Report on the Geochemical Program on the Crazy Fox Property

June 13, 2010 to June 28, 2010

By:

D. J. Bridge, P.Geo

601 – 31 Elliot Street,

New Westminster, B.C. Canada V3L 5C9

SUMMARY

The Newmac Crazy Fox Property lies approximately 25 km northwest of the village of Little Fort BC located on the Yellowhead Highway, BC Hwy 5, approximately 100 km north of Kamloops BC. The property lies within the Kamloops Mining Division.

Newmac acquired the property in 2005 from prospectors Lloyd Addie and Robert Bourdon from Nelson BC . Bourdon and Addie acquired the property by staking.

Addie and Bourdon were originally interested in the property south of 14 Mile Creek for its massive sulphide potential in that area. The molybdenum showings at Crazy Fox became available and they staked the area, naming it Crazy Fox.

Work has been done around the Crazy Fox molybdenum showings dating back to their discovery about 1928. Most of the significant work was performed by Rio Tinto, Falconbridge and Amax between 1968 and 1982. Newmac's interest was sparked when new logging roads, prospected by Addie and Bourdon, exposed new molybdenite showings almost 1000m east of the historical showing area, both hosted by leucocratic granite related rocks.

Geochemical sampling by previous operators shows erratic but significant responses over much of the poorly exposed granite bedrock. IP surveys suggest a circular feature roughly coincident with the poorly exposed granite.

Newmac commenced a sampling – prospecting program in the fall of 2005 followed by trenching. This was followed by a drill and trenching program commencing in the winter of 2006. 24,600 ft of NQ drilling was completed by end of June 2006. The drilling confirmed that a low angle fault (310°/011° SW) cuts off mineralization at a depth of about 300m posing the obvious question: Where is the lower extension of the mineralization? During the summer of 2007, the author noticed a trend in the thermal metamorphism of the underlying volcanic rocks revealed by the drilling. Further study and examination led to the postulation that the lower plate fault offset was in the order of 700 m down dip along the fault. This postulation was tested by DDH CF 07-40 and 41. DDH 07-41 penetrated the fault, and entered mineralized granite for over 400m containing 0.1%Mo.

This discovery led directly into the drilling in 2007 and 2008. By end of August 2008 a total of 13,331m (43726 ft) of additional diamond drilling composed of 6916m (22685 ft) of NQ and 6415m (21041 ft) of HQ sized hole had been completed. 3295 core and quality control samples had been submitted to Acme Labs in Vancouver for analysis.

In July 2009 a geological and geochemical program focusing on the area immediately south-west of the drilling in 2008 and collected 36 soil and 34 gravel samples and 17 rock samples and mapped over an area 118 ha.

In September 2009 977 soil samples were collected on a grid surrounding the Ace gold showing in the northern part of the Crazy Fox property and in October 2009 610.2 meters of NQ diamond drilling was

completed to test two geological structures for molybdenite mineralization where the July, 2009 program had been conducted.

In June 2010 a geochemical program was conducted in the Lemieux Creek valley on the eastern part of the Crazy Fox Property. A total of 453 soil samples and 9 rock samples were collected to test for gold mineralization in the valley related to the "Best" gold showing.

LIST OF FIGURES

INTRODUCTION

This report on the soil sampling along the Lemieux Creek valley has been commissioned by Newmac Resources Inc. and is prepared for the purposes of filing for assessment credit and for company records on the geochemical program on the Crazy Fox Property in 2010.

Field work was conducted during the period June 13, 2010 and June 14, 2010 by a crew of four men from Geotronics Consulting Inc. They collected a total of 453 soil and 9 rock samples from the Best showing area of the Crazy Fox Property, located south-east of the Crazy Fox Deposit.

LOCATION AND ACCESS

The property is located on BCGS map sheet 092/P-059,069. The molybdenum and tungsten prospect area is centered on Latitude 51°36' N and Longitude 120°18' W or UTM (NAD 83, Zone 10U) 5719000 N, 0687000E. The "Ace" showing area is located at UTM 5721387 N and 686686E (NAD 83, Zone 10U). The "Best" showing area is located at UTM 5713000 N and 693000E (NAD 83, Zone 10U)

The Crazy Fox Property is situated in the Kamloops Mining Division approximately 100 km north of Kamloops or about 25 km northwest of the town of Little Fort, BC (Figures 1 and 2). Good access to the molybdenum and tungsten prospect is from Highway 24 about 20 km west of Little Fort, then north on Taweel Lake logging road onto the property at about 12 km.

Access to the Ace and Best showing area is obtained by travelling up the Lemieux Creek Road which leads to Taweel Lake from Highway 24 approximately 3.5 km north of Little Fort, BC.

Access to the VMS/Sedex prospect area on the Crazy Fox Property is described by Bourdon and Addie in their April 2000 assessment report.

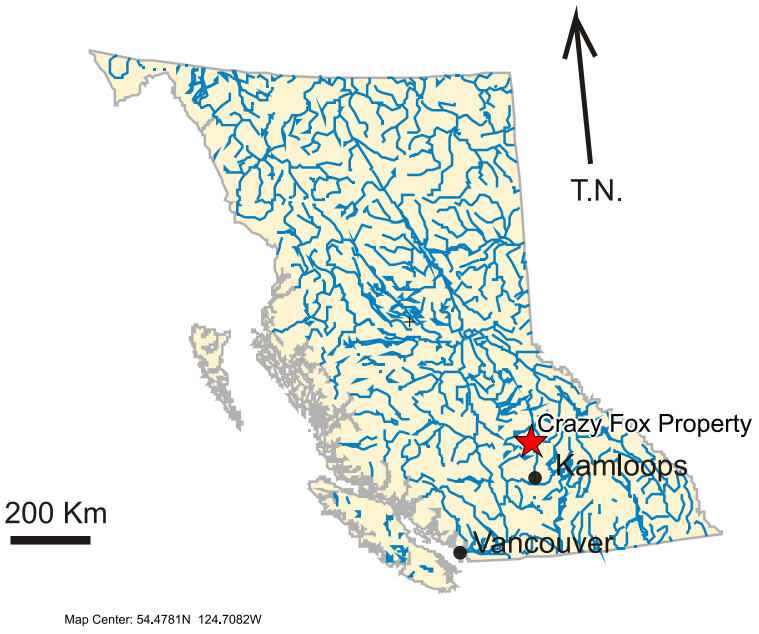

Figure 1. Location map of the Crazy Fox Property.

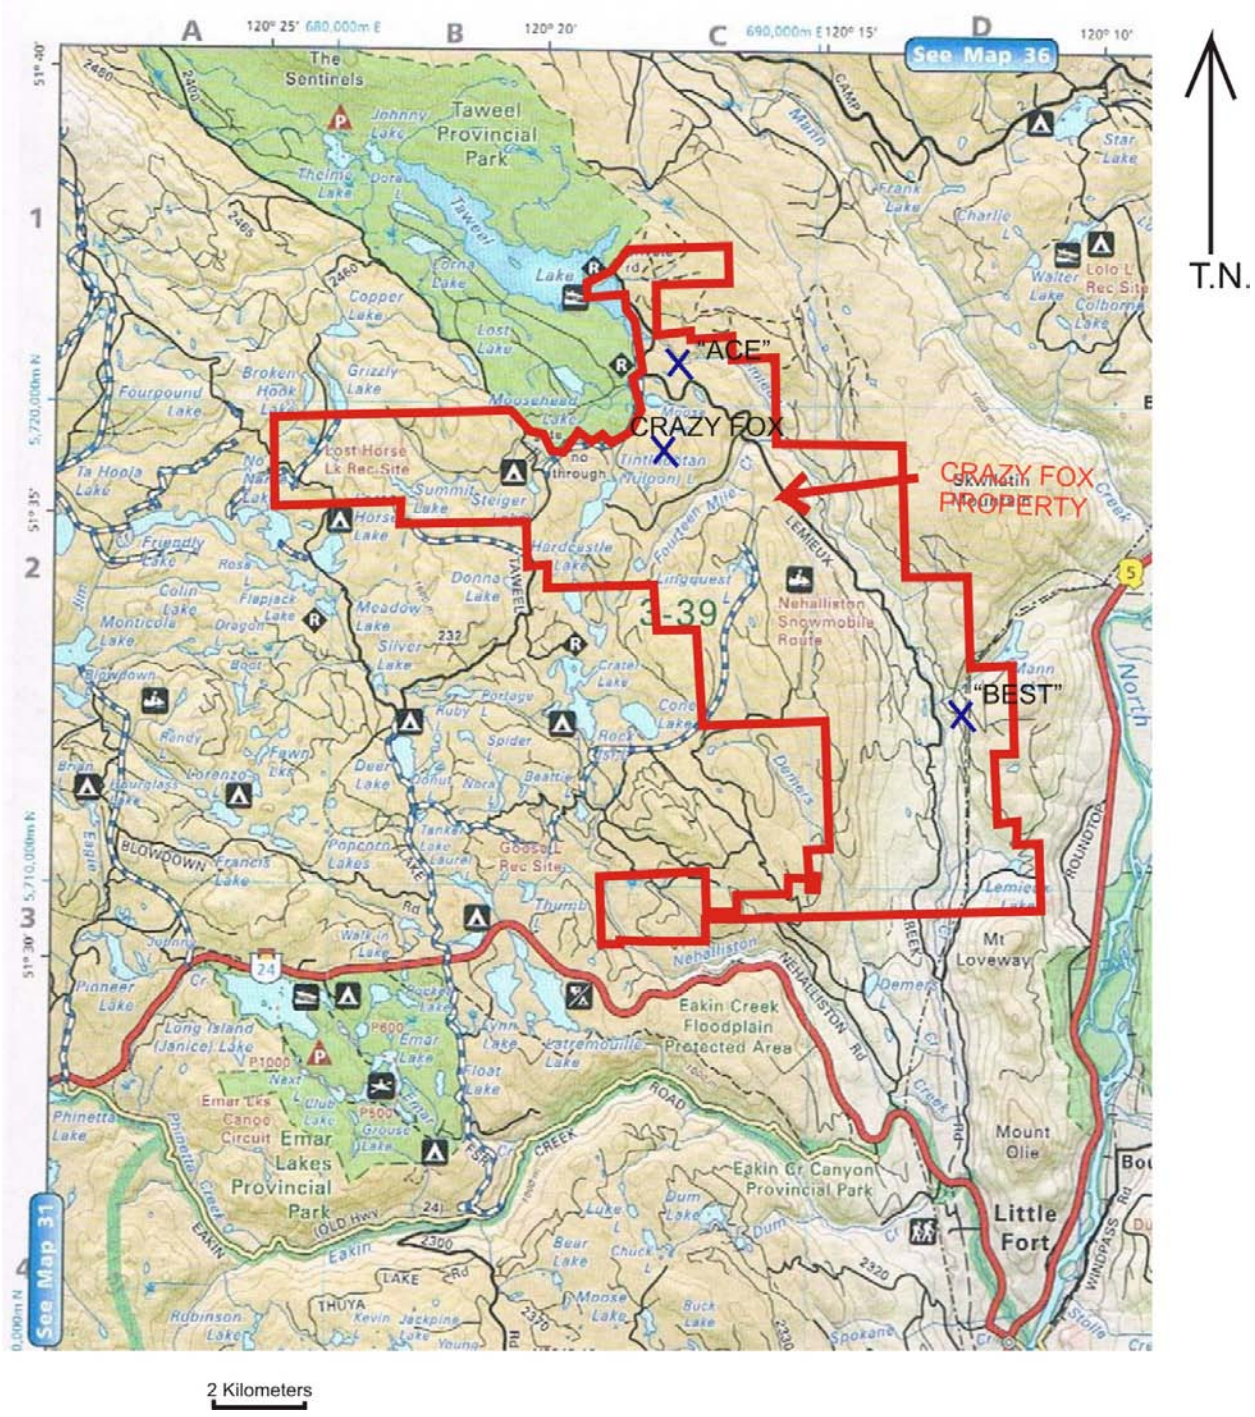

Figure 2. Access Map showing the Crazy Fox Property with the "Ace", "Best" and Crazy Fox prospects shown on it. Base map is excerpted from BC Backroads Mapbook, Thompson-Okanogan volume.

GENERAL SETTING

The molybdenum and tungsten prospect area on the Crazy Fox Property is located on the north side of 14 Mile Creek between 1100 and 1400 meters elevation. Except for the major drainage valleys, which quickly become very steeply inclined with steep valley walls as the drainage descends from the Nehaliston Plateau, the topography is generally gently rolling with 100 to 300 meters relief. Valleys on the plateau commonly contain lakes and ponds. The larger lakes are known for their recreational fishing and several commercial fishing lodges are found on the lakes adjacent to the property.

The property receives an average of 1-2 meters of snow, but it is generally snow free from mid May to late October. The property can be explored or operated all year.

The property is extensively covered by overburden, consisting of basal and ablation tills and glacio-fluvial deposits. Bourdon and Addie have estimated the thickness away from the valley bottoms to be roughly 1 to 2 meters in depth. Drilling has encountered overburden up to 20 meters of boulder, clay till. Bedrock outcrop is rare and accounts for less than 1% of the claim area.

Vegetation in the area consists mainly of coniferous forest with a few scattered open areas of brush. There has been extensive clear-cut logging and corresponding new road construction which has taken place since the 1980's with earlier re-grown cut blocks evident. In recent time, there has been an endemic infestation of mountain pine bark beetle which has affected a vast area of central British Columbia including the Crazy Fox mineral claim area. During the winter of 2007-2008, new roads and drill access which were constructed did not expose any new surface mineralization.

Along the Lemieux Creek valley are extensive clearcuts which are slowly growing trees.

The settlement of Little Fort lies in the valley of the North Thompson River, and provides basic services: ie, fuel, bus depot, restaurant and motel. Additional services are found along Highway 5. The communities of Barriere and Clearwater are located south and north of Little Fort. Each is approximately 30 km distant and offer additional services such as banking, vehicle repairs and medical facilities. The North Thompson River corridor is also used by the CNR and by major power transmission lines.

Above dates are contingent upon acceptance of work credits presented by this report.. Work was completed on mineral claims with a (*).

The property mineral claims a total area of approximately 8450ha or 84.5 square kilometer. The owner of which is Newmac Resources Inc. subject to a NSR. The operator of the program is Newmac Resources Inc.

HISTORY AND PREVIOUS WORK

Claims were first staked for molybdenum at the 'ANTICLIMAX' prospect in 1938 when mineralization in float containing up to 10% Mo was recognized near Tintlhoten (Tuloon) Lake. Later, trenching and pitting uncovered a small flat lying pod of pegmatitic (?) material which appeared to be the source of the float. About 1958, the property was owned by Mr. G.L. Jim from Little Fort and Mr. K Calder of Vancouver. The property was optioned to the Calder Molybdenum Company during which time some diamond drilling and trenching was done.

The first report on the property was written in 1960 by H.B. Leitch, who made a generalized map of the geology and showings and directed the drilling of 3 diamond drill holes along Moly Creek in the vicinity of the granite argillite contact. Total footage was 407 feet. This core was apparently removed from the property before it could be properly examined and assayed.

In 1961, the property was optioned to Bralorne Pioneer mines for 3 months. They did some limited IP work and trenching. They also drilled three holes for a total of 529 feet. Detailed sampling of the trenches revealed low Mo and WO_3 values. Data for this period is not available.

In 1961 at the request of Mr. G.L. Jim, the property was examined by an independent consultant, Dr. A.P. Fawley. Fawley made no recommendations for future work.

Rio Tinto took an option on the ground in 1965. Rio did the first detailed geological mapping of the area. They also did magnetometer work and soil geochemistry over the entire property, trenching, some IP work and reconnaissance stream geochemistry over the entire general area. The reconnaissance work did not delineate any other areas of interest. Molybdenum values in the trenches were generally 0.03%Mo and lower. The report, did call attention to an apparent zone of radial fractures centered at Rong Lake. Rio dropped the property just before a large option payment was due.

Falconbridge optioned the property in 1966 for a six month period. Areas of known mineralization were remapped and 5 holes totaling 2032 feet were drilled in the vicinity of Rong Lake. No significant mineralization of interest was found. (*From company report, S. H. Pilcher, Taweel Lake property, 1969, Falconbridge Property Files, Ministry of Mines Property File Archives.)*

Falconbridge reexamined the property in 1968 and decided that the property still had untested possibilities and warranted additional work. Their objectives were to drill the known mineralized fracture zone and to drill the contact zone at several locations. Previous mapping by Rio and Falconbridge was field checked and found to be "quite accurate". Other work completed by Falconbridge in 1969 included the following;

1. Soil geochemistry over the grid area. Approximately 900 samples collected. Samples were analyzed for copper and molybdenum.
2. Stream sediment geochemistry, approximately 300 samples were collected within a radius of about 2 miles. Samples were analyzed for copper and molybdenum and a few for lead and zinc.
3. EM-16 over grid area, 12 line miles.
4. Magnetometer over part of grid area, 10 line miles.
5. Diamond drilling – 9 holes 3233 feet (985.6m) "no significant mineralization was found" and the option was dropped.

In 1980, Amax of Canada Ltd. conducted an exploration program over the Anticlimax prospect (AR 8492). They reviewed and described the geology and conducted soil and stream sediment sampling along traverses approximately 500 m apart. Samples were collected every 100 m from "b" horizon soils. Samples were analyzed for copper, molybdenum, silver, lead and zinc. Some samples were analyzed for tungsten and fluorine. Amax concluded a broad and intense W-Mo soil anomaly overlies the southeast portion of the intrusive stock in the vicinity of Rong Lake.

Several soil samples, taken immediately east of central Tuloon Lake (Tintlhohten Lake), range in value from 12 to 30 ppm Mo. The anomaly remains unexplained.

There is an unexplained silver-molybdenum anomaly roughly coincident with the intrusive contact area in the north eastern sector of the intrusive stock between Moosehead and Moose Lakes.

Amax also identified two zones of silver-zinc and zinc in areas now excluded from mining exploration within Taweel Park. (*AR 8492, S.G.Enns for Amax of Canada Ltd.)*

There were no recommendations for further work and Amax dropped their option.

The claims lapsed in 1998 and were acquired by prospectors Lloyd Addie and Robert Bourdon of Nelson BC. Bourdon and Addie initially focused their exploration efforts on the massive sulphide potential, building on data developed by the Geological Survey Branch (Bobrowsky et al; OF-1998-6)

In 2004 new roads were extended into the area of the historical molybdenite showings in preparation for salvage logging areas of blown down timber and infested by pine bark beetle.

Bourdon and Addie, while routinely prospecting the new roads, found significant new high grade mineralization (2.38% Mo) approximately 1000 m from the historical showings and on the eastern flank of the broad moly-tungsten high geochem area in the vicinity of Rong Lake, previously defined and noted by S.G.Enns.

In the summer of 2005, Newmac Resources Inc. concluded an option agreement with Addie and Bourdon and shortly thereafter commenced a program of geochemical sampling and prospecting followed by excavator trenching on some of the geochemical anomalies. Newmac completed their program in early December. At the same time logging operations were commencing over much of the area underlain by prospected granite between "new showings" and the historical showings.

In February 2006, Newmac returned to the property and commenced a drilling program utilizing a newly constructed and recently used logging roads and skid trails. A total of 7486 m (24560 ft) of NQ drilling was completed between February 16 and June 16, 2006 in 33 drill holes. A significant feature of the drilling was that several of the holes drilled through the granite and into a thrust fault bounded volcanic member of the Nicola Group. Newmac initiated regional prospecting and sampling in an attempt to locate the mineralized granite originally underlying the thrust fault.

Newmac started another drill program in June of 2007 and by the end of August 2008, from the drill program had completed a total of 13,331m (43726 ft) of diamond drilling composed of 6916m (22685 ft) of NQ and 6415m (21041 ft) of HQ sized hole. A total of 3295 core and quality control samples had been submitted to Acme Labs in Vancouver for analysis.

The Ace showing was first explored in the 1920's with a short vertical shaft to access the mineralization. Subsequent work was the drilling of three short holes by Peppa Resources Inc. in 1988 (Steiner, 1988) and a ground magnetometer survey by John Jenks in 1997 (Jenks, 1998).

In the course of the 2009 program 118 ha was geologically mapped and 17 rock samples were collected from float and outcrops. 36 soil samples and 34 gravel samples were collected from an area surrounding a small pond. This area was diamond drilled by three holes totaling 610.2 meters of NQ core. No significant mineralization was intersected. The reason for the drill holes was to locate intrusive rocks and geological structures. The program was a partial success. The drill core is covered and stored at the Tuloon Lake Camp located at UTM 5717966 N and 685665E NAD 83 Zone 10U.

In the vicinity of the old Ace showing, 977 soil samples and 12 rock samples were collected from a grid with samples spaced 25 meters apart on east – west lines spaced 50 meters apart north – south. Several anomalous gold soil samples were collected and a multi-element copper, zinc, molybdenum and lead soil anomaly was outlined in the vicinity of Lemieux Creek, southeast of Taweel Lake.

The "Best" showing was explored by Brican Resources Ltd. in the late 1980's. They discovered anomalous gold and arsenic in soil along the oil transmission line which crosscuts the Crazy Fox Property along the Lemieux Creek valley (Gilmour, 1985, Gilmour, 1989).

SUMMARY OF WORK

A total of 453 soil samples and 9 rock samples were collected along logging roads in the Lemieux Creek valley located in the eastern portion of the Crazy Fox Property during June of 2010.

REGIONAL GEOLOGY

The Crazy Fox Property is underlain by a sequence of Middle to Late Triassic Nicola Group volcanic sandstone, siltstone and conglomerate etc. overlying mafic volcanic breccias and massive to pillowed pyroxene – phyric basalt (Figure 4). The Ace showing area is underlain by the Lemieux succession of siltstone and phyllite of the Nicola Group. These units have been locally hornfels and intruded by a swarm of small dykes and approximately 1.0 kilometer diameter granite and quartz-feldspar porphyry Cretaceous intrusions exposed at various levels of erosion on the property. The granite host for the Crazy Fox Mo – W –F mineralization has been offset and twisted by northeasterly directed compression during mineralization and cooling. The mineralization has been the focus of the 2007-2008 drilling program.

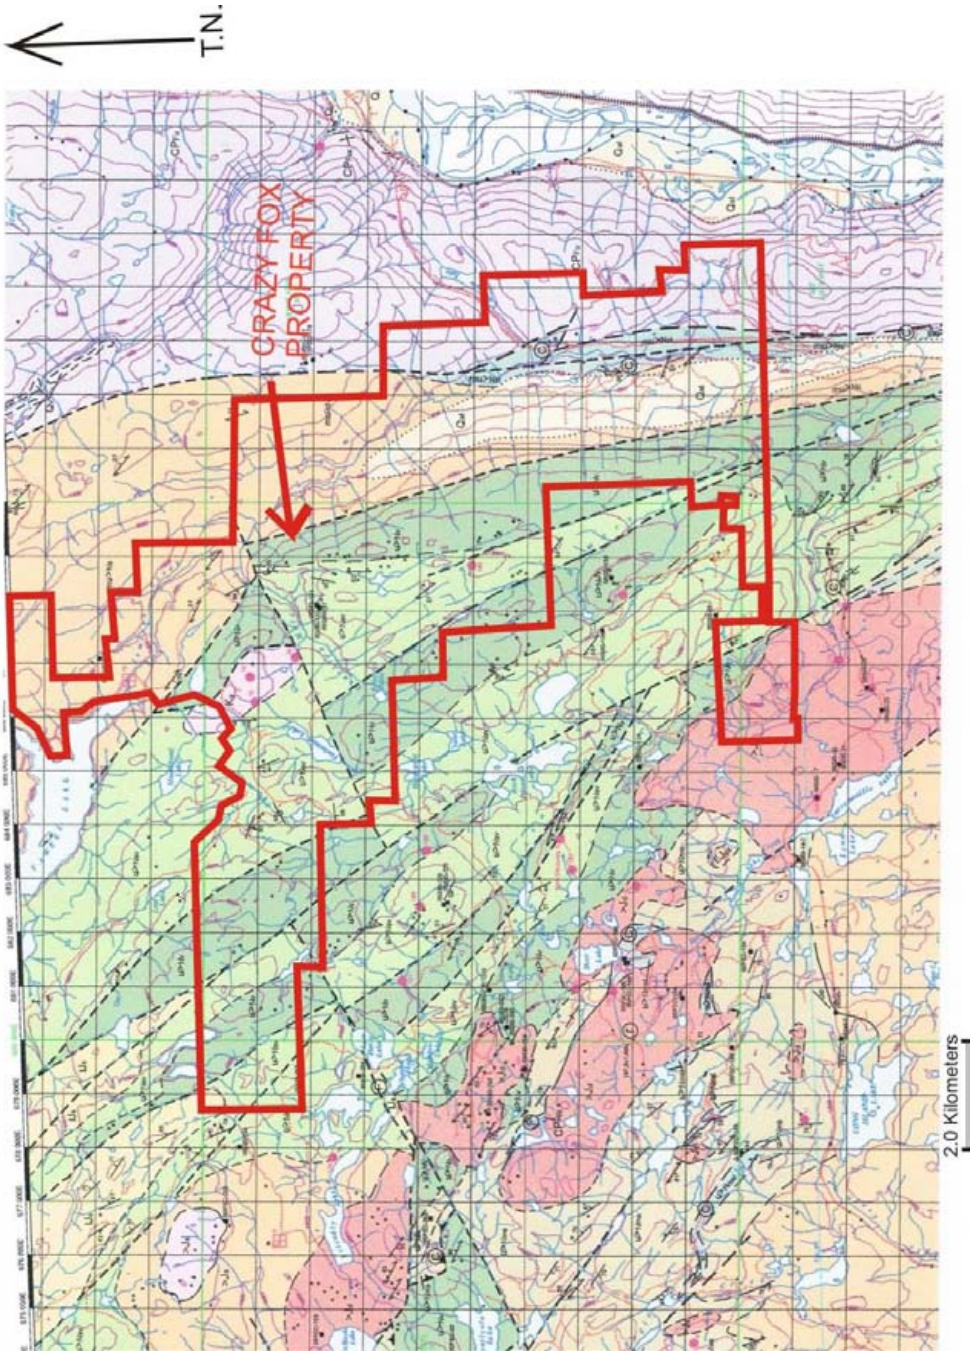

Figure 4. Regional Geology Map of the Crazy Fox Property and Index Map; Excerpted from Open File 2002-4, Geology of Nehalliston Plateau by P. Schiarizza, S. Israel, S. Heffernan and J. Zuber

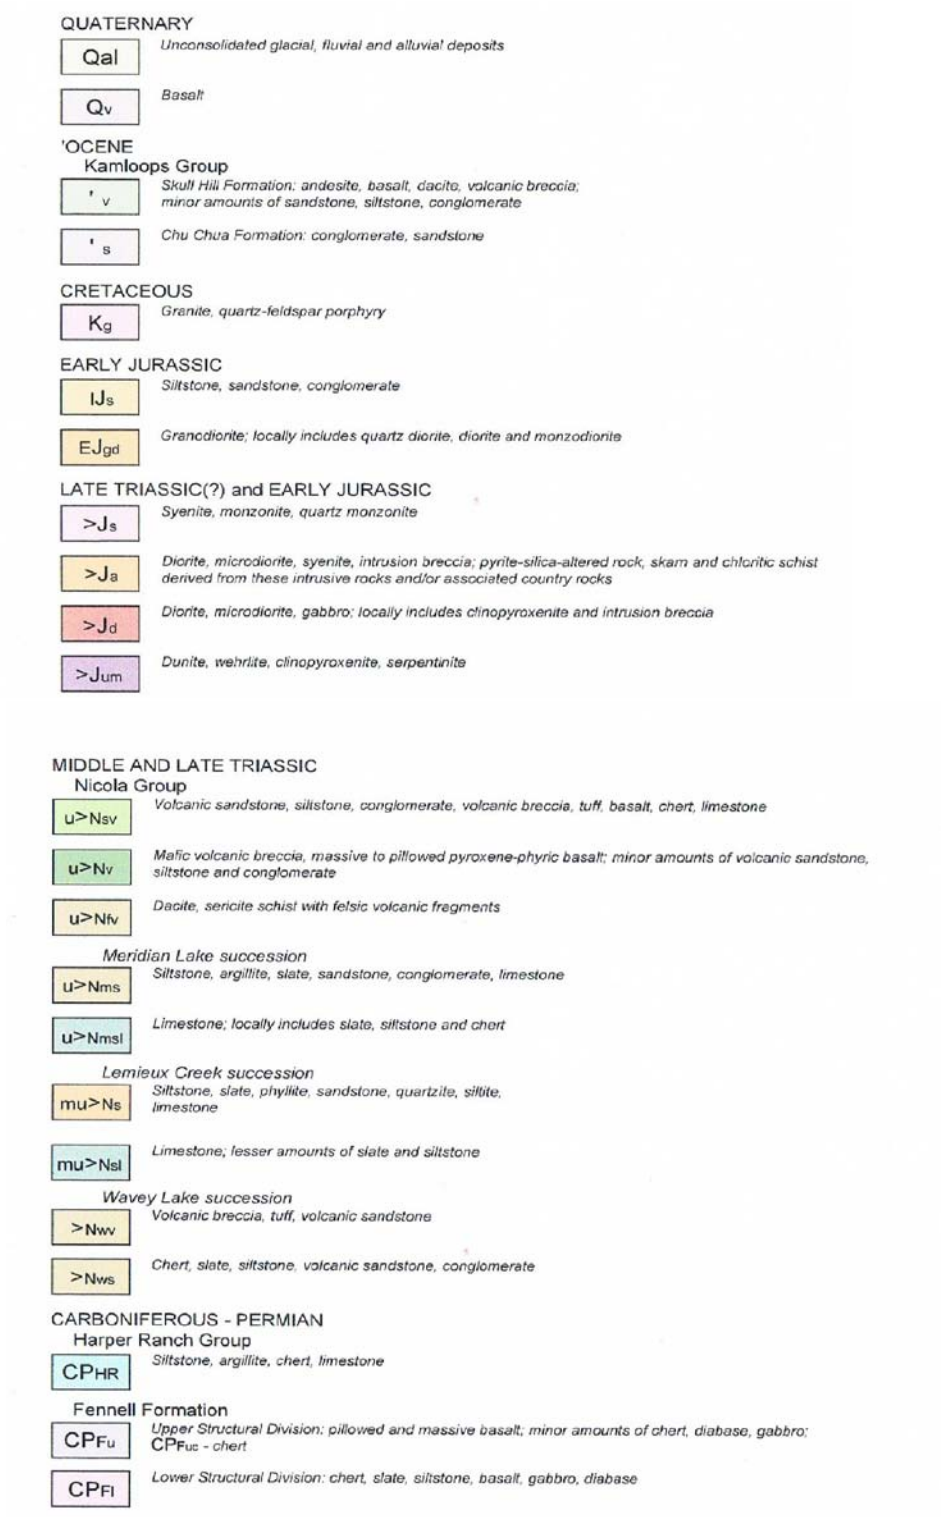

Figure 4b. Regional Geology legend.

LOCAL GEOLOGY

The lowermost Nicola Group volcanics are exposed to the northeast of the mineralized Cretaceous granite and quartz – feldspar porphyry intrusion. These volcanics are overlain by black bedded graphitic argillite which is locally highly deformed with coal and marble (limestone) intervals which is metamorphosed to graphite and locally hornblende rich hornfels next to the granite intrusion. The distance to the intrusion can be estimated by recording the first appearance of various skarn minerals (chlorite [coolest], amphibole, garnet, pyroxene and scapolite [hottest]) in the limestone beds in the sediments. The sediments were intruded by a Cretaceous leucocratic granite which was subsequently intruded by a quartz – feldspar porphyry along its western side.

The leucocratic granite (Alaskite) is composed approximately of equigranular crystals of 40% feldspar, 30% orthoclase, 20% quartz and 10% biotite with accessory minerals apatite? and rutile?

The quartz – feldspar porphyry (QFP) is composed of feldspar, quartz and biotite phenocrysts in an aphanitic matrix of quartz and feldspar.

During cooling and mineralization of the leucocratic granite, deformation occurred which separated the granite body into an upper plate (approximately 700 meters of offset to the northeast) from the lower plate. The lower plate was also deformed by a north trending shear zone , the locus of the quartz – molybdenite mineralization. During thrusting there was a 30 degree rotation of the upper plate anticlockwise, so that an earlier quartz – molybdenite – wolframite stockwork now trends N 30 W while the l earlier stockwork in the lower plate was superimposed by additional quartz-molybdenite veins in a north-south orientation. The N 30 W stockwork was the focus of the 2006 drilling program and the

lower plate north-south stockwork was the focus of the 2007 to 2008 drilling program. Using airphotos, the rotation of the upper plate can be observed by looking at the change in orientation of lineaments across the Mile Creek fault from south to north.

Magnetic lows evident in the vicinity of the exposed leucocratic granite intrusive may be the expression of buried granite bodies. This interpretation leads to the conclusion that there may be a cluster of buried intrusions on the Crazy Fox Property. It is a matter of speculation that additional mineralized bodies occur.

An andesitic dyke appears to have intruded erratically along the trace of the thrust fault. This dyke is locally clay altered and hosts local quartz – sphalerite veins where it is freshest. The dyke has fine grained phenocrysts of biotite in a grey matrix of feldspar and quartz? when fresh. The rock is distinctive and appears on surface at the projection of the thrust fault from 14 Mile Creek to the south east of the granitic intrusion.

The geology along the Lemieux Creek valley consists of the Lemieux Creek succession of siltstone, slate, phyllite, sandstone, quartzite, siltite and limestone in fault contact in the east with the older Fennell Formation. There is a sliver of limestone with minor granitic dykes at the fault contact. The fault is a major tectonic fault (Lemieux Creek fault) with minor gold mineralization ie: the “Best” showing. To the west of the sedimentary rocks is a package of Nicola Group volcanic rocks which are slightly younger than the sediments (Schiarizza et al., 2002).

GEOCHEMICAL PROGRAM RESULTS

A total of 453 soil samples were collected from a sample site every 50 meters along the logging roads in the eastern portion of the Crazy Fox Property. The samples were assayed by Acme Analytical Labs Ltd. of Vancouver, British Columbia. The gold and arsenic soil results are plotted in figures 5 and 6.

The assay method for the analysis is as follows:

> At Acme Analytical Labs, soil samples were dried at 60° C prior to sample preparation, they were then sieved to –80 mesh. A sample split of 15 gm was digested for one hour using a modified Aqua Regia solution of equal parts of concentrated HCl, HNO3 and DI H2O. The sample is made up to volume with dilute HCl. The sample solution is analyzed for 37 elements by ICP – mass spectrometry techniques.
>
> Full assay results appear in the appendix 2.

The gold and arsenic soil data was plotted on a topographic and geology base and contoured using the mean plus two standard deviations as a threshold to separate background values and anomalous values (Figures 5 to 6). The following cut-off values were used:

Gold	40.6 ppb (after the outlier of 1090 ppb Au is omitted from the dataset)
Arsenic	77.3 ppm

Analysis of sample duplicates and internal standards by Acme Analytical Labs Ltd. returned assay results which were acceptable in quality.

Both soil sampled the B horizon soil layer at 10 to 40 centimeters depth along the logging road cuts.

There are spot high anomalous soil samples concentrated mostly in the southern part of the surveyed area. These need further investigation to determine the cause of the anomalous soil. There are several near anomalous and one anomalous sample on strike of the major tectonic structure (the Lemieux Creek fault) in the eastern portion of the surveyed area – this may warrant further exploration.

MINERALIZATION

The rock sample (RLH -5) of weakly metamorphosed limy greywacke with minor pyrite in quartz – carbonate veins returned 181.3 ppb gold and 1372 ppm arsenic. This sample was collected close to the trend of the Lemieux Creek fault in the eastern portion of the surveyed area.

INTERPRETATION and CONCLUSIONS

The spot high anomalous gold and arsenic soil samples along the Lemieux Creek valley should be followed up with prospecting and soil sampling along strike of the anomalies to determine the extent of the anomalous soil.

Trenching and drilling is warranted to expose and test the gold anomaly along the Lemieux Creek fault.

STATEMENT OF QUALIFICATIONS David J. Bridge, P.Geo.

I, David J. Bridge, hereby certify that:

I am an geologist residing at 601-31 Elliot Street, New Westminster, BC, Canada.

I am a graduate of the University of British Columbia with a bachelor of applied science degree in geological engineering (1990) and a master of applied science degree in geological engineering (1994).

I am registered as a Professional Geoscientist with the Association of Professional Engineers and Geoscientists of British Columbia. (APEGBC number 24944)

Dated at New Westminster, BC April 10, 2011

Respectfully submitted,

"David Bridge"

David J. Bridge, P.Geo., MASc.

STATEMENT OF COSTS June 13 to June 28, 2010

June Program

Geotronics Consulting Inc.			$5,000.00
Assays	453 soil samples and 9 rock samples		$9,836.10
Report			$2,542.59
		Total	$17,378.69

APPENDIX 1

ROCK SAMPLE DESCRIPTIONS

SAMPLE DESCRIPTIONS OF SAMPLES FROM THE CRAZY FOX PROPERTY 2010

Sample Number	Location (NAD 83, Zone 10)	Description	Important Assay Results
RLA-1	5714410N 692295E	Dull grey greywacke with 1% calcite? Veins	2.6 ppm As, <0.5 ppb Au
RLA-2	5714420N 692273E	Rusty – grey greywacke with 5% deformed quartz – carbonate veins upto 5 mm thick	9.7 ppm As, <0.5 ppb Au
RLH-1	5715021N 692523E	Dark black argillite	15.0 ppm As, 0.7 ppb Au
RLH-2	5715046N 692510E	Weakly oxidized schistose rock – possibly greywacke ??	24.7 ppm As, 10.3 ppb Au
RLH-3	5715451N 692388E	Dark grey marble with white marble	6.7 ppm As, <0.5 ppb Au
RLH-4	5715511N 692339E	Boulder sample – slate with 50% quartz veins	5.8 ppm As, <0.5 ppb Au
RLH-5	5715512N 692350E	Metamorphosed – grey – red/ rusty orange greywacke with trace pyrite in 10-15% milky white quartz – carbonate veins	1372 ppm As, 181.3 ppb Au
RLJ-1	5716729N 690738E	Dark grey foliated slate	3.9 ppm As, 1.8 ppb Au
RLJ-2	5717595N 690191E	Metamorphosed greywacke with metamorphic quartz veins with trace pyrite	1.2 ppm As, 0.5 ppb Au

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CERTIFICATE OF ANALYSIS VAN10002962.1

CLIENT JOB INFORMATION

Project: Crazy Fox
Shipment ID:
P.O. Number
Number of Samples: 9

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
R200-250	9	Crush, split and pulverize 250 g rock to 200 mesh			VAN
1DX2	9	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN

SAMPLE DISPOSAL

STOR-PLP	Store After 90 days Invoice for Storage
DISP-RJT	Dispose of Reject After 90 days

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

ADDITIONAL COMMENTS

Invoice To: Newmac Resources Inc.
511 - 475 Howe Street
Vancouver BC V6C 2B3
Canada
