APPENDIX 3: AREA 1 (SW TARGET) ROCK SAMPLE LOCATIONS AND PRELIMINARY DESCRIPTIONS

ITEM 3: SUMMARY

Vendetta Mining Corp. (formerly Azincourt Resources Inc.) holds a 100% interest in 21 contiguous mineral tenures (4,862 hectares) that cover a northwest oriented, staircase shaped block of ground located south of the community of Clearwater in south central BC. The claims are accessible by existing forest service roads and cover a known, early stage stratiform massive sulphide occurrence identified in the BC Ministry of Mines (BCMEM) Minfile database as the JOSEPH PROSPECT (Minfile No. 082M-194) and potential extensions of structurally controlled gold bearing quartz veins referred to as the HONEYMOON PROSPECT (Minfile No.092P 174).

The property (referred to as the Honeymoon East Property) is located in the Adams Plateau – Clearwater exploration area. Regional geological maps published by the BC Ministry of Energy and Mines (BCMEM) show that the claim area covers a north to northwest trending package of Paleozoic aged Fennell and Eagle Bay Formation volcanic and sedimentary rocks cut by a series of complex, north to northwest trending thrust faults. According to the BCMEM the Fennell Formation hosts various styles of mineralization including Cypress-type massive sulphide Cu (Zn) mineralization, Noranda/Kuroko-type massive sulphide Cu-Pb-Zn mineralization, and Ag-Pb-Zn+/-Au vein mineralization. The most significant prospects in the project area include the Harper Creek copper deposit located approximately 11 kilometers east of the Property, the Chu Chua copper deposit located approximately 15 kilometres to the south of the Property, the former producing Windpass Gold Mine located approximately 10 kilometres to the south of the Property, the Joseph Prospect located within the Honeymoon East Property and the Jake Gold Prospect located approximately 10 km to the northwest of the Property. The reader is cautioned that there is no assurance that mineralization similar to the Harper Creek copper deposit, the Chu Chua copper deposit, the Jake Prospect or the former Windpass Gold Mine will be identified within the boundaries of the Honeymoon East Property.

Previous exploration work was carried out within the boundaries of the Honeymoon East Property between 1978 and 1988 by Craigmont Mines, “Craigmont”, Esso Minerals Canada, “Esso”, and Kerr Addison Mines, “Kerr Addison”. Previous work consisted of airborne geophysical surveys (total field magnetic and EM surveys), prospecting, rock sampling and geological mapping, soil geochemical surveys, limited ground geophysical surveys and a limited drill program in 1984 designed to test one of the target areas that was identified by the geochemical and geophysical surveys.

In 1979 Craigmont, in conjunction with Barrier Reef Resources Ltd. (“Barrier”) acquired the ground between Clearwater and the Chu Chua deposit and completed a DIGHEM II airborne electromagnetic and magnetic survey to explore the continuation of the Fennel and Eagle Bay Formation rocks. Several bands of conductors, magnetic highs and resistivity lows were delineated.

During 1983 Esso completed numerous grid based soil geochemical surveys designed to evaluate some of the targets identified by the airborne surveys. Each of the grid based geochemical surveys consisted of varying numbers of 25 to 50 meter spaced samples collected along lines spaced 100 to 200 meters apart. This work defined multiple soil anomalies which were identified by letters of the alphabet. One

of the strongest anomalies, referred to as Anomaly "B" was tested by two short drill holes in 1984 and resulted in the discovery of a previously unknown zone of stratiform lead – zinc – copper -silver mineralization which is now referred to as the "Joseph Prospect". According to BCMEM Minfile records (Occurrence number 082M-194) one of the two drill holes intersected a 9.2 meter wide interval that assayed 2.39% lead, 1.05% zinc, 0.014% copper, 30.9 g/t silver and 0.07 g/t gold together with 1.27% barium. This intersection included a 2.7 meter interval that assayed 9.2% lead, 1.56% zinc, 0.02% copper, 93.9 g/t silver and 0.17 g/t gold with 2.45% barium. According to Marr (1984) the mineralized zone trends north and has an estimated true width of 8.0 meters. The second drill hole completed approximated 210 meters to the northwest reportedly intersected a 1.8 meter interval that assayed 2.9% lead, 0.45% zinc and 26.1 g/t silver.

It is important to note that the work completed by Esso in 1983 and 1984 did not evaluate all of the target areas identified by the airborne geophysical survey. No additional follow up work was reported by Esso and the claims covering the airborne geophysical anomalies and the area of the Joseph Prospect were allowed to lapse. In 1988 Kerr Addison Mines Ltd., "Kerr Addison", staked most of the ground that had been held by Esso to explore for structurally controlled, gold bearing quartz veins similar to those developed at the former Windpass Mine located approximately 10 kilometers south of the Honeymoon East Property. In 1988 Kerr Addison completed extensive prospecting and sampling programs and successfully identified, gold bearing quartz veins in two areas referred to as Area 1 and Area 2. According to BCMEM Minfile records the areas of interest identified by Kerr Addison are referred to as the Honeymoon Prospect (located within the Dunn Peak protected area)and rock samples (grab samples) from Area 1 (located within the Honeymoon East Property) returned assays of up to 0.94 g/t gold.

The present Honeymoon East Property covers several of the airborne geophysical targets identified by Craigmont, several of the soil geochemical survey grids completed by Esso (including the Joseph Prospect) and Area 1 of the Honeymoon Prospect explored by Kerr Addison. Between January and March of 2010 Vendetta compiled all available technical data for the former Craigmont Mines, Esso Minerals and Kerr Addison Properties and completed a detailed soil geochemical survey using specialized augers in the area of the Joseph Prospect. The objectives of the 2010 program were to verify the soil geochemical sampling results reported by Esso, delineate the extent of mineralization at the Joseph Prospect using the soil sampling data and to determine if the limited drill program, carried out by Esso in 1984 adequately tested the potential of the Joseph Prospect.

The preliminary exploration work completed by Vendetta in 2010 confirmed the historic Esso technical data and clearly showed that existing exploration targets within the Honeymoon East property have only been partially tested. Based on the results of the 2010 program the author recommended that Vendetta complete a staged exploration program designed to evaluate potential extensions of the mineralization identified by Esso at the Joseph Prospect and to assess the gold bearing vein targets identified in Area 1 by Kerr Addison. In the event that additional mineralized zones are defined a follow up program of ground geophysics, trenching and drill testing would be warranted.

Between March and November of 2011 Vendetta completed an extensive program of soil and rock sampling at a total cost of $118,932.00 as outlined in SOW No.s 5191027 and 5191030. Two large soil geochemistry grids (referred to as the Main Grid and the North grid) comprising 1,537 samples were completed to test two priority target areas identified by the Craigmont airborne survey along strike of the Joseph Target and an area of approximately 9 square kilometers (covering the area referred to as Area 1 (SW Target) by Kerr Addison) was systematically prospected for gold bearing quartz veins VMS type alteration and mineralization. Several areas of interest were identified and a total of 97 rock samples were collected however analysis of the rock samples was deferred pending confirmation of exploration budgets for 2012.

The Main Grid geochemical survey successfully identified a north northwest trending continuation of the soil geochemical anomaly associated with the Joseph Prospect. Samples were collected from depths of between 0.2 and 0.5 meters using augers and were placed in standard kraft soil sample bags and delivered to the ALS Chemex assay facility in North Vancouver. Samples were dried, sieved to minus 80 mesh and analyzed by ICP 41 for a suite of 35 trace and path finder elements. To ensure adequate QA and QC ALS Chemex includes 5% industry standard and blank samples into the sample stream and the reported results were within industry standards. A total of 27 strongly anomalous zinc results and 12 strongly anomalous lead results were reported. Peak values within the anomalies are subdued relative to the soil geochemistry results reported for Joseph Prospect however the anomalous samples define a distinctive north trending target that extends for approximately 1,200 meters to the north northwest of the area surveyed by Esso. The results also indicate that the new target area may be up to four hundred meters in width which is similar to the overall width of the geochemical anomaly associated with the Joseph Prospect. Assay values of up to 787 ppm zinc and 354 ppm lead were recorded in the assay reports provided by ALS Chemex.

Based on the results of the work completed in 2011 it is recommended that Vendetta carry out additional fill-in surveys to delineate the overall extent of Joseph Prospect. Overburden conditions with the target area are variable and a combination of sampling methods will need to be utilized to ensure that the limits of the target area can be accurately defined. Additional auger sampling should be carried out within the areas surveyed in 2010 and in 2011 and should be designed to evaluate the relationship between surface values and depth to bedrock. Although the lead and zinc values reported for the extension of the Joseph Prospect are lower than those reported by Esso in the area that was drill tested overburden appears to be thicker and may simply be muting the geochemical response of bedrock mineralization. In the event that in fill and auger sampling confirms that the geochemical anomalies are associated with areas of overburden covered mineralization ground geophysical surveys and follow up drill testing would be warranted.

No significant results were reported from the North grid and assays are pending for the rock samples collected from Area 1 (also referred to as the SW Target Area). Assay costs and a separate technical report will be filed after results are received.

ITEM 4: INTRODUCTION AND TERMS OF REFERENCE

The author was retained by the Board of Directors of Vendetta Mining Corp. (formerly Azincourt Resources Inc.) to supervise the 2011 follow up exploration program on the Honeymoon East Property and if warranted, outline recommendations for follow-up exploration program. Vendetta Mining Corp. intends to file this technical report on SEDAR in support of TSX Venture Exchange requirements.

ITEM 5: RELIANCE ON OTHER EXPERTS

The author has prepared this report based on information which is believed to be accurate but which is not guaranteed. The available technical data for the Honeymoon East Property consists of regional geological and airborne geophysical information compiled by the BC Ministry of Energy and Mines and documentation regarding field investigations completed within the current claim area by various previous operators including Craigmont Mines Ltd. in 1979, Esso Minerals Ltd. and Barrier Reef Resources Ltd. in 1983 and 1984 and by Kerr Addison Mines Ltd. in 1988. Sources are listed in the References section of this report and are cited where appropriate in the body of the report. The technical reports listed in the References section of this report appear to have been completed by professional geologists without any promotional or misleading intent and the author has no reason to doubt the accuracy or completeness of the contained information.

To the best of the author's knowledge at the time of writing of this report, the Honeymoon East Property is free of any liens or pending legal actions and is not subject to any underlying royalties, back-in rights, payments or other encumbrances.

To the best of the author's knowledge, there are no known existing environmental liabilities to which the property is subject, other than the requirement to mitigate any environmental impact on the claims that may arise in the course of normal exploration work and the requirement to remove any camps constructed on the Honeymoon East Property or any equipment used in exploration of the claims in the event that exploration work is terminated.

The author conducted an online title search on June 29, 2012 to verify that all of the mineral claims that comprise the Honeymoon East Property are registered in the name of Vendetta Mining Corp. (formerly Azincourt Resources Inc.). This title search is not a legal opinion as to the validity of the property claims as such opinions are not within the professional scope of the author.

ITEM 6: PROPERTY DESCRIPTION AND LOCATION

6.1 Property Description and Location

Vendetta Mining Corp. (formerly Azincourt Resources Inc.) holds a 100% interest in 21 contiguous mineral tenures comprising 4,862 hectares that cover a northwest oriented, staircase shaped block of ground located south of Clearwater in south central BC. On November 01, 2011 portions of the property were allowed to laps and were restaked by Vendetta (the original property consisted of 18 contiguous mineral tenures (4,642 hectares). All of the claims which comprise the Honeymoon East Property were staked pursuant to the BC Ministry of Energy and Mines MTO system (Mineral Titles Online System). The earliest expiry date of the claim package is November 02, 2012. The location of the property relative to other mining claims, local communities, parks and access roads is shown in figure 1. The individual claim tenure numbers are shown in figure 3. The central and eastern parts of the property are on NTS Mapsheet 92P09 and the southeastern part of the property is on NTS Mapsheet 82M12.

The mineral cell title claim statistics are summarized in Table 1; note that this claim information is not a legal title opinion but is a compilation of claims data based on the author's review of the government of the British Columbia Mineral Rights inquiry website (BC Mineral Titles June 29, 2012). The mineral claims do not have to be legally surveyed; since they are BC Government established mineral cell title claims.

There are two known areas of mineralization that have been identified within the Honeymoon East Property. These include the area referred to as the Joseph Prospect (initially identified by Esso Minerals in 1983) and an area that was explored by Kerr Addison Mines in 19897 referred to as Area 1. The Joseph Prospect is located in the southeastern part of the Honeymoon East Property and is accessible by existing four wheel drive roads as described in Section 7. Area 1 (also referred to as the SW Target) is located in the south western part the Honeymoon east Property and is also accessible by existing four wheel drive roads as described in Section 7. The location of the Joseph Target and Area 1 are shown graphically in figure 4,5,9, 10 and 11.

The southern boundary of the Honeymoon East property is located immediately north of the northern boundary of the Dunn Peak Protected Area. None of the claims that comprise the Honeymoon East Property are located within the Dunn Peak Protected Area.

Vendetta Mining Corp. Honeymoon East Property Tenure Listing

Tenure Number	Claim Name	Owner	Tenure Type	Issue Date	Good To Date	Area (ha)
846679		232801 (100%)	Mineral	2011/feb/16	2015/dec/31	120.59

6.2: Provincial Mining Regulations

The Honeymoon East Property is owned 100% by Vendetta Mining Corp. (formerly Azincourt Resources Inc.) and is not subject to any royalties, back in rights, payments or other agreements. Title to the claims is maintained through the performance of annual assessment filings and payment of required fees. For the first three years a minimum of $4.00 per hectare in eligible exploration expenditures must be incurred. In subsequent years a total of $8.00 per hectare in eligible exploration expenses must be incurred.

To the best of the author's knowledge, government permits will be required to carry out the proposed Stage II exploration program and for any follow up diamond drilling program recommended after completion of this program. These programs will require application to the Ministry of Energy and Mines for permits and the Issuer may be required to post security equivalent to the estimated costs of any reclamation work which will be required after completion of the proposed exploration work.

To the best of the author's knowledge approval from local First Nations communities may also be required to carry out the proposed Stage 2 exploration program. The reader is cautioned that there is no guarantee that the Issuer will be able to obtain approval from local First Nations. However, the author is not aware of any problems encountered by other junior mining companies in obtaining approval to carry out similar programs in nearby areas nor is the author aware of any instances where local First Nations communities have objected to exploration work in the general project area.

To the best of the author's knowledge, none of the claims which comprise the Honeymoon East Property have surface rights. The BCMEM online database indicates that surface rights for the Honeymoon East property are held by the Crown. In the event that a significant mineralized zone is identified an application that includes detailed environmental impact studies must be made to the Crown for surface rights prior to initiation of any advanced exploration or mining activities. The reader is cautioned that there is no guarantee that areas for potential mine waste disposal, heap leach pads, or areas for processing plants will be available within the subject property.

ITEM 7: ACCESSIBILITY, CLIMATE, PHYSIOGRAPHY AND INFRASTRUCTURE

7.1 Accessibility and Infrastructure

Access to the property is by Provincial Highway 5, 110 kilometres north from Kamloops, along the north Thompson River to Clearwater. From Clearwater the west side of the property can be accessed by a road on the eastside of the Thompson River heading south along the Dunn Lake Forest Service Road (FSR). Approximately 12 kilometers south of Clearwater (UTM 5716600N and 699000E: NAD 83 Zone 10) there is a well maintained gravel road that extends east to the radio tower near Axel Lake. This road provides access to Area 1 (explored by Kerr Addison in 1988) which forms part of the Honeymoon Prospect and the western parts of the Honeymoon East property. The eastern part of the property can be accessed by travelling east from Birch Island along the south side of the North Thompson River and then by travelling south and west along the Jones Creek Forest Service Road. This is the access road that was utilized during the 2010 exploration program to access the Joseph prospect area.

In general, infrastructure in the vicinity of the subject property is considered excellent. There are existing roads that can be used to access the known areas of mineralization and the proposed exploration areas. There are numerous small lakes and streams within the claim area that would easily provide sufficient water for exploration purposes. Trained exploration personnel are available in several local nearby communities.

7.2 Physiography, Climate, Vegetation and Current Land Use

Climate in the Clearwater area is typical of the Shushwap Highlands ranging from sub-alpine in the mountains to a semi-arid, more temperate, continental climate. Summer is normally warm and dry and winter is moderate to very cold and dry.

The property is in the Shuswap Highlands physiographic region and encompasses a rugged, hilly upland area. Elevations range from 1070 – 2130 meters in elevations. The slopes are covered with tall, close spaced fir and spruce forest. Open areas are thick with buck brush and similar vegetation. Swamps and small lakes dot the uplands in virtually every depression. Figure 4 shows the generalized topography of the Honeymoon East property.

ITEM 8: HISTORY OF EXPLORATION

In 1977 a consortium of companies consisting of Vestor Explorations Ltd., Seaforth Mines Ltd. and Pacific Cassiar Mines Ltd. carried out reconnaissance geochemical sampling to explore the Fennel and Eagle Bay Formation rocks in the area around Chu Chua Mountain approximately 30 kilometers south of Clearwater. Results of this program generated considerable industry interest in the Clearwater area and the claims were optioned to Craigmont Mines in 1978. In 1978 and 1979 Craigmont drilled a total of forty drill holes and delineated a significant zone of copper rich massive sulphide mineralization referred to as the Chu Chua deposit.

In 1979 Craigmont, acquired the ground between Clearwater and the Chu Chua deposit and completed a DIGHEM II airborne electromagnetic and magnetic survey to explore the continuation of the Fennel and Eagle Bay Formation rocks. Several bands of conductors, magnetic highs and resistivity lows were delineated. In 1980 and 1981 Craigmont and Barrier Reef initiated ground follow-up and in 1982 Esso optioned the Craigmont and Barrier Reef property.

During 1983 Esso completed numerous grid based soil geochemical surveys designed to evaluate the targets identified by the airborne surveys. Each of the geochemical survey grids consisted of varying numbers of 25 – 50 meter spaced samples collected along lines spaced 100 to 200 meters apart. This work defined multiple soil anomalies which were identified by letters of the alphabet. One of the strongest anomalies, referred to as Anomaly “B” was tested by two short drill holes in 1984 and resulted in the discovery of a previously unknown zone of stratiform lead – zinc – copper -silver mineralization referred to as the “Joseph Prospect”. According to BCMEM Minfile records (Occurrence number 082M-194) one of the two drill holes intersected a 9.2 meter wide interval that assayed 2.39% lead, 1.05% zinc, 0.014% copper, 30.9 g/t silver and 0.07 g/t gold together with 1.27% barium. This interval included a 2.7 meter interval that assayed 9.2% lead, 1.56% zinc, 0.02% copper, 93.9 g/t silver and 0.17 g/t gold with 2.45% barium. According to Marr (1984) the mineralized zone trends north and has an estimated true width of 8.0 meters. The second drill hole completed approximated 210 meters to the northwest intersected a 1.8 meter interval that assayed 2.9% lead, 0.45% zinc and 26.1 g/t silver.

It is important to note that the work completed by Esso in 1983 and 1984 did not evaluate all of the target areas identified by the airborne geophysical survey. No additional follow up work was reported by Esso and the claims covering the airborne geophysical anomalies and the Joseph Prospect were allowed to lapse.

In 1988 Kerr Addison staked most of the ground that had been held by Esso to explore for structurally controlled, gold bearing quartz veins similar to those developed at the former Windpass Mine located immediately south of Dunn Peak Protected Area approximately 10 kilometers south of the Honeymoon East Property. Prospecting and sampling programs successfully identified gold bearing quartz veins and mineralized float in two areas referred to as Area 1 and Area 2. According to BCMEM Minfile records samples from Area 1 and 2 returned assays of up to 2.9 g/t gold. It is important to note that Area 2 lies within the boundaries of the Dunn Peak Protected Area.

ITEM 9: GEOLOGICAL SETTING

9.1 Regional geology

The Honeymoon Project is situated within the Adams Plateau - Clearwater Exploration area which lies near the southern end of the Omineca Crystalline Belt, one of the five morphological belts of the Canadian Cordillera. The Omineca belt refers to variably deformed and metamorphosed rocks of continental affinity, that are exposed east of Mesozoic arc and back-arc sequences (i.e., Intermontane belt) and west of deformed Paleozoic continental margin sedimentary rocks (i.e., Foreland belt). The Adams Plateau - Clearwater Exploration area includes the Fennel Formation of the Slide Mountain Terrane and the Eagle Bay assemblage of the Kootenay Terrane.

The regional geology of the project area is taken from Paper 1982-1, BCDM Geological Fieldwork 1981, Clearwater Area by P. Schiarizza. Figure 2 shows the generalized geology of the Clearwater - Chu Chua Area that shows the locations of the most advanced prospects. In the area of the Harper Creek Prospect (located approximately 10 kilometers to the east) the predominant rock types are rusty weathering greenish-grey feldspathic chlorite schists, chlorite schists, sericite schists and sericitic quartzites of the Eagle Bay Formation.

The area of the Honeymoon East Property is primarily underlain by rocks of the Lower and Upper Fennel Formation. The Lower Fennel Formation consists of aphanitic to very coarse grained basalt, chert and cherty mudstone, quartz - feldspar porphyry, conglomerate, sandstone, argillite and phyllite and partly crystalline limstone. The Upper Fennel Formation consists mainly of aphanitic to fine grained pillowed basalts with minor discontinuous pods of chert. Although the contact is not exposed the contact between the Lower and Upper Fennel Formation appears to be stratigraphic rather than tectonic. This is the unit that hosts the Chu Chua Copper deposit and the Joseph Prospect.

The middle Cretaceous Baldy Batholith occupies the southeast corner of the project area. Coarse grained biotite quartz monsonite comprises much of the batholith. A small body of similar rock outcrops in the Joseph Creek Valley (located immediately south of Area 1 defined by Kerr Addison) in the southeastern part of the Honeymoon East Property. The Raft Batholith located in the northwestern part of the project area is associated with the mineralization identified at the Jake prospect.

The Honeymoon Project straddles the lower and upper structural divisions of the Fennell Formation. The basalts, of the upper division, are aphanitic to fine-grained medium to dark grey or green in colour, and rarely display a tectonic foliation. Microscopically, they consist of relict clinopyroxeneand plagioclase variably altered to an assemblage of chlorite, actinolite, epidote, leucoxene, titanite, and minor carbonates and quartz (Schiarizzaand Preto, 1987). The diabase and gabbro, of the lower division, are coarser grained than the volcanic rocks, but they have the same composition. Un-pillowed and pillowed basalt flows of the upper structural division host the stratabound Chu Chua Cu-Zn-Au-Ag sulphide deposit (Paradis et al. 2006).

9.2 Property Geology

According to Everett, 1983 the geochemical survey grids that were sampled by Esso (Grid No.s B1 to B5 and B8) are underlain by aphanitic to coarse grained basalt, basic lapilli crystal tuffs, gabbro, chert, cherty siltstone, conglomerate, sandstone, argillite and limestone of the Upper Fennel Formation.

A westerly overturned syncline in the Fennel Formation is the dominant structural feature between Joseph Creek and Clearwater. It plunges shallowly towards the north north-west and there appears to be a slight flexure in the axial trace from the northeast to the north.

The generalized trend of the volcanic and sedimentary rocks within the Honeymoon East property is from northwest to southeast. Outcrop is generally scarce on the property and general unit trends are extrapolated mainly from float occurrences. Detailed soil geochemical sampling using augers is believed to be the most effective exploration method for tracing the mineralized horizons within the Fennel Formation. The extensive database of soil sample assays that exists for the project area will improve the ability to target mineralized zones that are completely masked by overburden.

The geological work completed by Kerr Addison in the central part of the Honeymoon East Property did not include detailed geological mapping so there is only a limited amount of detailed information available on the rock units that host the vein occurrences referred to as Area 1.

ITEM 10: DEPOSIT TYPES

10.1 VMS (Cypress and Kuroko type) massive sulfide mineralization

Volcanogenic massive sulfide ("VMS") deposits are a type of metal sulfide ore deposit, mainly Cu-Zn-Pb which are associated with and created by volcanic-associated hydrothermal events in submarine environments. They are predominantly stratiform accumulations of sulfide minerals that precipitate from hydrothermal fluids on or below the seafloor. Their immediate host rocks can be either volcanic or sedimentary. Most VMS deposits have two components. There is typically a mound-shaped to tabular, stratabound body composed principally of massive sulfide, quartz and subordinate phyllosilicates, and iron oxide minerals and altered silicate wall-rock. These stratabound bodies are typically underlain by discordant to semidiscordant stockwork veins and disseminated sulfides. The stockwork vein systems are enveloped in distinctive alteration halos, which may extend into the strata above the VMS deposit.

VMS deposits are grouped according to base metal content, gold content, and host-rock lithology. The base metal classification divides VMS deposits into Cu-Zn, Zn-Cu, and Zn-Pb-Cu groups according to their contained ratios of these three metals. Gold content has a simple bimodal definition of "normal" versus "Au-rich". Au-rich VMS deposits are arbitrarily defined as those in which the abundance of Au in ppm is numerically greater than the combined base metals (Zn+Cu+Pb in wt%). VMS deposit classification by their host lithologies includes all strata within a host succession defining a distinctive time-stratigraphic event. There are five different groups: bimodal-mafic, bimodal-felsic, felsic-siliciclastic, mafic-backarc,

and mafic-siliciclastic. These lithologic groupings generally correlate with different submarine tectonic settings. Bimodal-mafic VMS deposits are formed during the extensional stages (island arc-rifting) of an island arc. The Minfile classification G06 Noranda/Kuroko-type VMS deposit contains the Bimodal-mafic VMS deposits. Bimodal-felsic VMS deposits are formed during the extensional stages (continental arc-rifting) of a continental margin arc. The Minfile classification G06 Noranda/Kuroko-type VMS deposit contains the Bimodal-felsic VMS deposits. Back-arc mafic VMS deposits are hosted in mature back-arc ophiolites found in oceanic arc settings. The Minfile classification G05 Cyprus-type VMS deposit is Back-arc mafic VMS deposit. Mafic-silicidastic VMS deposits are formed in oceanic extensional environments close to continental margins. The Minfile classification G04 Besshi-type VMS deposit is a Mafic-siliciclastic VMS deposit. Felsic-siliciclastic VMS deposits are formed in continental back-arc basins. The Minfile classification G06 Noranda/Kuroko-type VMS deposit contains the felsic-siliciclastic deposits.

10.2 Structurally controlled Gold and polymetallic vein type mineralization

Mineralization in structurally controlled Polymetallic (Ag-Pb-Zn ± Au) veins is epigenetic and is formed from structurally focused hydrothermal fluids. These types of deposits are normally associated with regional faults, fault sets and fractures; however, veins are typically associated with second order structures. Veins typically occur in the central parts of discrete shear zones within a larger regional fault, where the rotational or simple shear strains predominate. Vein systems are tabular, sub vertical structures of varying thickness and lateral extent. Precious metal mineralization often occurs as coarse individual grains, occasionally making this type of deposit difficult to evaluate, due to a “nugget effect” on sample analyses.

ITEM 11: MINERALIZATION

Between 1979 and 1987 Craigmont Mines, Esso and Kerr Addison carried out surface exploration of the claim area now covered by the Honeytmoon East Property. The Honeymoon East Property covers a known, early stage stratiform massive sulphide occurrence identified in the BC Ministry of Mines (BCMEM) Minfile database as the JOSEPH PROSPECT (Minfile No. 082M-194) and potential extensions of structurally controlled gold bearing quartz veins referred to as the HONEYMOON PROSPECT (Minfile No.092P-174).

11.1 Joseph Prospect

The strongest soil geochemical anomaly identified by Esso is within the Honeymoon East Property (referred to as Anomaly "B2" and also referred to as the Joseph Prospect). According to published technical reports prepared by Esso there is a 50-100 by 1800 meter area in the B2 grid that exhibits elevated zinc, lead, copper and silver in the soil, referred to as anomaly “B”. There is also a 30-75 by 1100 meter area, parallel to anomaly “B” that exhibits elevated copper, lead, zinc and silver in the soil, referred to as anomaly “C”. Esso tested this target with two short drill holes in 1984 and identified a previously unknown zone of stratiform lead - zinc - copper -silver mineralization which is now referred to as the "Joseph Prospect". According to BCMEM Minfile records one of the two drill holes

intersected a 9.2 meter wide interval that assayed 2.39% lead, 1.05% zinc, 0.014% copper, 30.9 g/t silver and 0.07 g/t gold together with 1.27% barium. This intersection included a 2.7 meter interval that assayed 9.2% lead, 1.56% zinc, 0.02% copper, 93.9 g/t silver and 0.17 g/t gold with 2.45% barium. According to Marr (1984) the mineralized zone trends north and has an estimated true width of 8.0 meters. The second drill hole completed approximately 210 meters to the northwest reportedly intersected a 1.8 meter interval that assayed 2.9% lead, 0.45% zinc and 26.1 g/t silver. Based on the characteristics of the mineralization and the classification proposed by the BCMEM the Joseph Prospect is believed to be a Kuroko type massive sulphide occurrence. No additional follow up work was reported by Esso and the claims covering the airborne geophysical anomalies and the Joseph Prospect were allowed to lapse. In 1988 Kerr Addison staked most of the ground that had been held by Esso to explore for structurally controlled, gold bearing quartz veins similar to those developed at the former Windpass Mine located approximately 10 kilometers south of the Property.

11.2 Area 1 (SW Target)

The former Windpass Mine reportedly consists of a series of narrow, north trending, gold bearing veins which were developed between 1934 and 1939. According to BCMEM Minfile records a total of 93,455 tonnes of ore were produced yielding 1,071,684 grams of gold, 53,469 grams of silver and 78,906 kilograms of copper. The reader is cautioned that there is no assurance that mineralization similar to that developed at the former Windpass Mine will be identified within the boundaries of the Honeymoon east Property. According to BC Minfile records in 1988 Kerr Addison completed extensive prospecting and sampling programs in the central parts of the Honeymoon East Property and the area south of the Dunn Peal Protected Area. This work successfully identified exposed, gold bearing quartz veins in two areas of interest referred to as the Honeymoon Prospect and samples from Area 1 (located within the Honeymoon East Property) returned assays of up to 0.94 g/t gold. The mineralization identified by Kerr Addison Mines is classified as structurally controlled vein type mineralization however extensive additional work will be required to assess the exact style of mineralization.

ITEM 12: EXPLORATION WORK COMPLETED IN 2011

12.1 Summary of exploration work carried out in 2010

The preliminary exploration work completed by Vendetta in 2010 confirmed the historic Esso technical data and clearly showed that existing exploration targets within the Honeymoon East property have only been partially tested. Based on the results of the 2010 program the author recommended that Vendetta complete a staged exploration program designed to evaluate potential extensions of the mineralization identified by Esso at the Joseph Prospect and to assess the gold bearing vein targets identified in Area 1 by Kerr Addison.

12.1 Summary of exploration work carried out in 2011

Between March and November of 2011 Vendetta completed an extensive program of soil and rock sampling at a total cost of $118,932.00 as outlined in SOW No.s 5191027 and 5191030. Two large soil geochemistry grids (referred to as the Main Grid (which covers and area of approximately 4 square kilometers) and the North grid (which covers and area of approximately 2 square kilometers)) comprising 1,537 samples were completed to test two priority target areas identified by the Craigmont airborne survey along strike of the Joseph Target and an area of approximately 9 square kilometers (covering the area referred to as Area 1 (SW Target) by Kerr Addison) was systematically prospected for gold bearing quartz veins. Several areas of interest were identified and a total of 97 rock samples were collected however analysis of the rock samples was deferred pending confirmation of exploration budgets for 2012.

The Main Grid geochemical survey successfully identified a north northwest trending continuation of the soil geochemical anomaly associated with the Joseph Prospect. Samples were collected from depths of between 0.2 and 0.5 meters using augers and were placed in standard kraft soil sample bags and delivered to the ALS Chemex assay facility in North Vancouver. Samples were dried, sieved to minus 80 mesh and analyzed by ICP 41 for a suite of 35 trace and path finder elements. To ensure adequate QA and QC ALS Chemex includes 5% industry standard and blank samples into the sample stream and the reported results were within industry standards. A total of 27 strongly anomalous zinc results and 12 strongly anomalous lead results were reported. Peak values within the anomalies are subdued relative to the soil geochemistry results reported for Joseph Prospect however the anomalous samples define a distinctive north trending target that extends for approximately 1,200 meters to the north northwest of the area surveyed by Esso. The results also indicate that the new target area may be up to four hundred meters in width which is similar to the overall width of the geochemical anomaly associated with the Joseph Prospect. Assay values of up to 787 ppm zinc and 354 ppm lead were recorded in the assay reports provided by ALS Chemex.

Based on the results of the work completed in 2011 it is recommended that Vendetta carry out additional fill-in surveys to delineate the overall extent of Joseph Prospect. Overburden conditions with the target area are variable and a combination of sampling methods will need to be utilized to ensure

that the limits of the target area can be accurately defined. Additional auger sampling should be carried out within the areas surveyed in 2010 and in 2011 and should be designed to evaluate the relationship between surface values and depth to bedrock. Although the lead and zinc values reported for the extension of the Joseph Prospect are lower than those reported by Esso in the area that was drill tested overburden appears to be thicker and may simply be muting the geochemical response of bedrock mineralization. In the event that in fill and auger sampling confirms that the geochemical anomalies are associated with areas of overburden covered mineralization ground geophysical surveys and follow up drill testing would be warranted.

No significant results were reported from the North grid (see figure 6 to 8) and assays are pending for the rock samples collected from Area 1 (also referred to as the SW Target Area).

Summary of Main Grid soil geochemical data

Main Grid - Lead Anomalies – Figure 9
There are 12 strongly anomalous (lead > 75 ppm) lead samples. The lead anomalies have confirmed there is a north to northwest trending extension of the geochemical anomalies identified by Esso minerals B2 grid (Joseph Target). These anomalous areas are likely the expression of multiple mineralized horizons, which is common in VMS environments.

Main Grid - Zinc Anomalies – Figure 10
There are 27 anomalous (zinc > 150 ppm) zinc samples. The zinc anomalies have verified the geochemical anomalies identified by Esso minerals B2 grid and have confirmed there is a north to northwest trending extension of the geochemical anomalies identified by Esso minerals B2 grid (Joseph Target). These anomalous areas are likely the expression of multiple mineralized horizons, which is common in VMS environments. The distribution of zinc values have also outlined a significantly broader zone than that defined by Esso's soil program.

Main Grid - Silver Anomalies – Figure 11
There are 21 strongly anomalous (silver > 2 ppm) identified on the Main Grid The silver anomalies have verified the geochemical anomalies identified by Esso minerals B2 grid and have confirmed there is a north to northwest trending extension of the geochemical anomalies identified by Esso minerals B2 grid (Joseph Target). These anomalous areas are likely the expression of multiple mineralized horizons, which is common in VMS environments. The distribution of zinc values have also outlined a significantly broader zone than that defined by Esso's soil program.

Assay certificates for the soil sampling program completed on the Honeymoon East Property are included as Appendix 2. Large format figures LF-1 to LF-4 show sample locations and sample reference numbers as well as thematic data for lead, zinc and silver for the Main Grid. Large format figures LF-5 to LF-8 show sample locations and sample reference numbers as well as thematic data for lead, zinc and silver for the North Grid.

Item 13 - Statement of Costs

Vendetta Mining Corp.
Stage 1 Exploration Program - Honeymoon East Project
SOW No. 5191027
SOW No. 5191030

Summary of expenditures for the period ended February 15, 2012

	CDN
Geological Field Work and Subcontractors - Project survey control mapping and soil geochemical survey	$ 73,748.14
Field Equipment Rentals/Expenses	$ 19,425.23
Auxilliary Field Equipment Rentals	$ 7,581.86
Geochemical Analyses	$ 19,182.23
Preparation of Technical Report	*Pending*
Total	$ 119,937.46

Summary of Geological Field Work and Subcontractors
Honeymoon East Project

Equipment Preparation: HD 4x4 F250 modified for off road usage, motorhome modified for winter operation, 3 longtrack snowmobiles, survey control instruments, soil augers and sampling equipment, Project Review with client.

For the period ended May 31, 2011
Carl von Einsiedel, PGeo
April 18 - 20
3 days @ $900 $ 2,700.00

For the period ended February 15, 2012

Subtotal	$	19,182.23

ITEM 14: SAMPLING METHOD AND APPROACH

Two large soil geochemistry grids (referred to as the Main Grid (which covers and area of approximately 4 square kilometers) and the North grid (which covers and area of approximately 2 square kilometers)) comprising 1,537 samples were completed to test two priority target areas identified by the Craigmont airborne survey along strike of the Joseph Target and an area of approximately 9 square kilometers (covering the area referred to as Area 1 (SW Target) by Kerr Addison) was systematically prospected for gold bearing quartz veins. Several areas of interest were identified and a total of 97 rock samples were collected however analysis of the rock samples was deferred pending confirmation of exploration budgets for 2012.

Samples were taken approximately every 25m along lines spaced approximately every 100m. Samples were collected with conventional soil augers. In order to ensure that the soil samples were representative of the areas sampled multiple samples were collected at several stations from depths between 25cm and 100cm. All samples were secured in kraft paper sample bags, sealed and labeled with a unique sample numbers. The samples were then shipped to the ALS Chemex laboratory in North Vancouver. See Section 15 for details on analytical methods.

ITEM 15: SAMPLE PREPARATION, ANALYSIS AND SECURITY

The published technical reports which detail previous exploration work on the Honeymoon East Property indicate that standard QA and QC procedures were implemented by the laboratories that analyzed the samples and that the variability of all reported analyses are within acceptable industry standards.

The samples collected during the 2011 program were collected by independent geologists and field technicians. During the field program samples were stored in vehicles that were used in completion of the field work and were transported to the authors residence in Mission BC by the project geologist Mike Middleton. All samples were checked for sample identification numbers and overall quality by the author and were transported by the author to the ALS Chemex facility in North Vancouver.

All samples collected during the 2011 exploration program were submitted to ALS Chemex, of North Vancouver, for analysis. The -80 micrometer mesh sieved fraction of the soil samples was dissolved in an aqua regia solution (3:1 mixture of hydrochloric and nitric acid) and analyzed for a series of elements by ICP-AES. The Elements analyzed for and the detection limits are listed in Table 12.5.1. ALS Chemex employs standard QA and QC protocols on all sample analyses including inserting one blank, reference standard and duplicate analysis in every twenty samples analyzed. Based on the fact that the sampling program was designed to verify and follow up previous exploration work completed by Esso in 1983 no additional QA and QC procedures were implemented as part of the program. Sample Certificates from the 2011 exploration program are included in Appendix 2.

Table 12.5.1 Elements analyzed by ICP-AES and their lower detection limit

Element	LDL	Element	LDL	Element	LDL	Element	LDL	Element	LDL
Cd	0.5 ppm	K	0.01 %	Ni	1.0 ppm	Al	0.01 %	Zn	2 ppm
Co	1.0 ppm	La	10 ppm	P	10 ppm	Th	20 ppm	As	2 ppm
Cr	1.0 ppm	Mg	0.01 %	Pb	2.0 ppm	Ti	0.01 %	B	10 ppm
Cu	1.0 ppm	Ag	0.2 ppm	S	0.01 %	Tl	10 ppm	Ba	10 ppm
Fe	0.01 %	Mn	5.0 ppm	Sb	2 ppm	U	10 ppm	Be	0.5 ppm
Ga	10 ppm	Mo	1.0 ppm	Sc	1 ppm	V	1 ppm	Bi	2 ppm
Hg	1.0 ppm	Na	0.01%	Sr	1 ppm	W	10 ppm	Ca	0.01 %

ALS Vancouver is in compliance for the requirements of ISO 9001:2000 through February 12, 2011 (ALS Laboratory Group, 2009). ALS Vancouver is accredited through the Standards Council of Canada (SCC) for Metallic Ores and Products Mineral Analysis testing for several techniques including Fire Assay with an Atomic Absorption (AA) finish, Fire Assay with a gravimetric finish and ICP-AES using a four acid digestion. Standard QA and QC procedures were implemented by ALS Chemex including one blank, one reference standard and one duplicate analysis in every 20 samples submitted. In the author's opinion the variability of all reported analyses are within acceptable industry standards and the ALS Chemex data can be considered to be reliable.

ITEM 16: DATA VERIFICATION

The objectives of this program were to assess potential extensions of the soil geochemical sampling results reported by Esso for the Joseph Target area. The compilation work carried out by Vendetta Mining Corp. (formerly Azincourt Resources Inc.) involved geo-referencing the historic technical maps from Craigmont, Esso and Kerr Addison, digitizing the UTM locations of the reported soil and rock sample sites and entering the historic assay data into a GIS database. A total of 1,281 historic soil sample sites and data from 790 2010 soil samples were incorporated into the database for the Honeymoon East property.

The soil sample assay results from the 2011 program appear to be consistent between the results reported by Esso in 1983 and the results reported by ALS Chemex during the 2010 exploration program. It is the authors opinion that the Esso soil sampling data, the 2010 ALS Chemex data and the 2011 ALS Chemex data can be reasonably incorporated into the database for the Honeymoon East Property.

ITEM 17: ADJACENT PROPERTIES

The property (referred to as the Honeymoon East Property) is located in the Adams Plateau – Clearwater exploration area. Regional geological maps published by the BC Ministry of Energy and Mines (BCMEM) show that the claim area covers a north to northwest trending package of Paleozoic aged Fennell and Eagle Bay Formation volcanic and sedimentary rocks cut by a series of complex, north to northwest trending thrust faults. According to the BCMEM the Fennell Formation hosts various styles of mineralization including Cypress-type massive sulphide Cu (Zn) mineralization, Noranda/Kuroko-type massive sulphide Cu-Pb-Zn mineralization, and Ag-Pb-Zn+/-Au vein mineralization. The most significant prospects in the project area include the Harper Creek copper deposit located approximately 11 kilometers east of the Property, the Chu Chua copper deposit located approximately 15 kilometres to the south of the Property, the former producing Windpass Gold Mine located approximately 10 kilometres to the south of the Property, the Joseph Prospect located within the Honeymoon East Property and the Jake Gold Prospect located approximately 10 km to the northwest of the Property. The reader is cautioned that there is no assurance that mineralization similar to the Harper Creek copper deposit, the Chu Chua copper deposit, the Jake Prospect or the former Windpass Gold Mine will be identified within the boundaries of the Honeymoon East Property.

The Joseph Target, which consists of the soil geochemical anomaly located in the southeastern part of the Honeymoon East Property, appears to lie completely within the Honeymoon East Property. According to Marr (1984) the mineralized zone associated with this geochemical anomaly trends north and it is important to note that possible extensions of this mineralized zone are now covered by the claims held by Vendetta.

ITEM 18: MINERAL PROCESSING AND METALLURGICAL TESTING

There is no mineral processing or metallurgical testing data available from the Honeymoon East Property.

ITEM 19: MINERAL RESOURCE AND MINERAL RESERVE ESTIMATE

There is no mineral resource compliant with CIM Standards on Mineral Resources and Reserves (CIM, 2000) and therefore no NI 43-101 compliant resource for the Honeymoon East Property

ITEM 20: OTHER RELEVENT DATA AND INFORMATION

There is no other relevant data or information concerning the Honeymoon East Property.

ITEM 21: INTERPRETATION AND CONCLUSIONS

The geology of the area south of Clearwater is prospective for both Cypress and Kuroko type massive sulphide deposits and for structurally controlled, gold bearing vein deposits. Airborne geophysical surveys completed by Craigmont in 1978 identified multiple targets that warrant follow-up exploration. In 1983 Esso completed soil geochemical and ground geophysical surveys over some of the airborne survey targets and successfully identified several areas which exhibit elevated base and precious metal contents in soils. In 1984 Esso tested one of the soil geochemical anomalies with two short drill holes and intersected a previously unknown zone of lead – zinc – silver – barite mineralization. According to Marr (1984) the mineralized zone trends north and has an estimated true width of 8.0 meters. In 1988 Kerr Addison completed an extensive prospecting and sampling program designed to identify structurally controlled, gold bearing veins within the project area and successfully identified two areas of exposed mineralization. One of these areas (Area 1) is located within the Honeymoon East Property. Between January and March of 2010 Vendetta compiled all available technical data for the former Craigmont Mines, Esso Minerals and Kerr Addison Properties and completed a detailed soil geochemical survey consisting of 790 samples in the area of the Joseph Prospect. The assay data from the 2010 samples confirmed the historic Esso technical data and shows that the soil geochemical anomaly associated with the Joseph Prospect is significantly larger than was estimated by Esso.

Between March and November of 2011 Vendetta completed an extensive program of soil and rock sampling at a total cost of $118,932.00 as outlined in SOW No.s 5191027 and 5191030. Two large soil geochemistry grids (referred to as the Main Grid and the North grid) comprising 1,537 samples were completed to test two priority target areas identified by the Craigmont airborne survey along strike of the Joseph Target and an area of approximately 9 square kilometers (covering the area referred to as Area 1 (SW Target) by Kerr Addison) was systematically prospected for gold bearing quartz veins. Several areas of interest were identified and a total of 97 rock samples were collected however analysis of the rock samples was deferred pending confirmation of exploration budgets for 2012.

The Main Grid geochemical survey successfully identified a north northwest trending continuation of the soil geochemical anomaly associated with the Joseph Prospect. Samples were collected from depths of between 0.2 and 0.5 meters using augers and were placed in standard kraft soil sample bags and delivered to the ALS Chemex assay facility in North Vancouver. Samples were dried, sieved to minus 80 mesh and analyzed by ICP 41 for a suite of 35 trace and path finder elements. To ensure adequate QA and QC ALS Chemex includes 5% industry standard and blank samples into the sample stream and the reported results were within industry standards. A total of 27 strongly anomalous zinc results and 12 strongly anomalous lead results were reported. Peak values within the anomalies are subdued relative to the soil geochemistry results reported for Joseph Prospect however the anomalous samples define a distinctive north trending target that extends for approximately 1,200 meters to the north northwest of the area surveyed by Esso. The results also indicate that the new target area may be up to four hundred meters in width which is similar to the overall width of the geochemical anomaly associated with the Joseph Prospect. Assay values of up to 787 ppm zinc and 354 ppm lead were recorded in the assay reports provided by ALS Chemex.

ITEM 22: RECOMMENDATIONS

Based on the results of the work completed in 2011 it is recommended that Vendetta carry out additional fill-in surveys to delineate the overall extent of Joseph Prospect. Overburden conditions with the target area are variable and a combination of sampling methods will need to be utilized to ensure that the limits of the target area can be accurately defined. Additional auger sampling should be carried out within the areas surveyed in 2010 and in 2011 and should be designed to evaluate the relationship between surface values and depth to bedrock. Although the lead and zinc values reported for the extension of the Joseph Prospect are lower than those reported by Esso in the area that was drill tested overburden appears to be thicker and may simply be muting the geochemical response of bedrock mineralization. In the event that in fill and auger sampling confirms that the geochemical anomalies are associated with areas of overburden covered mineralization ground geophysical surveys and follow up drill testing would be warranted.

No significant results were reported from the North grid and assays are pending for the rock samples collected from Area 1 (also referred to as the SW Target Area).

ITEM 24: CERTIFICATE OF QUALIFIED PERSON, CARL A. VON EINSIEDEL

I, Carl A. von Einsiedel, PGeo. hereby certify that:

1) I am an independent consulting geologist with a business address at #3206-610 Granville St., Vancouver, British Columbia V6C-3T3.

2) I am a graduate of Carleton University, Ottawa, Ontario (1989) with a B.Sc. in Geology.

3) I am a registered Professional Geologist in good standing with the Association of Professional Engineers and Geoscientists of British Columbia (APEGBC – License no. 21474).

4) I have worked as a geologist for a total of 26 years since graduation from university. I have work experience in most parts of Canada, as well as the United States and Mexico. I have VMS deposit exploration experience in British Columbia.

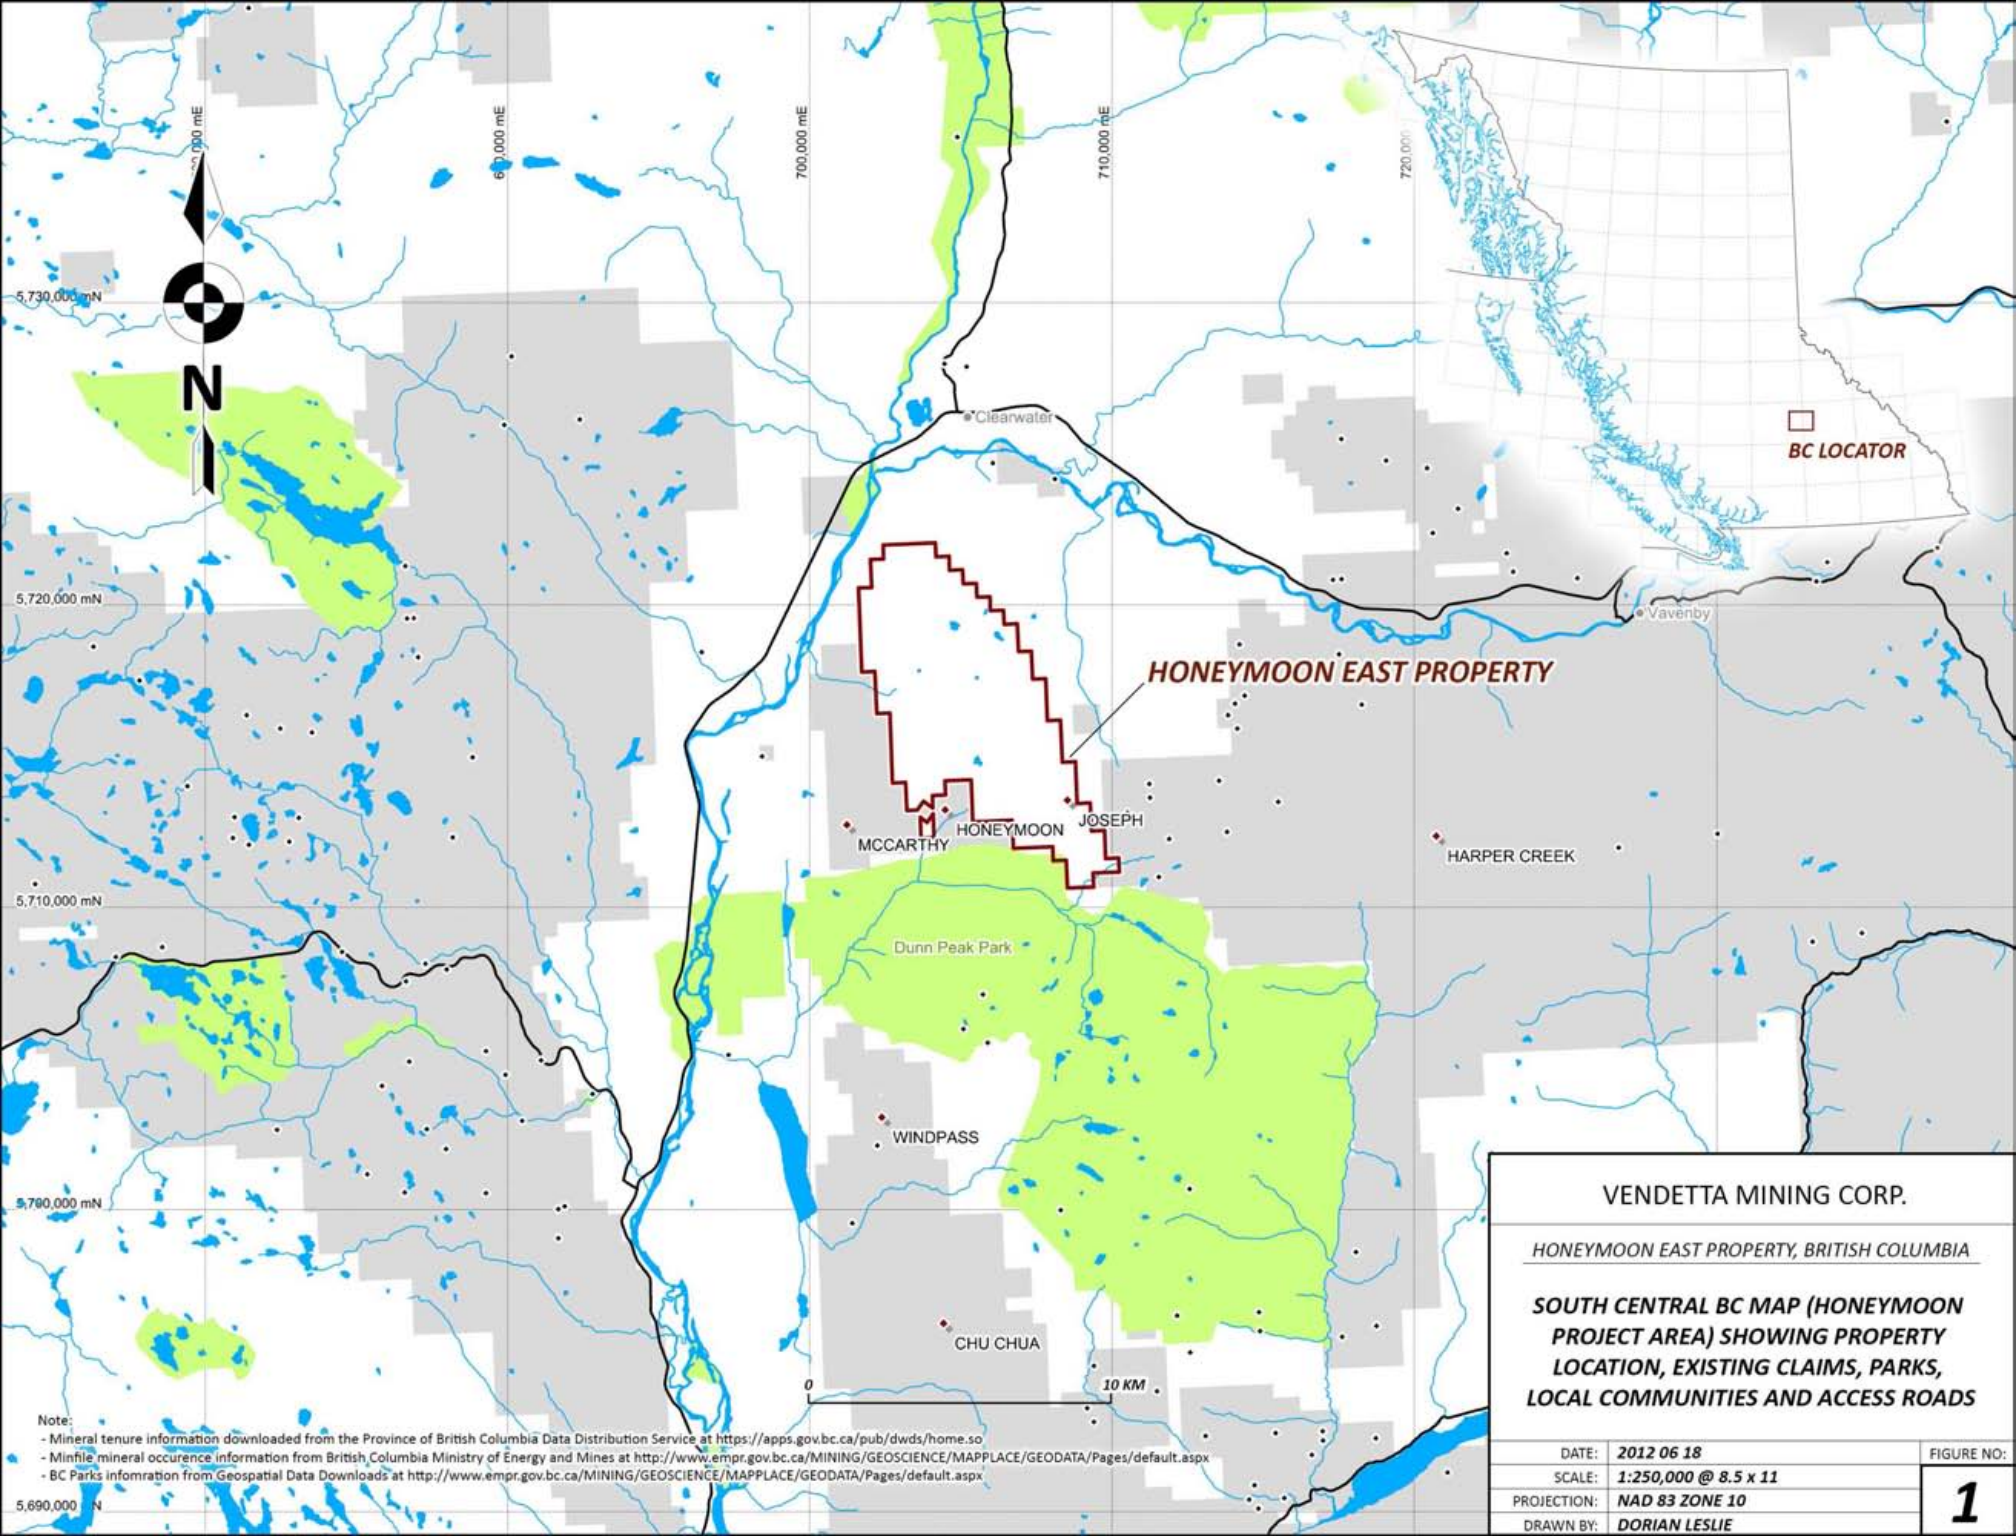

5) I have read the definition of "qualified person" set out in National Instrument 43-101 ("NI 43-101") and certify that by reason of my education, affiliation with a professional association (as defined in NI 43-101) and past relevant work experience, I fulfill the requirement to be a "qualified person" for the purposes of NI 43-101.

6) I am responsible for all sections of the technical report titled "TECHNICAL ASSESSMENT REPORT – GEOLOGICAL AND GEOCHEMICAL SURVEYS - HONEYMOON EAST PROPERTY" prepared for Vendetta Mining Corp. (formerly Azincourt Resources Inc.) dated June 29, 2012 (the "Technical Report") relating to the Honeymoon East Property.

7) As of the date of this certificate, to the best of my knowledge, information and belief, the Technical Report contains all scientific and technical information that is required to be disclosed to make the Technical Report not misleading.

Carl von Einsiedel, P.Geo.

Dated at Vancouver, B.C. this 29th day of June, 2012

CERTIFICATE VA11072401

Project:

P.O. No.:

This report is for 248 Soil samples submitted to our lab in Vancouver, BC, Canada on 29-APR-2011.

The following have access to data associated with this certificate:

CARL VON EINSIEDEL		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: **RAM EXPLORATION LTD.**

CERTIFICATE VA11073776

Project:

P.O. No.:

This report is for 185 Soil samples submitted to our lab in Vancouver, BC, Canada on 29-APR-2011.

The following have access to data associated with this certificate:

CARL VON EINSIEDEL		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: **RAM EXPLORATION LTD.**

CERTIFICATE VA11070697

Project:

P.O. No.:

This report is for 200 Soil samples submitted to our lab in Vancouver, BC, Canada on 29-APR-2011.

The following have access to data associated with this certificate:

CARL VON EINSIEDEL		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: **RAM EXPLORATION LTD.**

CERTIFICATE VA11070698

Project:

P.O. No.:

This report is for 200 Soil samples submitted to our lab in Vancouver, BC, Canada on 29-APR-2011.

The following have access to data associated with this certificate:

CARL VON EINSIEDEL		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

CERTIFICATE VA11070699

Project:

P.O. No.:

This report is for 199 Soil samples submitted to our lab in Vancouver, BC, Canada on 29-APR-2011.

The following have access to data associated with this certificate:

CARL VON EINSIEDEL		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: **RAM EXPLORATION LTD.**
ATTN: CARL VON EINSIEDEL

CERTIFICATE VA12014638

Project: Honeymoon East

P.O. No.:

This report is for 129 Soil samples submitted to our lab in Vancouver, BC, Canada on 26-JAN-2012.

The following have access to data associated with this certificate:

CARL VON EINSIEDEL		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

APPENDIX 3: AREA 1 (SOUTHWEST TARGET) ROCK SAMPLE LOCATIONS AND PRELIMINARY DESCRIPTIONS

ID	East	North	GPS_Elev	sulfides	alteration	Matrix	Hardeness	Host Rock	color	remarks	Sample Type
4051	703065	5713447	1454 m	none visible			>5	quartz vein	white		Grab
4052				pyrite	hm-lim	aphanitic		metasedimentary - muscovite schist			Grab
4053	704293	5715144	1690 m	pyrite	hm-lim	aphanitic		metasedimentary - muscovite schist			Grab
4054	704477	5715159	1687 m	none visble	hm-lim-silicified	aphanitic		metasedimentary	brown- green-grey		Grab
4055	704758	5715228	1705 m	none visible			>5	quartz vein	white		Grab
4056	704794	5715192	1697 m	none visble	chlorite - carbonate	aphanitic	<5	metavolcanic - chlorite greenston	green-bluw -white	etched carl	Grab
4057	703749	5714301	1593 m	none visble	chlorite	aphanitic	<5	volcanic - greenstone	dark green	quartz vein	Grab
4058	703742	5714316	1593 m	none visible			>5	quartz vein			Grab
4059				pyrite	silicification hm-lim			metavolcanic		strongly sili	Grab
4060	703686	5714381	1586 m	none visible				quartz vein	white		Grab
4061	703810	5714228	1577 m	none visible			>5	quartz vein	white		Grab
4062	703833	5714185	1570 m	none visible	chlorite - silica flooding	aphanitic		metavolcanic - chlorite greenstone	green-blue	quartz floo	Grab
4063	703244	5713738	1453 m	pyrite	chlorite	aphanitic	<5	metavolcanic - chlorite greenstone	green-blue	quartz vein	Grab
4064	703284	5713582	1484 m	galena - chalcopyrite - pyrite			>5	quartz vein	white		Grab
4065	704189	5714708	1682 m	fine grained pyrite	hm-lim	apahanitic		metasedimentary - muscovite schist	brown	silicified	Grab
4066				none visble	chlorite-sericite-silicification	aphanitic		metasedimentary - schist	brown - black	silica floodi	Grab
4067	704013	5714585	1653 m	none visble			>5	quartz vein	white		Grab
4068	703794	5714653	1658 m	pyrite	hm-lim-silicified	aphanitic		metasedimentary	brown- green-grey		Grab
4068	703794	5714653	1658 m	pyrite	Hem-Lim	aphanitic	<5	volcanic	rusty brown		Grab
4069	703783	5714651	1653 m	pyrite	chlorite	aphanitic		metasedimentary	grey	disseminat	Grab
4070	703783	5714663	1653 m	pyrite	chlorite - silcification	aphanitic		metavolcanic - chlorite greenston	green-blue	large pyrite	Grab
4071	703806	5714607	1631 m	pyrite	chlorite - silicified	aphanitic		metavolcanic - chlorite greenstone	green-blue-grey		Grab
4072	703810	5714596	1626 m	none visble		crystaline		metasedimentary		silicified	Grab
4073	703732	5714341	1590 m	none visbile	chlorite-silicified	apahanitic	<5	metavolcanic - chlorite greenstone	blue-green		Grab
4074	703051	5713319	1451 m	none visble			>5	quartz vein	white		Grab
4075				none visble			>5	quartz vein	white		Grab
4076	703049	5713283	1460 m	none visible			>5	quartz vein	white		Grab
4077	703037	5713189	1486 m	none visible			>5	quartz vein	white		Grab
4078	703040	5713164	1484 m	none visible			>5	quartz vein	white		Grab
4079	703038	5713158	1489 m	pyrite			>5	quartz vein	white		Grab
4080	703039	5713141	1493 m	pyrite			>5	quartz vein	white		Grab
4081	703016	5712926	1505 m	none visible	chlorite - silica flooding	aphanitic		metavolcanic - chlorite greenstone	green -white	quartz vein	Grab
4082	702995	5712722	1508 m	none visible			>5	quartz vein	white		Grab
4083	702986	5712691	1512 m	none visble	chloritic	aphanitic	<5	volcanic - greenstone	blue-green	quartz lens	Grab
4084				pyrite	chlorite - silcification	aphanitic		metavolcanic - chlorite greenstone	green-blue	large pyrite	Grab
4085	702975	5712600	1507 m	none visible			>5	quartz vein	white		Grab
4086	703060	5712249	1527 m	none visble	carbonate	apahanitic		metavolcanic - muscovite schist	black - grey		Grab
4087	703461	5712567	1585 m	pyrite	chlorite -hm-lim	aphanitic		metavolcanic - chlorite greenstone	greeen-blue	quartz vein	Grab
4088	703490	5712575	1588 m	pyrite			>5	quartz vein	white		Grab
4089	703529	5712623	1593 m	none visible	chlorite - silicification	aphanitic		metavolcanic - chlorite greenstone	green-blue	quartz floo	Grab
4090	703668	5712810	1601 m	none visble	silica flooding			metavolcanic - muscovite schist		quartz vein	Grab
4091	703763	5712955	1618 m	pyrite	chlorite - silcification	aphanitic		metavolcanic - chlorite greenstone	green-blue	large pyrite	Grab
4092	703882	5712957	1612 m	pyrite			>5	quartz vein	white		Grab
4093	703881	5712935	1616 m	none visible			>5	quartz vein	white		Grab
4094	703887	5712926	1614 m	pyrite				quartz vein	white		Grab
4095				chalcopyrite - mal	mineralized silica flooding		>5	quartz vein	white		Grab
4096				none visible		aphanitic		metavolcanic - chlorite greenstone	green	quartz vein	Grab
4097				pyrite	hm-lim	aphanitic	<5	metavolcanic - muscovite schist	brown	strong silici	Grab
4098	702488	5720676	849 m	none visible	chlorite - silicification	apahanitic		metavolcanic - muscovite schist		quartz floo	Grab
4099	701930	5720172	843 m	none visble	chlorite	aphanitic	<5	metavolcanic - muscovite schist	black		Grab
4100	701910	5720145	841 m	none visble	silcified	fine grained - laminated		metasedimentry	black white	silicifieed	Grab
4101	701473	5716399	957 m	none visble	hm-lim strong - silicificiation	coarse grained		pyroclastic (?)	brown-orange		Grab

4102	701475	5716218	964 m	none visible	hm-lim-silica			metasedimentary - schist		silica floodi	Grab	
4103				none visble	chlorite minor silicification	aphanitic	<5	metavolcanic - chlorite greenstone	light green-blue grey		Grab	
4103				pyrite	hm-lim-chl	aphanit		metavolcanic - chlorite greenstone	green-blue-grey	strong pyri	Grab	
4104	707654	5718881	1385 m	pyrite - galena	silicification hm-lim			metasedimentary	brown	silicified	Grab	
4105	703367	5715347	1464 m	none visible	chlorite-silicified	apahanitic	<5	metavolcanic - chlorite greenstone	blue-green		Grab	
4106	703416	5715388	1456 m	none visble			>5	quartz vein	white		Grab	
4107				pyrite	chlrotie -silicified	aphanitic		metavolcanic - chlorite greenstone	green-blue	strongly sili	Grab	
4108	701506	5712785	968 m	none visible	chlorite	aphanitic		metavolcanic - chlorite greenstone	green-blue	quartz-veir	Grab	
4109	701527	5713005	968 m	none visible	chlorit	aphanitic		metavolcanic - chlorite greenstone	greeen-blue		Grab	
4110	701538	5713088	971 m	pyrite	chlorite	aphanitic		metavolcanic - chlorite greenstone	green-0blue	white qv w	Grab	
4111	701533	5713127	968 m	pyrite	chlorite - silicified	aphanitic		metavolcanic - chlorite greenstone	green-blue-grey		Grab	
4112	701439	5713412	970 m	none visbile	chlorite-silicified	apahanitic	<5	metavolcanic - chlorite greenstone	blue-green		Grab	
4113	701440	5713418	964 m	none visible	chlorite	apahanitic	<5	metavolcanic - chlorite greenstone	blue-green		Grab	
4114	701442	5713407	965 m	none visible	chlorit	aphanitic		metavolcanic - chlorite greenstone	greeen-blue		Grab	
4115	701445	5713394	962 m	none visible	chlorite	apahanitic	<5	metavolcanic - chlorite greenstone	blue-green		Grab	
4116	701441	5713377	962 m	none visble	weakly silicified	crystaline		metavolcanic - chlorite greenstone	green	quartz lens	Grab	
4117				pyrite	chlorite	aphanitic	<5	metavolcanic - chlorite greenstone	green-blue		Grab	
4119				none visble	chlorite	aphanitic	<5	metavolcanic - chlorite greenstone	green-blue	quartz lens	Grab	
4120	702056	5712934	1157 m	none visbile	chlorite-silicified	apahanitic	<5	metavolcanic - chlorite greenstone	blue-green		Grab	
4121	702040	5712906	1151 m	minor sulfides	chlorite-calcite	coarse calcite - aphanitic matrix	<5	metavolcanic - chlorite greenstone	green-blue	calcite lens	Grab	
4122	702040	5712927	1154 m	none vivible	chlorite silicified			metavolcanic - chlorite greenstone	green-blue	weakly silic	Grab	
4123	701384	5712936	941 m	none visbile	chlorite-silicified	apahanitic	<5	metavolcanic - chlorite greenstone	blue-green		Grab	
4124	701344	5712927	931 m	none visble	chlorit	aphanitic	<5	metavolcanic - chlorite greenstone	greeen-blue		Grab	
4125	701415	5712734	942 m	none visible	chlorite	crystaline-aphanitic	<5	metavolcanic	green-blue		Grab	
4126	701416	5712733	942 m	none visble	chlorite- silica	aphanitic	<5	metavolcanic - chlorite greenstone	green-blue-grey		Grab	
4127	701406	5712367	955 m	pyrite	chlorite - silicified	crystaline	<5	metavolcanic	green-blue	silicified	Grab	
4128	701415	5714150	987 m	pyrite	hm-lim	aphanitic	>5	metavolcanic		silicified wi	Grab	
4129	701433	5714168	989 m	none visble	chlorite	1-3mm feldspar crystals in aphai	<5	volcanic	dark green	calcite vein	Grab	
4130	701627	5713503	1033 m	none visble	carbonate		<5		white	calcite vein	Grab	
4132	701388	5713415	977 m	none visble	chloritic	aphanitic	<5	volcanic - greenstone	blue-green	quartz lens	Grab	
4132				none visble	chlorit	aphanitic	<5	metavolcanic - chlorite greenstone	greeen-blue		Grab	
4133				none visbile	chlorite-silicified	apahanitic	<5	metavolcanic - chlorite greenstone	blue-green		Grab	
4134	701396	5712627	954 m	none visble	chlorite- silica	aphanitic	<5	metavolcanic - chlorite greenstone	green-blue-grey		Grab	
4135	701402	5712637	955 m	none visible	chlorite-silicification	crystalline	<5	metavolcanic		silicified	Grab	
4136	701531	5713162	957 m	pyrite	chlorite	aphanitic	<5	metavolcanic - chlorite greenstone	green-blue	small amou	Grab	
4136				pyrite	chllorite	aphanitic	<5	metavolcanic - chlorite greenstone	green-blue		Grab	
4137	701703	5713862	1084 m	none visble	chlorite	aphanitic	<5	metavolcanic - chlorite greenstone	blue-green	quartz vein	Grab	
4138				none visible	chlorite	aphanitic	<5	metavolcanic - chlorite greenstone	green-blue	quartz-veir	Grab	
4139				pyrite	chlorite	aphanitic	<5	metavolcanic - chlorite greenstone	green-blue	quartz-veir	Grab	
4140				none visble	chlorite	aphanitic	<5	metavolcanic - chlorite greenstone	green-blue		Grab	
4141				none visible		aphanitic	<5	metavolcanic - chlorite greenstone	green	quartz vein	Grab	
4142	701700	5713853	1082 m	none visble	chlorite - hm-lim	crystaline	<5	metavolcanic - chlorite greenstone	green	quartz vein	Grab	
4143				none visble	chlorite	crystaline	<5	metavolcanic - chlorite greenstone	greeen-blue		Grab	
4144	701701	5713825	1079 m	none visible	chorite - quartz flooding	aphanitic	<5	metavolcanic - chlorite greenstone	green-blue-grey	quartz vein	Grab	
4145				none visible	chlorite	aphanitic	<5	metavolcanic - chlorite greenstone	green-blue	quartz-veir	Grab	
4146				galena and pyrite	chorite - quartz flooding	aphanitic host	<5	metavolcanic - chlorite greenstone	green-blue	quartz floo	Grab
