Assessment Report
Title Page and Summary

TYPE OF REPORT [type of survey(s)]: Diamond Drilling

TOTAL COST: 153,934.11

AUTHOR(S): Douglas Anderson **SIGNATURE(S):**

NOTICE OF WORK PERMIT NUMBER(S)/DATE(S): **YEAR OF WORK:** 2011

STATEMENT OF WORK - CASH PAYMENTS EVENT NUMBER(S)/DATE(S): SOW - M (5138007)/Nov28,2011

PROPERTY NAME: Dewdney Trail

CLAIM NAME(S) (on which the work was done): 515885

COMMODITIES SOUGHT: Gold

MINERAL INVENTORY MINFILE NUMBER(S), IF KNOWN:

MINING DIVISION: Fort Steele **NTS/BCGS:** 082G073

LATITUDE: 49 ° 79 '85 " **LONGITUDE:** 115 ° 56 '75 " **(at centre of work)**

OWNER(S):
1) PJX Resources Inc. - option from SG Spirit Gold 2)

MAILING ADDRESS:
5600 - 100 King Street West, Toronto, Ontario, Canada
MX5 1C9

OPERATOR(S) [who paid for the work]:
1) PJX Resources Inc. 2)

MAILING ADDRESS:
As Above

PROPERTY GEOLOGY KEYWORDS (lithology, age, stratigraphy, structure, alteration, mineralization, size and attitude):
Dewdney Trail overlies a sequence of Mesoproterozoic sedimentary rocks including the Middle and Upper Aldridge Formation sub-divisions, Creston Formation, and Kitchener Formation. The property straddles a major overturned anticline with upright rocks on the west side and an overturned sequence on the east. Gold has been found in quartz veins within a package of Middle Aldridge-style quartzitic turbidites.

Diamond Drilling on the Dewdney Trail Property

TABLE OF CONTENTS

List of Figures:

Appendices:

DIAMOND DRILLING REPORT FOR THE DEWDNEY TRAIL PROPERTY

1.0 Introduction

The Dewdney Trail property is located in the Rocky Mountains of southeastern B.C. about 30 kilometres NNE of Cranbrook, B.C. It straddles the front range of the mountains west of the Wild Horse Creek drainage. It is an area of high relief from 1100 to 2100 metres in the area of the drilling program reported on herein. Access is via the Wild Horse forest service road then along the Victoria Creek road to an unnamed drainage about 1.5 kilometres northeast of Victoria Creek.

2.0 Property Definition, History, and Background Information

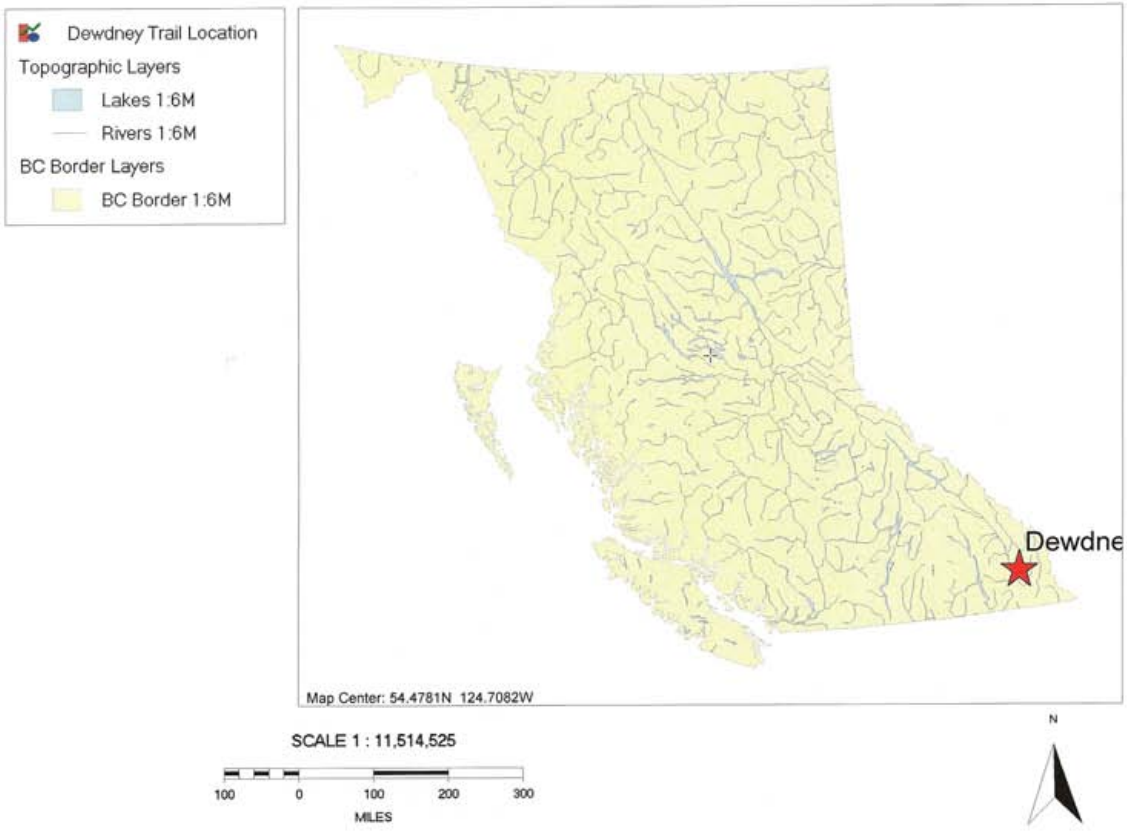
2.10 Property Definition

The Dewdney Trail claims encompass 53 claims totaling 18879.36 Ha. The claims cover west of the Wild Horse Drainage north to Lewis Creek. The claims are owned by SG Spirit Gold but are under option to purchase to PJX Resources Inc. The drilling was completed on one claim – Tenure number 515885.

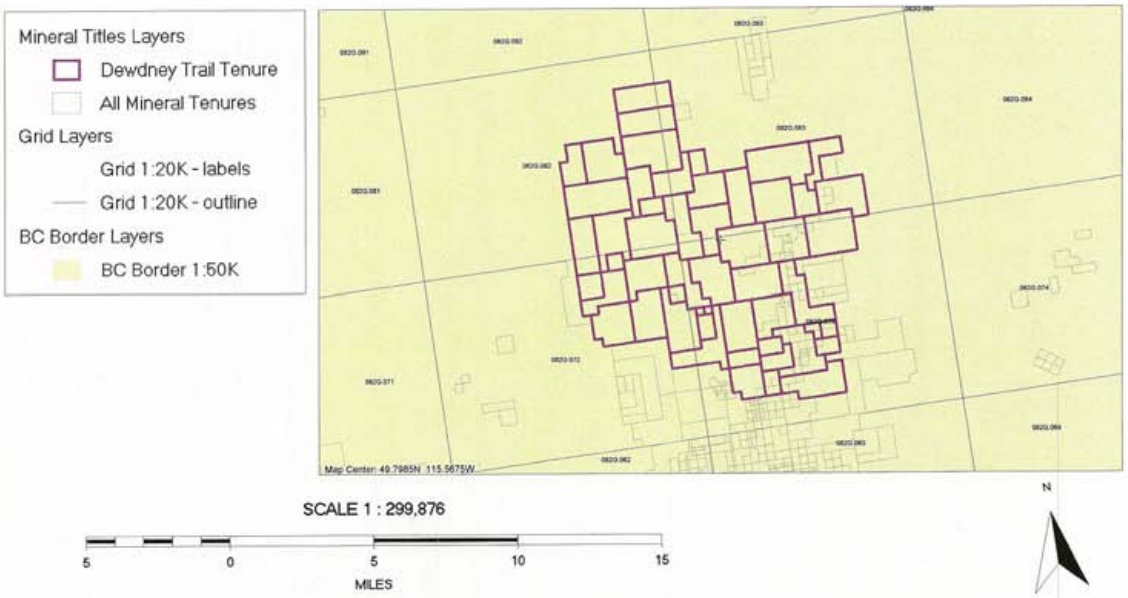
2.20 History of Exploration

The history of exploration for the current Dewdney Trail claims involves an extended period of work done in the areas of the Estella and the Kootenay King Mines. This brief history will deal only with the current area of drilling and the property work done a few kilometers to the south (Spirit Dream) and north (Tac – Little Tackle and Tackle drainages). Some of the earlier work which bears on the area drilled in 2011 was started by Placer Dome to the north (AR20202) on the Tac property (late 1980s) where they completed mapping, soil geochem and some geophysics. The outcome was they identified anomalous gold on two soil grids and in rock samples. They noted Ag, Pb, Zn and Cu was associated with the gold and considered some syenitic intrusives as a possible source for the metals. Next for the southern portion of the Dewdney Trail (Spirit Dream at the time)were soil lines done on the drill area with some positive gold numbers. Mapping was conducted to the south with soil geochem done as a follow-up. Trail excavation and trenching followed. During this several years of work, explorers were noting gold in soils and rocks over a series of quartzites hosting quartz veins. Several contour soil lines were done on the ridge above the drilling and down into the Little Tackle drainage. Anomalous gold was erratically distributed on these lines. The entire property was mapped in 2009 and reported on in AR31437.

Dewdney Trail Location Map



Dewdney Trail Claim Map



3.0 Regional Geology

The Dewdney Trail property is a Rocky Mountain claim block lying west of the Wild Horse drainage, encompassing the Little Tackle, Tackle, Trail, and Lewis Creek drainages. The 52 claims cover a large area of about 12 by 10 kilometres.

The property is underlain by Mesoproterozoic sedimentary rocks of the Fort Steele, Aldridge, Creston and Kitchener Formations. These rocks have been deformed into a large, east verging, overturned, asymmetric anticline. This Wild Horse anticline is straddled by the property meaning the east portion of the claim block is overturned stratigraphy. The sediments generally strike approximately north-south, dipping east on the west flank and dipping west on the east side of the anticline.

Briefly the **stratigraphy** as described by T.Hoy:

Fort Steele Fm – Base of the succession (Base not exposed) is some 2000 metres of several fining-upward sequences of coarse-grained, massive to cross-bedded quartzites each grading up into laminated siltstone at the top.

Aldridge Fm – 3500 to 3800 metres thinning to the north. T. Hoy divides the lower Aldridge into six sub-divisions of A1:

a. A basal grey to black siltstone and argillite
b. Silty dolomite horizon
c. Grey siltstone and argillite with tan and black graphitic argillite
d. Buff colored dolomitic siltstones and argillites
e. Thick bedded quartzite package
f. Dark grey siltstone and argillite

A2 is quartzite and siltstone interbedded with dark argillites.
A3 is dark grey to black, laminated to thin bedded argillites and lesser siltstones.

Creston Fm – About 1500 metres of green, purple, and white quartzite, siltstone, and argillite. Crudely divided into three segments:
A massive, medium bedded, greenish-grey to buff colored siltstone overlies the Aldridge. Above are dark, thin laminated argillites and white quartzites. Next are siltstone/argillite couplets, purple and green with a few white quartzites. The upper section is interlayered thin, irregular and discontinuous white and green quartzites with some green or purple argillites.

Kitchener Fm – 500 to 1000 metres of interlayered dolomite, silty dolomite and green siltstones overlain by massive dolomite with dark grey argillite partings.

Intrusive rocks are not that common but do occur along the front range of the mountains including:
a. Purcell sills and dykes within the Aldridge Fm – these are generally gabbroic in composition.

b. East of the Estella Mine there are small bodies of white, coarse crystalline syenite intruding Aldridge rocks.
c. Very small occurrences of buff colored sills and dykes named the JudyLu intrusions. These occur throughout the property and appear to be very young.

Structurally the Dewdney Trail property overlies the Wild Horse recumbent anticline with its axial plane dipping to the west. The anticline is cut by a number of high angle normal and reverse faults. There are several E-W faults, particularly to the north with the Nicol and Lewis Creek faults offsetting the N-S stratigraphy varying amounts. In the much smaller area of concern to this report there appear to be several E-W faults offsetting the stratigraphic units present. Normal faults striking N-S also complicate the setting on this southern end to the property.

4.0 Local Geology (proximal to drilling)

Because the property is so large, the regional geology covers the setting for the Dewdney Trail claims. However, the area where the 2011 diamond drilling was conducted is addressed here. This M1 target area which was drilled is a portion of the southern extent of the DT claims. It is a 4 square kilometre area, the preliminary geologic map of which is included as Figure 3. The area has not been mapped in a comprehensive manner so the geology shown is based on several sources of peripheral information, the trenching/road exposures, and on the airborne Mag flown in 2011.

The area is overturned stratigraphy of the Lower Creston through upper Middle Aldridge. The focus for drilling is a series of quartzite units within a black argillite package which is probably part of the upper Middle Aldridge but questions remain about this interpretation because the quartzites do not resemble the quartzitic turbidites of the upper Middle Aldridge seen elsewhere. The pyrrhotitic, finely laminated to couplet-style bedded black argillites of the Upper Aldridge are diagnostic of the stratigraphic level involved. The area around the drilling is interpreted to be block faulted with several E-W strike-slip faults and at least one N-S striking normal fault.

The principal economic interest are the light grey, fine-grained quartzites which are silicified and sericitally altered. These medium to thick bedded quartzites are host to several generations of quartz vein which have been demonstrated to be host to gold to multiple grams in individual hand samples.

5.0 Diamond Drilling Program

During the fall of 2011, PJX initiated a diamond drilling program to test for gold in a small area about 300 by 400 metres in size. Four holes were drilled totalling 796.46 metres. The holes were positioned to test below excavated quartzites which host gold in at least three different quartz vein sets. The target area also

displays airborne magnetic linears and some weak EM responses which were also incorporated into the drilling plans.

Past rock sampling of the individual quartz veins in this area yielded consistently anomalous gold up to 1.7 grams. Rocks up slope of the drilling produced similar or even higher isolated numbers from quartz veins some 300 metres in elevation above the drill area.

Hole number 1 was collared the lowest in elevation at about 1520 metres. It was drilled at -45 degrees to azimuth 045° to a total depth of 249 metres. It was positioned to drill approximately at 90° to bedding and to depth beneath the trench area where anomalous gold is present. The hole intersected about 115 metres of dominantly quartzite with some intervals of dark grey argillite over 1 to 5 metres with visual evidence that some of the interbedded argillite is now largely replaced by silica. Below 115 metres the hole is in exclusively dark grey argillite which is laminated and quite highly sulphidic due to pyrrhotite and some pyrite. There is the occasional quartzite within but they are rare.

The quartzites are very clean, pale grey, fine-grained rocks without bedding features excepting where remnant argillite can be found. They have been silicified and have pale green sericite along most fractures/breaks.

The quartzites are cut by at least three different sets of quartz veins to several centimeters thick which all carry varying amounts of pyrite and produce the anomalous gold at various points in the hole. Micro-fractures are also present in each of the drill holes and when combined with the quartz veining yield a brecciated appearance to the quartzites. In hole 1 the thickest interval with anomalous gold is 7.6m of 79ppb with numerous shorter intervals up to 164ppb gold.

Hole number 2 was collared 80 metres upslope from Hole 1 and slightly off section to test the same section but at a shallower depth beneath the trenching. It confirms the section of Hole 1 with the interval dominated by 75% quartzite about 115 metres thick. In this hole the brecciation produced by quartz veining and micro-fractures with quartz seams is more intense to about 60 metres depth. This has resulted in more anomalous gold over thicker intervals such as 6.7m of 209.5ppb. There is one interval from 11 to 13 metres of 559.2ppb.

Hole 3 was drilled across the trenched zone at a steeper angle and in a direction opposing that of Holes 1 and 2. It was to attempt to test the sets of quartz veins with a different orientation and was somewhat successful in achieving thicker zones of anomalous gold. The highest gold value from the drilling was 608.9ppb Au from 47 to 48 metres. The thickest interval was 12.15 metres of 138.15ppb.

Hole 4 was collared near Hole 3 but drilled to the north-northeast to attempt to cross a fault and test the section near it. It was unsuccessful, hitting a continuous section but again intersected anomalous gold over several metres at a time.

6.0 Summary and Conclusions

A program of almost 800 metres of diamond drilling was drilled in a small area on the southernmost target area of the Dewdney Trail property. This target defined by the geological setting, airborne EM, airborne Mag and trenching results yielded some interesting drill intersections. The quartz veining carrying the gold is restricted to three sets of quartz veins in quartzites overlying a thick interval of sulphidic black argllite/siltite. The holes yielded anomalous gold over intervals from one to 12 metres. The highest gold values were 559.2ppb over 2 metres and 608ppb over one metre.

The Dewdney Trail drill program tested a very small area where trenching of individual quartzites had yielded numerous anomalous gold values in grab samples taken from quartz veins. The results from the drilling are disappointing not achieving >gram values for gold but are significant in defining a thick package of dominantly quartzites which are highly altered due to pervasive silica and sericite. The quartz veining is widespread and carries anomalous gold scattered throughout the package of quartzites. The geological setting needs to be resolved to better understand the host stratigraphy, sources of the alteration and gold, and how the overall setting here relates to potential targets going north on the property.

7.0 Itemized Cost Statement

Permitting, amendments, coordination (M.Best)	1246.88
Dorado Drilling – direct drilling costs	94324.27
D.Anderson – coordination,logging core,sampling etc.	10123.50

Total	**$153934.11**

9.00 Author's Qualifications

I, Douglas Anderson, Consulting Geological Engineer, have my office at #100 – 2100 13th St. South in Cranbrook, B.C. V1C 7J5.

I graduated from the University of British Columbia in 1969 with a Bachelor of Applied Science in Geological Engineering.

I have practiced my profession since 1969, predominantly with one large mining company, in a number of capacities all over Western Canada and since 1998 within southeastern B.C. as a mineral exploration consultant.

I am a Registered Professional Engineer and member of the Association of Professional Engineers and Geoscientists of B.C., and I am authorized to use their seal.

Douglas Anderson

Dewdney Trail Property - Drill Hole DT - 11 - 1 Page 1

From (m)	To (m)		Description
2	6.0m	**Lithology:**	Fine-grained, pale grey, very hard quartzite. Quite oxidized in veins and along fracture. Oxidation continues to about 23m.
		Primary Structure:	No bedding recognizable.
		Tectonic Structure:	Fractured with veining at 30 and 50 degrees to core axis. Some healed micro fractures. More intense brecciation and veining to 32 metres. Veins are quartz-dolomite (siderite).
		General Alteration:	Some sericite on fractures and some silicification of the quartzites.
		Mineralization and Associated Alteration:	Oxidized, vuggy quartz veins to 7mm thick - 3 sets of veins over first 50cm. Remnant pyrite with limonite and hematite.

PJX Resources

Dewdney Trail Property - Drill Hole DT - 11 - 1 Page 5

From (m)	To (m)		Description
11	31.0m	**Lithology:**	Continued alternating fine-grained light grey quartzite and darker, still oxidized argillites. Quartzites are micro-brecciated but not intensely so. No thicker veins. Interval was limited only because the veining lessens beyond ~ 31 metres. Thickest argillite unit is about 1.0m - most are interbedded with the quartzites as 5 to 15cm thick units.
		Primary Structure:	No bedding in the quartzites.
		Tectonic Structure:	Hairline fractures but not intense - narrow and not enough to produce a breccia.
		General Alteration:	Little noted - quartzites appear as fine-grained, vitreous, silicified quartzite
		Mineralization and Associated Alteration:	Hairline fractures - white with quartz and dolomite - contain some pyrite and grey specularite at 20 to 40 degrees to ca. White veinlets cut the mineralized ones. Thickest veins are 0.5 cm - most are 1 to 5mm. Thicker one contains the pyrite. Overall the veinlets are not well mineralized.

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
1581301	30	31.0m	1.0m	8.1				
1581302	31	32.0m	1.0m	46.7				
303	32	33.0m	1.0m	51.3				
304	33	34.0m	1.0m	21.3				
305	34	35.0m	1.0m	1				
306	35	36.0m	1.0m	<0.5				
307	36	37.0m	1.0m	0.7				
308	37	37.9m	0.9m	<0.5				
309	37.9	38.9m	1.0m	<0.5				
310	38.9	40.3m	1.4m	<0.5				
1581311	40.3	41.7m	1.4m	3.4				

From (m)	To (m)		Description
31	54.6m	**Lithology:**	Same lithologies continue but darker grey laminated to thin bedded dark grey argillites are more intermixed with the light colored, fine-grained quartzites. The lighter beds in the overall dark argillites are harder siltstones but very thin. Get clasts of argillite in the fine sands. Overall pale greenish grey with minor dark grey units.
		Primary Structure:	Bedding defined by the darker argillaceous units at 45 degrees to core axis.
		Tectonic Structure:	The fine-grained clean quartzites are competent,not fractured.
		General Alteration:	Sericite in the fractures. The grey thin beds of argillite have been highly silicified so only remnants remain.
		Mineralization and Associated Alteration:	Micro veins/veinlets not that abundant - most are 1 to 5mm and at 25 degrees to ca except over short intervals (<0.5m) where several veinlets are white quartz-dolomite at 10, 25 and 40 degrees to ca. Pyrite, pyrrhotite, and a dark magnetic mineral are minor components within the veinlets.

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
1581312	41.7	42.5m	0.8m	<0.5				
13	42.5	43.7m	1.2m	<0.5				
14	43.7	45.0m	1.3m	<0.5				
15	45	46.0m	1.0m	0.7				
16	46	46.5m	0.5m	<0.5				
17	46.5	47.5m	1.0m	<0.5				
18	47.5	49.0m	1.5m	2.4

21	51	52.0m	1.0m	10				
22	52	53.0m	1.0m	0.8				
1581323	53	54.6m	1.6m	0.7				

From (m)	To (m)		Description
54.6	58.5m	**Lithology:**	Dark and light grey striped with dark grey argillites very dominant. Regular bedding/planar. Beds can be lenticular. Base of zone is mixed with lighter more silica-rich units interbedded with argillite - transitional change from quartzites.
		Primary Structure:	Bedding is thin bedded to laminated, variably grey. At ~50 degrees to core axis. Beds probably near vertical.
		Tectonic Structure:	Little for structure - no veining, no fracturing
		General Alteration:	Nothing noted.
		Mineralization and Associated Alteration:	Pyrite, lesser pyrrhotite in some of the lighter grey thin beds (some conductive across the core). Pyrite cubes late - growth across the bedding. Dark 'sheared' argillite partings - not conductive, not graphitic.

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
1581324	54.6	56.5	1.9m	<0.5				
1581325	56.5	58.5	2.0m	<0.5

Dewdney Trail - Drill Hole DT - 11 - 1 Page 8

From (m)	To (m)		Description
58.5	63.4m	**Lithology:**	Light greenish-grey, fine-grained quartzites - clean orthoquartzite, little for impurities, some white muscovite flakes. Quartz grains less than 0.2mm
		Primary Structure:	Bedding barely visible
		Tectonic Structure:	Ver competent, massive core. A few micro veins in cracks, no fracturing.
		General Alteration:	Continued pale green sericite as coatings on fractures.
		Mineralization and Associated Alteration:	Very little veining - few present at 30 degrees to core axis to 3 to 4mm thick. One 1cm vein at 50 degrees to ca. Minor pyrite.

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
1581336	75	76.0m	1.0m	4.9				
1581337	76	77.0m	1.0m	18.2

Dewdney Trail Property - Drill Hole DT - 11 - 1 Page 9

From (m)	To (m)		Description
63.4	73.65m	**Lithology:**	Mixed lithologies - 63.4 to 64.8m is darker grey argillite beds and lighter grey siltstones to minor quartzite. Dark argillites get wispy (altered) in the more silica-rich units. The only quartzite within is ~67.0 to 67.45m
		Primary Structure:	Well bedded at 45 to 55 degrees to ca. The dark argillite is wispy to well bedded. Even some clasts of dark argillite and abrasion of the argillite by the sandier units.
		Tectonic Structure:	Internal, small scale folds within the argillite.
		General Alteration:	Not notable.
		Mineralization and Associated Alteration:	Locally get pyrite as a late phase. Not much sulfide with the bedding - when present with the siltier beds. Dark mud along fractures - not graphitic.

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
1581340	79.6	81.0m	1.4m	0.9				
41	81	82.0m	1.0m	3.7				
42	82	83.0m	1.0m	<0.5				
43	83	84.0m	1.0m	13.6				
44	84	85.0m	1.0m	49.9				
1581345	85	86.0m	1.0m	5				

From (m)	To (m)		Description
73.65	106.9m	**Lithology:**	Dominated (85%) by pale greenish-grey quartzites. Fine-grained, relatively pure except where there are remnant argillite beds.
		Primary Structure:	Bedding at 50 to 60 degrees to ca. Argillite intervals: 74.8-75.4m; 78.2-81.0m; 85.8-86.3m; 88.4-89.0m; 91.0-91.55m; 94.6-95.6m; 98.75-99.3m; and 103.2-103.7m. Some shredding of the argillite interbeds by the sands.
		Tectonic Structure:	Competent core with good core recovery.
		General Alteration:	Little to be noted.
		Mineralization and Associated Alteration:	Scattered quartz-dolomite veins 0.25 to 1cm thick at 15 to 30 degrees to ca. Pyrite (po) but not well developed (low %) Some oxided around 86 - 87.5m along bedding partings. 89.5 - 98.7m More quartz veins in the quartzites at 0 to 40 degrees - most ~20 degrees to ca. Most <1cm thick. Two patches of quartz veins all with pyrite and specularite. Minor chlorite along some vein margins.

Sample Number	From (m)	To (m)	Length (m)	Au ppb

Dewdney Trail Property - Drill Hole DT - 11 - 1 Page 11

From (m)	To (m)		Description
105.9	108.6m	**Lithology:**	Dominated by thin bedded to finely laminated dark grey argillites - alternating with grey and dark grey beds. A 1 metre interval of light grey siltstone is present with sericite.
		Primary Structure:	Well bedded at 65 degrees to ca.
		Tectonic Structure:	None
		General Alteration:	Sericitic siltstone
		Mineralization and Associated Alteration:	Pyrtie and pyrrhotite in sulphidic layers with the bedding - mostly in siltier layers. Pyrite (cubic) across the bedding.

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
1581358	99.3	100.0m	0.7m	2.6				
59	100	101.0m	1.0m	6.7				
60	101	102.0m	1.0m	38.2

64	105.8	107.0m	1.2m	4.3				
1581365	107	108.0m	1.0m	28.1				

From (m)	To (m)		Description
108.6	116.5m	**Lithology:**	Light greenish-grey, very fine grained quartzites - vitreous, clean, massive and very hard. Mixed with the grey argillites locally.
		Primary Structure:	Bedding recognized where a few beds of black argillite present at 52 to 42 degrees to core axis.
		Tectonic Structure:	Little structure - some minor, local micro-fractures.
		General Alteration:	little discerned - sericite on the fracture surfaces.
		Mineralization and Associated Alteration:	A few quartz-dolomite veins at 10 to 20 degrees to core axis and some 1 - 2mm micro veins along irregular fractures. Some local pyrite patches - disseminated in some units.

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
1581366	108	108.7m	0.7m	2.4				
67	108.7	110.0m	1.3m	10.6				
68	110	111.0m	1.0m	19.6				
69	111	112.0m	1.0m	165.1				
70	112	113.0m	1.0m	162.7				
71	113	114.0m	1.0m	15.6				
72	114	115.0m	1.0m	4.3				
73	115	116.0m	1.0m	68				
74	116	117.0m	1.0m	23.5				
1581375	117	118.0m	1.0m	6.4				

From (m)	To (m)		Description
116.5	123.5m	**Lithology:**	Predominantly the darker grey argillaceous rocks but altered to quite hard siliceous rock. Thin to laminated, soft to hard disrupted section. Medium to dark grey.
		Primary Structure:	Bedding is variable at 50 degrees down to 20 degrees then parallel with core axis. Towards end of interval bedding is back to 45 degrees.
		Tectonic Structure:	Core is more broken but core recovery good. These rocks have been strained. - if there is a fault it is probably at about 117.4 metres.
		General Alteration:	Some of the argillite has been silicified.
		Mineralization and Associated Alteration:	Minor pyrite.

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
1581376	118	119.2m	1.2m	1.9				
77	119.2	120.75	1.55m	1.7				
78	120.75	121.75	1.0m	<0.5				
79	121.75	122.9	1.15m	1.3				
1581380	122.9	123.5m	1.6m	30.6				

From (m)	To (m)		Description
123.5	125.7m	**Lithology:**	Pale green to grey again because of fine grained, very hard quartzites. Greenish in part due to sericite.
		Primary Structure:	Bedding is at 45 to 50 degrees to core axis.
		Tectonic Structure:	Tight, discontinuous fractures.
		General Alteration:	Sericite, otherwise nil.
		Mineralization and Associated Alteration:	Micro-veinlets yielding modest brecciation - are <1 to 4mm thick. Contain fine grey mineral and pyrite. Also minor pyrite patches (late growths). Quartz dolomite veins (to 5mm) cut across the micro-veinlets along fractures.

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
1581381	123.5	125.1m	1.6m	1.7

Dewdney Trail - Drill Hole DT - 11 - 1 Page 15

From (m)	To (m)		Description
125.7	163.0m	**Lithology:**	Dark grey overall with varying shades of grey in the thin bedded argillites. Couplet-style units common. A few possible Judy-Lu dykes of pale sandy colored, cross-cutting (calcareous) fine-grained bodies. Largest is 160.9 to 161.45 metres.
		Primary Structure:	Thin bedded - some couplet-style beds but also laminated. 138.3m at 48 degrees; 147m at 50 degrees; and 156.5m at 50 degrees.
		Tectonic Structure:	Little apparent.
		General Alteration:	Silica alteration of the argillites locally.
		Mineralization and Associated Alteration:	Very sulfidic with disseminated pyrite and pyrrhotite in siltier beds and in cross-cutting dewatering features and as replacive patches and pyrite growths across bedding.

Sample Number	From (m)	To (m)	Length (m)					

From (m)	To (m)		Description
163	170.4m	**Lithology:**	Tectonized argillite with loss of bedding - sheared and re-constitute. Brecciated intensely but also sheared post brecciation. Old structure which is well preserved because it is silicified.
		Primary Structure:	No bedding recognizable
		Tectonic Structure:	Fault Zone which is healed and silicified. Probably near vertical ?
		General Alteration:	The rocks are silicified post brecciation. Some dyke influence.
		Mineralization and Associated Alteration:	Still some pyrite and pyrrhotite. Some irregular but sparse quartz veins.

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
1581386	163	164m	1.0m	48.4				
1581387	164	165m	1.0m	3.3				
88	165	166m	1.0m	88.4				
89	166	167m	1.0m	12.2				
1581390	167	168m	1.0m	17.6				

From (m)	To (m)		Description
170.4	172.4m	**Lithology:**	Silicified thin bedded argillite sequence - some siltstones. Some sandier, darker units interbeddded with the argillites.
		Primary Structure:	Bedding at ~ 53 degrees to ca. Beds lenticular.
		Tectonic Structure:	Nil
		General Alteration:	Some units silicified.
		Mineralization and Associated Alteration:	Not much sulphide.

Sample Number	From (m)	To (m)	Length (m)					

From (m)	To (m)		Description
172.4	175.5m	**Lithology:**	Mostly the light greenish-grey, very fine grained quartzites interbedded in a minor way with darker argillite. Transitional to the darker argillite with thin beds of quartzite interbedded.
		Primary Structure:	Bedding not present except with darker, wispy argillite.
		Tectonic Structure:	None except micro-fracturing of the quartzite.
		General Alteration:	Sericite on fractures.
		Mineralization and Associated Alteration:	Fractures at 40 to 50 degrees with fine grey specularite and minor pyrite.

Sample Number	From (m)	To (m)	Length (m)					

From (m)	To (m)		Description
175.5	232.6m	**Lithology:**	Dark grey argillites dominate with lighter grey silty beds (striped in part). Thin bedded to laminated with some very planar, others wispy, wavy and or lenticular.
		Primary Structure:	Well bedded - bedding at: 178m at 55 degrees; 191.6m at 60; 201.7m at 80; 224.6m at 55; and 231.2m at 55 degrees.
		Tectonic Structure:	None
		General Alteration:	Not recognized in dark, fine-grained argillites.
		Mineralization and Associated Alteration:	still sulphidic as above the fault - with silty beds; disseminated, in fractures and as fine lams - both pyrite and pyrrhotite.

Sample Number	From (m)	To (m)	Length (m)					

From (m)	To (m)		Description
232.6	237.3m	**Lithology:**	Pale green intrusive rock with a variety of textures from very fine crystalline to mottled with quartz inclusions. Judy Lu sill with gradational contacts.
		Primary Structure:	Variety of rock types included with some basic matrix as well.
		Tectonic Structure:	None
		General Alteration:	Soft and scratchable and calcareous.
		Mineralization and Associated Alteration:	A few quartz-feldspar (?) veins with modest pyrrhotite and pyrite.

Sample Number	From (m)	To (m)	Length (m)					

From (m)	To (m)		Description
237.3	249.0m EOH	**Lithology:**	Medium grey and greenish-grey, planar thin-bedded argillite with paler colored siltite. Contains several thin beds of tuff-like material with the bedding.
		Primary Structure:	Well bedded with some local irregularities. At 60 degrees to core axis.
		Tectonic Structure:	None
		General Alteration:	Sericite
		Mineralization and Associated Alteration:	Only minor pyrrhotite and pyrite - disseminated or in patches but far less than higher in hole.

Sample Number	From (m)	To (m)	Length (m)

From (m)	To (m)		Description
6.3m	57.2m	**Lithology:**	Fine-grained, pale grey quartzite interbedded with grey to dark grey, thin bedded argillites which occur over short intervals to 25cm. Highly oxidized to about 33.5m. Some scattered remnant sulphide. Limonitic fractures continue to 57m.
		Primary Structure:	Bedding is represented in the limonitic argillite at 45 to 50 degrees to ca. Improves to 55 then 75 degrees.
		Tectonic Structure:	Quartzites are fractured with some veining - some 'crackling' over short lengths with fractures and veins at 25 degrees; 35 to 40 degrees opposing; and some along the core axis.
		General Alteration:	Silicified with red hematite flooding of portions of the core to 30 metres.
		Mineralization and Associated Alteration:	Leached and oxidized veins and fractures - limonite to about 33.5m. Some pyrite seen. The quartz-dolomite veins are <1 cm thick and scattered but no boxwork/breccia zone developed. Most veins are at 10 to 30 degrees to ca. Higher above 30m heavy oxidation.

From (m)	To (m)		Description
57.2	60.3m	**Lithology:**	Dark grey, thin bedded to laminated argillites. Same as interbeds within dominantly quartzite sections demonstrate a changing, repetitive depositional environment - cyclic.
		Primary Structure:	Bedding is at 65 degees to core axis. From 57.9 to 58m is a pale green dyke rock.
		Tectonic Structure:	Disking of the argillite is common.
		General Alteration:	Quartzites are silicified - generally argillites are not altered.
		Mineralization and Associated Alteration:	Quite common pyrite as seams along bedding; patches and lams; some late crystalline cubic pyrite.

1581224	48.1	49.0m	0.9m	19.1				

From (m)	To (m)		Description
73.2	102.1	**Lithology:**	Dominated by the fine-grained, hard silicified quartzites - amalgamated so bedding not recognized. Vague argillite beds which appear replaced by silica. A few argillite intervals to 0.5m thick - very finely laminated. Where the quartzites are more interbedded with the argillite they are more of a siltstone. Note: from 74.7 - 79.5m mix of JudyLu dyke and altered sediments.
		Primary Structure:	There is 'ghosty' bedding from slightly argillaceous intervals - bedding mainly from dark argillites at 55 to 72 degees to ca.
		Tectonic Structure:	Micro-fracturing present but the unit is not as brecciated as the first interval from 0 to 57m.
		General Alteration:	Silicification and sericite
		Mineralization and Associated Alteration:	Pyrite - fine along fractures and in small quartz veins. Quartz veins contain white dolomite - veins at 15 to 30 degrees to ca but are generally not abundant.

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
1581225	49	50	1.0m	14.7

From (m)	To (m)		Description
112.8	195m EOH	**Lithology:**	Dominated by laminated to thin bedded dark grey argillite. Some couplet-style bedding down the hole. Lighter beds seem siltier. Good planar contacts minor internal folding. Load casting upside down.
		Primary Structure:	Bedding - 50 at 131m; 68 at 162m; 60 at 170m; 65 at 181m. More couplet-style bedding in this hole than hole 1.
		Tectonic Structure:	The argillites seem more prone to disking down to ~125m.
		General Alteration:	Not recognized as such - some silicification locally. 117.5-118.3m Light green dyke rock (calcareous) with quartz-dolomite and veining - contains sediment clasts and is crudely conformable.
		Mineralization and Associated Alteration:	Sulphides as pyrite and pyrrhotite with more po with depth - occur as bedding-parallel discontinuous lams and patches. Irregular cross-cutting seams also. Late pyrite as cubic growths across the bedding. Quartz-dolomite veins not present then a few below 152m.

Dewdney Trail Property Drill Hole DT -11 - 2 Page 1

From (m)	To (m)		Description
6.3m	57.2m	**Lithology:**	Fine-grained, pale grey quartzite interbedded with grey to dark grey, thin bedded argillites which occur over short intervals to 25cm. Highly oxidized to about 33.5m. Some scattered remnant sulphide. Limonitic fractures continue to 57m.
		Primary Structure:	Bedding is represented in the limonitic argillite at 45 to 50 degrees to ca. Improves to 55 then 75 degrees.
		Tectonic Structure:	Quartzites are fractured with some veining - some 'crackling' over short lengths with fractures and veins at 25 degrees; 35 to 40 degrees opposing; and some along the core axis.
		General Alteration:	Silicified with red hematite flooding of portions of the core to 30 metres.
		Mineralization and Associated Alteration:	Leached and oxidized veins and fractures - limonite to about 33.5m. Some pyrite seen. The quartz-dolomite veins are <1 cm thick and scattered but no boxwork/breccia zone developed. Most veins are at 10 to 30 degrees to ca. Higher above 30m heavy oxidation.

Dewdney Trail Property - Drill Hole DT - 11 - 3 Page 1

From (m)	To (m)		Description
8	33.4m	**Lithology:**	Rubble of HQ boulders to about 8 m., then better NQ recovery. Light greenish-grey silicious quartzites with thin breaks to rusty, limoniticargillite beds (less than 10 cm.) Pale grey.
		Primary Structure:	Bedding only represented by thin bedded, rusty weathering argillites and a few green argillite tops. Bedding at 40 at 17m; 45 at 21.5m; and 50 at 27.5m.
		Tectonic Structure:	Micro-fracturing of the quartzites - multiple veining - 2 minor vein sets and third as micro-fractures.
		General Alteration:	Silicification and sericite of the quartzites and almost obliteration of argillites also.
		Mineralization and Associated Alteration:	White quartz-dolomite (ankerite?) veins to 1 cm. thick contain pyrite (specularite). Pyrite is finely spread through veins and is finely disseminated spotting locally.

From (m)	To (m)		Description
34.9	36.85m	**Lithology:**	Light greenish-grey colored, very fine grained, hard quartzites.
		Primary Structure:	Minor argillite remnants after alteration.
		Tectonic Structure:	Fractured and veined
		General Alteration:	Silicification is widespread.
		Mineralization and Associated Alteration:	Several vein sets - magnetite replacing specularite. Quartz-ankerite(cream colored) veins.

From (m)	To (m)		Description
36.85	40.5m	**Lithology:**	Dominated by a dyke rock (known as Judy Lu type) - intrusive with minor intermixed dark argillite and pale, oxidized quartzite. Pale yello-green color.
		Primary Structure:	Bedding at 50 degrees to ca.
		Tectonic Structure:	Poor core recovery but not a fault or structure.
		General Alteration:	Sericite seems intense with the same angle as the bedding in hole.
		Mineralization and Associated Alteration:	Oxidized fractures in the short quartzite sections.

From (m)	To (m)		Description
43.2	66.8m	**Lithology:**	Dominated by the light colored, fine-grained altered quartzites. Light grey.
		Primary Structure:	Bedding indicated by remnant argillites - at 45 degrees to ca.
		Tectonic Structure:	Some micro-brecciation for short intervals.
		General Alteration:	Still limonite on fractures and in veins (oxide zone). Silicification (sericite) is remarkable.
		Mineralization and Associated Alteration:	Most veins (<1cm) are at ~20 degrees to core axis or at 60 degrees to ca. Contain pyrite in quartz-dolomite or ankerite. Occassional quartz veins with the hole(cream colored).

Sample Number	From (m)	To (m)	Length (m)	Au ppb

Dewdney Trail - Drill Hole DT - 11 - 3 Page 7

From (m)	To (m)		Description
66.8	92.4m	**Lithology:**	Dominantly the light colored, fine-grained siliceous quartzites. Scattered dark grey argillite beds, some partially replaced bands. Limonitic argillite units: 66.7 - 69.2m; 72.45 - 73.4m mixed Q and A; 78.4 - 79.0m; Numerous <10cm argllite beds which are limonitic.
		Primary Structure:	Bedding at 30 to 38 degrees to ca.
		Tectonic Structure:	Micro-fracturing locally but not intense. Quartz veins but not on strong structures.
		General Alteration:	Silicification - replacing some thin bedded units as well. Still some oxidation down to 88m.
		Mineralization and Associated Alteration:	Quartz veining - 2 main sets both at 55 degrees to core axis. Locally boxworks over intervals to 1cm. - some are leached with only limonite remaining. Widely dispersed pyrite spotting within the altered quartzites. Only some of the quartz veins carry pyrite.

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
866974	83	84	1.0m	14.9				
75	84	85	1.0m	4.9

Dewdney Trail - Drill Hole DT -11 - 3 Page 11

From (m)	To (m)		Description
117.4	137.46m	**Lithology:**	Pale greenish-grey quartzites with scattered bands of the argillite.
		Primary Structure:	Bedding of the dark argillite at 36 to 45 degrees to ca. At 40 at end of hole.
		Tectonic Structure:	Micro-fracturing over short distances right to bottom of hole.
		General Alteration:	Silicification of both rock types. Sericite throughout.
		Mineralization and Associated Alteration:	A few quartz veins - are down axis of the core. Quartz-dolomite to 0.5cm thick. Fine pyrite on some fractures and in margins to quartz veins. Some scattered veins at 35 to 40 degrees to ca. Some dark green chlorite in quartz veins near end of hole. Locally some pyrite spotting. Note: Hole was lost due to broken rod string.

Dewdney Trail Property - Drill Hole DT -11 - 4 Page 5

From (m)	To (m)		Description
16.6	27.3m	**Lithology:**	Very limonitic quartzite series with several short breaks to thin bedded to laminated argillite over <0.25cm. Short section of slightly coarser beds with visible quartz grains. Grey and yellow-orange.
		Primary Structure:	Bedding at 65 degrees to ca.
		Tectonic Structure:	Micro-fracturing with some veins but not that common. Fractures and veins 0 to 10 degrees and 40 to 45 degrees to core axis.
		General Alteration:	Silica widespread and sericite along breaks.
		Mineralization and Associated Alteration:	Narrower oxidized and leached quartz veins.

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
1581101	44	45	1.0m	2.3				
102	45	46	1.0m	2.3

1581110	53	54	1.0m	240.9				

From (m)	To (m)		Description
27.3	28.82m		Dark grey, very finely laminated argillite with a few thin bedded, light grey silty beds.
		Primary Structure:	Bedding is at 75 to 78 degrees to ca.
		Tectonic Structure:	None
		General Alteration:	Abundant white spotting (dolomite?).
		Mineralization and Associated Alteration:	Pyrite overgrowths across bedding. A few small gash veins but very minor.

PJX Resources

Dewdney Trail Property - Drill Hole DT - 11 - 4 Page 7

From (m)	To (m)		Description
28.82	67.2m	**Lithology:**	Dominated by light grey, altered quartzitic rocks with varying intervals of dark grey, thin bedded to laminated argillite. A few short (<20cm) intervals with slightly coarser units.
		Primary Structure:	bedding only where argillites present/recognized - longer intervals of darker, less altered argillite: 54.8 - 56.25m; 61.4 - 62m. Bedding at 15 to 30 to core axis.
		Tectonic Structure:	Some broken core - some weakly brecciated intervals.
		General Alteration:	Silicification is intense. Sericite - especially on fractures. Oxide (limonite) continues (aleit diminishing with depth) to 61.5m.
		Mineralization and Associated Alteration:	Veins and micro-fractures - white quartz veins scattered through (to maximum 1 cm) - pyrite, magnetite, specularite in a few of the veins. Network fracturing and veining seems to lessen below ~ 50 metres. Veins at ~30 degrees - two orientations cross at 60 degrees; fractures with or without veining at 60 degrees or low angles to ca. Two quartz veins of ~5cm at 64.3 to 64.5m (magnetic).

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
1581121	65	66	1.0m	1.5				
122	66	67.2	1.2m	3.4

129	74	75	1.0m	10.6				
1581130	75	77.2	2.2m	2				

From (m)	To (m)		Description
67.2	69.9m	**Lithology:**	Black, laminated to thin bedded argillite - lighter grey, silty thin beds within.
		Primary Structure:	Dark grey to black with bedding at 60 degrees to ca.
		Tectonic Structure:	None
		General Alteration:	None
		Mineralization and Associated Alteration:	A few quartz-dolomite veins with the bedding. Pyrite in patches, a few weakly developed lams. Pyrite overgrowths.

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
1581131	77.2	78.2	1.0m	<0.5				
132	78.2	79.7	1.5m	0.7

1581140	90	91.5	1.5m	<0.5				
141	91.5	92.9	1.4m	<0.5				
142	92.9	93.8	0.9m	<0.5				

From (m)	To (m)		Description
69.9	79.7m	**Lithology:**	Dominated by light grey, fine grained, altered quartzites. Clean, uniform quartzites with "ghosty" argillites and thin bedded sequences. Mostly thin argillite 76 to 77.2m.
		Primary Structure:	Bedding only recognized because of the interbedded dark argillites. Bedding at 60 to 65 degrees to core axis.
		Tectonic Structure:	None
		General Alteration:	Silicification has altered both the quartzite and argillites - obliterated some of the dark argillite. Sericitization also.
		Mineralization and Associated Alteration:	Quartz veining (dolomite) in the quartzites - two main sets at 60 degrees to each other. Most of the quartz veins are devoid of sulphides or contain only low concentrations.

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
1581143	93.8	95.6	1.8m	1.2				
144	95.6	96.7	1.1m	2.8

151	105.75	107.05	1.3m	23				
152	107.05	108.3	1.25	76.7				
153	108.3	109.2	0.9m	38.5				
154	109.2	110.6	1.4m	4.2				

From (m)	To (m)		Description
79.7	83.0m	**Lithology:**	Varying shades of grey - thin bedded and laminated with more disrupted bedding than other similar intervals above.
		Primary Structure:	Bedding disrupted - folding internal to the interval (unit). Beds down to parallel to core axis but bedding above and below at 60 to 65 degrees to core axis.
		Tectonic Structure:	Folded within
		General Alteration:	Some widespread replacement by silica.
		Mineralization and Associated Alteration:	Pyrite within the folds as patches. Also pyrite overgrowths. Low levels of pyrite disseminated in the thin quartzites.

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
1581155	110.6	112.5	2.1m	7.1				
156	112.5	113.25	0.75	62.4				
157	113.25	115.1	1.85m	37.2				
158	115.1	115.9	0.8m	2.5				
159	115.9	117.2	1.3m	0.9				
1581160	117.2	118.6	1.4m	1				
161	118.6	1120	1.4m	10.1				
162	120	121.68	1.68	114.3				
163	121.68	123	1.32m	22.6				
164	123	123.75	0.75m	12.3				
1581165	123.75	125.05	1.3m	111.8				

From (m)	To (m)		Description
83	130.5m	**Lithology:**	Predominantly pale greenish quartzites with dark grey argillites alternating - altered and recrystallized fine-grained, massive rock - first hole where green argillites are present along with the dark grey interbedded argillites - dominate over 0.5 to 1.5m intervals as follows: 86.3-88.0; 92.9-93.8; 97.2-97.55;100.4-101.5;103.6-104.8;110.6-111.1;113.3-113.9;117.15-118.6;119.9-121.68. (more like Creston with green A and Q)
		Primary Structure:	Bedding reflected in the argillites - at 45, 40 and 43 degrees down the hole. 50 degrees by 176.5m
		Tectonic Structure:	None - seems to lessen with depth - less fracturing and veining because more proximal to the thick black argillite section.
		General Alteration:	Black argillites are partially replaced by silicification. Creamy-white spotting is widespread but not intense ove any significant width.
		Mineralization and Associated Alteration:	Quartz-dolomite veining but only multiple veins and fractures over short distances. More veining and frctures: 95.5-96.7; 101.5-102; 108.3-109.3; 112.45-113.2m. Pyrite line some veins; minor chlorite; darker specularite and or magnetite but only in a few quartz veins.

Sample Number	From (m)	To (m)	Length (m)	Au ppb				
1581166	125.05	126.78	1.73	79.6				
167	126.78	127.8	1.02	2.8				
168	127.8	129	1.2	1.7				
169	129	130.5	1.5	0.8				
1581170	130.5	132	1.5m	<0.5				

From (m)	To (m)		Description
130.5	215m EOH	**Lithology:**	Dark grey to black argillite - very finely laminated to thin bedded to couplet-style siltite/argillite - striped rocks. (Upper Aldridge like sequence.) From 177 - 177.9m Pale green f.g. altered sill with quartz-dolomite veins brecciating the dyke rock - minor po and Cp. From 193 to 197.3m Pale pistachio green Judy Lu sill - fine crystalline, mottled with vague ovoid forms, weakly calcareous. At 50 degrees to ca.
		Primary Structure:	Bedding consistent - 135.5m at 48; 148m at 47; 152m at 58; 163m at 50; 180m at 45; 192m at 50; 207m at 60; 215m at 55 degrees to ca.
		Tectonic Structure:	Nothing
		General Alteration:	Cream spotting by dolomite or ankerite of the siltite layers.
		Mineralization and Associated Alteration:	Quite sulphidic - as bedding parallel lenses, lams, patches of mostly pyrrhotite. Pyrite overgrowths replacing pyrrhotite and across beds.

CERTIFICATE OF ANALYSIS VAN11006382.1

CLIENT JOB INFORMATION

Project: Dewdney Trail
Shipment ID:
P.O. Number
Number of Samples: 201

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
R200-250	201	Crush, split and pulverize 250 g rock to 200 mesh			VAN
1DX3	201	1:1:1 Aqua Regia digestion ICP-MS analysis	30	Completed	VAN

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT Dispose of Reject After 90 days

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

ADDITIONAL COMMENTS

Invoice To: PJX Resources Inc.

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.
