INTRODUCTION

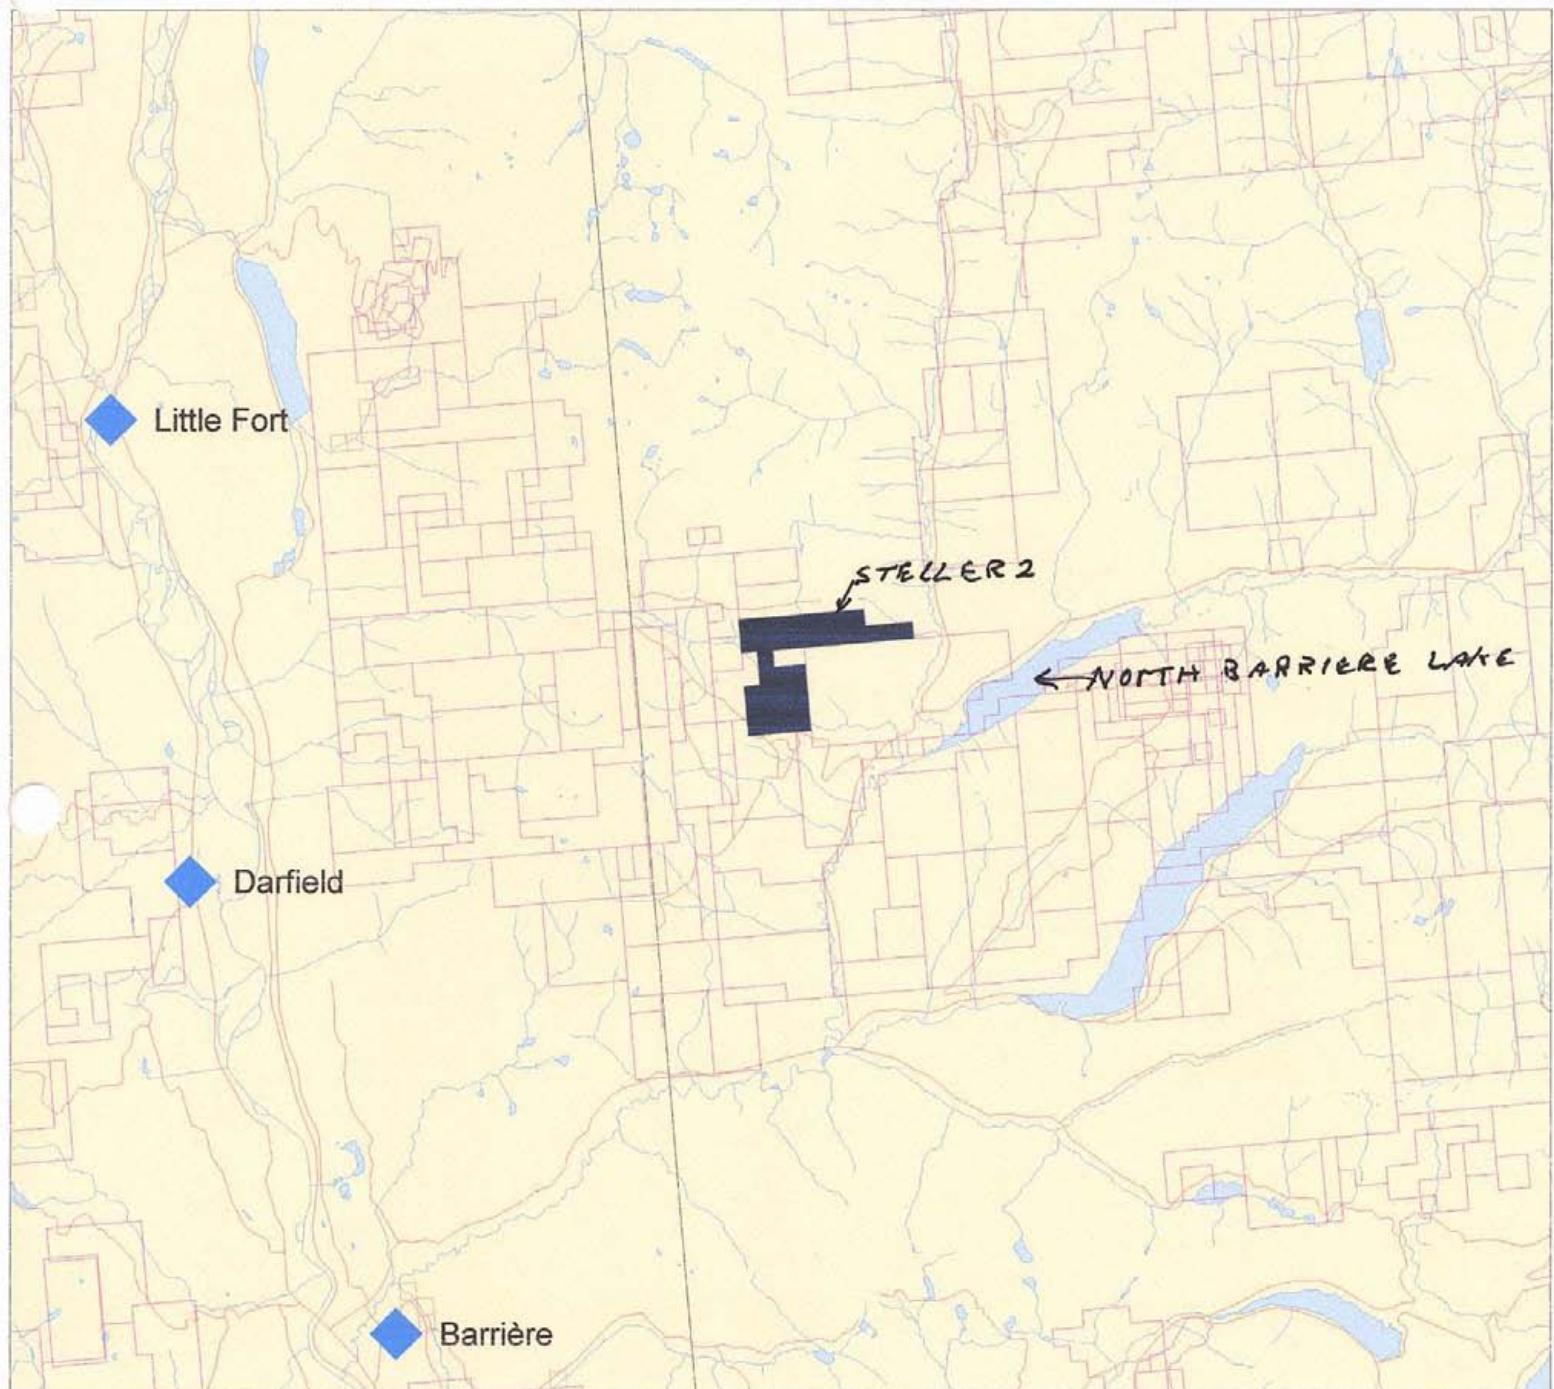

This report has been prepared for the purpose of filing assessment work credit and fulfilling the requirements of the mineral act on the STELLER2 claim block.

Field work on the STELLER2 claim block was carried out by Tom McDonald and Alfred McKay between June and July 2011. A total of 54 soil samples, 4 rock samples and 3 silt samples were collected and were analyzed by Echo-Teck laboratory in Kamloops B.C.. there was also brush clearing and removal of windfalls along the access roads to access the known areas of mineralization and general mapping and prospecting of new logging roads on the property.

SCALE 1 : 52,471

N

GENERAL SETTING

The STELLER2 claim block is located 85 kilometers north-east of Kamloops B.C. From Kamloops you drive the # 5 highway north to Barriere and turn east, drive 16 kilometers on the paved barriere lakes road and turn north on the North barriere lakes road, drive 9 kilometers on the all weather road then turn north on a logging haul road and drive 8 kilometers to the claims.

The claim is accessible by logging roads on the claim block and there has been active logging this year. The slope on the claim block is moderate but the west side drops off sharply to birk creek. The elation is approximately 1400 meters average. The property receives 2 to 3 meters of snowfall in the winter months and is usually snow free late may until early November. The property is heavily wooded with mature Cedar, Spruce, Fir, Birch and Alder and several of the areas have been recently logged. The logging roads have cut through several veins of quarts with galena in the quarts. The STELLER2 claim block is 500 hectares in size.

EXPLORATION HISTORY

Exploration activity in the area began about 1920 with the excavation of adits and trenches along Birk Creek and later between 1938 and 1940, 234 tons grading 2% copper, 57 gpt silver and 28 gpt gold were shipped from the Copper Cliff showing on lower Birk Creek.

The area remained dormant until the early 50's and was intermittently explored by about 15 company's up to the early 1990's. (refer to references page). Noranda, Falconbridge and Teck amongst others spent a lot of time and money defining targets between 1985 and 1992 and several targets were found but , due to politics and the price of metals at the time, they pulled out of the province before fully exploring the known targets.

We started staking the area before MTO as claims became available and we staked a large group of claims when MTO came online, these are our steller claims. We had over 1900 hectares claimed but dropped some due to access. We still have over 1400 hectares in our STELLER claim block The claims we dropped were logged this year and they cut quartz veins containing galena so we re staked what was not already staked and called it STELLER2.

We have done rock, silt and mostly soil sampling on the claims and we now have areas to concentrate on where we had high numbers in the soils.

REGIONAL GEOLOGY

Regional studies by Schiarizza and Preto (1987) form the basis for understanding the area's geology and their results are summarized below.

The Adams Lake area is underlain by a structurally complex belt of weakly metamorphosed Palaeozoic marine sedimentary and volcanic rocks known as the Eagle Bay Formation and the Fennel Formation (Figure 1). Shuswap Complex high grade metamorphic rocks flank the area to the east, with the Intermontane Belt sedimentary and volcanic rocks forming the western margin.

The Eagle Bay assemblage is a Cambrian to Late Mississippian volcano-sedimentary succession divided into eight units (Schiarizza and Preto, 1987). This stratigraphy, as presented in Table I, reflects not only the lithologies, but also the area's complex structural history.

To the west, the Fennel Formation occurs in fault contact with Eagle Bay rocks. Two structural divisions make up the Fennel Formation which is essentially a mafic volcanic sequence with subordinate chert and rhyolite. The formation is Devonian to Early Pennsylvanian in age, coeval with the upper Eagle Bay.

Both formations are intruded by Cretaceous granite to granodiorite known as the Baldy Batholith and Raft Batholith. Contact metamorphic zones are locally well-developed. Completing the section are late Tertiary porphyry and lamprophyre dykes.

The Palaeozoic rocks were initially deformed by a late Triassic to Jurassic east directed thrust event which brought in the Fennel against Eagle Bay rocks. A subsequent late Jurassic to Cretaceous compressional event developed large southwest verging overturned folds and thrusting concurrent with greenschist to amphibolite metamorphism. The event's complexity resulted in the division of the rocks into four structural slices, each separated by southwest directed thrust faults. The upper three fault slices contain Eagle Bay

(9)

units, while the Fennel Formation with some Eagle Bay strata forms the fourth division which underlies the Birk Creek projects.

Later west trending folds and kinks, and rare reverse faults are associated with the Cretaceous plutonic event. Younger, possibly Eocene, north and northeast striking faults, and kink folds occur throughout the area.

PROJECT RATIONAL

We own the STELLER claim block that is contiguous with the STELLER2 claim block. The reason we staked the STELLER2 claims is because the logging company working the area cut several quartz veins containing abundant galena.

CONCLUSIONS AND RECOMENDATIONS

The STELLER2 claim block is contiguous with our STELLER claims which we have very good results soil sampling. The reason we staked the STELLER2 claim block is because the logging company working in the area cut a new road and when doing so they cut through several quartz veins containing healthy amounts of galena. We did soil sampling this year and more work will have to be done to determine if this is an economic deposit.

GOLD AQUA REGIA DIGEST: ICP-MS FINISH (Au1-10.25)

Samples are digested in an aqua regia solution for 45 minutes. They are bulked with de-ionized water, and an aliquot of this is taken for analysis a Thermo Scientific X series II ICP-MS unit. All synthetic standards are purchased and verified by 3 independent analysts and are used for instrument calibration before each and every ICP-MS run.

A 2-3 point standardization curve is used to check the linearity (high and low). Certified reference material is used to check the performance of the machine and to ensure that proper digestion occurred in the wet lab. QC samples are run along with the client samples to ensure no machine drift or instrumentation issues occurred during the analysis of the sample(s). Repeat samples (every 10 or less) and re-splits (every 35 or less) are also run to ensure proper weighing and digestion occurred. Detection limits for aqua regia digest gold values is 1-1000ppb.

Results are collated by computer and are printed along with accompanying quality control data (re-splits and standards). Results are emailed, faxed, or mailed to the clients.

**** This method is recommended for soil and silt samples only.

Analytical Procedure Assessment Report

MULTI ELEMENT ICP ANALYSIS

A 0.5 gram sample is digested with 2ml of a 3:1:2 SULFURIC:CHLORIC ACID mixture containing 100 ppm La which acts as an internal standard for 90 minutes in a water bath at 95°C. The sample is then diluted to 10ml with water. The sample is analyzed on a Jarrell Ash ICP unit.

Results are collated by computer and are printed along with accompanying quality control data (precision and standard). Results are printed on a laser printer and are faxed and/or mailed to the client.

	Detection Limit		PC	Detection Limit	
	Low	Upper		Low	Upper

Copper Assay

Methodology

Samples and standards undergo an aqua regia digestion in 200 ml phosphoric acid flasks. The digested solutions are made to volume with RO water and allowed to settle. The metals of interest are determined by Atomic absorption procedures. Instrument calibration is done by verified synthetic standards, which have undergone the same digestion procedure as the samples.

Digestion

1. Weigh 0.5g sample into 200 ml phosphoric acid flask.
2. Add 20 ml conc. HNO₃ to flasks using a calibrated dispenser.
3. Remove flasks from hot plate and when cool, add 60 ml conc. HCl from a calibrated dispenser. Put flasks on hot plate and digest for 60 minutes
4. Remove flasks from hot plate, allow to cool to room temperature and bulk to 200 ml mark with RO water.
5. Allow assay to settle or clarify by centrifuging an aliquot for analysis.

Analysis

- 1 Run the analysis by Atomic Absorption using the instrument parameters in the following table.
- 2 Set up calibration with verified synthetic standards.
- 3 Verify instrument calibration after every 10 samples.
- 4 Perform analysis in the linear range of the absorbance curve. It may be necessary to dilute some samples or rotate the burner to do this.
- 5 Standards used narrowly bracket the absorbance value of the sample for maximum precision.

Quality Control

- 1 Standard quality control procedures are used for these determinations. (ie repeat every 9 samples)
- 2 Run one Can Met CRM/WCM CRM for each batch of 35 or less samples (one CRM per work sheet)

CRM	ICu%
CZn-1	0.144±0.003
CZn-3	0.605±0.008
KC-1a	0.628±0.016
Su-1A	0.967±0.005
CCU-1a	26.78±0.07
CCU-1b	24.67±0.03
Cu106	1.43
Cu107	0.28
PB100	0.62

- 4) The following Can Met CRMS/WCM CRM are available in this laboratory.

Reporting

Minimum reportable concentration is as follows:

Cu 0.01%

Gold, Platinum, Palladium Geochemistry

Samples are sorted and dried (if necessary). The samples are crushed through a jaw crusher and cone or rolls crusher to ~10 mesh. The sample is split through a Jones riffle until a -250 gram sub sample is achieved. The sub sample is pulverized in a ring & puck pulverizer to 95% - 140 mesh. The sample is rolled to homogenize.

A 15 g sample size is fire assayed using appropriate fluxes. The resultant dore bead is parted and then digested with aqua regia and then analyzed on a Perkin Elmer AA instrument for Gold and Palladium. Platinum is analyzed by ICP.

Appropriate standards and repeat sample (Quality Control Components) accompany the samples on the data sheet.

PROSPECTORS QUALIFICATIONS

In May 2003 I attended BCIT's prospecting course 1005, prospecting exploration field school in Oliver B.C.

In March 2004 I attended BCIT's course 1010, exploration and mining for investment advisers and investors in Vancouver B.C.

I have also attended several courses at Roundup in Vancouver and at the Kamloops exploration group conferences and have been actively prospecting since the spring of 2004 after retiring from the CPR.

Tom McDonald.

I have been active in placer mining and mineral claims for the past 35 years and have attended several courses that the Kamloops exploration group puts on and also attend the annual conference and trade show(KEG) held in April in Kamloops every year.

Alfred McKay.

STELLER2 ADDITIONAL INFORMATION 2011

1- We are using 2 Magellan Explorist 500 LE GPS's and due to the thick mature forest it takes a lot of time getting accurate readings as sometimes the accuracy is shown on the GPS's is up to 60 meters off so we always take our readings after both the GPS's have an accuracy of less than 10 meters.

2- All soils are taken at a depth of 14 to 18 meters in B horizon soils. The holes are dug down to the B horizon soil and then an auger is used to get down another 6 to 8 inches in the B soil.

3-The rocks were all taken from bedrock, rock sample # 58 was dark black and rusty with visual pyrite and a high copper reading, 59 was a rusty quarts with visual galena, 60 was a black shist with visable pyrite and 61 was also a quarts rock with galena.
