July 2011

Suite 718 – 744 West Hastings St.
Vancouver, British Columbia, Canada
V6C 1A5

Summary

The Miner Mountain property is an alkalic porphyry copper-gold project located in the Similkameen region of British Columbia. The property is located 15 kilometres north of the Copper Mountain Mining Corp – Mitsubishi Materials Corporation, Copper Mountain project (359.56 MT of 0.37% Cu). It is located on trend with other deposits such as the Axe (38 MT of 0.38% Cu), the Big Kidd (9 MT of 0.15% Cu and 0.33 G/T Au) and New Afton (66.6 MT of 1.02% Cu, 0.77 G/T Au and 2.59 G/T Ag).

The Miner Mountain property is fully owned by Sego Resources Inc. , subject to an NSR, and is within 15 minutes of the town of Princeton B.C. with access via paved roads. The Big Dog and Iris properties are owned by Al Hilton, adjoin the Miner Mountain property to the east and northwest respectively.

Previous operators had focused on the high grade Regal slide block at the base of Miner Mountain, and the Granby zone above it. Long widths of mineralization had been intercepted, but were not pursued by further exploration.

From 2007 to 2008 Sego Resources mapped, trenched and drilled ten NQ diamond drill holes on the Miner Mountain property with success in finding long widths of alkalic copper gold porphyry style alteration and mineralization, in both trenches and drill core.

In 2009 Sego followed up this exploration with further mapping, a Titan 24 survey, and further trenching. In addition various studies including Petrographic Reports and Terrain Analysis were done to further understand the formation of the mineralization and post-glacial mass wastage. In late 2009 and 2010 Sego drilled a further ten HQ holes which expanded the area of known mineralization.

In 2011 Sego performed a 34 hole percussion drilling program which is the subject of this report.

The Big Dog property was prospected in 2009 and 2010.

Property Description and Location

The Miner Mountain Property totals 2056.54 hectares in 15 mineral claims within NTS map sheet, 92H/8W at 5484400 North and longitude 694500 East (UTM Zone 10 NAD 83). The claims are situated in the Similkameen Mining Division and occur immediately northeast of the town of Princeton, British Columbia.

On June 22nd 2009 Sego fulfilled the terms of the Option Agreement and acquired a 100% interest in the claims. There remains a 3% net smelter return to the vendors of which one-half of the net smelter return can be purchased by Sego for the sum of $1,500,000.00. As of June 16th 2011 three claims of 335.62 hectares were acquired. There is no NSR on these new claims.

856634	2011/jun/10	2012/jun/10	100%	20.9801

The claims have not undergone a legal survey. All known mineralized zones that will be described and referenced in this report are within the Property and the mineral tenures listed in Table 1 above. Prior to acquisition of the Property by Sego, the environmental liabilities on the Property consisted of over 3200 m of unreclaimed bulldozer trenches from previous exploration programs. As part of the current exploration program, Sego has reopened, sampled, mapped, and reclaimed those trenches and has received a citation from the B.C.Technical and Research Committee on Reclamation, for the high quality of its reclamation work.

Sego has been granted permit number MX-04-501 for drilling, trenching and reclamation on the

Property.

The project lies within the Traditional Territory of the Upper Similkameen Indian Band. On September 28th 2007, Chief Rick Holmes, of the Upper Similkameen Indian Band and Sego! announced that they had signed a comprehensive Memorandum of Understanding to enable the exploration and potential future mine development of the Property.

The Big Dog group comprises six claims totaling 1573.79 hectares. They are 100% owned by J. Allan Hilton and adjoin the Miner Mountain Project to the east

Table 2 Claim Information Big Dog Group

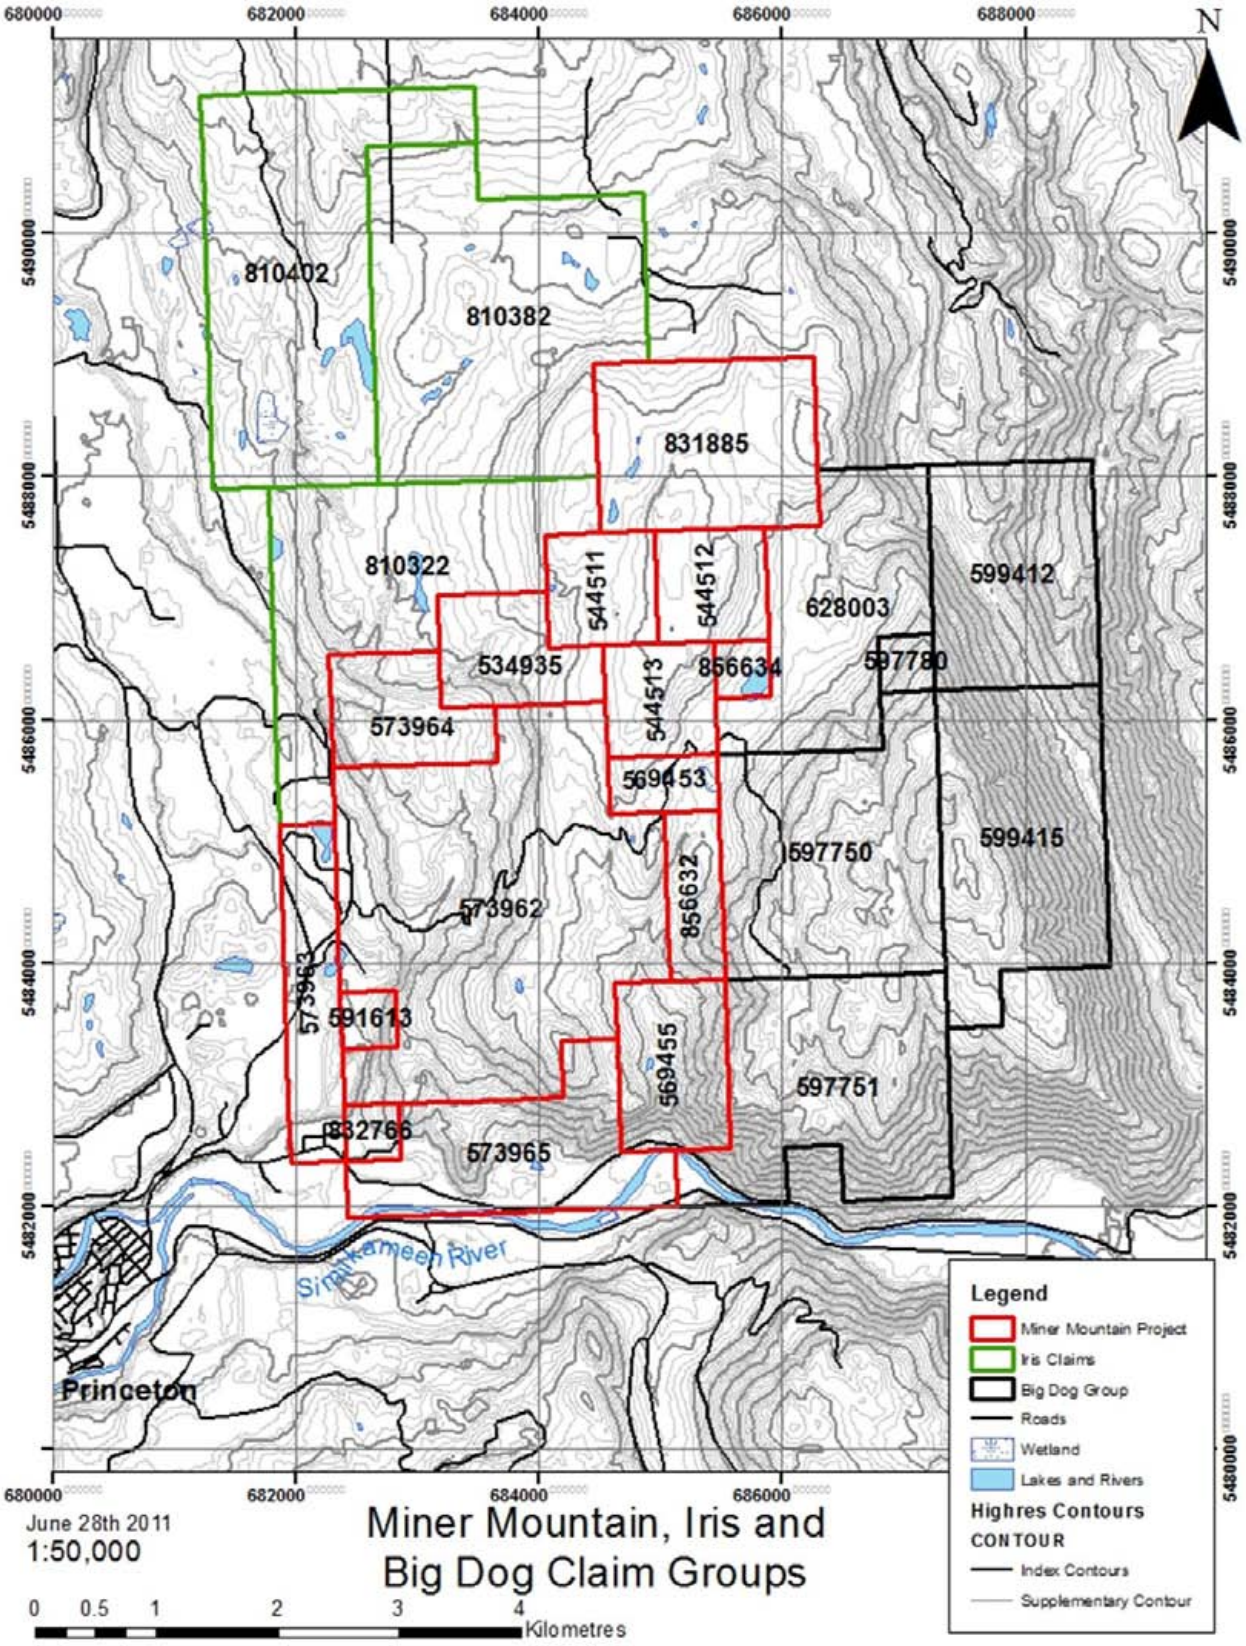

Figure 2 Project Location and Claims

Accessibility, Climate, Local Resources, Infrastructure, and Physiography

(the text in italics below is abstracted from Preto 2011)

Main access to the Miner Mountain Property is by traveling 2 km northeast of Princeton, B.C., on the Summerland road and then 0.5 km northeast on the Iron Mountain road. A number of smaller roads and tracks traverse most of the Property. Princeton, the main population centre in the area, lies 4.5 km southwest of the centre of the Property and provides the infrastructure required to base and carry out an exploration program, including accommodation, communication services, supplies and ease of access.

The area is at the southern boundary of the Interior Plateau, borders the Cascade Mountains to the south and west, and receives an average of 40 cm of annual precipitation. Higher elevations are generally moister and well timbered, with lower elevations being semi-arid open grassland sparsely timbered by Ponderosa pine, Douglas fir, lodgepole pine and aspen.

The Property ranges in elevation from 700 to 1,310 metres, and consists of benches and moderate slopes of open grassland and a few rocky bluffs.

Winters on the Property are generally mild with little or no snow, lasting from November to February. Summers are hot and dry with temperatures reaching 30 degrees Celsius or higher. Exploration on the Property can generally be carried out year round.

The entire area of the Property has been extensively glaciated and drift cover ranges from nil to more than 15 metres.

History

(the text in italics below is abstracted from Preto 2011)

Initial work on the Property was by United Empire in 1908. A total of 450 feet of mine shafts were driven for coal exploration and mining in which the company encountered "diorite flecked with Bornite" (unpublished Climax Copper report). The British Columbia Ministry of Mines Annual Report (A.R.) for 1915 notes that "a shaft 40 feet deep, was sunk about half-way up the hill, at the bottom of which blocks of quartz carrying chalcopyrite occurred in the decomposed rock" (p 241). In 1918 the Annual Report states that "Development work done consists of an open-cut 150 feet in length by 25 feet in depth, this cut being continued as a tunnel for 50 feet, also extensive stripping," and that "Assays of samples taken on the surface give from 1.15 to 5 per cent. Copper'. The sulphides in the tunnel assay from 1.37 to 2.3 per cent copper and $1.50 in gold and silver." (p214). The 1929 Annual Report reported that some diamond drilling had been done but was abandoned due to poor ground (p 278). All this work was in the general area of the Regal Zone (see Figure 3).

Granby Consolidated Mining held the ground from 1951 to 1962 and conducted diamond drilling, trenching, geochemical, electromagnetic and magnetic surveys in the Regal and Granby zones. While the geophysical surveys were filed as assessment work (Fahrni,K., 1958, A.R. 251), the results of

drilling were not.

In 1959 Kennco Explorations (Western) Ltd. performed a wide ranging geochemical, geological and geophysical exploration program in the Princeton area. The company performed an 83 sq mile (215 sq kilometres) aeromagentic survey covering the region from the Copper Mountain mine in the south to Separation Lakes, 5 kilometres north of the Property, covering what is now the Miner Mountain Project (M.M.A.R., 1959, p.142).

Climax Copper Mines Ltd (a Silver Standard Inc. subsidiary) conducted trenching, geochemical surveys, thin section analysis, Induced Polarization surveys, percussion and diamond drilling programs in 1962 and 1963 (unpublished internal report, M.M.A.R. 1963 p.63). The area covered by Climax Copper's exploration was extensive, including the Granby, Regal and South zones. (See Figure 3.) A total of 10 diamond drill holes totaling 3,535 feet (1,078 metres) were completed finding native copper, chalcopyrite and pyrite in several holes, but no assays were reported. In addition to the drilling, an Induced Polarization survey completed on the south of the Property located several anomalies.

Granby re-optioned the Property in 1965 and drilled 41 percussion holes totaling 1782 meters (5880 ft) in the area of the Granby trenches in the central portion of the Property. Copper mineralization above 0.30% Cu was intercepted in 3 of these holes, and between 0.10% Cu - 0.30% Cu in 5 other holes (BCGS Property file 92HSE079-06, M.M.A.R. 1965 p.252).

In 1968 an Induced Polarization survey was performed on the Regal Zone by Great Slave Mines which indicated that the Regal zone was a slide block. (Cochrane, D., 1968, A.R. 1721)

In 1970 Joy Mining Ltd optioned the ground at and near the Regal Trenches and increased the land position to 343 claims. Trenching of 152 metres and ¼ sq mile (0.12 hectares) of stripping was done. Saracen Mines Ltd., operators for Joy, in 1971 carried out surface geological mapping at approximately 1:20,000 scale, 103 kilometers of soil geochemistry at 30.5 metre spacings, 37 kilometres of Induced Polarization, 3 diamond drill holes totaling 457 metres and constructed a small acid leach plant at the Regal Zone. An attempt to acid leach some highly oxidized material was unsuccessful and the data was subsequently lost (G.E.M. 1971 p 275, Taylor, K.J., 1988, A.R. 17 715).

In 1973 Bethlehem Copper Corporation optioned the Property from Joy and completed five diamond drill holes. Bethlehem Copper DDH 73-4, located on the eastern margin of the Granby zone, averaged 0.27% copper from 66 ft to 300 ft and 0.05% copper from 300 ft to the bottom at 598 ft. The other four Bethlehem Copper holes had no anomalous intersections and three of these holes were not on the Property. (G.E.M. 1974 p 118)

In 1977 Quintana Mining carried out an Induced Polarization survey on the B.T.U. claims which covered the Granby and Regal Zones, was unable to locate significant anomalies and dropped the claims. (Nielsen, P., 1977, A.R. 6336)

In 1979 K.W. Livingstone drilled four percussion holes on the Property but abandoned them in overburden (Livingstone, K.W., 1979, A.R. 7477).

In 1981 A geochemical survey of rock chip and soil sampling was done by K.W. Livingstone focusing on copper mineralization. This survey located many areas of anomalous (> 100 ppm Cu) Copper zones

in the Granby and Regal Zones. (Livingstone, K.W., 1981, A.R. 9634) This was followed in 1982 by a similar survey focusing on lead-zinc geochemistry, but the results were inconclusive (Livingstone, K.W., 1982, A.R. 10 379).

Also in 1981 Peter Christopher and Associates explored and mapped the historic working on the G.E. Claims (Granby Zone area), and recommended no further work be done. (Christopher, P.A., 1981, A.R. 10 565)

In 1988 Mingold optioned the Property and did a soil geochemical survey for copper, gold, and silver. They reported that though modest, the survey was successful in locating low grade gold along with the copper anomalies. Further exploration was recommended. (Taylor, K.J., 1988, A.R. 17 715). In 1989 the soil geochemical survey was extended to the northwest of the initial survey area and was successful in extending the known anomalous zones (Reynolds, P., 1990, A.R. 20 221)

In 1995 Douglas Hopper did a soil geochemical survey to the south and north of the historical workings encountering encouraging copper, gold and silver anomalies (Hopper, D., 1995, A.R. 24 070). Further work in 1999 consisted of lineament analysis, structural analysis and the compilation of historical data on the Property. (Sookochoff, L., 1999, A.R. 25 864)

In 1997 Big I Developments Ltd. (subsequently Nustar Resources Inc.) drilled five diamond drill holes totaling 717 m (2,354 ft). Only selective portions of two drill holes were assayed. DDH 97-1, 220 ft to 355 ft, averaged 0.115% copper, and DDH 97-2, 175 ft to 350 ft, averaged 0.18% copper with some gold-palladium values. In 2000 Nustar completed five diamond drill holes for a total footage of 565 m (1,854 ft). Only DDH 00-1 was partially assayed and from 300 ft to the bottom at 430 ft the hole averaged 0.252% copper with appreciable gold and palladium values. In addition to the drilling, a magnetometer and VLF EM survey was completed on the western half of the Property (McLeod, J.W., 2000, A.R. 26 296)

In 2000 a soil geochemical survey was conducted along the northern edge of the Property by Diamet Resources. Several copper-gold soil anomalies from this program, referred to as the North Zone, are in the northern part of the Sego! Property (Rodgers, G., 2000, A.R. 26 305).

In 2002 Nustar drilled four short diamond drill holes which totaled 296 m (970 ft). The holes were collared in an east-west trending fault zone and core recovery from all four holes was extremely poor. Only random grab samples were assayed. In addition to the drilling the 2000 magnetometer survey was extended further west. (McLeod, J.W., 2002, A.R. 26 902, Unpublished Report by R.J. Nethery, P. Eng, 2003)

The Property was acquired by Sego! in July 2007.

Geological Setting

Regional Geology

(the text in italics below is abstracted from Preto 2011)

The Miner Mountain property is located within the southern portion of the Quesnel Terrane, or Quesnellia, of the Intermontane Tectonic Belt of British Columbia. Quesnellia is a northwesterly trending belt of Upper Triassic to Lower Jurassic submarine and subaerial alkalic and calc-alkalic volcanic rocks, related sedimentary rocks, and comagmatic intrusive rocks some 40 to 50 kilometres wide and traceable from the 49th parallel along the full length of the Intermontane Belt into northern British Columbia and Yukon.

In the southern part of the Province this assemblage of volcanoplutonic arc rocks is known as the Nicola Group, a name derived from Nicola Lake near Merritt and coined by G.M. Dawson who in 1877 did the earliest geological work on these rocks (Dawson, 1879). In northern British Columbia and Yukon these rocks are known as the Takla and Stuhini volcanoplutonic assemblages. Throughout the Intermontane Tectonic Belt these rocks are noted for their mineral deposits, principally copper-gold porphyry deposits, and copper and gold skarns.

The central part of the Nicola Group between Merritt and Princeton has been subdivided into three subparallel structural belts, referred to as the Western, Central, and Eastern Belt, on the basis of physical and chemical differences of the rock assemblages. The three belts are separated by two northerly trending high-angle fault systems (Preto, 1979). North of the Property, the Summers Creek Fault separates rocks of the Central Belt from those of the Eastern Belt which underlie the Property. Farther north and west, the Allison Fault system separates Central Belt from Western Belt rocks (Preto, 1979).

North of the Property, in the area between Missezeula Lake and Merritt, Eastern Belt rocks consist of an assemblage of westerly facing volcanic siltstone, sandstone and conglomerate, tuff, laharic deposits, and distinctly alkaline trachybasalt flows which occur near numerous stocks of micromonzonite porphyry which may have associated copper-gold porphyry style mineralization. On the Property itself, Nicola Group rocks are separated from much younger sedimentary rocks of the Eocene Princeton Group by the northerly trending Boundary Fault, a probable southern extension of the Summers Creek Fault.

Central Belt rocks are dominated by massive pyroxene and plagioclase-rich andesitic and basaltic flows of alkalic and calc-alkalic composition, breccia and lahar deposits, and subordinate amounts of conglomerate and finer grained pyroclastic and sedimentary rocks. Comagmatic intrusive rocks are mostly diorite with subordinate syenite, occur mostly along major faults in the eastern half of the Belt, and may contain copper-gold porphyry type deposits such as the Axe Deposit.

Western Belt rocks include andesite to rhyolite flows of distinctly calc-alkalic composition and tuff, which are interbedded with limestone of Lower to Middle Norian age, volcanic conglomerate, and sandstone (Preto, 1979).

The large northerly trending fault systems such as Allison and Summers Creek, are believed (Preto, 1979) to represent deep-seated crustal fractures which dominated the geology of the region in Late Triassic time and caused volcanic centres to be aligned in a northerly direction, thus producing a central zone of dominantly volcanic and intrusive rocks, the Central Belt and part of the Eastern Belt, flanked to the west and east by sedimentary basins. Some of these eruptive centres can be identified with stocks or clusters of stocks of micromonzonite or microdiorite which may have associated copper-

gold mineralization such as at the Miner Mountain and Axe Properties, and at Copper Mountain 15 kilometres south of Princeton.

Property Geology

(the text in italics below is abstracted from Preto 2011)

The geology of the Miner Mountain property is dominated by volcanic flows of the Upper Triassic Nicola Group and associated microdiorite-diorite intrusions. To the west the northerly trending Boundary Fault separates these rocks from sedimentary and volcanic rocks of the Eocene Princeton Group.

The Nicola Group flows consist of green and maroon to nearly black, massive and flow banded andesites, basalts and cherty tuffs. Weak alteration is ubiquitous and commonly consists of chlorite, hematite, hematite stained albite and epidote. Less common, but locally intense, are gypsum, sericite, silica and potassic (k-feldspar/biotite/magnetite) alteration. Co-magmatic intrusions of diorite and micro-diorite crosscut the volcanics and have similar styles of alteration. Aphanitic, mafic dykes are present but uncommon and only seen in drill core.

The Princeton Group exposures on the Property are composed of oxidized buff to orange arkosic sandstones, conglomerates and, in places, coal measures. These beds are poorly lithified and easily eroded, and the contact with the underlying Nicola Group is a steep scarp which marks the Boundary Fault.

The older Nicola Group rocks are ubiquitously altered and strongly faulted. On the Property limited outcrop and heavy alteration have obscured the attitude of the volcanic units. The beds of the Princeton Group dip towards the east following the half-graben created by the Boundary Fault.

After the last glaciation, a large block of oxidized porphyry style copper-gold mineralization hosted by Nicola volcanic rocks and microdiorite, slid downward and to the west from the Granby Zone to the Regal Zone in a landslide event. Similar mineralization remains in situ upslope in the Granby Zone. As in other similar porphyry systems hosted by Nicola rocks in south central British Columbia, such as the Afton Deposit, the extensive oxidation of the hypogene sulphide mineralization required a long period of warm and humid climate which prevailed in the region in Late Cretaceous-Early Tertiary time prior to the formation of the Tertiary grabens.

The Big Dog property has the same geology as the Miner Mountain Property. It is composed of Nicola group volcanic flows, and lahars with minor microdioritic intrusions. Alteration is composed of ubiquitous carbonate/calcite stringers, with chlorite and quartz. Sulphide mineralization consists of minor pyrite disseminations, and trace chalcopyrite on a few samples. (Kauss, 2010, 2009)

The Iris property is located over the sediments of the Eocene Princeton Basin. According to Massey 2000-10 the area of the Iris claims is underlain by the Sunday Conglomerate, Summers Creek Sandstone, and the Vermillion Bluffs Shale.

Mineral Deposits Style

(the text in italics below is abstracted from Preto 2011)

The deposit type sought on the Property is alkalic copper-gold porphyry deposits similar to those found throughout Quesnellia and particularly at Copper Mountain some fifteen kilometres south of the Property, at Afton twelve kilometres west of Kamloops, and at Mt. Polley fifty-six kilometres northeast of Williams Lake.

Alkalic porphyry systems are known worldwide and their significance as important sources of copper and gold is continuously enhanced by new discoveries. The best known mineral provinces hosting these deposits are the Upper Triassic to Lower Jurassic volcanoplutonic arcs of Quesnellia and Stikinia in British Columbia and the Late Ordovician Lachlan Fold Belt of New South Wales.
Key characteristics of Alkalic copper-gold systems in the Mesozoic arcs of British Columbia include:

- *Association with coeval and comagmatic volcano-plutonic complexes that formed at intermediate (≤ 5 km) to very shallow, subvolcanic (≤ 1.5 km) depth.*
- *Association with small pipe-like or dyke-like subvolcanic intrusions, which may occur in clusters (e.g. Mt. Polley), or with larger stocks that were emplaced at intermediate depth .*
- *Association with large fault structures or intersections of such structures which may have localized the emplacement of the mineralizing intrusions.*
- *Mineralization may be largely intrusive–hosted (e.g. Mt. Polley, Afton), volcanic-hosted (e.g. most of Copper Mountain), or both (e.g. Copper Mountain-Ingerbelle; Preto, 1972)*
- *Can be high-grade in gold and copper and may contain significant palladium.*
- *Mineralization may be hosted in pre- or early-mineral magmatic-hydrothermal breccias (Sillitoe, 1985). If so, grade in the breccias is usually considerably higher than the rest of the system(e.g. Mt. Polley)*
- *Association with moderate to strong albitic and potassic alteration of the intrusive and volcanic rocks, but lack of an advanced argillic alteration assemblage. Phyllic alteration, if present, is limited to fault zones.*
- *Zones of alteration can terminate abruptly due to structural control which would also determine the shape and extent of intrusions and mineralized zones.*
- *Absence of a wide alteration halo.*
- *Low sulphide content of the hypogene mineral assemblage, resulting in limited or no supergene enrichment, though oxidation can be very extensive (e.g. Afton)*

Exploration 2007 - 2011

Since acquiring the Miner Mountain Property in July 2007, Sego has performed the following exploration work summarized below. For detailed discussions, figures, and maps the reader is referred to B.C. Assessment Reports 29549, 30277 and 31730 (the text in italics below is abstracted from Preto 2011 and deals exclusively with the Miner Mountain Property).

Since staking there have been two prospecting visits to the Big Dog property one in 2009 and the other in 2010 as described by Kauss (2009, 2010) a total of 26 rock samples were taken and minor geologic mapping was done. There has been no work on the Iris Property since staking.

2007

In the fall of 2007 geological mapping of natural exposures was started and continued until the onset of winter.

2008

In April approximately 99 line kilometres of soil sampling was done by SabreX Contracting Ltd. Nineteen hundred and seventy-three samples of the B Horizon were collected at 50 m intervals along east-west lines spaced 100 m apart and covering most of the Property from a northerly line at UTM 5486700 to a southerly line at UTM 5482800. A north-south baseline for the grid was established at UTM 684300 east. Samples were sent to Acme Analytical Laboratories Ltd. for analysis. The results of this survey are shown in Figure 6. Soil anomalies coincide well with areas of mineralization, particularly the Granby, South and Regal Zones.

As soon as ground conditions allowed, an excavator trenching program was started. All old bulldozer trenches were reopened, deepened and, where practicable, extended. In total 5,306 metres of trenches were excavated, mapped and 2,170 samples taken. The location of each trench and sample was determined by GPS. Trench mapping and sample results were entered in the geological database. Because all trenches are in grazing land and when open pose a danger to livestock, mapping and sampling was done as soon as possible after excavation and the trenches closed and reclaimed as soon as practicable. Excavator trenching proved to be a very cost effective method of exploration in the largely drift covered, open range land of the Property. Zones of known mineralization determined by previous operators were confirmed, in some cases extended, opened and re-sampled.

In August and September ten NQ drill holes totaling 1039.89 metres were completed.

Field mapping, sampling and core logging was done by Sego! geologists with consulting services provided by the author of this report and by Chris Sampson, P.Eng.

2009

A Titan 24 IP survey was performed by Quantec Geoscience between April 25th 2009 to May 14th 2009. The survey grid includes 13 DC/IP parallel lines along a total of 31.2 km (38.7 km with extension) (Figure 8). Each line was surveyed with dipole spacing of 100 m and line separation of 200 m. Survey line length was approximately 2.4 km plus additional current injections up to 500 m beyond the end of the line. The data were inverted using the 2D inversion algorithms to produce maps of resistivity and chargeability of the subsurface.

The resistivity distribution over the survey area can be characterized as a resistive low associated with the Princeton Group and a resistive high associated with the Nicola Group. The resistivity of the Princeton Group in the northwest part of the survey grid is generally less than 50Ωm. The resistivity of the Nicola Group, which covers most of the survey area, is on the order of several hundreds of Ωm. These results are in agreement with the known geology of the area

The chargeability maps show a relatively heterogeneous distribution of the anomalies over the survey area. The chargeability varies between 0 mrad to 20 mrad with a background chargeability of ~6 mrad. Chargeable anomalies, as high as 20 mrad, are mainly located in the western and eastern parts of the survey grid. A moderate elongated chargeable anomaly is resolved at a depth of ~400 m. The elongated anomaly has a SW-NE orientation and traverses the grid in the south part of the survey area.

Mapping was carried out in July and August 2009 to look for zones of alteration and mineralization associated with the geophysical anomalies outlined by the Titan 24 survey, and also to locate new zones outside of the areas of known mineralization. The mapping was concentrated to the Southeast and Northeast of the claim blocks away from the known areas of mineralization.

The results were successful in locating three new zones of alteration and mineralization in the Southeast co-incident with the MT 1 anomaly and to the Northeast where previous trenching had located scattered lead-zinc-copper mineralization. The new zones include the Schissler and Miner Zones in the South East of the property and the North Zone in the centre north of the property.

In September and October of 2009, trenching was focused on the South Zone to test the potential for precious metal mineralization indicated by the 2008 exploration Figure 7 and in the Schissler Zone to test near surface chargeability anomalies

Three HQ diamond drill holes totalling 496.45 metres were completed in 2009, two in the South Zone and one in the Granby Zone.

Thin section work by K. Dunne, P.Geo was done in October 2009 on trench and drill core samples from the South and Granby Zones respectively.

2010

A geomorphological study of the property was done by Dr. Selina Tribe P.Geo of Carta Explorations on March 17th 2010. This was an overview of the surficial geology of the property looking at the immediate post-glacial history. The emphasis was on analyzing the mass wastage events to determine possible source areas of the high grade Regal slide block. This study was successful in delineating the history and located several potential slide routes (Tribe, S. 2010) which Sego began testing in 2010 by trenching the slopes above the Regal Zone, and in the Southwest corner of the Granby Zone.

Of these trenches, trenches 95, 96 and 97 were also excavated to test for surface expression of the mineralization located by diamond drill hole MM-10-19. Trench 96 successfully located excellent grade mineralization above the drill hole (see press release dated Dec 15th 2010), while trenches 97 and 98 located a zone leached gossanous rock that could not be penetrated by the excavator and extended at least 150 metres to the east of trench 96.

Seven HQ drill holes totalling 1001.1 metres were completed on the Granby Zone. Details are given in section 13.2 below.

A second petrographic study was completed by K. Dunne, P. Geo on May 7, 2010. In total the 2009 and 2010 studies included 28 samples taken from drill core and trench material. The work confirmed the presence of multiple intrusives and intrusive phases from microdiorite and quartz monzonite to syenite, and elucidated the variety of volcanic rocks from crystal tuffs to amygdaloidal basalts. In many cases the work discovered previously unsuspected phases of alteration, and defined multiple stages of veining.

2011

Exploration work completed to date in 2011 consists of 34 percussion drill holes totalling 2002 metres. This is phase 1 of a program of such drilling designed to test a broad east-west zone across the southern part of the Granby Zone, which is underlain by a chargeability anomaly, and to penetrate underneath the leach cap encountered in trenches 97 and 98 in 2010. The program was started and completed in March, 2011. The hole spacing's are approximately 30 metres and contained within 5484250 to 5484390 northing and 683735 to 684045 easting.

These holes were drilled at approximately 30 metre intervals along east-west and north-south grid lines, across the southern portion of the Granby Zone and cover an area approximately 300 metres east-west and 125 metres north-south (See Map 1). PDH 32 was abandoned due to poor ground conditions and was not logged or assayed.

Mineralization highlights are as follows:

PDH 1 From 24 to 48 m 0.156% Cu.

PDH 2 From 60 to 70 m 0.355% Cu, 0.446 G/T Au, 1.2 G/T Ag.

PDH 6 From 16 to 20 m 0.128% Cu, 0.179 G/T Au (and Isolated hits between 10 to 30m)

PDH 8 From 38 to 56 m 0.186% Cu, 0.138 G/T Au, and from 68 to 72 m 0.226 G/T Au.

PDH 9 From 12 to 64 m 1.264% Cu, 1.061 G/T Au , 3.79 G/T Ag, Including 12 to 44 m 1.845% Cu, 1.628 G/T Au 5.569 G/T Ag including from 16 to 24 m 3.681% Cu 5.256 G/T Au and 15.975 G/T Ag which includes from 18 to 22 m 3.999% Cu 6.925 G/T Au and 23.450 G/T Ag.

PDH 12 Isolated 0.1% Copper from 70 to 82 m.

PDH 13 from36 to 38 m from 0.139% Cu, 0.083 G/T Au, 64 to 68 m 0.272% Cu, 0.237 G/T Au 0.50 G/T Ag.

PDH 14 From 20 to 70m 0.126% Cu, 0.087 G/T Au.

PDH 15 From 24 to 50m 0.161% Cu, 0.4 G/T Au, 0.43 G/T Ag including from 32 to 38 m 0.191% Cu, 1.053 G/t Au.

PDH 16 From 14 to 20 m 0.237% Cu, 0.16 G/T Au, and from 28 to 40 m 0.141% Cu, 0.096 G/T Au.

PDH 17 From 32 to 44 m 0.135% Cu, 0.094 G/T Au (isolated Cu and Au from 28 to 48 m)

PDH 18 From 34 to 38 0.216% Cu, 0.030 G/T Au, and from 40 to 56 m 0.186% Cu, 0.046 G/T Au and from 68 to 74m 0.112% Cu, and 0.021 G/t Au.

PDH 19 From 44 to 46 0.121% Cu, 0.029 G/T Au.

PDH 20 From 10 to 22 m 0.197%, Cu, 0.257 G/T Au.

PDH 21 From 16 to 28 m 0.8 % Cu, 0.647 G/T Au, 1.367 G/T Ag including 18 to 24 m 1.342% Cu, 1.064 G/T Au and 2.067 G/T Ag and from 44 to 50 m 0.295% Cu 0.173 G/T Au.

PDH 22 From 12 to 22 m 0.142% Cu, 0.071 G/T Au and from 32 to 42m 0.145% Cu 0.122 G/T Au.

PDH 26 From 38 to 42 metres 0.14% Cu, 0.056 G/T Au.

PDH 28 From 14 to 28 metres 0.15% Copper, 0.261 G/T Au. 40 – 44 metres 0.16% Cu, 0.769 G/T Au.

PDH 31 From 32 to 42 metres 0.21% Cu r, 0.121 G/T Au.

PDH 34 From 24 to 48 metres 0.22% Cu, 0.144 G/T Au, includes 30 – 36 metres 0.38% Cu, 0.234 G/T Au, and, 30 – 32 metres 0.52% Cu, 0.238 G/T Au.

The percussion chips were collected and split every two metres with half sent for assay and half kept for logging. The chips were initially logged in the Sego warehouse in Princeton and later at Sego head office in Vancouver. Logging showed similar rocks to those described in previous assessment reports. They are primarily eastern facies of the Nicola Group, composed of dark-grey green to black basaltic andesites, microdiorite, with minor brick red (hematized) basalt and very minor crystal tuff in one hole. The basaltic andesites range from an aphanitic to porphyritic texture with plagioclase and/or augite phenocrysts. The brick red basalt unit is devoid of mineralization and mostly limited to the southwest area of the percussion drill grid in PDH 6, 27, 28, and 29, The Microdiorite is found at depth and to the east, and it is distinguished from the volcanics by its equant phenocrysts and epidote-chlorite highlighting of the plagioclase and relict pyroxenes. There is minor buff coloured rock chips with linear hornblende crystals at the base of PDH 1 which is thought to be a dyke.

The volcanics and intrusives subjected to a pervasive, weak to intense chloritization and with a lesser degree and prevalence of epidotization. Albitic alteration is also widespread, but more common at lower depths. Potassium feldspar is present but mostly sparsely dispersed, without a coherent zonation. Biotite is found at the top of one hole. There is a blanket of limonitic alteration near surface ranging in thickness from 3 to 50 metres, from where the casing ends. Fracture-controlled weak to intense hematite is also common. Gypsum, calcite, and quartz fragments, with colours ranging from white, orange-pink, and translucent, suggest that these stringer/vein types are common, and sometimes associated with sulphide mineralization. In the area around PDH 9 alteration is so intense that it obliterated much of the host rock, leaving only quartz fragments and fine white grey clay.

The phase I percussion program successfully intercepted consistent significant intervals of copper and gold mineralization. PDH 2, located in the south-east area of the grid, intersected 0.329% Cu and 0.343 G/T Au from 58 to 68 metres and ended in mineralization. PDH 9 had the best mineralization of progam, with 52 m of 1.264% Cu and 1.061 G/T Au. Inferring from the pulverized bleached rubble sample taken, the rocks are thought to have been an andesite which were subjected to intense albitic

alteration with significant copper sulphide disseminated throughout. The main sulphides in this hole are chalcopyrite, bornite, and pyrite. PDH 21 had 12 metres of 0.8% Cu with 0.647 G/T Au, and appears to be part of the same mineralization as PDH 9. PDH 34, the most westerly percussion hole of this program, also intersected 24 metres of 0.22% Cu and 0.144 G/T Au with pyrite and chalcopyrite and bottoming in mineralization. The andesites intersected by PDH 34 are chloritized, and epidotized with fracture-controlled limonite/hematite with abundant calcite chips. Most holes had values greater than 0.1% Cu and 0.1 G/T Au indicating a wide zone of Copper-Gold mineralization associated with the chargeability anomaly.

The copper mineralization in this area appears to trend northwest from PDH 9 to PDH 21 and is open to the northwest. These two percussion holes may be associated with the mineralization in PDH 31 and PDH 34 to the west-northwest. It was suggested by the geological consultant that there is a copper mineralization trend running northwest to southeast from PDH 9. There also appears to be a sub-parallel northwest-southeast trend 50-80 metres northeast from PDH 9. This trend runs northwest from PDH 1 to PDH 13 through to PDH 17. The neighbouring east and west of the above mentioned three holes also have good copper and/or gold mineralization. The mineralization is open to both the northwest and southeast.

Rough sulphide zonation has been defined by drilling. There is a pyrite dominant interval found proximal to surface, with a deeper more copper-rich pyrite-chalcopyrite interval below. Further down there is a richer copper interval of bornite-chalcopyrite-pyrite. The thicknesses of these intervals vary substantially from one hole to the next and are discontinuous at parts. Initial indications are that the intervals dip to the west.

Geochemical associations discovered during this program include an elevated zinc anomaly (up to 1000 ppm) along 683 930 easting running N-S located in the middle of the percussion grid. Higher grades of copper and gold were associated to both the east and west of this trend. Also, the brick red basalt unit had a pronounced geochemical signature being anomalously high in nickel and extremely depleted in copper and gold.

Conclusions & Recommendations

Copper mineralization is pervasive on and peripheral to the chargeability anomaly. Mineralization is open to the west and northwest in the western part of the grid and east, southeast, and northeast in the eastern part. Expanding the current percussion grid by drilling in the direction mentioned above should increase tonnage and define the target further. More specifically, an additional line of holes along 5 484 400 northing and filling in the gaps, a set of holes along 683 700 easting to define the western mineralization, and another set of holes to the south from PDH 5 across to PDH 15 and to the east of PDH 15 up to PDH 16. Additional holes southwest of PDH 27 would be unnecessary as they would intersect the depleted brick red unit.

The area around PDH 09 should be diamond drilled to confirm and define the extent of copper mineralization. Since mineralization is very strongly structurally controlled, orientated core drilling could prove to be useful in providing accurate structural data.

Less than 400 metres strike east-west has been percussion drilled to date and there still remains a large area to be explored. It is recommended that the chargeability anomaly be completely drilled and

prospective areas followed up with HQ diamond drilling to evaluate the full economic potential of this area. Further and deeper drilling to the southeast and northeast from the current grid should extend current known copper and gold mineralization. A 35 hole Phase II percussion drilling program is recommended as the next step, with further drilling of the areas to the east of PDH 1 and 15 and to the west of PDH 34 and northwest of PDH 9 and 21. A minimum depth of 50 metres for all holes is recommended and all holes should be checked for mineralization before the drill is moved.

Budget for Phase II PDH program

3500 metres at $42 per metre	$ 147,000
1750 ICP assays at $30.55	$ 56,000
3 Geologists for 1.5 Months	$ 45,640
Supplies, Accomodations etc..	$ 30,000
Reclamation	$ 25,000
10% Variance	$ 30,000
Total	$ 333 640

CERTIFICATE OF ANALYSIS VAN11000978.3

CLIENT JOB INFORMATION

Project: None Given
Shipment ID:
P.O. Number
Number of Samples: 162

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT Dispose of Reject After 90 days

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
R200-250	162	Crush, split and pulverize 250 g rock to 200 mesh			VAN
1DX2	162	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
G601	12	Fire Assay fusion Au by ICP-ES	30	Completed	VAN
7AR1	24	1:1:1 Aqua Regia digestion ICP-ES analysis	1	Completed	VAN

ADDITIONAL COMMENTS

Version 3: G601 for sample 944658 included

Invoice To: Sego Resources Inc.
Suite 718 - 744 W. Hastings St.
Vancouver BC V6A 1A5
Canada

CERTIFICATE OF ANALYSIS VAN11001002.2

CLIENT JOB INFORMATION

Project: Miner Mountain
Shipment ID:
P.O. Number
Number of Samples: 188

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT Dispose of Reject After 90 days

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
R200-250	186	Crush, split and pulverize 250 g rock to 200 mesh			VAN
1DX2	186	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
G601	29	Fire Assay fusion Au by ICP-ES	30	Completed	VAN
7AR1	44	1:1:1 Aqua Regia digestion ICP-ES analysis	1	Completed	VAN

ADDITIONAL COMMENTS

Version 2: G601 & 7AR1 Cu included

Invoice To: Sego Resources Inc.
Suite 718 - 744 W. Hastings St.

CERTIFICATE OF ANALYSIS VAN11001106.2

CLIENT JOB INFORMATION

Project: Miner Mountain
Shipment ID:
P.O. Number
Number of Samples: 228

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT Dispose of Reject After 90 days

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
R200-250	227	Crush, split and pulverize 250 g rock to 200 mesh			VAN
1DX2	227	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
G601	93	Fire Assay fusion Au by ICP-ES	30	Completed	VAN
7AR1	93	1:1:1 Aqua Regia digestion ICP-ES analysis	1	Completed	VAN

ADDITIONAL COMMENTS

Version 2 : G601 & 7AR-Cu included.

CERTIFICATE OF ANALYSIS VAN11001195.2

CLIENT JOB INFORMATION

Project: Miner Mountain
Shipment ID:
P.O. Number
Number of Samples: 195

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT Dispose of Reject After 90 days

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
R200-250	195	Crush, split and pulverize 250 g rock to 200 mesh			VAN
1DX2	195	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
G601	37	Fire Assay fusion Au by ICP-ES	30	Completed	VAN
7AR1	37	1:1:1 Aqua Regia digestion ICP-ES analysis	1	Completed	VAN

ADDITIONAL COMMENTS

Version 2 : G6-Au & 7AR-Cu included.
