1.0 SUMMARY

The Volcanics Property consists of one mineral tenure located 6.0 km south of the town of Chemainus on southern Vancouver Island. RCR Mining LLP owns Rock-Con Resources Inc. which holds a 100% interest in the Property.

The geologic setting at the Property is prospective for both VMS and quartz-sulphide mineralization. Significant mineral deposits in the Cowichan-Chemainus-Ladysmith area are hosted by the same lithologies that are present at the property.

The 2011 grid soil sampling survey was successful in identifying several zones of anomalous soil geochemical concentrations for arsenic, copper, lead, molybdenum, silver, and zinc. The magnitudes of the concentrations suggest mineral sources beyond background rock concentrations, and the linear shapes of the anomalies suggest a source having a strike comparable to that of the prominent geologic banding.

The anomalous areas should be followed up by prospecting, and where appropriate, hand pitting in search of mineralized rock. Geology should be mapped in greater detail to help interpret the soil geochemistry, and to prioritize areas that warrant follow-up prospecting. A budget of \$20,000 is suggested for this work.

2.0 INTRODUCTION

The directors of Rock Con Resources Inc. contracted Arnd Burgert Consulting, Ltd. to manage a reconnaissance soil sampling program on the Property. The field work was supervised by Mr. Arnd Burgert, P.Geo. A total of 169 soil samples were collected. A statement of expenditures is included as Appendix 1. The work was carried out by a four person crew based in Chemainus, during the period of May 16 to May 20, 2011 (inclusive).

The Volcanics Property is situated 6.0 km south of the town of Chemainus, on southern Vancouver Island. Centred at 48° 52' 15" north latitude and 123° 43' 47" west longitude, it is located in the Victoria Mining Division. The Property location is shown on Figure 1.

Geology underlying the Property consists of intrusives of the Mount Hall Suite and volcanics belonging to the Sicker Group. The main host rocks for volcanogenic massive sulphide mineralization on Vancouver Island are those of the Mississippian to Devonian age Buttle Lake and Sicker Groups. In the area of the Volcanics Property, the Sicker Group is the main host of volcanogenic massive sulphide (VMS) mineralization, including past producers Lenora and Victoria, located 6 km to the west. Quartz-sulphide mineralization can be hosted in Mount Hall Suite rocks that occur in the northern portion of the Property. The geologic setting at the Property is prospective for both VMS and quartz-sulphide mineralization.

The grid soil geochemistry was successful in identifying areas containing anomalous soil concentrations for arsenic, copper, lead, molybdenum, silver, and zinc. Two prominent, linear, parallel, multi-element soil geochemistry anomalies cross the central and southern portions of the grid area from northwest to southeast.

The magnitude of the concentrations suggests mineral sources beyond background rock concentrations, and the linear shapes of the anomalies suggest sources which follow the strike of the local geologic banding.

3.0 PHYSIOGRAPHY

The Volcanics Property is situated on the eastern flank of Sicker Mountain. Topography slopes northeast at a moderate grade of about 25%. This grade is broken by occasional rocky bluffs. Elevations range from 80 m at the base of the mountain in the northeast corner of the Property to 360 m on the hillside at the southwest corner (Figure 2).

The area lies in the Pacific Maritime ecozone, with hot, dry summers and mild, wet winters. At Chemainus, mean temperatures are 4.7°C in January and 19°C in July. The 30-year normal annual precipitation at North Cowichan is 1169 millimetres. The property can be worked year-round, but the woods are typically closed to mechanical work some time in August due to fire hazard.

Vegetation consists of mature fir up to 50 centimetres in diameter at breast height, except where recently logged. Underbrush is generally sparse but can be thick along drainages. Labour, contractors and supplies are readily available in Chemainus, located 6 kilometres to the north.

The route to the centre of the Property, and main access for the soil sampling program, is a logging road that turns west off Highway 1, about 4.3 km south of the Chemainus turnoff.

4.0 HISTORY

In the Cowichan-Chemainus-Ladysmith area, several occurrences of volcanogenic massive sulphide-style copper-lead-zinc deposits have been documented in Paleozoic Sicker and Buttle Lake groups. These include the past producers Lenora and Victoria, both located about 6 km west of the Property atop Sicker Mountain.

Previous exploration work carried out on the Property includes prospecting and rock sampling by Rock-Con (Houle, 2011), and a remote sensing study (McLelland, 2010), also undertaken for Rock-Con. During December 1982, a small drill program took place at a location 1,000 m south of the southeast corner of the current Volcanics claim (Lonsdale, 1983). Three X-Ray drill holes intersected chlorite- and epidote-altered

mafic volcanics. Calcite veins were commonly encountered, and occasionally disseminated pyrite and narrow (typically 1 mm wide) pyrite veins.

5.0 CLAIM INFORMATION

The Volcanics Property consists of one mineral tenure, information for which is listed in Table 1. The claim covers an area of 106.26 hectares, at the location depicted on Figure 2. The expiry date listed in Table 1 assumes that work described in this report is accepted for credit. The mineral claim is held by Rock-Con Resources Inc.

TABLE 1: MTO CLAIM INFORMATION

Tenure No.	Claim Name	Issue Date	Good To Date	Area (ha)
550746	VOLCANICS	2007/jan/30	2022/jan/12	106.2599

6.0 GEOLOGY

6.1 Regional Geology

A map of regional geology is included as Figure 3. The following description of regional geology is modified from Massey (1995) and Ruks (2010).

The oldest rocks in the Duncan area belong to the Sicker and Buttle Lake groups which contain volcanic and sedimentary units ranging from Middle Devonian to Early Permian age. As described in Houle (2011), they are the main host rocks for volcanogenic massive sulphide (VMS) mineralization on Vancouver Island, including the Myra Falls deposit in the Campbell River region. Younger plutonic rocks, such as the Late Triassic Mount Hall gabbroic to dioritic rocks or the Jurassic Island Plutonic Suite rocks, can host quartz-sulphide mineralization.

The Sicker Group is a thick package of lower greenschist facies, metavolcanic and volcaniclastic rocks that formed in an oceanic island-arc environment. A comparison of stratigraphic nomenclatures is illustrated at right, in which the Yorath framework may be applicable to the entire Sicker Group.

The Sicker Group within the Cowichan Lake uplift is presently interpreted to

Muller, 1977 (Vancouver Island)		Juras, 1987 (Buttle Lake Uplift)		Yorath et al., 1999 (Alberni area)

Sicker Gp		Price Fm				

represent three distinct volcanic and volcaniclastic assemblages that together are thought to record the evolution of an oceanic magmatic arc. The lowermost Duck Lake Formation, consisting largely of basalt, is interpreted to represent the oceanic crust basement on which the Sicker arc was built. It is overlain by the Nitinat Formation, consisting of mafic volcanic and volcaniclastic rocks representing early stage arc development. The Nitinat Formation in turn is overlain by the rhyolitic to dacitic McLaughlin Ridge Formation which reflects a more evolved stage of arc activity. Lithologic descriptions typical of each of the three formations and the overlying Buttle Lake member formations follow.

The Duck Lake Formation yields mainly normal midocean-ridge basalt (N-MORB) geochemical signatures. The upper portions of the Duck Lake Formation yield tholeiitic to calcalkaline compositions and may represent primitive arc rocks.

The Nitinat Formation consists of a heterogeneous sequence of mafic to felsic volcanics and volcaniclastic sediments. It comprises mafic, submarine volcanic and volcaniclastic rocks with dominantly calcalkaline compositions and trace-element signatures typical of volcanic arc settings. Pyroxene-feldspar-porphyritic basalts and basaltic andesites typically occur as agglomerates, breccias, lapilli tufts and crystal tuffs that formed as pyroclastic flows, debris flows and lahars. Pyroxene-phyric, amygdaloidal, pillow and massive flows are also developed.

The andesitic to mainly dacitic and rhyolitic McLaughlin Ridge Formation overlies, apparently conformably, the Nitinat, and is believed to be correlative with the Myra Formation, the host rocks for the Myra Falls deposits. McLaughlin Ridge volcanics are predominantly intermediate pyroclastics, commonly feldspar crystal-lapilli tufts, heterolithic lapilli tufts and breccias and minor pyroxene-phyric lapilli tuffs. A thick package of felsic quartz-crystal, quartz-feldspar-crystal and fine dust-tuffs is developed in the Chipman Creek-Mount Sicker-Mount Richards area. It thins to the west, where it interfingers with andesitic lapilli tufts and breccias. The uppermost unit is a distinctive maroon schistose heterolithic breccia and lapilli tuff with minor jasper, exposed in the Chipman Creek area. Eruption of Nitinat volcanic and volcaniclastic rocks appears to have occurred from several widely scattered centres, whereas the McLaughlin Ridge Formation within the Cowichan Lake up lift is thought to represent eruption from one or more major volcanic edifices. The abundance of proximal felsic volcaniclastic rocks and the presence of voluminous comagmatic felsic intrusions in the Saltspring Island and Duncan areas indicate that one of these major volcanic centres was located in this area. Plant fossils indicate that at least a minor amount of the McLaughlin Ridge volcanism occurred in a subaerial setting. Coeval, and probably consanguineous, with the felsic volcanics in the McLaughlin Ridge Formation is a suite of granodiorite stocks and quartz porphyry dikes collectively known as the Saltspring Intrusive Suite. The Sicker Group volcanic rocks and associated intrusions form a coherent suite of medium-potassium calcalkaline chemistry typical of an island-arc.

The Buttle Lake Group is made up of a dominantly epiclastic and bioclastic limestone sedimentary sequence ranging from Mississippian to Early Permian in age. Within the

Duncan area, the Buttle Lake Group is most often found in fault contact with the lower volcanic units of the Sicker Group. However, it is conformable on the McLaughlin Ridge Formation south of Sansum Point and in the Chipman Creek area and on the southwest limb of the Cowichan uplift, is unconformable on the lower volcanics.

The Fourth Lake Formation comprises mostly thin-bedded, often cherty sediments. North of the Chemainus River, thinly bedded turbiditic clastic sediments conformably overlie the McLaughlin Ridge volcanics and dominate the sequence. Minor volcanism was synchronous with early Fourth Lake Formation sedimentation in the Coronation Mountain area. This 'Coronation Mountain suite' consists of hornfelsed, amygdaloidal diabasic flows, which are generally massive but occasionally pillowed, and interbedded cherty tufts and sediments. The basalts are slightly undersaturated olivine tholeiites or transitional basalts, with somewhat enriched incompatible trace-element contents akin to ocean-island tholeiite or enriched ocean-floor basalt.

The Mount Mark Formation conformably overlies the Fourth Lake Formation, although outcrops of the formation are restricted to the Fairservice Mountain-Bear Creek area, south of the Cowichan River. It comprises massive and laminated crinoidal calcarenites with chert and argillite interbeds.

The Paleozoic and Triassic rocks have been intruded by granodioritic bodies of the Early to Middle Jurassic Island Plutonic Suite. With the exception of the large Ladysmith pluton, these granodiorite intrusions are elongate in surface outcrop shape, paralleling the overall structural grain of the area. The dominant lithology is a medium to coarse-gained, equigranular granodiorite to quartz diorite with a characteristic 'salt-and-pepper' texture. Most of the large intrusive bodies are rich in mafic inclusions, especially in marginal intrusive breccias. Contact metamorphic aureoles are developed around the intrusions causing hornfelsing and skarning in Paleozoic rocks. A variety of dikes and small irregular intrusions, that are probably coeval with the Island Plutonic Suite, occur throughout the area. Lithologically they include intermediate feldspar porphyry, hornblende feldspar porphyry and minor diabase. The Jurassic intrusions are coeval with the Bonanza volcanics, which outcrop in the Cowichan Lake area to the west. They form a metaluminous, medium to high-potassium calc-alkaline suite typical of a convergent-margin environment.

Clastic sediments of the Upper Cretaceous Nanaimo Group lie unconformably on the older rocks. They are most thickly developed in the Maple Bay to Mount Prevost area, the Cowichan and Chemainus River valleys and the shoreline from Crofton to Ladysmith. The lower Benson Formation comprises basal cobble and boulder conglomerates and overlying medium to coarse-grained sandstones. These are succeeded by the black argillites and siltstones of the Haslam Formation. Pebble and cobble conglomerates of the Extension Formation conformably overlie Haslam Formation argillites on top of Mount Prevost and along the Chemainus River. Grey, medium to coarse-grained sandstones are interbedded with and overlie the conglomerates. Argillites of the Fender Formation, overlying the Extension Formation,

are exposed in the incised gorge along the Chemainus River just below its confluence with Chipman Creek. Younger formations of the Nanaimo Group are absent.

In the area of the South Group Properties, the McLaughlin Ridge Formation of the Devonian Sicker Group is the main host of volcanogenic massive sulphide (VMS) mineralization.

6.2 Property Geology

A map showing property geology appears as Figure 4, and descriptions of rock samples are summarized in Appendix 2. Geology underlying the Property is mapped as intrusives of the Mount Hall Suite and volcanics belonging to the Sicker Group.

The volcanic rocks mapped on the Property consist of fine-grained, dark green, chlorite-altered andesite belonging to Sicker Group. Quartz eyes commonly comprise 15% to 25% of the composition. Thin (1 mm wide) magnetite bands are noted, and fine-grained pyrite is seen as small clots (1 mm wide), fracture coatings, and disseminations.

Intrusive rocks on the Property are medium-grained, equigranular intrusives, of approximately dioritic composition.

7.0 GEOCHEMISTRY

7.1 Methodology

During the 2011 grid soil sampling program, 169 soil samples were collected. Soil sample sites were marked with aluminum tags inscribed with sample numbers and fastened to tree limbs with wire ties. Geotuls were used to collect soil samples from the 'B' soil horizon whenever possible, but where no 'B' horizon was visible, 'C' horizon was sampled. Soil was placed in Kraft soil bags labelled with the corresponding sample number. All soil samples were shipped to Inspectorate Exploration & Mining Services Ltd. in Richmond for analyses.

In the laboratory, samples were dried and sieved to - 80 mesh. The fine fraction was digested in a four-acid mix and analyzed for 50 elements by the ICP-MS method, and gold by fire assay with atomic absorption finish.

During the course of the field work, ten rock grab samples were also collected. Rock sample sites were marked with aluminum tags inscribed with sample numbers and fastened to tree limbs with wire ties. Grab samples were composed by selecting two or three fist-sized chunks of rock and packing them in plastic rock bags together with a numbered sample tag. A duplicate sample was collected as a specimen to be retained

for later reference, and for microscopic examination. Sample bags were sealed using cable ties before submitting them to Inspectorate Exploration & mining Services Ltd. in Richmond for analyses.

At the lab, rock samples were crushed, split, and a subsample was pulverized. The subsample was digested in a four-acid mix and analyzed for 50 elements by the ICP-MS method, and for gold by fire assay with atomic absorption finish.

7.2 Results

Locations of rock samples are plotted on Figure 4, annotated with sample numbers and copper concentrations. Locations of soil samples are plotted on Figure 5. Soil geochemistry plots for arsenic, copper, lead, molybdenum, silver, and zinc are presented on figures 6 through 11. A summary of rock and soil sample descriptions is included as Appendix 2, and Certificates of Analysis are included as Appendix 3.

The highest copper concentration (1332.1 ppm) was obtained from rock sample No. 18060. The rock consisted of fine-grained dark green volcanic and 25% quartz vein.

The grid soil geochemistry program has identified areas containing anomalous soil concentrations for arsenic, copper, lead, molybdenum, silver, and zinc. A prominent, linear, multi-element soil geochemistry anomaly crosses the centre of the grid area from northwest to southeast. A second, parallel, linear, multi-element anomaly extends across the southern corner of the grid.

8.0 INTERPRETATION AND CONCLUSIONS

The magnitudes of the peak soil concentrations for elements of interest (1093 ppm copper; 1.7 ppm silver; 5.2 ppm molybdenum; 103.9 ppm lead; and 2263 ppm zinc) suggest mineral sources having concentrations greater than typical bedrock background concentrations.

The narrow, elongate shapes of the anomalous zones are aligned parallel with the local trend of the geologic banding, suggesting a nearby bedrock source. Follow-up work is warranted to fully explain the soil geochemistry anomalies.

9.0 RECOMMENDATIONS

The anomalous areas should be followed up by prospecting, and where appropriate, hand pitting in search of mineralized rock. Additionally, geology should be mapped in greater detail to help interpret the soil geochemistry, and prioritize areas that warrant follow-up prospecting. A budget of \$20,000 is suggested for this work.

APPENDIX 2

**ROCK AND SOIL SAMPLE
DESCRIPTIONS**

2010 & 2011 Rock Sample Descriptions									
Sample No.	Year	UTM Easting	UTM Northing	Descriptions	Cu ppm	Pb ppm	Zn ppm	Ag ppm	Au ppm
1.7	2010	446456	5412950	5 - 10 % fine to medium grained cubic sulphides .5 % chalcopyrite. quartz-eyes blue rhyolite with Fe oxidation	216.0	8.4	40	0.25	<0.2
2.7	2010	446360	5413043	similar to sample 1.7	61.3	1.2	31	0.06	<0.2
3.7	2010	446151	5413361	3 - 5 % fine dark sulphides with 3 - 5 % fine chalcopyrite in a pale schist. Fe oxidation	1080.0	9.3	37	0.37	<0.2
4.7	2010	446242	5413352	5 % fine dark sulphides 5 % cubic pyrite in a pale schist. Fe oxidation	8.8	3.9	37	0.03	<0.2
5.7	2010	446244	5413356	5 - 10 % finely diminished metallic mineral with 2 % Fe medium grained Fe sulphides with visible fine bornite	20.8	1.4	78	0.03	<0.2
6.7	2010	446244	5413356	similar to sample 5.7	6.3	4	60	0.07	<0.2
7.7	2010	446250	5413300	1 - 3 % medium grained cubic chalcopyrite diminished throughout in a green schist	67.5	1.6	61	0.06	<0.2
18011	2011	446141	5413523	Green and locally brown, black or white, f.g., chloritic, mafic volcanics with 50% quartz veins and 1% rust-rimmed, black sulphide stringers (sphalerite?) mainly in volcanics	71.2	10.1	87	0.25	<0.005
18057	2011	446472	5413318	Green, white and black, f.g. to m.g., chloritic, silicified mafic volcanic breccia? With 25% m.g. quartz/barite aggregates and 0.25% f.g. clustered sulphides including sphalerite, chalcopyrite	456.3	5.4	146	0.34	<0.005
18058	2011	446513	5413324	Green, grey and black, f.g., chloritic, silicified mafic volcanic with 25% quartz eyes, 0.5% clustered sulphides including chalcopyrite, sphalerite	90.7	3.5	66	0.42	<0.005
18059	2011	446512	5413323	Green, grey and black, f.g., chloritic, silicified mafic volcanic with 15% quartz eyes, 0.25% f.g. sulphides mainly sphalerite	304.1	2.8	97	0.37	<0.005
18060	2011	446516	5413351	Green and locally black or white, f.g., chloritic, mafic volcanics with 25% quartz veins and 10% quartz eyes; possible f.g. sphalerite	1332.1	3.7	114	0.53	<0.005
18061	2011	446519	5413353	Green, grey and white, f.g. with wavy foliations, chloritic, silicified and sulphidic mafic volcanics, with 10% quartz eyes and 15% bedded sulphides mainly sphalerite	223.3	3.2	232	0.28	<0.005
18062	2011	446509	5413345	Green, grey and white, f.g. with weakly foliated, chloritic, sulphidic mafic volcanics, with 10% bedded sulphides mainly sphalerite, plus chalcopyrite, pyrite	407.3	4.6	195	0.26	0.006
18063	2011	446519	5413362	Green, grey and white, f.g. to m.g., chloritic, silicified mafic volcanics with 15% quartz/barite clusters, 10% f.g. sulphide aggregates, mainly sphalerite, trace chalcopyrite, pyrite	369.7	4.5	173	0.33	0.005
18064	2011	446525	5413350	Green and grey, f.g. to m.g., chloritic, silicified mafic volcanics with 20% quartz/barite clusters, 1% sulphides in f.g. clusters, mainly sphalerite	124.8	4.8	101	0.09	<0.005

2011 Soil Sample Locations															
Sample No.	Date	Sampler	Sample Depth (m)	Soil Horizon	Soil Colour	Particle Size	% Organics	Gradient (degrees)	Ground Cover	Cultural Impacts	UTM Zone	Easting	Northing	Elevation	Remarks
18201	16-May-11	P. Carpenter/M. Ickringill	0.3	B	org brn	pebbles w/ silt/sand	3	5	2 nd gr fir	logging	10N	447076	5412935	115	off skid trail
18202	16-May-11	P. Carpenter/M. Ickringill	0.4	B	org brn	pebbles w/ silt/sand	3	30	fern/cedar		10N	447045	5412878	124	moved off of road
18203	16-May-11	P. Carpenter/M. Ickringill	0.2	B	org brn	pebbles w/ silt/sand	6	5	2nd gr fir	logging	10N	447089	5412975	147	
18204	16-May-11	P. Carpenter/M. Ickringill	0.15	B	org brn	pebbles w/ silt/sand	5	5	2nd gr fir	logging	10N	447123	5413016	156	
18205	16-May-11	P. Carpenter/M. Ickringill	0.15	B	org brn	silt/sand/pebbles	2	5	2nd gr fir	logging	10N	447151	5413058	170	
18206	16-May-11	P. Carpenter/M. Ickringill	0.2	B	org brn	silt/sand/pebbles	2	7	2nd gr fir	logging	10N	447173	5413103	160	
18207	16-May-11	P. Carpenter/M. Ickringill	0.2	B	org brn	silt/sand/pebbles	7	2	2nd gr fir	logging	10N	447169	5413279	140	
18208	16-May-11	P. Carpenter/M. Ickringill	0.15	B	org brn	silt/sand/pebbles	4	15	2nd gr fir	logging	10N	447144	5413240	133	
18209	16-May-11	P. Carpenter/M. Ickringill	0.15	B	org brn	silt w/ sand	5	40	fir/vacc		10N	447113	5413188	156	
18210	16-May-11	P. Carpenter/M. Ickringill	0.1	B	org brn	silt w/ pebbles	5	2	fir		10N	447094	5413151	188	
18211	16-May-11	P. Carpenter/M. Ickringill	0.2	B	org brn	silty sand	2	2	fir		10N	447059	5413094	186	
18212	16-May-11	P. Carpenter/M. Ickringill	0.2	B	org brn	silt/sand/pebbles	3	15	fir/cedar		10N	447028	5413060	178	
18213	16-May-11	P. Carpenter/M. Ickringill	0.05	B	org brn	silt/sand/pebbles	3	15	2nd gr fir	logging	10N	447015	5413025	171	sampled out of road cut (high side)
18214	16-May-11	P. Carpenter/M. Ickringill	0.1	B	org brn	silty sand	5	45	arbutus fir	logging	10N	446990	5412980	196	
18215	16-May-11	P. Carpenter/M. Ickringill	0.2	B	brn	silt/sand/pebbles	8	15	2nd gr fir	logging	10N	446962	5412936	194	
18216	16-May-11	P. Carpenter/M. Ickringill	0.3	B	brn	sand/silt/pebbles	3	25	fir/maple		10N	446957	5412882	198	
18217	16-May-11	P. Carpenter/M. Ickringill	0.2	A/B	brn	silty sand	20	10	2nd gr fir	logging	10N	446810	5413260	193	
18218	16-May-11	P. Carpenter/M. Ickringill	0.25	B	med brn	silt	3	2	2 nd gr fir/cedar	logging	10N	446798	5413210	204	
18219	16-May-11	P. Carpenter/M. Ickringill	0.05	B	org brn	silt/sand/pebbles	3	10	cedar		10N	446762	5413169	205	sampled out of road cut (high side)
18220	16-May-11	P. Carpenter/M. Ickringill	0.2	B	org brn	silty sand	5	15	cedar/fir	logging	10N	446734	5413125	225	
18221	16-May-11	P. Carpenter/M. Ickringill	0.1	B	org brn	silt/pebbles	5	15	cedar		10N	446710	5413089	236	
18222	16-May-11	P. Carpenter/M. Ickringill	0.05	B	org brn	silty sand	3	35	fir/cedar		10N	446682	5413037	252	sample taken from tree root
18223	17-May-11	P. Carpenter/M. Ickringill	0.1	B	red brn	silty sand	2	33	fir/cedar	old logging	10N	446656	5412993	269	
18224	17-May-11	P. Carpenter/M. Ickringill	0.1	B	org brn	silty sand	3	20	fir	old logging	10N	446636	5412953	280	
18225	17-May-11	P. Carpenter/M. Ickringill	0.25	B	med brn	silty sand	5	25	fir/cedar	old logging	10N	446606	5412914	270	moved off a wet area of overlandflow/stream
18226	17-May-11	P. Carpenter/M. Ickringill	0.05	B	org brn	silty sand	3	20	fir	old logging	10N	446580	5412860	295	
18227	17-May-11	P. Carpenter/M. Ickringill	0.2	B	med brn	silty sand	5	20	2nd gen fir	old logging	10N	446471	5412871	331	
18228	17-May-11	P. Carpenter/M. Ickringill	0.1	B	org brn	silty sand	3	25	2nd gen fir	old logging	10N	446485	5412910	321	
18229	17-May-11	P. Carpenter/M. Ickringill	0.05	B	med brn	silt	5	5	maples	old logging	10N	446521	5412952	310	
18230	17-May-11	P. Carpenter/M. Ickringill	0.2	B	red brn	silty sand	3	30	fir/cedar	old logging	10N	446551	5413004	307	
18231	17-May-11	P. Carpenter/M. Ickringill	0.2	B	org brn	silty sand	3	35	fir/cedar	old logging	10N	446570	5413043	286	sampled at the bottom of rocky hill
18232	17-May-11	P. Carpenter/M. Ickringill	0.15	B	org brn	silty mud	15	7	fir	old logging	10N	446588	5413096	281	
18233	17-May-11	P. Carpenter/M. Ickringill	0.05	B	org brn	silty sand	2	25	cedar/maple	old logging	10N	446625	5413130	249	samples above road
18234	17-May-11	P. Carpenter/M. Ickringill	0.05	B	org brn	silt w/ pebbles	3	15	cedar	old logging	10N	446641	5413178	238	
18235	17-May-11	P. Carpenter/M. Ickringill	0.1	B	org brn	silty sand	3	35	cedar	old logging	10N	446671	5413219	235	
18236	17-May-11	P. Carpenter/M. Ickringill	0.1	B	org brn	silty clay	4	10	old cedars	old logging	10N	446700	5413270	215	
18237	17-May-11	P. Carpenter/M. Ickringill	0.3	B	org brn	silty sand	6	30	fir/maple	old logging	10N	446721	5413298	202	sampled above an old road
18238	17-May-11	P. Carpenter/M. Ickringill	0.05	B	org brn	silt	3	30	fir/maple	old logging	10N	446745	5413349	182	sampled above an old road
18239	17-May-11	P. Carpenter/M. Ickringill	0.3	B	org brn	silty sand	3	45	maples	old logging	10N	446771	5413389	167	
18240	17-May-11	P. Carpenter/M. Ickringill	0.25	B	org brn	silt w/ pebbles	5	20	fir/maple	old logging	10N	446805	5413428	154	
18241	17-May-11	P. Carpenter/M. Ickringill	0.2	B	org brn	silty sand	3	12	maples	old logging	10N	446818	5413478	138	sampled above an old road
18242	17-May-11	P. Carpenter/M. Ickringill	0.15	B	org brn	silty sand w/pebbles	3	50	cedar	old logging	10N	446908	5413434	146	
18243	17-May-11	P. Carpenter/M. Ickringill	0.15	B/a	med brn	silty sand	4	5	maples/cedar		10N	446878	5413387	152	
18244	17-May-11	P. Carpenter/M. Ickringill	0.2	B	org brn	silty sand	3	5	maples		10N	446859	5413349	165	
18245	17-May-11	P. Carpenter/M. Ickringill	0.1	B	red brn	silty sand	3	40	fir	logging	10N	446831	5413310	179	
18246	18-May-11	P. Carpenter/M. Ickringill	0.05	B	red brn	silt sand	3	20	alder fir	logging	10N	446285	5413159	290	
18247	18-May-11	P. Carpenter/M. Ickringill	0.15	B	org brn	silt sand pebbles	2	12	alder fir	logging	10N	446312	5413195	276	
18248	18-May-11	P. Carpenter/M. Ickringill	0.1	B	org brn	silt sand	2	8	alder	logging	10N	446338	5413245	268	
18249	18-May-11	P. Carpenter/M. Ickringill	0.2	B	red brn	silt sand	3	20	fir cedar	logging	10N	446365	5413280	264	
18250	18-May-11	P. Carpenter/M. Ickringill	0.1	B	org brn	silt	3	40	fir cedar	logging	10N	446378	5413315	258	
18301	16-May-11	A. Burgert/B. Protasiewich	0.3	B	red brn	silty sand	2	15	2 nd gr.	logging	1

Submitted By: **Mineral Exploration Consulting**
6552 Peregrine Road,
Nanaimo, BC V9V 1P8

Attention: **Jacques Houle**

Project: **Volcanics**
Description: **Lot#1**

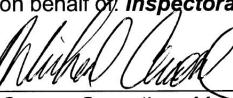

Location	Samples	Type	Preparation Description
Vancouver, BC	9	Rock	SP-RX-2K/Rock/Chips/Drill Core
Vancouver, BC	169	Soil	SP-SS-1K/Soils, Humus Sediments 1kg dried, sieved and riffle split

Location	Method	Description
Vancouver, BC	50-4A-UT	50 Element, 4 Acid, ICPMS, Ultra Trace Level
Vancouver, BC	Au-1AT-AA	Au, 1AT Fire Assay, AAS

Submittal Information

Re-released data with Fe results reported to 25%

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim or deposit has been determined based on the results of assays of multiple samples of geologic materials collected by the prospective investor or by a qualified person selected by him and based on an evaluation of all engineering data which is available concerning any proposed project. For our complete terms and conditions please see our website at www.inspectorate.com.

Vancouver, BC	1	Rock	SP-RX-2K/Rock/Chips/Drill Core

Location	Method	Description
Vancouver, BC	50-4A-UT	50 Element, 4 Acid, ICPMS, Ultra Trace Level
Vancouver, BC	Au-1AT-AA	Au, 1AT Fire Assay, AAS

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim or deposit has been determined based on the results of assays of multiple samples of geologic materials collected by the prospective investor or by a qualified person selected by him and based on an evaluation of all engineering data which is available concerning any proposed project. For our complete terms and conditions please see our website at www.inspectorate.com.
