PROPERTY GEOLOGY KEYWORDS (lithology, age, stratigraphy, structure, alteration, mineralization, size and attitude):

Altered green vesicular volcanics and bleached felsic volcanics - Sub volcanic porphyries  
Package occupies the intersection of E.W. magnetic trend with N.S. magnetic trend.  
Mineralization associated with epithermal quartz rich breccia zones cutting all stratigraphics.  
Alteration types - silica, carbonate, barite, zeolite, pyrite, hematite, chlorite, sericitic and epidote

## **ROCK GEOCHEMISTRY REPORT**

### **1.00 INTRODUCTION**

#### **1.10 Location and Access**

The Alco-Silver Lake property is approximately 60 kilometres south east of the town of Burns Lake in Central BC, Map sheets 093F.084/085 centered at UTM coordinates 353452E -5969881N.

Access is provided by good main and secondary logging roads. Topography is gentle to moderate with heavy windfall. The forest hosts green spruce and balsam with a large component of dead lodgepole pine. Historic to present day timber harvesting dominates the landscape.

#### **1.20 Property**

The Alco-Silver Fox Property is made up of tenure numbers: 756102, 774702, 832013, 843281, 843282, 889493, 896418, 712182, 851892, 851893, 887149, 889491 & 889492. The claims are owned by D Critchlow of Kaslo BC & Kootenay Silver of Vancouver BC who is also funding the work program.

#### **1.30 History of Previous Exploration**

The area has seen moderate to heavy exploration through the past 50 years. Mo/Cu porphyry and epithermal Ag/Au mineralization has been the major exploration focus.

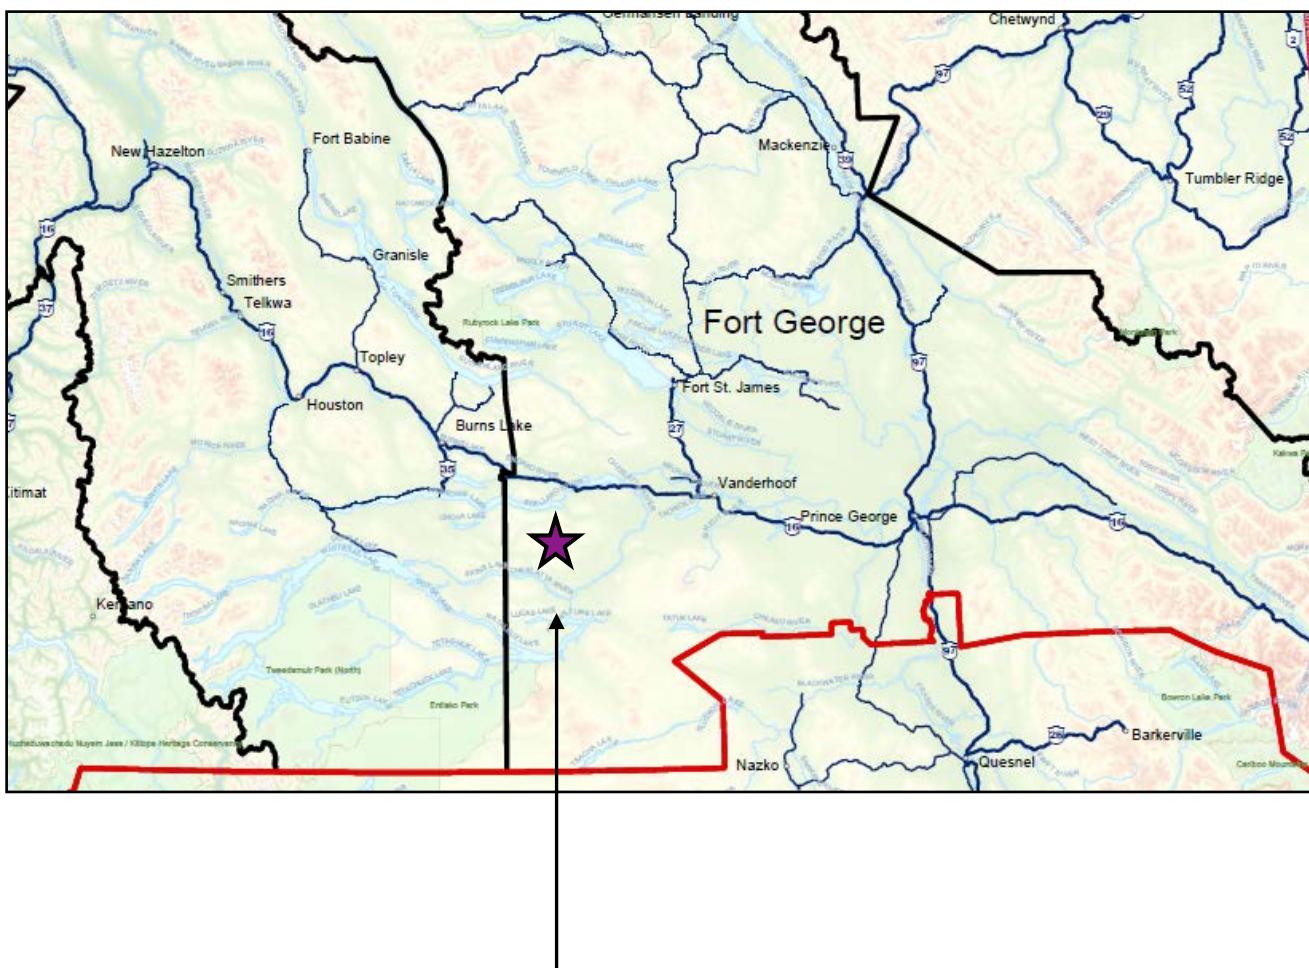

#### **1.40 Summary**

The Alco-Silver Lake claim group are part of a number of properties hosted by the postulated Nechako Arch. Kootenay Silver Inc. entered

into a grubstake agreement with Critchlow Contracting to evaluate, then elect on those properties fitting Kootenay Silver's exploration criteria. The Nechako Arch is an exploration concept contained within a north-eastern running structural zone, which since Eocene time has been defined by strongly developed geomorphology. This geomorphology is delineated by stream and lake patterns. The general area hosts geology predominantly consisting of Jurassic through to tertiary volcanic and intrusive rocks. The metal mine which keys the area is the impressive Endako molybdenum porphyry deposit, approximately 40 kilometres to the north west of the properties. As with most of the Nechako plateau, bedrock occurrence is sparse but where available provides opportunity to view prominent structure controls and alteration styles. Jurassic and cretaceous intrusive rocks and Eocene volcanic rocks are the most common in Kootenay Silver's area of interest. These rocks are exposed as structural islands where northeast structure is cut by north-western structural systems.

It is speculated that the Endako deposit is a sub-hotspring system, which has been exposed by structural uplift and erosion. A key exploration clue is the Endako mine area is host to many age and phase type intrusive, a piston geological environment. The above feature is common in Kootenay Silver's area of interest and may in fact be diagnostic of the Nechako arch. Structural blocks with hetro-genius intrusive exposures maybe exposed too or below porphyry levels opening opportunity for shear zone and, or stockwork gold systems. Structural blocks with volcanic cover and hotspring alteration can be considered potential porphyry targets. These opportunities within this type of structural zone (Nechako Arch) provide encouragement for discovery of a large bulk mineable gold deposit. This target type is Kootenay Silver's favoured focus.

## **2.00 ROCK GEOCHEMISRTY**

Rock geochemistry programs on the Alco-Silver Lake Property have successfully associated a large alteration zone with anomalous precious and base metals. Green vesicled basalts, andesites and flow banded dacite host narrow fracture zones and breccias with silica, carbonate and zeolite alteration. Mineralization seems to have a general north north-west orientation which mimics the general magnetic trend of the area. Outcrops are sparse with structures suspected to be closely associated with linear draws, creek drainages and lake patterns. Interestingly, hilltop rock exposures exhibit evidence of alteration and structural affects which supports targeting valley bottoms with geophysics.

## **3.00 CONCLUSION**

The property hosts structures which contain anomalous values in both precious and base metals. In a regional sense the Alco-Silver Lake property area exists within a zone of braided north north-west magnetic anomalies. Future work should test geomorphology patterns for hidden mineralization. This could be accomplished with aerial and ground geophysics along with biogeochemistry.

## **5.00 AUTHOR'S QUALIFICATIONS**

As the author of this report I, Craig Kennedy, certify that:

1. I am an independent prospector residing at 2290 Dewolfe Avenue, Kimberley, BC.
2. I have been actively prospecting in the East and West Kootenays district of BC for the past 33 years and have made my living prospecting for the past 24 years.
3. I have been employed as a professional prospector by major and junior mineral exploration companies.
4. I own and maintain mineral claims in BC and have optioned numerous claims to various exploration companies.
