SWEET SPOT CLAIM
ROCK GEOCHEMISTRY REPORT

Craig Kennedy

August 2010

1.00 INTRODUCTION

This report provides the results of a rock geochemistry and prospecting program conducted on the Sweet Spot property in the Hawkins Creek (Yahk area) during 2009. The Sweet Spot claim is owned by Sara Kennedy of Kimberley B.C.

1.10 LOCATION & ACCESS

The Sweet Spot claim is located approximately 8.5 kms east of the town of Yahk B.C. The property is centered at UTM coordinates 575500 East – 5429500 North. The Sweet Spot claim's southern boundary is the international boarder between Canada and the USA. Access is gained off of highway 3 onto Hawkins Creek logging road. The property is accessed by a secondary logging road and an abandoned diamond drill access trail.

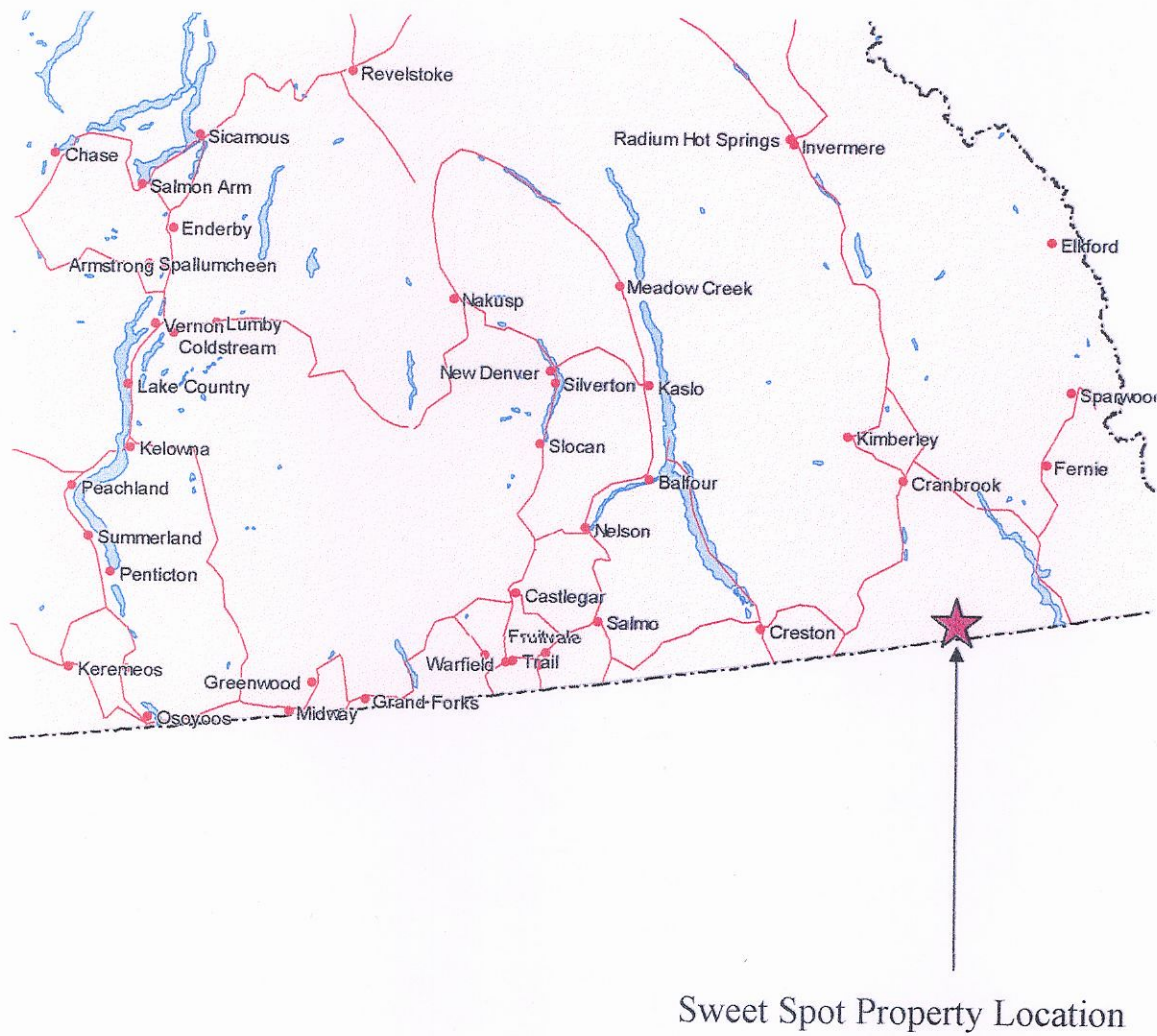

1.20 PHYSIOGRAPHY

The Sweet Spot claims are situated between 1400m and 1920m in elevation and consist of moderate to rugged topography. Forest cover is generally a mix of Lodgepole pine, Spruce, Balsam, and Larch. Outcrop is sparse and tree cover is dense, making surface exploration difficult. The lower elevation portion of the property has regenerated clear cut logging blocks.

1.30 HISTORY OF PREVIOUS EXPLORATION

The Sweet Spot claim covers an area that has been explored by various junior and senior mining companies in the past. Assessment report # 21786

Figure 1: Regional Location Map

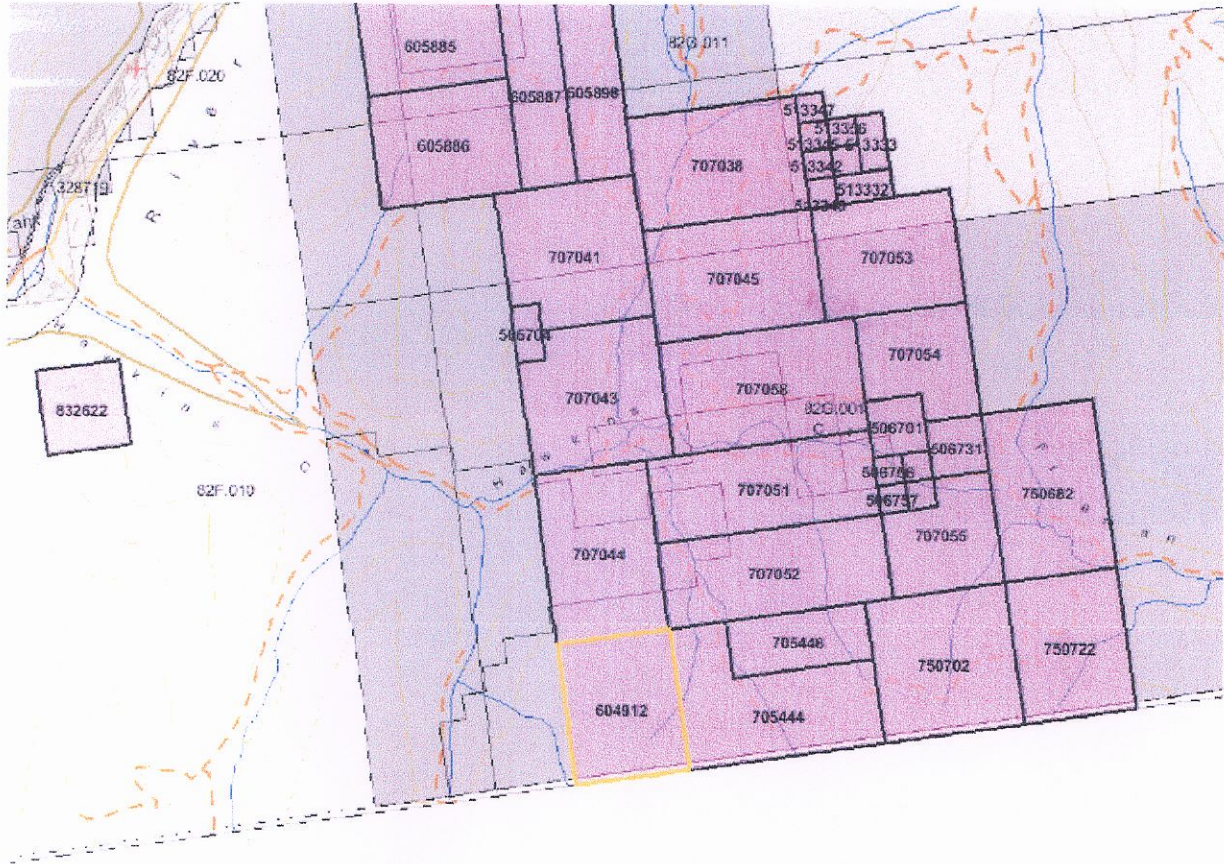

1.40 Purpose of work

Prospecting and rock geochemistry was conducted to ascertain if positive drilling results attained by Cominco (Assessment report # 21786) may represent an opportunity for discovering a massive sulphide veins system. The St. Eugene vein exists in the same structural domain 32 kms to the north at Moyie BC.

Figure 2: Claim Location Map

Map # 082F.070

Scale 1:100,000

Tenure # 604912

2.00 ROCK GEOCHEMISTRY (PROSPECTING)

Initial prospecting and rock geochemistry has been completed on the Sweet Spot claim group. Pb and Zn mineralization intersected in Cominco's drilling (Assessment report # 21786) can be seen in float and outcrop in disturbed areas associated with 1990's exploration work. The mineralization is fractured controlled and is consistent with mineralization associated with massive sulphide veins. Manganese and limonite wad samples are similar in nature to those seen at the St. Eugene mine 32kms to the north. Fragmental and tourmaline rocks indicate the existence of a close Precambrian conduit structure.

3.00 CONCLUSION

Prospecting has confirmed a structural and mineralogical structure consistent with those that host vein systems in other areas of the Belt Purcell. Future work should consist of trenching and rock sampling followed by drilling.

5.00 STATEMENT OF QUALIFICATIONS

As the author of this report I, Craig Kennedy, certify that:

1. I am an independent prospector residing at 2290 Dewolfe Avenue, Kimberley, BC.
2. I have been actively prospecting in the East and West Kootenays district of BC for the past 31 years and have made my living prospecting for the past 23 years.
3. I have been employed as a professional prospector by major and junior mineral exploration companies.
4. I own and maintain mineral claims in BC and have optioned numerous claims to various exploration companies.
