphyritic texture.																					
																				133313	28.00	30.00	2.00	0.01	0.3
				60.05-60.06m - Fault, gravel	Flt	20														133314	30.00	32.00	2.00	0.04	0.3
				Lct is sharp, intrusive, 10 tca.	Lct	10														133315	32.00	33.09	1.09	0.02	0.5
																				133316	33.09	33.33	0.24	0.25	32.8
78.81	88.73	22a	D/AX	**Dyke** - Dark grey coloured almost black, and fine grained. Contacts are sharp but with strong alteration. Weakly altered and broken up over short sections, minor epidote. Minor inclusions of dark coloured, porphyritic andesite.										3						133317	33.33	34.00	0.67	0.1	2.6
				78.81-80.69m - Altered, pale green coloured, weakly brecciated, chunky quartz veins.																133318	34.00	36.00	2.00	0.01	0.6
				83.0-85.5m - Weakly brecciated.																133319	36.00	38.00	2.00	<0.01	<0.1
				85.34-88.73m - Moderate pyrite, small blebs and often strung out along fractures.										7						133320	STD	PM427		3.41	1.9
				88.17-88.73m - Bleached, strong pyrite at base adjacent to contact.																					
					Lct	20														133321	38.00	40.00	2.00	0.01	0.9
				Lct is gradational over 1m due to alteartion. Displays a prominent fabric 20 tca.																133322	40.00	42.00	2.00	<0.01	<0.1
																				133323	42.00	43.31	1.31	<0.01	<0.1
88.73	122.92	7a	PIPX	**Plagioclase Porphyry** - Medium green-brown coloured, fine grained with abundant white subrounded to euhedral, 2mm plag phenos. Minor quartz-carbonate veins, and a locally moderate crackle breccia. Abundant disseminated to spotty fine grained pyrite.										10						133324	43.31	44.00	0.69	<0.01	<0.1
				88.73-92.0m - Weakly brecciated decreasing intensity with depth, with a weak chlorite/epidote alteration of matrix and rounded porphyrytic clasts.																133325	44.00	46.00	2.00	<0.01	<0.1
				118.54-119.05m - Siliceous alteration.					4					2						133326	46.00	48.00	2.00	0.01	<0.1
				118.87-119.05m - Chunky quartz vein																133327	48.00	50.00	2.00	0.02	<0.1
				119.05-122.92m - Weakly pale greenish coloured, quartz-epidote alteration. Weak breccia.										3						133328	50.00	52.00	2.00	<0.01	<0.1
				Lct is a faint change in rocktype, with a sharp decrease in plag porphyry phenos.																133329	52.00	53.98	1.98	<0.01	<0.1
																				133330	53.98	56.00	2.02	<0.01	<0.1
122.92	130.14	7s	QBXX	**Quartz vein breccia** - Dull green-grey coloured, fine grained with faint 1-2mm rounded plag phenos. Abundant white to dull grey coloured, chunky quartz veins with an irregular fabric. Minor subhedral black, weathered hornblende crystals, up to 3mm long but generally 1mm. Fine disseminated pyrite throughout. Moderate quartz crackle breccia.			2	4	4					5						133331	56.00	58.00	2.00	<0.01	<0.1
				122.92-125.30m - Weak quartz breccia and siliceous alteration. Moderate crackle breccia. Moderate plag porphyritic texture.			1	3	3					3						133332	58.00	60.00	2.00	0.01	<0.1
				128.81-130.14m - Weaker breccia and siliceous alteration.			1	2	3					5						133333	60.00	62.00	2.00	0.09	0.7
				Lct marks a decrease in quartz brecciation.																133334	62.00	64.00	2.00	0.03	0.7
																				133335	64.00	66.00	2.00	0.02	0.1
130.14	146.39	9a	AXXX	**Andesite, bleached** - Dull gree-grey coloured, fine grained with ghostly outlines of plag phenos and a grainy texture to groundmass. Minor quartz veins create a jig-saw fit breccia. Quartz veins at various orientations but angles typically close to ca. Increasing siliceous alteration with depth.			1		1					1						133336	66.00	68.00	2.00	<0.01	<0.1

Depth (m)				DESCRIPTION - LITHOLOGY	STRUCTURE		ALTERATION (1-5 = v wk-v stg)							MINERALIZATION (%)						Sample No.	Interval (m)			Au g/t	Ag g/t
From	To	Lith	Code		Type	Angle	Sericite	Qtz Stk	Si Flood	Bitumen	Chlorite	Epidote	Fe Ox	Py	Gn	Sph	Po	Cpy	Other		From	To	Width		
				140.75-145.75m - Quartz brecciation. Increasing quartz veining and stockwork, subparallel to ca. Quartz is white to grey.				3	2					2						133337	68.00	70.00	2.00	<0.01	<0.1
				145.75-146.39m - Chunky quartz vein subparallel to ca, with large blebs to 1cm of honey brown sphalerite strung out in vein. Minor pyrite +galena.				5	3					1	1	5				133338	70.00	72.00	2.00	<0.01	<0.1
				Lct is end of quartz vein.																133339	72.00	74.00	2.00	<0.01	<0.1
																				133340	STD	PM405		0.29	0.7
146.39	150.62	9z	AXXZ	**Andesite, bleached** - Similar to 130.14-146.39m but more highly altered. Pale green-grey altered, fine grained with a weak ghostly porphyritic texture. Weak breccia with faint outline of clasts.				3	2	4					2						133341	74.00	76.00	2.00	<0.01	<0.1
				Lct, rock is brecciated below																133342	76.00	78.00	2.00	<0.01	<0.1
																				133343	78.00	78.81	0.81	<0.01	<0.1
150.62	151.88	7s	QBXX	**Quartz Vein Breccia** - Quartz-rich with strong breccia texture. Matrix is white to grey coloured, fine grained with minor spots/veins of tan coloured quartz-sericite. Clasts are angular up to 3cm across, fine grained pale green-grey in colour with a weak porphyritic texture, very similar to 146.39-150.62m. Sulphides are poor. Quartz-sericite produces a fine overprinting crackle breccia.				3	5	5											133344	78.81	80.00	1.19	<0.01	<0.1
				150.62-150.65m - Fine grained and laminated, sheared? Fabric 40 tca.																133345	80.00	80.69	0.69	<0.01	<0.1
				150.81-150.86m - Quartz vein, 50 tca, white coloured and fine grained with irregular veins/chunks of quartz-sericite.				3	5	5										133346	80.69	82.00	1.31	<0.01	<0.1
				151.70-151.88m - Quartz vein, 35 tca, white coloured fine grained quartz with blebs/chunks of quartz-sericite.																133347	82.00	84.00	2.00	<0.01	<0.1
				Lct is bottom of quartz vein.																133348	84.00	85.34	1.34	<0.01	0.3
																				133349	85.34	86.00	0.66	0.01	0.4
151.88	161.97	9z	AXXZ	**Andesite, bleached and brecciated** - Dull green-grey coloured, fine grained grainy looking rock. Weak ghostly porphyritic texture. Moderate quartz stockwork, locally strong. Quartz veins are white coloured and fine grained with an irregular pattern, slight preferred orientation subparallel tca. Weak sulphides except at base.				1	2	1											133350	86.00	88.17	2.17	<0.01	0.3
				151.88-154.10m - Bleached.				2	5	3										133351	88.17	88.73	0.56	<0.01	1.1
				159.18-160.57m - Strong quartz stockwork, moderate siliceous alteration.				1	5	4										133352	88.73	90.00	1.27	0.01	1
				161.28-161.97m - Quartz veining with chunky honey brown sphalerite (+galena) aligned with veins. Largely at top and bottom of interval. Weak silicification.					2	2					1	2	7			133353	90.00	92.00	2.00	<0.01	0.9
				Lct is at end of sulphides, rocktype continues below.																133354	92.00	94.00	2.00	0.01	0.6
																				133355	94.00	96.00	2.00	<0.01	0.2
161.97	183.44	9a	AXXX	**Andesite, unaltered** - Dull green-grey coloured, fine grained with minor quartz-carbonate veinlets at a shallow angle tca. Weak porphyritic texture with up to 2mm long lath shaped, subhedral crystals possibly sericite altered hornblende. Groundmass is very grainy.											2					133356	96.00	98.00	2.00	<0.01	0.2
				161.97-168.00m - Weak bleaching and breccia texture, decreasing with depth. Clasts are rounded, medium grained and medium grey coloured.				1	1	3										133357	98.00	100.00	2.00	<0.01	0.7
				176.0-179.89m - Increasing quartz crackle breccia.					2											133358	100.00	102.00	2.00	0.01	2.3

Depth (m)				DESCRIPTION - LITHOLOGY	STRUCTURE		ALTERATION (1-5 = v wk-v stg)							MINERALIZATION (%)						Sample No.	Interval (m)			Au g/t	Ag g/t
From	To	Lith	Code		Type	Angle	Sericite	Qtz Stk	Si Flood	Bitumen	Chlorite	Epidote	Fe Ox	Py	Gn	Sph	Po	Cpy	Other		From	To	Width		
				176.43-176.45m - 2cm fine grained quartz-sericite vein, sharp contacts, 70 tca.	Qtz-cb vn	70														133359	102.00	104.00	2.00	0.03	3.8
				179.89-181.00m - Minor disseminated pyrite and small strung out blebs of sphalerite. Weak to moderate siliceous alteration.			1	2	2					2		1				133360	BLANK			<0.01	<0.1
				181.00-183.44m - Increasing siliceous and sericite alteration. Weak breccia texture with rounded clast to 3cm. Matrix is dark grey black coloured, and fine grained			2	1	2											133361	104.00	106.00	2.00	0.02	2.1
				Lct marks a change in alteration.																133362	106.00	108.00	2.00	0.04	2.3
																				133363	108.00	110.00	2.00	0.01	1.4
183.44	190.75	9z	AXXZ	**Andesite, brecciated** - Similar to 151.88-161.97m. Dull green-grey coloured, with a fine grained medium grey coloured altered matrix. Strong siliceous alteration with irregular shaped almost fluidal shaped clasts. Several stages of cross-cutting quartz +/- sericite veinlets at various angles to ca. Ghostly plag crystals plus minor white/tan coloured, lath shaped crystals similar to 161.97-183.44m. Abundant fine grained pyrite in matrix.																						
							1	2	5					5						133364	110.00	112.00	2.00	0.01	1.8
				Lct is a sharp decrease in alteration, 10 tca.	Lct	10														133365	112.00	114.00	2.00	0.19	5.5
																				133366	114.00	116.00	2.00	0.07	4.9
190.75	214.23	9a	AXXX	**Andesite** - Dull green-grey coloured, fine to medium grained, with minor quartz veining and a faint ghostly plag porphyritic appearance. Short brecciated intervals are similar in appearance to brecciated andesite at 183.44-190.75m. Weak crackle breccia.																					
								1	1					1						133367	116.00	118.00	2.00	0.03	4.1
				194.55-196.18m - Breccia, gine grained pyrite in matrix. Pale green coloured, fine grained fluidal clasts. Locally strong quartz stockwork.																					
							1	2	4					5						133368	118.00	118.54	0.54	0.02	3.7
				196.18-199.95m - Weak breccia at top, weakens with depth.																133369	118.54	119.05	0.51	0.09	3
				199.95-201.08m - Chunky quartz veining with small quartz pods and 1cm banded quartz vein with ca. Fine grained pyrite in matrix. Contact mark a distinct decrease/end to brecciation.			1	5	2					5						133370	119.05	120.00	0.95	0.07	1.1
				206.92-209.42m - Breccia, fine grained dark coloured pyrite-bearing matrix with pale green coloured, weakly porphyritic clasts. Clasts are flattened and aligned 45 tca, over 40cm at top of interval. Fine grained anastomosing matrix.																					
								3	1		1			5						133371	120.00	122.00	2.00	0.05	0.9
				212.0-214.23m - Weak quartz stockwork, stronger pyrite near base.																					
								3	1		1			5						133372	122.00	122.92	0.92	0.03	1.9
				Lct, brecciation continues below, but host rock appears different.																133373	122.92	124.00	1.08	0.03	6
																				133374	124.00	126.00	2.00	0.06	6.7
214.23	224.07	9a	AXXX	**Andesite, tuff** - Dark green coloured, fine grained to weakly plag porphyritic, grainy texture. Minor quartz veinlets to 2mm thick produce a weak crackle breccia texture. None to weak alteration, faint breccia.																					
								1						1						133375	126.00	128.00	2.00	0.17	3.2
				214.23-216.59m - Moderate quartz stockwork, irregular shaped to thin lenses, oriented 35 tca. Minor chlorite alteration of matrix and weak fine grained pyrite.																					
								3			1			2						133376	128.00	128.81	0.81	0.01	0.6
				Lct marks a change in rocktype.																133377	128.81	130.14	1.33	<0.01	0.7
																				133378	130.14	132.00	1.86	<0.01	0.4

0.00	1.52	OVB	CAS	**Casing**, minor recovery of overburden.																					
1.52	14.94	9a	AXXX	**Andesite** - Dark green-greyish coloured, fine grained grainy texture with moderate quartz-carbonate crackle breccia. Weak porphyritic texture. Minor fracture fill blebs to locally strong disseminated pyrite.				3						0.5						133489	1.52	2.00	0.48	<0.01	2.2
				Lct is sharp, intrusive at 40 tca and cuts fabric in andesite.	Lct	40														133490	2.00	4.00	2.00	0.05	2.1
																				133491	4.00	6.00	2.00	0.06	2.4
14.94	22.04	22a	D/AX	**Dyke** - Dark black coloured, very fine grained with a weak porphyritic texture of fine white coloured rounded fsp. Minor rusty weathering along fractures. Minor quartz veinlets to 3mm. Pyrite observed as fine grained crystals in small blebs. Weakly chilled over 3cm at base.										1						133492	6.00	8.00	2.00	0.12	1.5
				Lct is sharp, 40 tca.	Lct	40														133493	8.00	10.00	2.00	0.09	2.5
																				133494	10.00	12.00	2.00	<0.01	1.6
22.04	34.32	9a	AXXX	**Andesite, porphyritic** - Similar to 1.52-14.94m but with a more prominent and variable plag porphyry texture. Contains metre long intervals of plag porph with gradational contacts. Moderate quartz veining at a high angle tca, with a minor quartz-carbonate crackle breccia that appears to overprint the veins.			1	2	1					3						133495	12.00	14.00	2.00	0.02	1.6
				30.0-31.0m - Minor fine grained chlorite matrix breccia.							2									133496	14.00	14.94	0.94	<0.01	0.7
				Lct is faulted at a <cm thick rusty weathering gougey fault, 25 tca.	Lct	25														133497	14.94	16.00	1.06	<0.01	<0.1
																				133498	16.00	18.00	2.00	<0.01	<0.1
34.32	39.22	9a	AXXX	**Andesite** - Dark green to grey coloured, fine grained, with a weak quartz crackle breccia. Faint hornblende crystals, becomes weakly plag porphyritic in last metre. Minor crackle breccia, fairly uniform.																133499	18.00	20.00	2.00	<0.01	<0.1
				39.21-39.22m - Fault, gougey. Fine grained, grey coloured. 30 tca																133500	STD	PM427		3.5	1.3
				Lct gougey fault over <1cm, 30 tca.	Lct	30														133501	20.00	22.04	2.04	<0.01	<0.1
																				133502	22.04	24.00	1.96	<0.01	<0.1
39.22	45.01	7s	QBXX	**Quartz vein breccia** - Dull green-grey coloured, fine grained brecciated clasts of andesite in a quartz-rich (30%) matrix. Quartz matrix is fine grained from veinlets to large chunks. Veins typically 45 tca. Strong fine grained pyrite throughout matrix, somewhat concentrated, very minor sphalerite.				5	1			0.5		10		0.5				133503	24.00	26.00	2.00	0.11	0.2
				39.22-41.14m - Quartz vein with 80% quartz. Several large knots of epidote.				5				0.5								133504	26.00	28.00	2.00	<0.01	0.4
				Lct marks a change to strong carbonate alteration.																133505	28.00	30.00	2.00	<0.01	<0.1
																				133506	30.00	32.00	2.00	<0.01	0.3

45.01	47.10	7s	QBXX	**Carbonate Breccia** - Light grey-white coloured, fine to medium grained with an irregular, swirled texture. Clasts are rounded up to 3cm across.										5						133507	32.00	33.00	1.00	<0.01	0.5
				46.70-47.10m - Jig-saw fit breccia with carbonate matrix.																133508	33.00	34.32	1.32	0.02	0.4
				Lct marks a sharp decrease in carbonate and brecciation.																133509	34.32	36.00	1.68	<0.01	1
																				133510	36.00	38.00	2.00	0.01	0.5
47.10	60.12	9Lt	ALXX	**Andesite, tuff, lapilli tuff** - Dark green coloured, fine grained with a variable quartz-carbonate matrix breccia. Increasing lapilli with depth, especially noticeable after 56.0m. Weakly quartz altered rock. Minor plag porphyritic texture including lapilli. Minor fine grained disseminated pyrite, sometime observed as up 1mm euhedral crystals.				3	2					3						133511	38.00	39.22	1.22	<0.01	0.7
				48.38-49.26m - Dark coloured, fine grained hydrothermal breccia. Angular fragments with abundant pyrite in matrix.				4						10						133512	39.22	40.20	0.98	0.05	2.4
				50.28-50.67m - Quartz-fsp vein. Light greyish chunky quartz with white needle-like fsp. Cts 20 tca.				5												133513	40.20	41.14	0.94	0.14	2.7
				Lct is irregular.																133514	41.14	42.14	1.00	0.13	1.4
																				133515	42.14	43.14	1.00	0.63	4
60.12	62.79	7a	PIPX	**Plagioclase Porphyry** - Dull green-grey coloured, fine grained with subhedral fsp to 5mm, but generally 2mm. Incresing crackle breccia with depth, with a fine grained dark coloured matrix (chlorite and pyrite). Moderate fine grained disseminated pyrite.																133516	43.14	44.14	1.00	0.27	2.3
				61.0-62.79m - increasing crackle breccia, increasing siliceous alteration.				1	2					3						133517	44.14	45.01	0.87	0.04	1.5
				Lct is weakly gradational with a decrease in plag phenos.																133518	45.01	46.00	0.99	0.03	3.8
																				133519	46.00	47.10	1.10	0.1	2.8
62.79	73.34	9a	AXXX	**Andesite, altered** - Dark green-grey coloured, fine grained with a variable siliceous alteration and brecciation. Locally abundant plag phenos almost as PP clasts scattered through unit with moderate pyrite and siliceous alteration of matrix. Quartz stockwork with light grey to white coloured medium grained quartz (+fsp). Altered andesite clasts are fine grained and irregular in shape. Sporadic sphalerite.				1	2					4		0.5				133520	STD	PM405		0.28	0.6
				62.79-65.88m - Increased siliceous alteration.				3	3					7						133521	47.10	48.38	1.28	0.02	2.8
				72.0-73.34m - Minor carbonate-bearing veins.																133522	48.38	49.26	0.88	<0.01	4
				Lct marks a change in rocktype.																133523	49.26	50.28	1.02	0.01	2.2
																				133524	50.28	51.28	1.00	<0.01	2.2
73.34	78.48	7a	PIPX	**Plagioclase Porphyry, Altered** - Dark green-black coloured, fine grained with a variable but generally strong plag porphyry texture. Alteration is locallized, and irregular in form and very fine grained. Minor fine grained quartz-carbonate veins often with minor fine chlorite/biotite? crystals <1mm long. Moderate disseminated pyrite. Minor carbonate alteration.				2	2					5						133525	51.28	51.87	0.59	<0.01	1.3
				Lct marks a decrease in alteration and brecciation.																133526	51.87	53.00	1.13	0.05	2.9
																				133527	53.00	54.00	1.00	0.05	2.5

Silver Tip - Drilling south dipping Silver Tip structure/vein. Drilling intersected a short mineralized zone apparently related to a large porphyry (Premier Porphyry? Fine grained). Hole ends in swarm of several felsic dikes of Portland of Hyder swarms, and late andesite dikes cut everything. Downhole suvey az suspect.

P09-041

Unicorn - Drilling east through main Unicorn trend (NS) on section with #2(?) Adit (near A-Vein). Hole is mostly andesite with fine grained dikes (Premeir Porphyry Unit?). Moderate stockwork and sericite alteration throughout. Main feature is wide fault zone near bottom with strong vuggy quartz.

UTM E (NAD 83): 436506	**Azimuth (deg):** 090	**Start:** Sept 26,2009

152.53	163.34	9a	AXXX	**Amygduloidal Andesite -** grey green fine to medium grained groundmass as andesites up hole, but with abundant white irregular shaped quartz calcite filled amygdules. Amygdules appear to be strained and squished forming irregular shaped unlike nicely round amygdules seen in the 22c late dikes. Moderate quartz calcite stockwork throughout, 1% disseminated pyrite with some increased pyrite in veining. Weak fabric or bedding with aligned squished amygdules 60 tca.	fol / bed?	60		2			2			1						134359	65.23	66.20	0.97	0.29	4.3
				Lower contact farily sharp 60 tca, looks like a bedding contact	LC	60														134360	66.20	67.20	1.00	0.15	1.9
																				134361	67.20	68.20	1.00	<0.01	0.8
163.34	246.34	9a	AXXX	**Andesite -** grey green andesite with moderate to strong quartz carboante stockwork, moderately chloritic, intermittent beige sericitic zones, 1-2% disseminated pyrite throughout. Alteration and veining increases lower in hole towards massive wide quartz veining as indicated. Generally grainy mottled texture likely due to alteration, but may be lapilli texture. Alteration is strong in areas, and may be obscuring primary textures, so the unit is undifferentiated andesite. Stockwork is largely 50-70 tca.	stkwk	60	1	3	1		2			2						134362	68.20	69.20	1.00	<0.01	0.9
				179.3-181.2 - moderate beige sericite staining			3												134363	69.20	70.20	1.00	<0.01	0.8
				197.75-209.65 - strong beige sericite bleaching, moderate fine creamy carbonate stockwork, fine grey seams, 2% disseminated pyrite, fine gougy fault seams generally 50-70 tca.	flt gg	60	4	2	1					2						134364	70.20	71.20	1.00	0.01	1.1
				213.7 - 3cm fault gouge 40 tca	flt gg	40														134365	71.20	72.20	1.00	0.68	1.4
				214.42 - 3cm fault gouge 50 tca	flt gg	50														134366	72.20	73.20	1.00	<0.01	0.7
				216.5-221.5 - strong beige sericite staining with weak fine quartz creamy carbonate stockwork.			4	2												134367	73.20	74.20	1.00	<0.01	0.8
				221.5-223.9 - messed up section with strong sericite alteration, quartz carbonate veining, shear foliation from 0-70 tca, small fodl structures.			4	3	2											134368	74.20	75.20	1.00	<0.01	0.7
				223.9-231.9 - massive grey and white brecciated quartz veining with some silicified host chunks, fine grey selvages, brittle fracturing, about 5% creamy carbonate with quartz. 3% fine pyrite thoughout. General fracturing and seam fabric at 50-70 tca. Some fine bluey black seams look like stylolites in limestone (fine wiggly lines)	shear fol	60	4	5	5		1			3						134369	75.20	76.20	1.00	<0.01	0.9
				231.9-240.2 - about 50/50 quartz and sericite altered host. Still part of a messed up alteration zone associated with the massive veining, which is likely associated with a large shear structure in the Unicorn gully. Fine creamy carbonate and quartz stockwork, some gougy sections at 70 tca. Large barren looking white quartz veining overprinting earlier stockwork and silicification.	gg	70	4	4	3					2						134370	76.20	77.20	1.00	0.07	1
				240.2-246.34 - moderate sericite staining, moderate quartz stockwork, 2% pyrite associated with veining and disseminated.			3	3	2					2						134371	77.20	78.20	1.00	<0.01	0.8

																				134568	25.00	26.00	1.00	0.02	<0.1
111.71	112.45	22b	D/AN	**Mafic dike -** strongly magnetic dark grey black with fine calcite spots and fine pink fsp crystals throughout. Chill margin on this dike indicate it is younger than the previous one.																134569	26.00	27.00	1.00	0.02	0.9
				Lower contact sharp 40 tca.	LC	40														134570	27.00	28.00	1.00	0.01	1.2
																				134571	28.00	29.00	1.00	0.07	1
112.45	212.75	9a	AXXX	**Andesite -** grey fine grained andesite. Weak to moderate quartz carboante stockwork with increased areas as indicated. 2% fine to coarse grained pyrite disseminated. Weak to moderate silicification and increased hardness. Intermittent veinlets with red brown or pale sphalerite with pyrite and possible trace galena.																							
				125.8 - gougy gravelly section, fault, no orientation, just a pile of pyritic sand and gouge.				2	2		1			2	0.1	0.1				134572	29.00	30.00	1.00	0.03	4.7
														5						134573	30.00	31.00	1.00	0.09	2.7
				125.9-129.17 - about 50% white and dark green quartz calcite chlorite veining. Coarse grained crystals of all components. No pyrite assoicated with this veining, but host has 3% disseminated. Irregular, but roughly 40 tca.																						
					qtz cc chl vn	40								2						134574	31.00	32.00	1.00	0.12	2.8
				133.92-134.96 - strong quartz stockwork with fine pyrite sphalerite, trace galena. Sulfides are fine grained and sphalerite is generally pale wispy or dark grey. Zone irregular but roughly 30 tca.																						
					qtz stkwk	30		4			2			4	0.5	3				134575	32.00	33.00	1.00	0.01	0.9
				134.96-179.65 - weak to moderate quartz carbonate stockwork and zones if increased silicification as increased hardness. Occasional grey microcrystaline grey cherty vein (significant due to historical cherty tuff model for mineralization, here chert is clearly veining). 2% medium grained disseminated pyrite. Some spotty texure to andesite as spots of faint calcite.				2	2					2						134576	33.00	34.00	1.00	0.05	1.3
				179.6-180.86 - strong quartz breccia with angular to rounded silicified andesite and quartz clasts in a grey and white qquartz matrix with minimal calcite. Some brownish dirty looking clasts (could these be barite? This is seen sometimes with veining on surface. ?)																134577	34.00	35.00	1.00	0.07	1.1
				180.86-195.04 - moderate to strong stockwork, silicification and brecciated sections. Some veining has pale pink dolomite crystals. Generally stockwork oriented at high angels to core axis (60-90). 3% fine disseminated pyrite. Some grey cherty veins and clasts. Trace dark brownish red sphalerite.	stckwk	80		4	3					3		0.1				134578	35.00	36.00	1.00	0.12	1
				195.04-200.75 - strong quartz calcite stockwork and breccia, cherty quartz in matrix. 2% fine disseminated pyrite, trace dark brown sphalerite as locallized clusters of crystals. Stockwork generally fairly high angle to core axis.	stckwk	70		5	4					2		0.1				134579	36.00	37.00	1.00	0.06	2.2
				200.75-212.75 - weak to moderate fine quartz stockwork with moderate silicification and increased hardness throughout. 2% fine disseminated pyrite, 1% fine veinlets of pale orangy brown sphalerite throughout.																						
					stckwk	70		3	3					2		1				134580	37.00	38.00	1.00	<0.01	1.5
																				134581	38.00	39.00	1.00	<0.01	0.7
212.75	260.58	9Lt	ALXX	**Andesite Lapilli -** grey fine grained andesite with sub-angular to sub-rounded andesitic clasts in fine grained andesitic matrix. Clast are generally darker than matrix. Weak quartz carbonate stockwork.

4.57	10.99	9Lt	ALXX	**Andesite, Lapilli** - Dark grey-green coloured, with a fine to medium grained matrix and angular clasts up to 2cm long aligned at 50 tca. Matrix appears weakly altered and is lighter coloured than the clasts. Matrix supported with dark almost black coloured, plag porphyritic clasts. Rare quartz sericite veinlets at angle to aligned clasts. Rare pyrite veinlets observed.										0.5						135172	4.57	6.00	1.43	0.02	<0.1
				9.5-10.99m - rusty weathering and moderately fractured.									4							135173	6.00	8.00	2.00	0.02	<0.1
				10.99 - Lct is fairly sharp, 45 tca with a distinct change in rock and minor alteration over several cm above and below contact.	Lct	45														135174	8.00	10.00	2.00	0.01	<0.1
																				135175	10.00	10.99	0.99	0.03	<0.1
10.99	12.85	9a	AXXX	**Andesite** - Dark green-grey coloured, fine grained with a weak porphyritic texture of minor fine, rounded plagioclase crystals. Weakly vuggy with thin bands containing elongate cavities.									1							135176	10.99	12.00	1.01	<0.01	<0.1
				12.85m - Fairly sharp similar to contact above, weakly broken but distinct change in rock.	Lct	45														135177	12.00	12.85	0.85	0.01	<0.1
																				135178	12.85	14.00	1.15	0.02	<0.1
12.85	18.79	9a	AXXX	**Andesite** - Dark green-grey coloured, fine to medium grained with minor ghostly grey, rounded plag crystals. Several rusty weathered and weakly vuggy intervals over 40cm. Minor quartz veins/veinlets at a high angle tca, also locally producing an irregular stockwork. Becomes chunky and rusty weathered at base.									2							135179	14.00	16.00	2.00	0.06	0.2
				18.79m - Lct is a distinct change in rocktype similar to fine grained andesite above. Rusty weathered.																135180	BLANK			<0.01	0.6
																				135181	16.00	18.00	2.00	0.02	0.5
18.79	23.63	9a	AXXX	**Andesite** - Pale green-grey coloured, and fine grained. Rusty weathered through majority of unit, locally very strong. Very siliceous, increasing downhole. Unit appears to be fine grained andesite at top over 1m, but rest of altered unit has the appearance of an intrusion, contacts are sharp but weathered and broken. Minor white quartz-carbonate veinlets.				1	3				4	1						135182	18.00	18.79	0.79	0.06	0.5
				23.63m - Lct is a change in rocktype but contact is fractured and rusty weathered.																135183	18.79	20.00	1.21	<0.01	<0.1
																				135184	20.00	22.00	2.00	0.01	<0.1
23.63	50.47	9a	AXXX	**Andesite** - Green-grey coloured, with a fine to medium grained grainy groundmass. Moderate quartz (+/- carbonate) veinlets and stockwork creating a prominent breccia texture. Rare small blebs of sphalerite, variable disseminated to locally fracture fill pyrite.																135185	22.00	23.63	1.63	0.02	0.1

64.32	71.47	9t	ATXX	**Andesite, tuffaceous and fragmental** - Dark green-grey coloured, fine to medium grained, with a weak medium grained plag and hornblende porphyritic texture. Abundant coarse grained chunky quartz creating a strong stockwork and comprising up to 30% of unit. Minor chlorite with coarse quartz. Andesite groundmass has a moderate crackle breccia texture with a fine grained black matrix. Minor pyrite observed as small blebs, some finely disseminated. Rare sphalerite veinlets.			1	3	1		1			2		0.5				135197	38.00	40.00	2.00	0.09	1.2
				71.47m - Lct marks a weakening of alteration and brecciation.																135198	40.00	42.00	2.00	0.41	1.8
																				135199	42.00	43.00	1.00	0.06	<0.1
71.47	80.93	9a	AXXX	**Andesite** - Similar to 50.47-64.32m. Pale green-grey coloured, medium grained uniform rock with little alteration and minor quartz-carbonate veinlets. Weak breccia texture created by weak siliceous-sericite alteration. Minor disseminated pyrite.			0.5	1	1					0.5						135200	43.00	44.00	1.00	0.13	3.6
				80.93m - Lct marks a change in alteration.																135201	44.00	45.00	1.00	0.06	1.6
																				135202	45.00	46.00	1.00	0.25	4.5
80.93	108.83	9z	AXXZ	**Andesite, bleached** - Pale green to tan coloured, fine to medium grained groundmass with a weakly porphyritic texture of white to tan coloured, rounded elongate plag?. Alteration is variable with intervals of strong quartz-sericite, chunky white coloured, coarse grained chunky quartz, and short intervals of brecciated andesite containing a wispy texture. Quartz-sericite (bleaching) is predominant with other alteration occuring as intervals up to 2m long. Bleaching is weak in last 3m. Disseminated pyrite is moderate through most of unit, with short sections of pyrite stringers/veinlets.			2	2	3					2						135203	46.00	46.89	0.89	0.23	6.1
				88.98-92.16m - Weak alteration and bleaching.			1	2	1					1						135204	46.89	48.17	1.28	0.24	3.1
				98.0-106.3m - Strong bleaching (quartz-sericite alteration). Weakly vuggy and brecciated. Minor disseminated pyrite.			3	3	4					1						135205	48.17	49.00	0.83	0.17	0.8
				100.0-100.3m - Quartz vein breccia, with large knots of pyrite and some galena.				5	1					5						135206	49.00	50.00	1.00	<0.01	0.5

				106.3-108.83m - Weak alteration and bleaching. Moderate brecciation.				2	1											135207	50.00	50.47	0.47	0.01	0.5
				108.83m - Lct marks a change in alteration.																135208	50.47	51.00	0.53	0.02	0.2
																				135209	51.00	52.00	1.00	0.01	0.2
108.83	127.37	9a	AXXX	**Andesite** - Dark green to black coloured, fine to medium grained with a weak plag porphyritic texture. Weak pseudo breccia texture with a black coloured (chlorite/biotite?), fine grained almost wispy matrix. Some alteration of clasts. Moderate disseminated pyrite with euhedral crystals <1mm. Moderate quartz veinlets creating a weak stockwork texture.				3	1		2			3							135210	52.00	54.00	2.00	0.01	0.3
				114.0-116.0m - Subrounded blebs to 5mm of fine grained pyrite.																135211	54.00	56.00	2.00	0.01	<0.1
				117.0-123.0m - Weaker chlorite/biotite alteration.				3	1		1			2						135212	56.00	58.00	2.00	0.02	0.7
				126.0-127.37m - Faulted containing polished surfaces oriented with ca. Well brecciated with <1cm subrounded fragments.																135213	58.00	60.00	2.00	0.04	1.2
				127.37m - Fractured lct, with quartz vein below, 35 tca.	Lct	35														135214	60.00	62.00	2.00	0.02	0.9
																				135215	62.00	63.00	1.00	0.01	0.2
127.37	136.59	9z	AXXZ	**Andesite, siliceous** - Pale green-grey coloured, fine to medium grained with moderate siliceous alteration, abundant quartz veinlets (quartz crackle breccia), and several thick quartz veins.				3	3											135216	63.00	64.32	1.32	0.03	1.5
				136.37-136.49m - White coloured, fine grained quartz vein.																135217	64.32	65.00	0.68	0.05	1.5
				133.38-133.65m - White coloured, fine grained quartz vein with some inclusions of andesite.																135218	65.00	66.00	1.00	0.17	1
				134.59-134.88m - White coloured, fine grained quartz vein.																135219	66.00	67.00	1.00	0.08	1.9
				136.59m - Lct marks a change in alteration, weakly gradational.																135220	BLANK			<0.01	0.3
																				135221	67.00	68.00	1.00	0.09	1.3
136.59	149.19	9a	AXXX	**Andesite, porphyrytic/flow** - Dark green coloured, fine to medium grained with a weak and variable plag porphyritic texture. Minor dark almost black, weakly plag porphyritic angular fragments to 3cm. Small blebs and fracture fill pyrite observed through most of unit. Locally strong sphalerite over 5cm occuring as small blebs, becomes weaker after 146.0m. Weak wispy biotite crackle breccia. Moderate quartz-carbonate stockwork, along with minor quartz veining. Becomes weakly altered in last several metres.				3	1					5		0.5				135222	68.00	69.00	1.00	0.12	8.9
				136.59-146.0m - Locally strong sphalerite.												2				135223	69.00	70.00	1.00	0.03	0.8
				146.0-149.19m - Moderate localized sphalerite.												0.5				135224	70.00	71.00	1.00	0.05	<0.1
				149.19m - Lct marks a distinct change in rocktype, with abundant fragments below, ct at 50.	Lct	50														135225	71.00	71.47	0.47	0.01	<0.1
																				135226	71.47	72.00	0.53	0.01	0.2
149.19	167.56	9x	ABXX	**Andesite, Volcanic breccia/Fragmental** - Fine to medium grained medium green-tan coloured matrix and dark coloured plag porphyritic angular fragments. Plag phenos are white coloured, up to 1mm diameter and rounded to subrounded. Matrix supported with several short clast-poor intervals, especially lower in unit. Weak quartz veining. Poor sulphides.								0.5							135227	72.00	74.00	2.00	0.01	0.3
				151.64-154.44m - Heavily bleached with a small fracture with ca. Angular fragments observed.			3		1											135228	74.00	76.00	2.00	0.01	0.5
				167.56m - Lct marks a change in rock.																135229	76.00	78.00	2.00	0.01	0.2
																				135230	78.00	80.00	2.00	0.01	<0.1

From	To	Lith	Code		Type	Angle	Sericite	Qtz Stk	Si Flood	Bitumen	Chlorite	Epidote	Fe Ox	Py	Gn	Sph	Po	Cpy	Other		From	To	Width		
167.56	200.02	9a	AXXX	**Andesite, brecciated** - Dark green to black coloured, fine to medium grained, with a prominent hyrdothermal brecciation. Clasts are subrounded to angular, often elongate, with a medium green (postachio?) colour and a fine to porphyritic texture. White coloured plag phenos are rounded and up to 1mm in dia. Matrix is dark coloured, almost black and fine grained. Brecciation pattern creates a wispy texture to rock with jigsaw fit clasts common. Minor euhedral to rounded pyrite to 2mm but typically <1mm. Locally strong fine disseminated pyrite occurring as thin pyrite-rich veins. Several short sections of fragmentals similar to unit above, but <1m and not common. Weak quartz-carbonate veining.																								
								2	0.5			1		1						135231	80.00	80.93	0.93	0.03	2.6
				192.14-193.04m - Quartz vein. Bright white coloured, coarse grained with sharp contacts at 10 tca.					5											135232	80.93	82.00	1.07	0.11	3.8
				193.04-200.02m - Brecciation becomes more irregular with less angular and more fluidal shaped clasts.																135233	82.00	83.00	1.00	1.26	170.1
				196.68-197.29m - Quartz vein, with short inclusion of host. Bright white, coarse grained.					5											135234	83.00	84.00	1.00	0.3	6.7
				198.89-200.02m - Weak brecciation.																135235	84.00	85.00	1.00	0.23	4.2
				200.02m - Lct marks an end to brecciation.																135236	85.00	86.00	1.00	0.14	3.5
																				135237	86.00	87.00	1.00	0.99	135.6
200.02	248.78	9a	AXXX	**Andesite** - Medium green-grey, fairly uniform largely unaltered rock with a local very weak wispy brecciation. Moderate quartz-carbonate stockwork through most of unit. Larger quartz +/-carbonate veins observed at top of unit. Minor quartz crackle breccia. Very minor fine pyrite.																							
								2												135238	87.00	88.00	1.00	0.35	1.5
				200.02-222.0m - Quartz Veins up to 30cm thick, with sharp contacts 20-30 tca. Quartz is white coloured and medium to very coarse grained.																135239	88.00	88.98	0.98	0.01	0.8
				220.90-221.20m - Weathered fracture at top with weathered crumbly rock below.																135240	BLANK			0.01	0.3
				236.75-237.08m - Fault, sand and gravel. Uct fairly distinct at 60 tca.																135241	88.98	90.00	1.02	0.01	1.4
				248.78m - Sharp contact at 35 tca. Minor alteration over 10cm at base.																135242	90.00	91.00	1.00	0.01	0.3
																				135243	91.00	92.16	1.16	0.01	<0.1
248.78	267.30	9a	AXXX	**Andesite, siliceous** - Dull grey-tan coloured, fine grained with a quartz banded/laminated appearance. Very siliceous. Variable but abundant pyrite, as fine disseminations concentrated in thin bands, minor small blebs. Minor small subangular porphyritic fragments to 3cm surrounded by a siliceous matrix. Fairly uniform unit.

From	To	Lith	Code		Type	Angle	Sericite	Qtz Stk	Si Flood	Bitumen	Chlorite	Epidote	Fe Ox	Py	Gn	Sph	Po	Cpy	Other		From	To	Width		
0.00	3.04	OVB	CAS	**Casing**																					
3.04	62.89	11	BAXX	**Mudstone** - Dark coloured black, fine grained and locally weakly brecciated. Thin bands/laminations of medium grey-tan coloured and fine to medium grained. Variable moderate quartz-carbonate crackle breccia. Moderate to strong pyrite as blebs, fracture fill, disseminated as 1mm euhedral crystals. Pyrite crystals appear to have grown across banding.										5						135392	3.04	4.00	0.96	0.02	1
				59.5-62.98m - Weak brecciation with abundant disseminated pyrite.																135393	4.00	6.00	2.00	0.01	1.2
				62.89M - Lct, sharp intrusive contact, 70 tca.	Lct	70														135394	6.00	8.00	2.00	0.04	2.9
																				135395	8.00	10.00	2.00	0.01	1
62.89	69.51	7a	PIXX	**Plagioclase Porphyry** - Dull green-grey coloured, fine to medium grained with minor pyrite observed as fine grained fracture fill. Weakly porphyritic with fine ghostly, rounded plag phenos.										2						135396	10.00	12.00	2.00	0.15	2.5
				69.51m - Lct sharp, 70 tca.																135397	12.00	14.00	2.00	0.01	1.3
																				135398	14.00	16.00	2.00	<0.01	1.4
69.51	71.79	7a	PIXX	**Plagioclase porphyry** - Dark coloured, fine grained matrix, with white coloured, elongate plag crystals to 3mm long, slightly rounded.																135399	16.00	18.00	2.00	0.01	22.2
				71.79m - Lct sharp, 50 tca.	Lct	50														135400	BLANK			<0.01	<0.1
																				135401	18.00	20.00	2.00	0.03	3.7
71.79	75.61	7a	PIXX	**Plagioclase Porphyry** - Same as 62.89-69.51m. Dull green-grey coloured, fine grained. Weak breccia, minor pyrite.										1						135402	20.00	22.00	2.00	0.01	2.3
				75.61m - Sharp lct, 70 tca.	Lct	70														135403	22.00	24.00	2.00	0.01	2
																				135404	24.00	26.00	2.00	0.06	3.4
75.61	90.74	7a	PIXX	**Plagioclase Porphyry** - Similar to 69.51-71.79m. Dark coloured, fine grained with abundant and prominent elongate plag phenos. Minor fracture fill pyrite as small veinlets. Rock is very tight.										2						135405	26.00	28.00	2.00	<0.01	0.7
				90.0-90.74m - Slight increase in fracture fill pyrite.										5						135406	28.00	30.00	2.00	0.01	1.6
				90.74m - Lct is faint.																135407	30.00	32.00	2.00	0.01	1.3
																				135408	32.00	34.00	2.00	0.09	1.6
90.74	98.05	7a	PIXX	**Plagioclase Porphyry** - Dull green-grey coloured, fine grained with a variable breccia texture. Cm inclusions of mudstone with abundant euhedral pyrite. Minor quartz stockwork. Variable pyrite as small disseminations to 2mm, plus some fracture fill pyrite and pyrrhotite.										3			1			135409	34.00	36.00	2.00	0.02	1.9
				90.74-95.42m - Dull coloured with ghostly plag crystals.										3			1			135410	36.00	38.00	2.00	0.01	0.6

Depth (m)				DESCRIPTION - LITHOLOGY	STRUCTURE		ALTERATION (1-5 = v wk-v stg)							MINERALIZATION (%)						Sample No.	Interval (m)			Au g/t	Ag g/t
From	To	Lith	Code		Type	Angle	Sericite	Qtz Stk	Si Flood	Bitumen	Chlorite	Epidote	Fe Ox	Py	Gn	Sph	Po	Cpy	Other		From	To	Width		
				95.42-98.05m - Greenish coloured, weakly bleached and brecciated. Subhedral pyrite crystals to 3mm. Several short intrusions of white coloured, coarse grained quartz, with sharp contacts.																						
														5			1			135411	38.00	40.00	2.00	0.01	1
				98.05m - Lct is sharp, intrusive.																135412	40.00	42.00	2.00	<0.01	1
																				135413	42.00	44.00	2.00	0.01	0.3
98.05	99.12	22c	D/AP	**Dyke** - Dull green coloured, fine to medium grained matrix with euhedral, rimmed greenish coloured plag crystals to 3mm.																135414	44.00	46.00	2.00	0.02	0.9
				99.12m - Lct is intrusive, sharp with an irregular contact.																135415	46.00	48.00	2.00	0.21	2.8
																				135416	48.00	50.00	2.00	0.02	2.1
99.12	103.35	7a	PIXX	**Plagioclase Porphyry** - Light to dull green-grey coloured, fine to medium grained, with a weak plagioclase porphyry texture, and weak to moderate alteration (siliceous?). Rock is very hard. Weak quartz stockwork, plus several white coloured, coarse grained quartz veins including some small vugs and prismatic quartz crystals.																135417	50.00	52.00	2.00	0.01	1.5
				103.35m - Lct is gradational.																135418	52.00	54.00	2.00	0.05	3.3
																				135419	54.00	56.00	2.00	0.06	2
103.35	107.84	7a	PIXX	**Plagioclase Porphyry** - Similar to 75.61-90.74m. Dark coloured, fine grained matrix with prominent white to grey coloured, elongate plag crystals to 3mm long, slightly rounded. Minor fracture fill pyrite as small veinlets and rare pyrrhotite. Rock is tight, very hard (silica?). Several broken up inclusions of mudstone over <5cm, containing euhedral pyrite.																135420	BLANK			<0.01	<0.1
				107.84m - Lct is sharp and intrusive, 35 tca but slightly wavy.																135421	56.00	58.00	2.00	0.02	2.6
																				135422	58.00	59.00	1.00	0.31	5.5
107.84	109.14	22c	D/AP	**Dyke** - Dull green-grey coloured, fine grained with minor spotty subhedral carbonate blebs to 2mm.																135423	59.00	60.00	1.00	0.4	2.5

0.00	3.04	OVB	CAS	**Casing**																					
3.04	53.59	11	BAXX	**Mudstone** - Dark coloured black, fine grained and variably brecciated with a strong quartz-carbonate crackle breccia. Thin bands/laminations of medium grey-tan coloured and fine to medium grained, prominent through most of unit. Moderate to strong pyrite as blebs, fracture fill, and disseminated as 1mm euhedral crystals. Sporadic but minor galena. Pyrite crystals appear to have grown across banding.				2						5	0.5					135470	3.04	4.00	0.96	0.02	0.8
																				135471	4.00	5.00	1.00	<0.01	0.9
53.59	63.69	7a	PIXX	**Plagioclase Porphyry, brecciated** - Dull green-grey coloured, fine to medium grained, with a dark coloured, fine grained matrix. Brecciation is weak except for 57.13-60.57m where it is very strong. Moderate fracture fill pyrite through unit with subhedral pyrite to 5mm in strong brecciated area. Weak quartz-calcite stockwork as thin veinlets, ~45 tca. Brecciation is weak in last metre above lct.				1						3						135472	5.00	6.00	1.00	<0.01	0.6
				57.13-60.57m - Strong brecciation with increased pyrite, irregular pattern. Darker coloured (chlorite/biotite?). Weak disseminated carbonate.							2			7						135473	6.00	7.00	1.00	0.01	0.8
				63.69m - Lct marks an end to brecciation.																135474	7.00	8.00	1.00	<0.01	0.8
																				135475	8.00	9.00	1.00	0.01	1.2
63.69	93.90	7a	PIXX	**Plagioclase Porphyry** - Similar to above but unaltered. Medium to dark grey coloured, fine to medium grained with abundant subrounded to euhedral lathes of plag to 2mm. Moderate quartz-calcite veinlets, 45 tca, plus with a weak crackle breccia texture. Minor white coloured, coarse grained, quartz veins to 40cm thick with sharp contacts. Unit is fairly uniform, tight rocks with little fracturing. Minor small blebs of pyrite. Rare sporadic, small fracture fill blebs of pyrrhotite.				2						0.5			0.2			135476	9.00	10.00	1.00	0.25	0.9
				79.42-93.90m - Weak brecciation, minor blebs/fracture fill pyrite. Dark coloured, fine grained matrix (chlorite/biotite).							1			2						135477	10.00	11.00	1.00	0.03	0.6
				93.90m - Lct is sharp intrusive contact at high angle tca, slightly wavy.																135478	11.00	12.00	1.00	0.01	1.4
																				135479	12.00	13.00	1.00	0.01	3
93.90	95.17	22c	D/AP	**Dyke** - Green coloured, fine grained matrix with subhedral, slightly zoned plag to 5mm and with a slight green tinge. Contact are sharp.																135480	BLANK			<0.01	<0.1
																				135481	13.00	14.00	1.00	<0.01	2.6
95.17	115.24	7a	PIXX	**Plagioclase Porphyry** - Same as 63.69-93.90m.				2						0.5						135482	14.00	15.00	1.00	0.04	11

APPENDIX F

ASSAY DATA

- STATEMENT OF ANALYTICAL PROCEDURES
- ASSAY CERTIFICATES

ASSAYERS CANADA

8282 Sherbrooke Street,
Vancouver, B.C.
Canada V5X 4R6
Tel: 604 327-3436
Fax: 604 327-3423

Procedure Summary:

Gold (Au) Fire Assay

Elements Analyzed:

Gold (Au) – g/tonne

Procedure:

Lead flux and a silver inquart are added to the sample and mixed. Samples are fused in batches of 22 assays along with a natural standard and a reagent blank. This batch of 24 assays is carried through the whole procedure as a set.

After cupellation (which removes lead), the precious metal bead is parted in nitric acid to remove the silver. The remaining gold bead is either weighed (gravimetric finish) or dissolved in aqua regia and analyzed on an atomic absorption spectrometer, using a suitable standard set. The natural standard fused along with the sample set must be within 2 standard deviations of its known value or the whole set is re-assayed.

10% of the samples in a set are re-assayed and reported in duplicate, along with the standard and reagent blank.

Detection Limit:

Au – 0.01 g/tonne

ASSAYERS CANADA

8282 Sherbrooke Street,
Vancouver, B.C.
Canada V5X 4R6
Tel: 604 327-3436
Fax: 604 327-3423

Procedure Summary:

30 Element Aqua Regia Leach ICP-AES

Elements Analyzed:

Ag, Al, As, Ba, Be, Bi, Ca, Cd, Co, Cr, Cu, Fe, Hg, K, La, Mg, Mn, Mo, Na, Ni, P, Pb, S, Sb, Sc, Sr, Th, Ti, Tl, U, V, W, Zn, Zr

Procedure:

0.500 grams of the sample pulp is digested for 2 hours at 95°C with a 3:1 HCl:HNO_3 mixture. After cooling, the sample is diluted to 25mL with deionized water.

The solutions are analyzed by Inductively Coupled Plasma-Atomic Emission Spectra using standard operating conditions.

Each batch has 22 samples, 3 duplicates, one blank and two standards. Each batch will be rerun if the duplicates or the standards do not match the expected values.

Detection limit and analytical range are element specific.

ASSAYERS CANADA

8282 Sherbrooke Street,
Vancouver, B.C.
Canada V5X 4R6
Tel: 604 327-3436
Fax: 604 327-3423

Procedure Summary:

Metallic Gold Assay

Element(s) Analyzed:

Gold (Au) - g/tonne

Procedure:

The samples are pulverized to roughly 95% -150 mesh. Each sample is screened giving a +150 mesh fraction and a -150 mesh fraction.

The total weight of both fractions are recorded and both fractions are analyzed separately by Fire Assay for Au with total fusion on the +150 mesh fraction and duplicate fusions on the -150 mesh fraction.

The Net Au results are the combination of calculated values for both fractions.

Detection Limit : 0.01 g/tonne Au
