Item 1: INTRODUCTION

Almo Capital Corp. acquired the “Nickel - Cobalt - Magnesium - Gold Property recently for cash on March 23, 2007. The “Nickel – Cobalt - Magnesium - Gold Property” was acquired for a total of \$5000, of which \$100 has been already paid, and \$4,900 is yet to be paid in due time.

The Serp#1, Serp#2, Serp#3, Serp#4, and Serp#8 mineral claims are jointly held by Almo Capital Corp. , Silcum Resources Ltd. and Precious metals Corp. of Vancouver, B.C.

According to the terms of the agreement, Almo Capital Corp. acquired an equity position of 52% in the “Nickel - Cobalt - Magnesium - Gold Property”. There is a 3% NSR held by people who are in a cooperative relationship with the company. The remaining 48% of equity is also jointly held by Silcum Resources Ltd. and Precious metals Corp. who are in a cooperative relationship with Almo Capital Corp. and their interest is undivided.

These claims make up a larger part of contiguous group of claims, which straddle the southern extension of the Coquihalla serpentine belt. A brief geological exploration work program was conducted over the claims primarily for exploration purposes. The work essentially consisted of conducting soil and rock sampling over an area, which represents a section of the serpentine belt. The soil and rock sampling was carried out on October 13, and October 15 2010. The claims are located east of the town of Hope, just east of Coquihalla No.5 Highway, and can easily be accessed from the highway.

Item 1.1: LOCATION AND ACCESS

The claims are located near northeast of the town of Hope, British Colombia. Access is from Hope via the Coquihalla Highway No. 5. At about the 18 Kilometers on the highway, just past the Sowaqua Creek off-ramp, a well-maintained hiking trail is located. The trail, which is occasionally used by day hikers, leads to Serpentine Lake and to the claims. During the soil and rock-sampling program, the author along with the geologist utilized the trail to reach the claims, which is about one hours hike each way to the claims.

Item 1.2: HISTORY

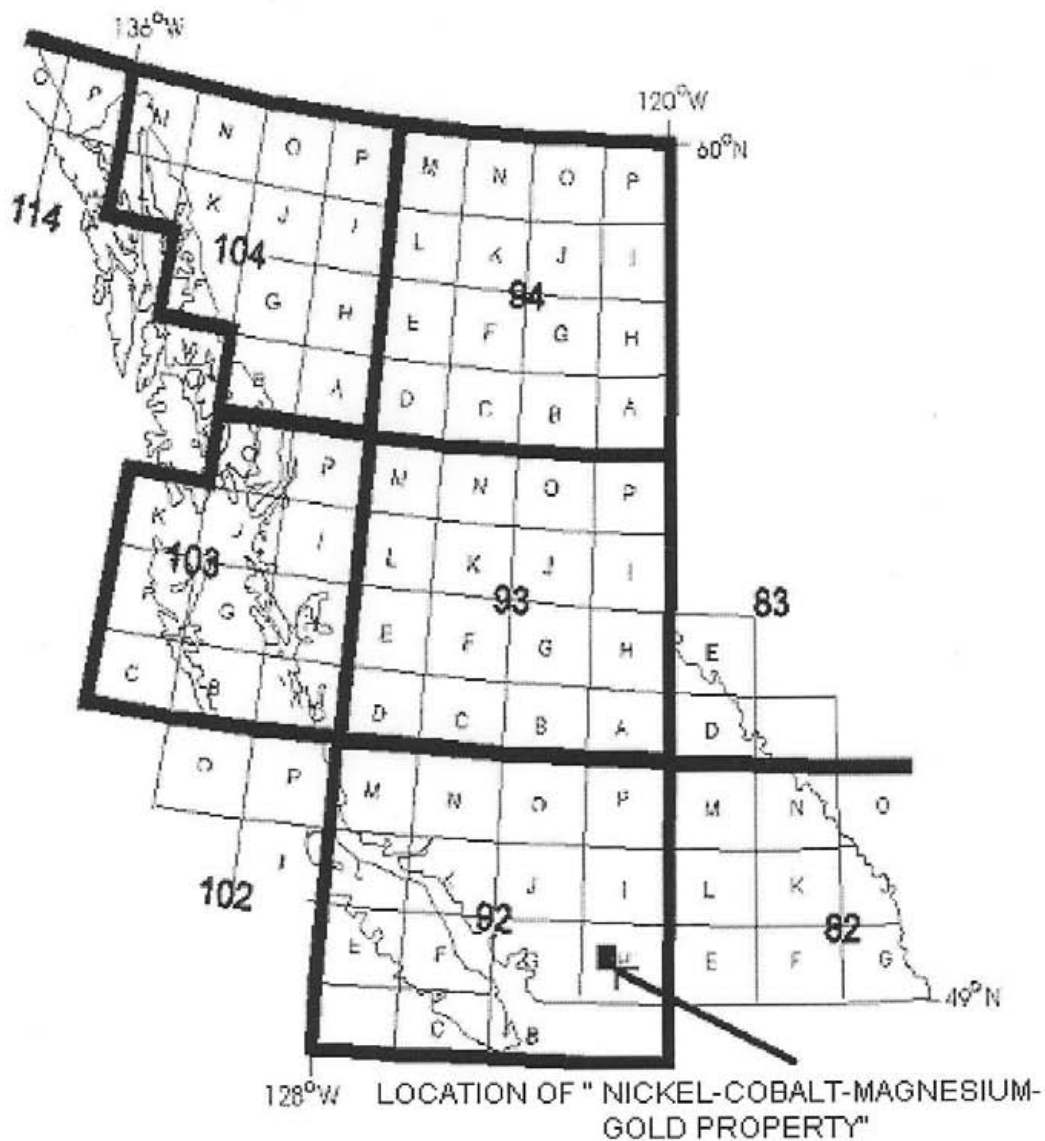

Historically the Coquihalla gold belt has developed, small former lode gold producers and several gold occurrences identified. More recently, the belt has given birth to a major gold discovery, the Carolin Mine. All of these auriferous findings have been spatially related to the Hozameen fault". (D.G. Cardinal 1981).

The Serp#1, Serp#2, Serp#3, Serp#4and Serp#8 mineral claim groups were staked in 1978 by Aquarius Resources Ltd. (under the name of Jessi I and Jessi II mineral claims) to cover the geologically favorable East Hozameen fault in the southern half of the Coquihalla gold belt. Research of records and assessment files indicate that in previous

years portions of this belt were staked by other companies, but subsequently were allowed to lapse. At present Almo Capital Corp. holds this claim group.

Most, if not all, of the work done on the claims by Cochrane Consultants and Aquarius Resources Ltd. between 1979 and 1981 consisted of a reconnaissance and follow up geological and soil sampling programs.

Below is a map outlining all NTS map areas that fall within the borders of British Columbia with location of "Nickel - Cobalt - Magnesium - Gold - Property".

Item 1.3: MINERAL CLAIMS

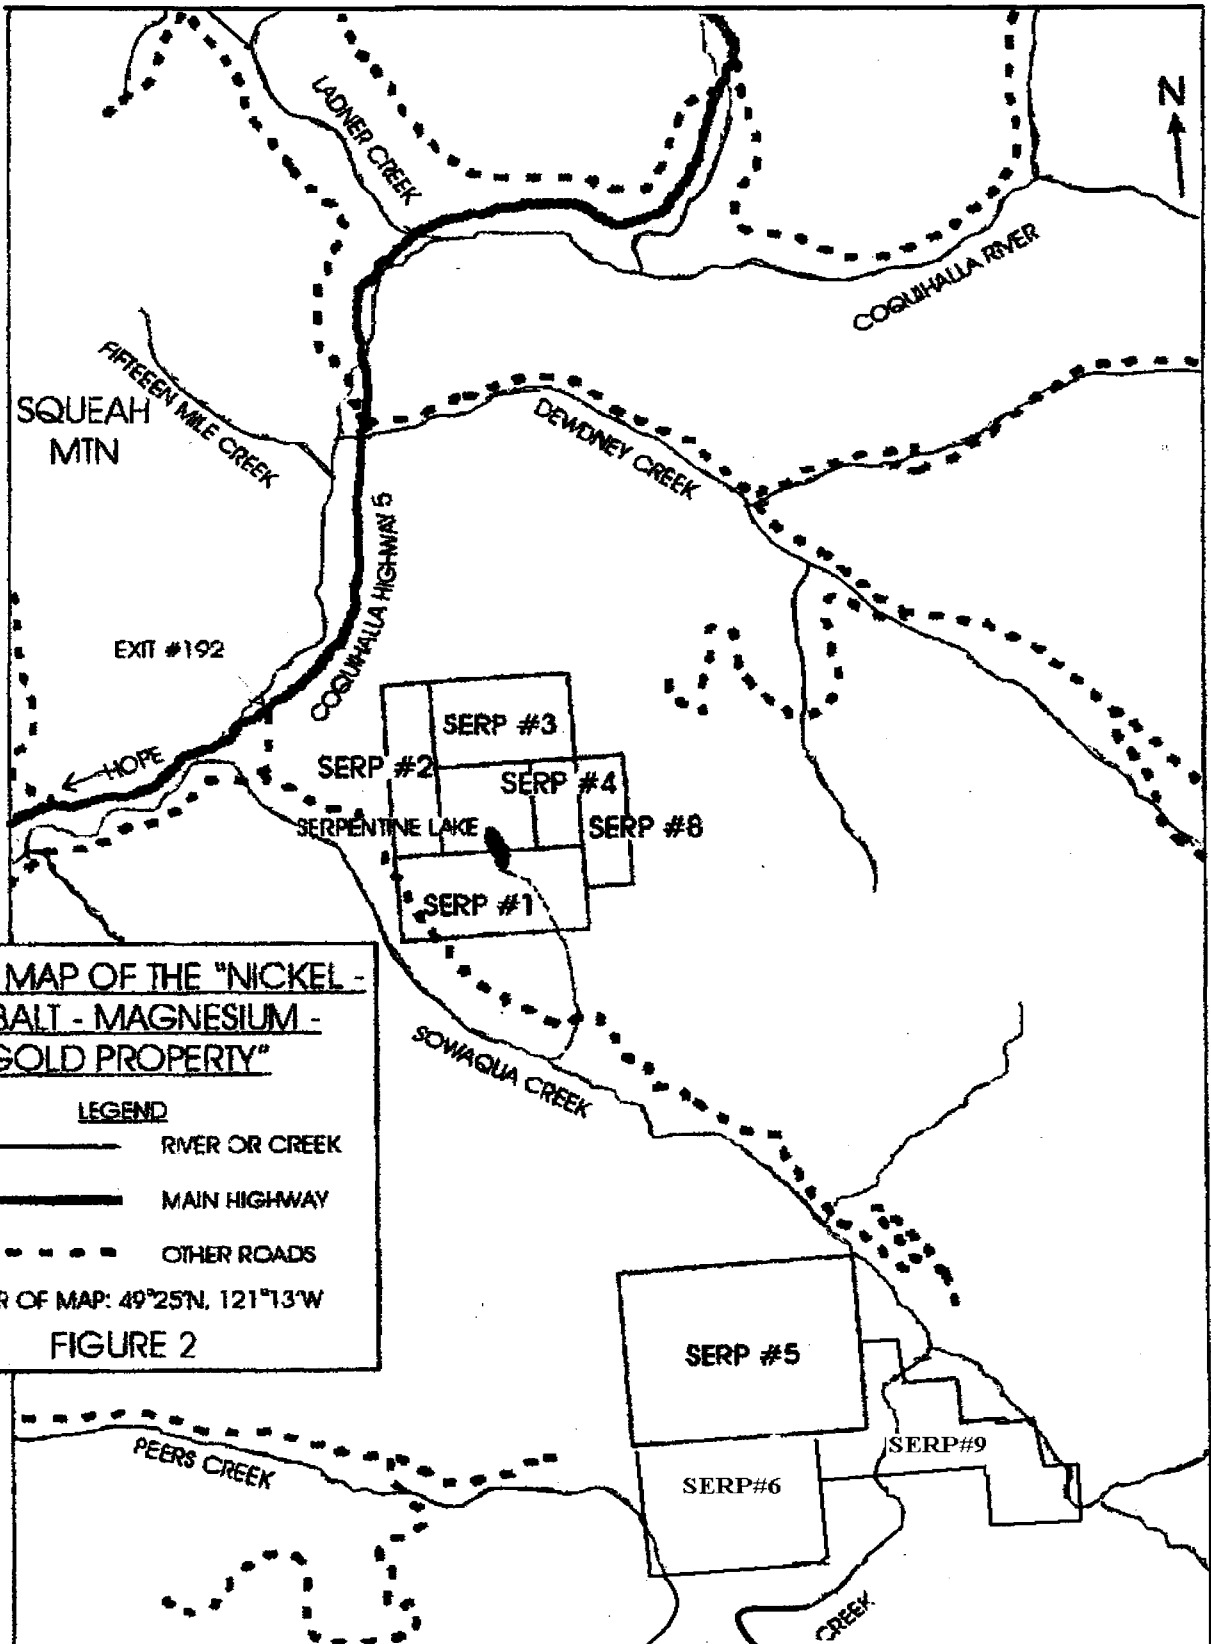

The Nickel-Cobalt-Magnesium-Gold Property covers five claims of North Group and two claims of South Group (Fig. 2). The North Group consist of Serp#1, Serp#2, Serp#3, Serp#4 and Serp#8 mineral claims, which encompass approximately 4841.91hacteres. The North Group mineral claims are situated around a small lake known as Serpentine Lake.

The claims are situated in the New Westminster Mining Division at Latitude: 49°25' N and Longitude 121°13'W. The Serp#1, Serp#2, Serp#3, Serp#4 and Serp#8 mineral claims are jointly held by Almo Capital Corp. , Silcum Resources Ltd. and Precious metals Corp. of Vancouver, British Colombia.

The following table summarizes the pertinent claim information:

Table 1: LIST OF MINERAL CLAIMS

Claim Name	Tenure Number	Units	Expiry Date
Serp# 1	551354	1	November 30, 2010
Serp# 2	551364	1	November 30, 2010
Serp# 3	551367	1	November 30, 2010
Serp# 4	551401	1	November 30, 2010
Serp# 8	554930	1	November 30, 2010

FIGURE 2

Item 2: GEOLOGICAL SETTING

Item 2.1: REGIONAL GEOLOGY

The regional geological setting is identified by a prominent northwest-southeast trending structure known as the Coquihalla Serpentine Belt. The belt, which is represented by a semi-continuous band of serpentine rock, is fault bounded by the East and West Hozameen faults. This geological break can be traced for at least 100 kilometers in southwestern British Columbia and it extends into northern Washington State.

The belt of serpentine separates two distinct crustal units. The East Hozameen fault is in contact with an andesitic volcanic greenstone unit, the Spider Peak Formation of Early Triassic age. The greenstone forms the basement for the unconformable, overlying Jurassic to Cretaceous turbidities and successor basin deposits of the Pasayten Trough. The West Hozameen fault is in contact with the Permian to Jurassic age Hozameen Group, which consists of a dismembered ophiolite succession represented by the ultramafic rocks of the Petch Creek serpentine belt in turn, overlain by a thick unit of greenstone and chert.

The oldest sedimentary rocks in the Pasayten Trough, the Ladner Group, contain a locally developed basal unit (e.g. conglomerate, greywacke, siltstone, and slate) that hosts the Idaho zone gold deposit (former Caroline Mines is in this area) along with a number of other former small gold producers. A series of the gold occurrences and past-producing camps occur along and immediately east of the East Hozameen fault and hosted in the Ladner sediments, which is also known as the 'Coquihalla Gold Belt'.

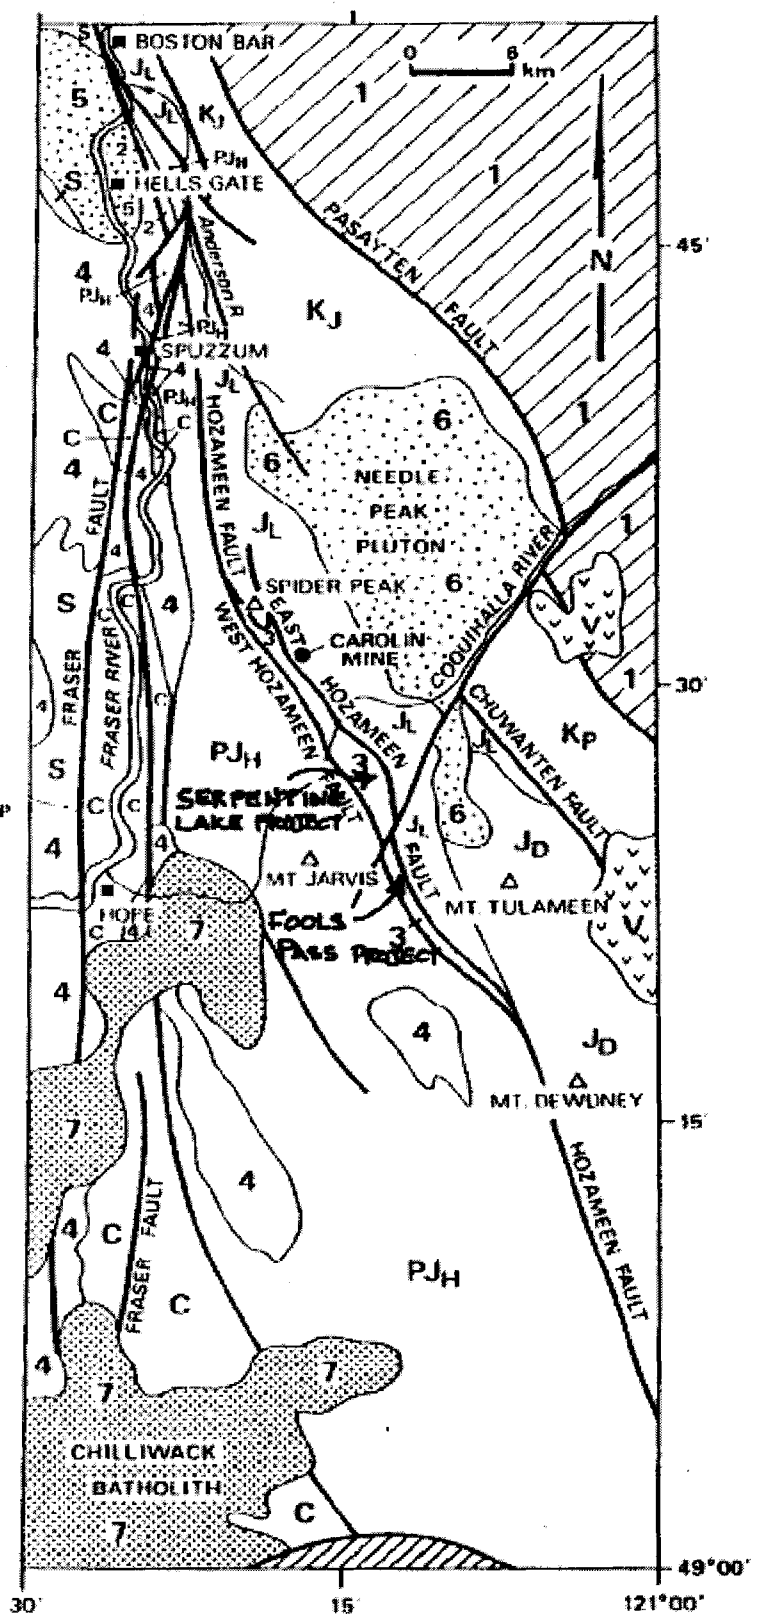

Some gold mineralization is hosted in greenstone volcanic such as the old Emancipation mine as well as in other rock types including a suite of small sodic felsic porphyry intrusions at Siwash Creek forks old ward mine.

There is potential for additional discoveries of precious metal (gold) mineralization along the Coquihalla gold belt. For example, the reported placer gold near Serpentine Lake may be locally derived possibly from greenstone volcanic that occur in the area, similar to the geological setting as the former Emancipation mine. As well as the reported occurrence of placer platinum in Sowaqua Creek and the reported gold-platinum workings of the old St. Patrick, this raises intriguing possibilities that the Coquihalla serpentine belt could be an exploration target for platinum-group elements.

Regional Geology Map	
DRAWN BY: U SHANKAR & AKUMAR	
JANUARY 23, 2009	FIGURE-3

Item 2.2 PROPERTY GEOLOGY

There are 3 main rock types that underlie the Serp#1, Serp#2, Serp#3, Serp#4 and Serp#8 claims, which includes chert and cherty argillites of the Hozameen Group, serpentine, greenstone volcanics of the Spider Peak formation and, siltstone, argillite and slate of the Ladner Group formation.

The serpentine is the prominent rock type underlying approximately 2/3 of the claims and forms a continuous belt striking northwest southeast. It is well exposed in a plateau-like area along Serpentine Lake, where it is at least 1.5 kilometers wide. The area forms the summit of the claims at an elevation of at least thousand meters. Glaciations have produced poor drainage with marshes and ponds as well as, ridges of polished-striated bedrock. East of the lake are a series of north south trending elongated ridges, which expose both the serpentine cut by diorite intrusions and greenstone volcanics.

Volcanic outcrops are especially well exposed about two kilometers east of the lake where sections of andesitic pillow lava-flow structures can be observed. Exposed just to the east of and in contact with the volcanic is a northwest striking, steeply dipping siltstone. About 1 kilometer east of the lake, the serpentine, and greenstone volcanics is in fault contact marking the East Hozameen fault. Approximately 250 meters west of the lake, the West Hozameen fault can be observed and which defines the contact between serpentine and cherty argillites of the Hozameen group.

Minor disseminated pyrite and Pyrrhotite mineralization was observed with the volcanics. The serpentine is usually massive with no crystal structure and is commonly associated with disseminated magnetite.

Structurally, all rock units observed in this area strike in northwest direction and are steeply dipping. Foliation is also concordant with northwest southeast trending faults. Several ancillary faults cut the serpentine and greenstone, paralleling the east and west Hozameen fault systems.

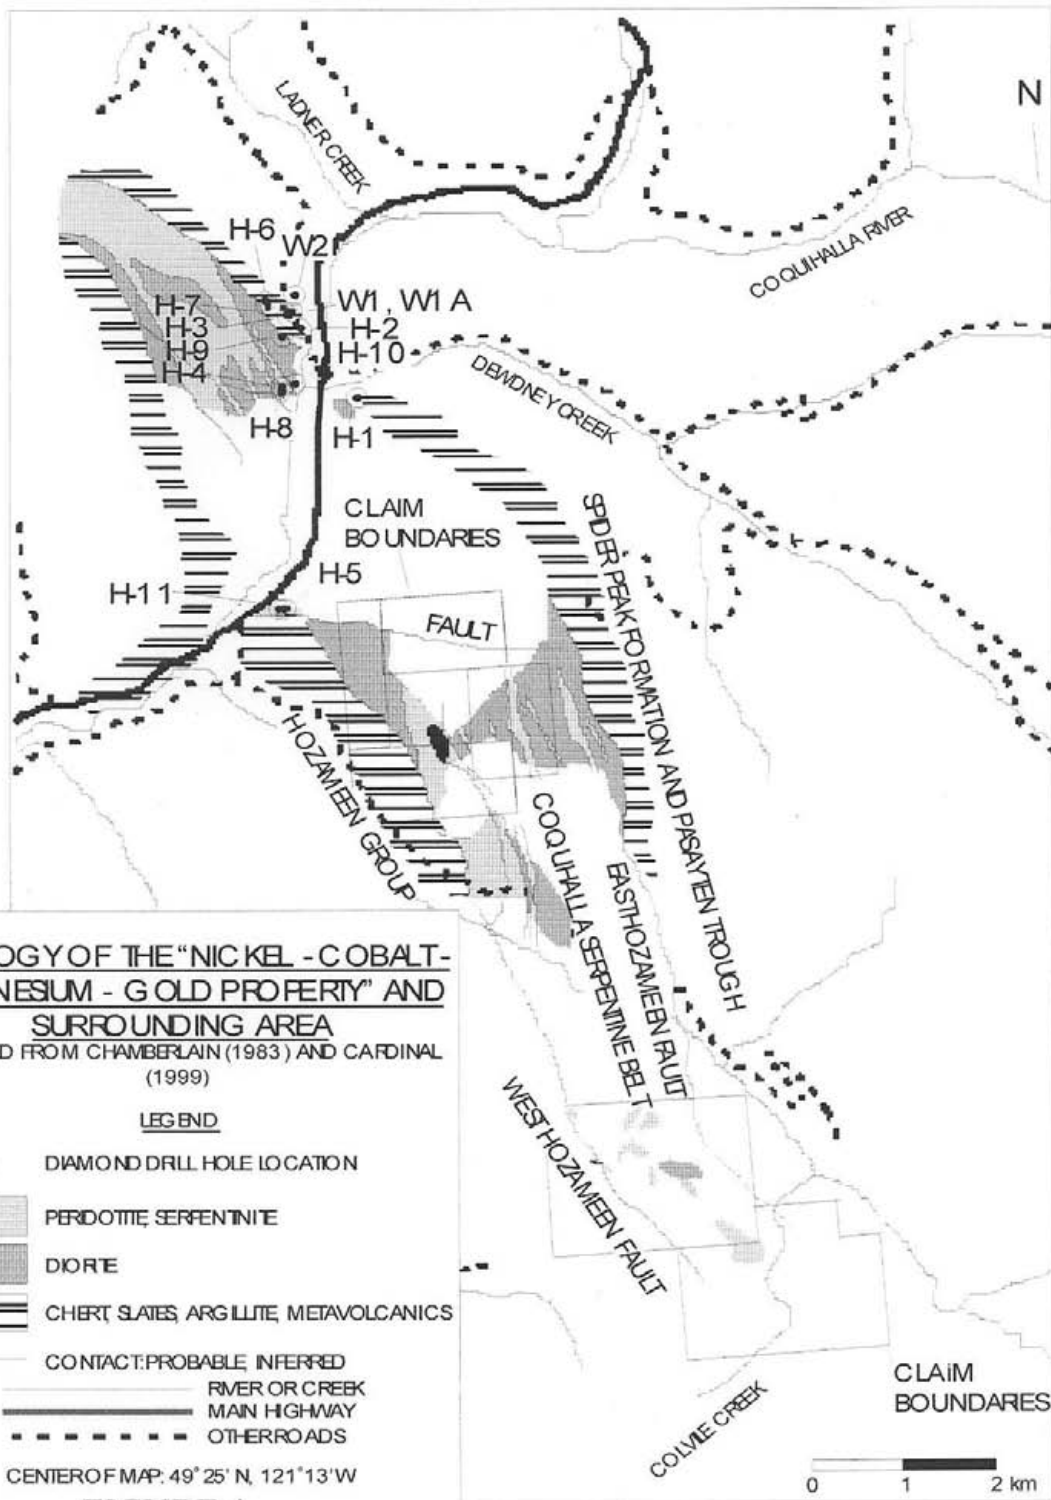

FIGURE 4

Item 2.3: MINERALIZATION

Limited amounts of mineralization were noted in at least three different localities on the North Group claims, associated with three different rock types. Coarse (1-3mm) blebs of magnetite were noted with serpentinites and diorites. An exposed section near the southeast end of Sowaqua Creek logging road shows pyritiferous argillites and lesser pyrrhotite. Alteration products consisting predominately of quartz, calcite, minor sericite, and chlorite chiefly occur with the sulphides. The majority of the Sulphides noted generally develop along volcanic and sedimentary contacts and along localized folds in the slates and argillites.

Item 3: FIELD PROCEDURES

Author and two geologists carried out the soil and rock sampling survey on October 13, and October 15th 2010. The author drove the Coquihalla highway from Vancouver to the base of the trail noted above and hiked up to Serpentine Lake. The climb, which is about 600m, takes approximately 1.5 hours. 1:20,000 topographic maps, obtained from the local forestry services were used for navigation. Hip chain, Brunton compass, and GPS were used in the sampling surveys.

Two traverse days were spent on the east and northeast section of the Serpentine Lake area out of which, one day was spent on the western side. Much of the area was surveyed; soil samples were collected randomly along the trail from the upper "B" (rusty) soil horizon where possible (on geological considerations). Some rock samples were also collected from the creek running through the property. Hand tools were used; the samples were placed in standard craft paper bags, and marked with UTM co-ordinates. The samples were strung up in camp and air-dried. At the close of the project, the samples were boxed and shipped to Acme Labs Ltd., of Vancouver, B.C., where analysis for Gold, Nickel, Cobalt, Magnesium, Chromium and Zinc was carried out.

Item 4: SAMPLING AND GEO-CHEMICAL ANALYSIS

Details of samples collected on October 13, 2010 and October 15, 2010.

Soil and Rock samples collected by: M.Sc. Geologist Amit Kumar and Uma Shankar

TABLE 2: DETAILS OF SOIL SAMPLES

SAMPLE CODE	SAMPLE ID	UTM LOCATION	DEPTH IN CM	COLOR	VISIBLE PROPERTIES
HNS 1	065983	0627307 5478894	35	Orange	Collected from 'B' Horizon, appx.60% of coarse-grained sand and silt, appx.20% of clay, sub- angular to angular clasts present.
HNS 2	065984	0627328 5478857	25	Orange	Collected from 'B' Horizon, fair amount of coarse-grained sand (0.5mm) and silt, sub- angular to angular clasts present.

**METHODS AND SPECIFICATIONS FOR ANALYTICAL PACKAGE
GROUP 1E & 1EX – ICP & ICP-MS ANALYSIS – 4-ACID DIGESTION**

Comments

Sample Preparation

All samples are dried at 60°C. Soil and sediment are sieved to -80 mesh (-180 µm). Moss-mats are disaggregated then sieved to yield -80 mesh sediment. Vegetation is pulverized or ashed (475°C). Rock and drill core is jaw crushed to 70% passing 10 mesh (2 mm), a 250 g riffle split is then pulverized to 85% passing 200 mesh (75 µm) in a mild-steel ring-and-puck mill. Pulp splits of 0.25 g are weighed into Teflon test tubes.

Sample Digestion

A 10 mL aliquot of the acid solution (2:2:1:1 H₂O-HF-HClO₄-HNO₃) is added, heated until fuming on a hot plate and taken to dryness. A 4 mL aliquot of 50% HCl is added to the residue and heated using a mixing hot block. After cooling the solutions are transferred to polypropylene test-tubes and made to a 10 mL volume with 5% HCl.

Sample Analysis

Group 1E: solutions aspirated into a Spectro Cirrus Vision or Varian T35 ICP emission spectrometer are analysed for 35 elements: Ag, Al, As, Au, Ba, Be, Bi, Ca, Cd, Co, Cr, Cu, Fe, K, La, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Se, Sc, Sn, Sr, Th, Ti, U, V, W, Y, Zn and Zr.

Group 1EX: solutions aspirated into a Perkin Elmer Elan 6000 or 9000 ICP mass spectrometer are analysed for 41 elements: Ag, Al, As, Au, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cu, Fe, Hf, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, S, Sb, Sc, Sn, Sr, Ta, Th, Ti, U, V, W, Y, Zn and Zr.

Quality Control and Data Verification

QA/QC protocol incorporates a sample-prep blank (G-1) as the first sample in the job which is carried through all stages of preparation to analysis. An Analytical Batch comprises 36 client samples and incorporates a pulp duplicate to monitor analytical precision, a -10 mesh rejects duplicate to monitor sub-sampling variation (drill core only), a reagent blank to measure background and aliquots of Certified or In-house Reference Material like STD DST6, Oreas 24P or Oreas 45P. Data undergoes a final verification by a British Columbia Certified Assayer who then validates results before it is released to the client.

Item 5: CONCLUSION

The geological soil and rock sampling was done on the property to find the major minerals of interest in the property. A total of 9 soil samples and 5 rock samples were geochemically analyzed for Gold, Copper, Nickel, Cobalt, Magnesium, Chromium, Manganese, and Zinc etc.

Geochemical results of soil samples shows the Copper values up to 37.00ppm, Zinc values up to 92ppm, Nickel values up to 562.7ppm, Cobalt values up to 48.70ppm, Manganese values up to 736ppm, Chromium values up to 1130ppm, and Magnesium values up to 5.54%

Geochemical results of rock samples shows the, Copper values up to 49.2ppm, Zinc values up to 95 ppm, Nickel values up to 1449ppm, Manganese values up to 1494ppm, Chromium values up to 1176ppm, and Magnesium values up to 16.78% as shown in the maps.

The Geochemical results of the Nickel-Cobalt- Magnesium-Gold Property indicates that this area is a good prospect of Gold, Copper, Nickel, Cobalt, Magnesium, Chromium, Manganese, Zinc etc. Future surveys in the area should be orientated toward further investigation and detail examination of the serpentine and associated diorite intrusive including the greenstone Volcanics and fault contact structures.

Item 6: COST STATEMENT OF EXPLORATION

Costs of Exploration on the north group claims of Nickel-Cobalt-Magnesium-Gold Property.

Geologist fee for work done on 13 th and 15 th October 2010	
@\$33.75/hr	\$ 2,025.00
Transport, vehicle rentals and Gas expenses	\$ 499.34
Vehicle repair	\$ 516.60
Expenditure on food supplies and Equipments	\$ 423.40
Sampling and Assaying	\$ 700.66
Geologist fee for report Preparation	\$ 1000.00
Total	<u>\$ 5,165.00</u>

Item 7: STATEMENT OF AUTHORS QUALIFICATIONS

I, Ram Vallabh, of 603 East 30th Avenue, Vancouver, British Columbia, Canada V5V 2V7, hereby certify that:

1. I am a graduate and post graduate from, University of Lucknow, India, B.Sc. in 1952, L.L.B. in 1955, and M.Sc. in 1957, both B.Sc. and M.Sc. Degrees are in Geology.
2. I am the registered owner of mineral claims held under Almo Capital Corp.
3. I had practiced geology for more than forty years in Canada.
4. This report is based upon assessment, government, and private reports listed in the references, and personal field examination.
5. I am a qualified person.
6. The assessment report has been prepared in conformity of Canadian mining industry practice.
