Item 1: INTRODUCTION

Almo Capital Corp. acquired the "Nickel - Cobalt - Magnesium - Gold Property recently for cash on March 23, 2007. The "Nickel - Cobalt - Magnesium - Gold Property" was acquired for a total of \$5000, of which \$100 has been already paid, and \$4,900 is yet to be paid in due time.

Almo Capital Corp. along with Silcum Resources Ltd. and Precious metals Corp. of Vancouver, B.C jointly owns a couple of contiguous mineral claims located approximately 24 kilometers due east of the town of Hope, British Columbia known as Serp#5, Serp#9 and Serp#6. These claims straddle along geological structure known as the Coquihalla Serpentine Gold Belt. Geological Exploration (rock and soil sampling) were carried out over the claims on September 16 and September 22, 2010.

Hillsbar Gold Inc. recognized the potential along the belt and staked an area reported to have both gold and platinum showings. Placer gold was reported in the Serpentine Lake area and the small streams leading from the lake. Bedrock geology in the area is favorable for hosting lode or vein type gold mineralization. Similar geological environment can be found at the old Emancipation gold mine, which is located several kilometers to the northwest. Platinum placer is also reported along Sowaqua Creek. As well, the old St. Patrick workings along Sowaqua Creek are reported as a gold-platinum occurrence. It has been suggested that perhaps the source of the platinum may have originated from the serpentized ultramafic rocks that form the Coquihalla serpentine belt. The west and east Hozameen fault systems are also potential targets such as the St. Patrick workings, which occur along the west Hozameen fault system.

Almo Capital Corp. intends to conduct systematic geological exploration program over the Serp#5, Serp#9 and Serp#6 mineral claims, with a view to find the source of gold, nickel, cobalt, magnesium, platinum etc. in the area.

Item 2: LOCATION AND ACCESS

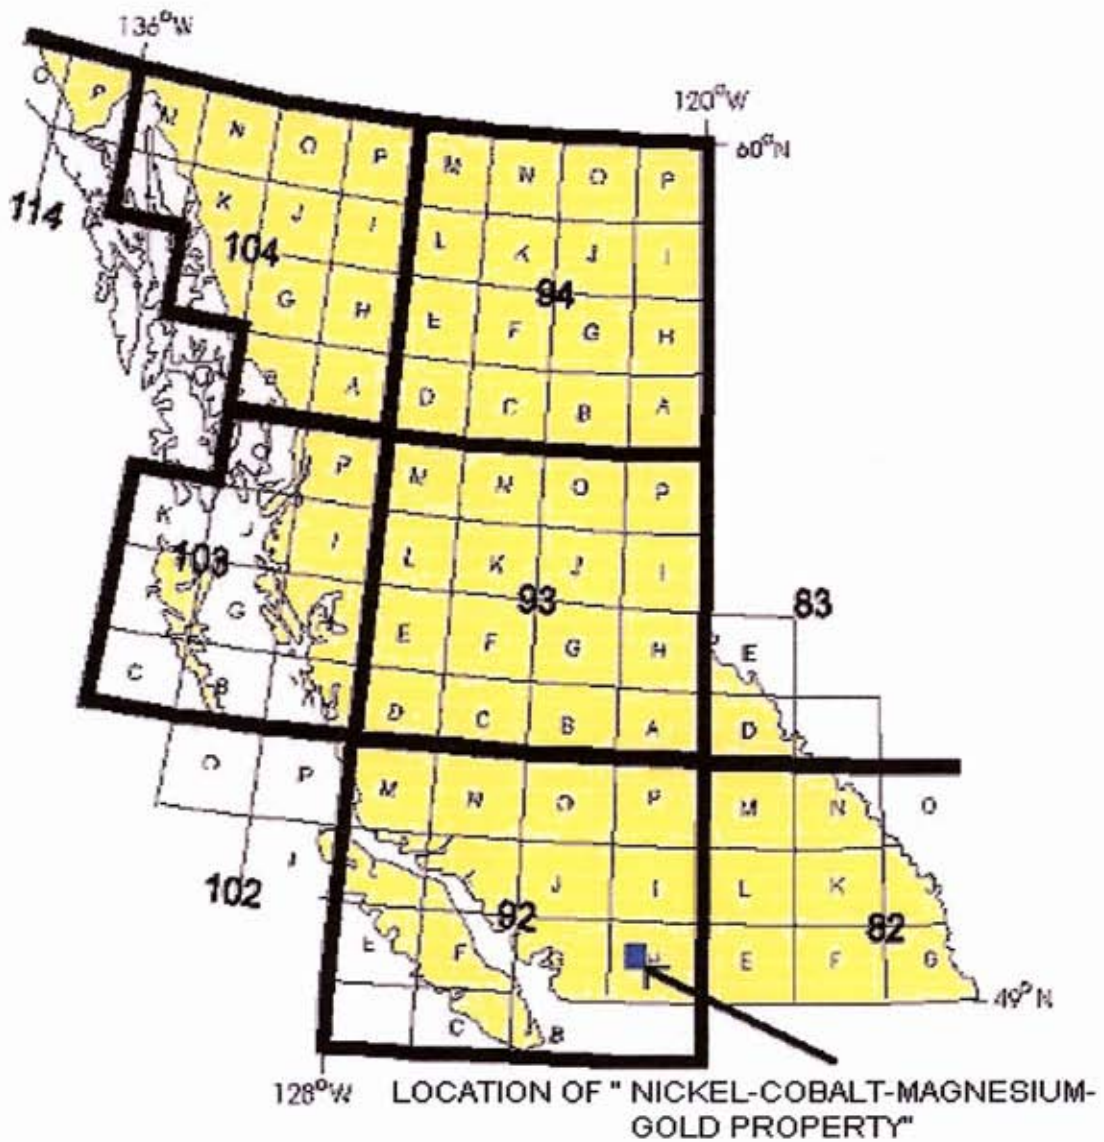

The Serp#5, Serp#9 and Serp#6 mineral claim (south group) is located approximately 24 kilometers due east of the town of Hope, British Columbia. The nickel-cobalt-magnesium-gold property is intersected by a large northwesterly flowing stream called Sowaqua Creek, a tributary of the Coquihalla River. Access to the property can easily be gained from Hope via the Coquihalla Highway Number5. The south end of the south property may be reached by taking Sowaqua creek Exit 192 and by traveling south on the Sowaqua Creek logging road until the turn off at past 16 kilometers.

In order to follow the logging road a 4-wheel drive vehicle is recommended. The boundary of the property can easily be reached within an easy one and a half-hour drive from Hope.

FIGURE 1

LOCATION MAP

Below is a map outlining all NTS map areas that fall within the borders of British Columbia specifically showing the location of "Nickel - Cobalt - Magnesium - Gold-Property" in New Westminster mining Division of British Columbia.

Item 3: MINERAL CLAIMS

The Nickel-Cobalt-Magnesium-Gold Property covers two claims Groups, North Group, and South Group (Fig. 2). The South Group consist of Serp#5and Serp#6 mineral claims, which encompass approximately 778 hectares. The Serp#5and Serp#6 mineral claims lies under the administrative area of the New Westminster Mining Division, British Columbia on N.T.S. Grid 92H/6(E). The co-ordinates are located near the central part of the property at Latitude: 49°25' N and Longitude 121°13'W. The Serp #5and Serp #6 mineral claims are jointly held by Almo Capital Corp., Silcum Resources Ltd. and Precious metals Corp. of Vancouver, British Columbia.

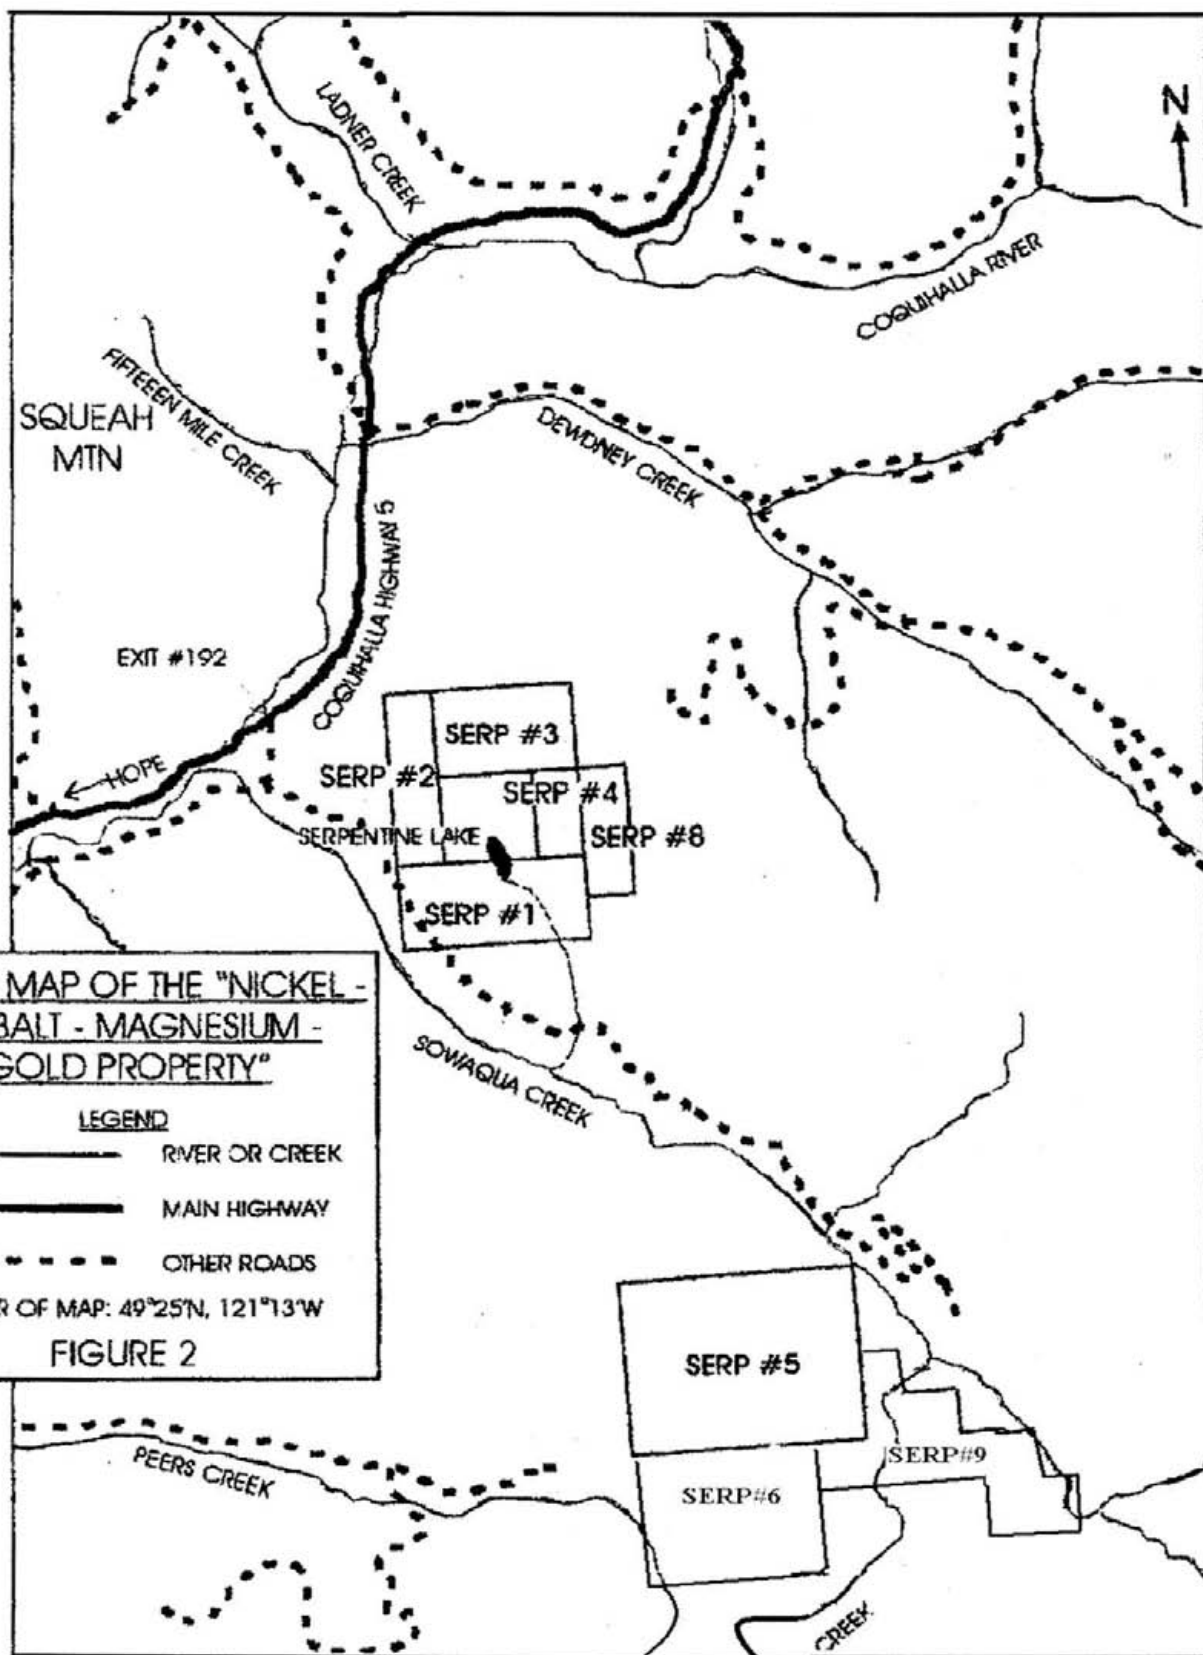

According to the terms of the agreement, Almo Capital Corp. acquired an equity position of 52% in the "Nickel - Cobalt - Magnesium - Gold Property". There is a 3% NSR held by people who are in a cooperative relationship with the company. The remaining 48% of equity is also jointly held by Silcum Resources Ltd. and Precious metals Corp. who are in a cooperative relationship with Almo Capital Corp. and their interest is undivided.

The following table summarizes the pertinent claim information:

Table 1: LIST OF MINERAL CLAIMS

Claim Name	Tenure Number	Units	Expiry Date
Serp# 5	677544	1	December 01, 2013
Serp# 6	677583	1	December 01, 2013
Serp# 9	677603	1	December 01, 2013

Item 4: GEOLOGICAL SETTING

Item 4.1: REGIONAL GEOLOGY

The regional geological setting is identified by a prominent northwest-southeast trending structure known as the Coquihalla Serpentine Belt. The belt, which is represented by a semi-continuous band of serpentine rock, is fault bounded by the East and West Hozameen faults. This geological break can be traced for at least 100 kilometers in southwestern British Columbia and it extends into northern Washington State, USA.

The belt of serpentine separates two distinct crustal units. The East Hozameen fault is in contact with an andesitic volcanic greenstone unit, the Spider Peak Formation of Early Triassic age. The greenstone forms the basement for the unconformable, overlying Jurassic to Cretaceous turbidities and successor basin deposits of the Pasayten Trough. The West Hozameen fault is in contact with the Permian to Jurassic age Hozameen Group, which consists of a dismembered ophiolite succession represented by the ultramafic rocks of the Petch Creek serpentine belt in turn, is overlain by a thick unit of greenstone and chert.

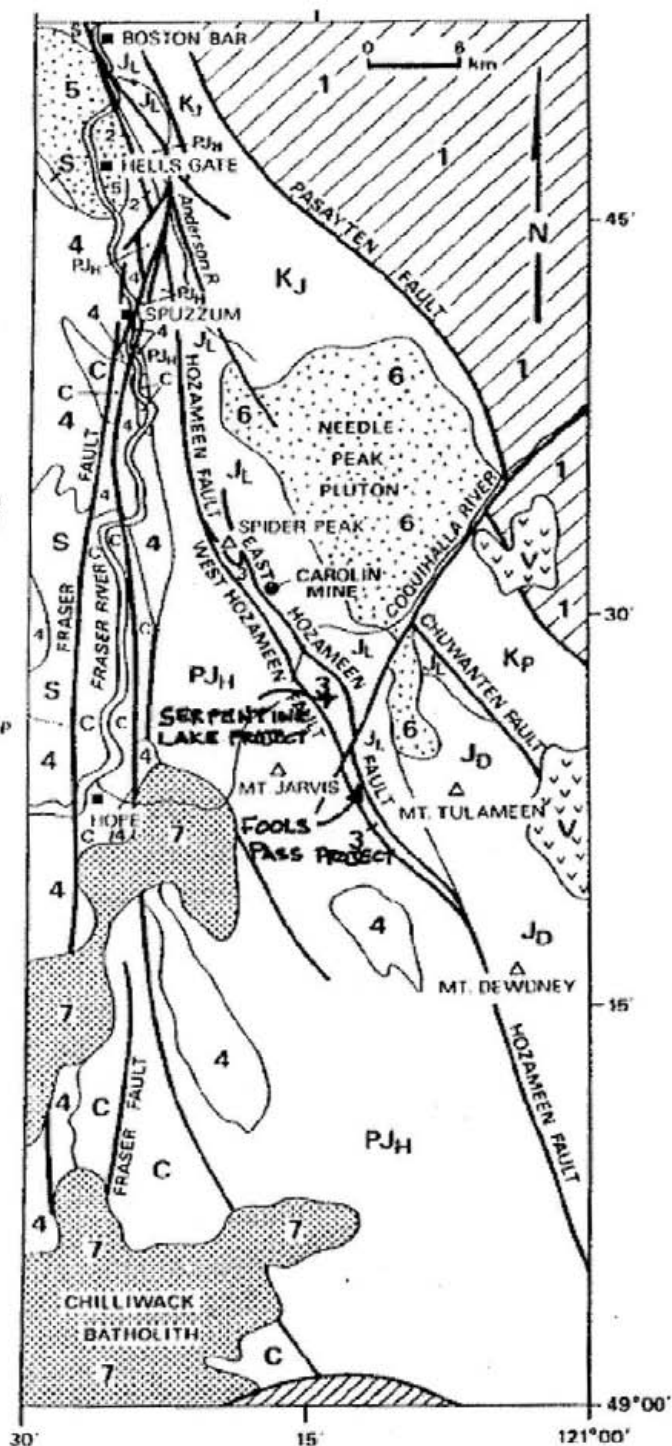

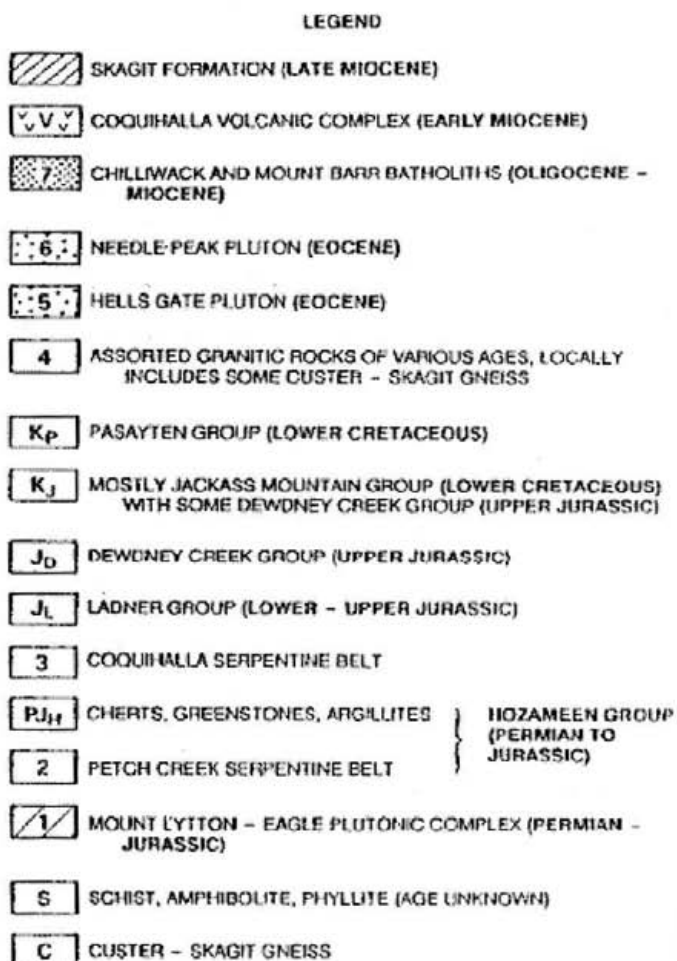

The oldest sedimentary rocks in the Pasayten Trough, the Ladner Group, contain a locally developed basal unit (e.g. conglomerate, greywacke, siltstone, and slate) that hosts the Idaho zone gold deposit (former Caroline Mines) along with a number of other former small gold producers. A series of the gold occurrences and past-producing camps occur along and immediately east of the East Hozameen fault and hosted in the Ladner sediments, which is also known as the 'Coquihalla Gold Belt'.

Some gold mineralization is hosted in greenstone volcanic such as the old Emancipation mine as well as in other rock types including a suite of small sodic felsic porphyry intrusions at Siwash Creek forks old ward mine.

There is potential for additional discoveries of precious metal mineralization along the Coquihalla gold belt. For example, the reported placer gold near Serpentine Lake may be locally derived possibly from greenstone volcanic that occur in the area, similar to the geological setting as the former Emancipation mine. As well as the reported occurrence of placer platinum in Sowaqua Creek and the reported gold-platinum workings of the old St. Patrick, this raises intriguing possibilities that the Coquihalla serpentine belt could be an exploration target for platinum-group elements.

REGIONAL GEOLOGY MAP

FIGURE 3

Item 4.2 PROPERTY GEOLOGY

There are 3 main rock types that underlie the Serp#5, Serp#6 and Serp#9 mineral claims, which includes chert and cherty argillites of the Hozameen Group, serpentine, greenstone volcanics of the Spider Peak formation and, siltstone, argillite and slate of the Ladner Group formation.

The serpentine is the prominent rock type underlying approximately 1/4 of the claims and forms a continuous belt striking northwest southeast. It is well exposed in a plateau-like area on Serp#5 mineral claims where it is at least 1.5 kilometers wide. The area forms the summit of the claims at an elevation of at least thousand meters. Glaciations have produced poor drainage with marshes and ponds as well as, ridges of polished-striated bedrock.

Serpentine Rock is exposed to the northeast and in contact with the volcanic is a northwest striking, steeply dipping siltstone. The serpentine and greenstone volcanics is in fault contact marking the East Hozameen fault. At the North portion of the South Property, the West Hozameen fault can be observed and which defines the contact between serpentine and cherty argillites of the Hozameen group.

Minor disseminated pyrite and Pyrrhotite mineralization was observed with the volcanics. The serpentine is usually massive with no crystal structure and is commonly associated with disseminated magnetite.

Structurally, all rock units observed in this area strike northwest and are steeply dipping. Foliation is also concordant with northwest southeast trending faults. Several ancillary faults cut the serpentine and greenstone, paralleling the east and west Hozameen fault systems.

Item 5: FIELD PROCEDURES

Author along with two geologists and a driver carried out the soil and rock sampling survey on (September 20, 26, 27 and September 28, 2011). The author drove from Hope via Coquihalla Highway Number 5. The south end of the "Nickel-Cobalt-Magnesium-Gold Property" South Group may be reached by taking Sowaqua creek Exit 192 and by traveling south on the Sowaqua Creek logging road until the turn off at past 16 kilometers. In order to follow the logging road a 4-wheel drive vehicle was used. The property can easily be reached within an easy one and a half-hour drive from Hope. 1:20,000 topographic maps, obtained from the local forestry services were used for navigation. Hip chain, brunton compass, and GPS were used in the sampling surveys.

Much of the area was surveyed; Soil samples were collected randomly along the logging road from the upper "B" (rusty) soil horizon where possible (on geological considerations). Hand tools were used; the samples were placed in standard craft paper bags, and marked with UTM co-ordinates. At the close of the project, the samples were boxed and shipped to Acme Labs Ltd., of Vancouver, B.C., where analysis for Gold, Nickel, Cobalt, Magnesium, Chromium and Platinum and other elements were conducted and forms a part of this report.

Item 6 Sampling and Geo-chemical analysis

Details of samples collected on September 20, 26, 27 and September 28, 2011
(Soil and Rock samples)

Samples collected by: M.Sc Geologists Amit Kumar and Uma Shankar.

Table: 2;Soil Sample

SAMPLE CODE	SAMPLE ID	UTM LOCATION	COLOUR	VISIBLE PROPERTIES
2011-S1	1576751	0629109E 5472912N	Brown	Sample collected from horizon B, consists of appx.70% clay, sub-angular to sub rounded clasts. Humus content is high
2011-S2	1576752	0629246E 5472473N	Dark brown	Fine-grained clay and silt, sub- angular to angular clasts present. Humus content is moderate. Clay contains organic rich residue
2011-S3	1576753	0629212E 5472445N	Light grey brown	Clay silt contains organic rich residue, angular to sub angular, root hairs present, moderately humus and medium grained.
2011-S4	1576754	0629340E 5472487N	Dark brown	Clay silt contains organic rich residue, angular to sub angular, root hairs present, moderately humus and medium grained.
2011-S5	1576755	0629320E	Dark brown	Clay silt contains organic rich residue.

		5472519N		angular to sub angular, root hairs present, moderately humus and medium grained.
2011-S6	1576756	0629482E 5472285N	Dark brown	Silty clay contains organic rich residue, Sub- angular to angular clasts are present. Root hairs are also present. Highly humic and medium grained.
2011-S7	1576757	0629482E 5472235N	Light grayish	Clay silt contains organic rich residue, angular to sub angular, root hairs present, moderately humus and medium grained.
2011-S8	1576758	0630034E 5471895N	Light brown	Silty clay contains organic rich residue, Sub- angular to angular clasts are present. Root hairs are also present. Low humic and medium grained.
2011-S9	1576759	0630078E 5471841N	Light grey brown	Clay silt contains organic rich residue, angular to sub angular, root hairs present, moderately humus and medium grained.
2011-S10	1576760	0630115E 5471809N	Dark Reddish Brown	Sample collected from horizon B, consists of appx.70% clay, sub-angular to sub rounded clasts. Humus content is low
2011-S11	1576761	0630088E 5471831N	Dark Reddish Brown	Sample collected from horizon B, consists of appx.70% clay, sub-angular to sub rounded clasts. Humus content is low
2011-S12	1576762	0630070E 5471853N	Dark brown	Silty clay contains organic rich residue, Sub- angular to angular clasts are present. Root hairs are also present. Highly humic and medium grained.
2011-S13	1576763	0630112E 5471816N	Brown	Sample collected from horizon B, consists of appx.70% clay, sub-angular to sub rounded clasts. Humus content is high
2011-S14	1576764	0630179E 5471772N	Dark Reddish Brown	Sample collected from horizon B, consists of appx.70% clay, sub-angular to sub rounded elasts. Humus content is low
2011-S15	1576765	0630229E 5471718N	Dark brown	Silty clay contains organic rich residue, Sub- angular to angular clasts are present. Root hairs are also present. Highly humic and medium grained.
2011-S16	1576766	0630256E 5471660N	Dark Reddish Brown	Sample collected from horizon B, consists of appx.70% clay, sub-angular to sub rounded clasts. Humus content is low
2011-S17	1576767	0630264E 5471631N	Dark brown	Silty clay contains organic rich residue, Sub- angular to angular clasts are present.

				Root hairs are also present. Highly humic and medium grained.
2011-S18	1576768	0630291E 5471594N	Dark brown	Silty clay contains organic rich residue. Sub- angular to angular clasts are present. Root hairs are also present. Highly humic and medium grained.
2011-S19	1576769	0630313E 5471561N	Dark brown	Silty clay contains organic rich residue. Sub- angular to angular clasts are present. Root hairs are also present. Highly humic and medium grained.
2011-S20	1576770	0630340E 5471522N	Reddish brown	Sample collected from 'B' horizon, organic rich residue. Fine to medium-grained sub- angular to angular clasts present. Humus content is moderate. Soil rich in organic matter Root hairs are also present.

Table: 3 ROCK SAMPLES

SAMPLE CODE	SAMPLE ID	UTM LOCATION	COLOUR	VISIBLE PROPERTIES
2011-R1	1576785	0629112E 5472918N	Black	Black fine-grained compact rock with lenses of serpentine.
2011-R2	1576786	0629859E 5471558N	Grey	Grey fine-grained compact rock turned to reddish brown (oxidized). fine quartz veins and mineralized sulphides present

2011-R13	1576797	0630229E 5471689N	Grey	Grey fine-grained compact rock turned to reddish brown (oxidized). quartz carbonate vein has sulphides quartz veins and mineralized sulphides present
2011-R14	1576798	0630228E 5471690N	Grey	Grey fine-grained compact rock turned to reddish brown (oxidized). quartz carbonate vein has sulphides quartz veins and mineralized sulphides present
2011-R15	1576799	0630227E 5471691N	Grey	Grey fine-grained compact rock turned to reddish brown (oxidized). quartz carbonate vein has sulphides quartz veins and mineralized sulphides present
2011-R16	1576800	0630225E 5471693N	Grey	Grey fine-grained compact rock turned to reddish brown (oxidized). quartz carbonate vein has sulphides quartz veins and mineralized sulphides present

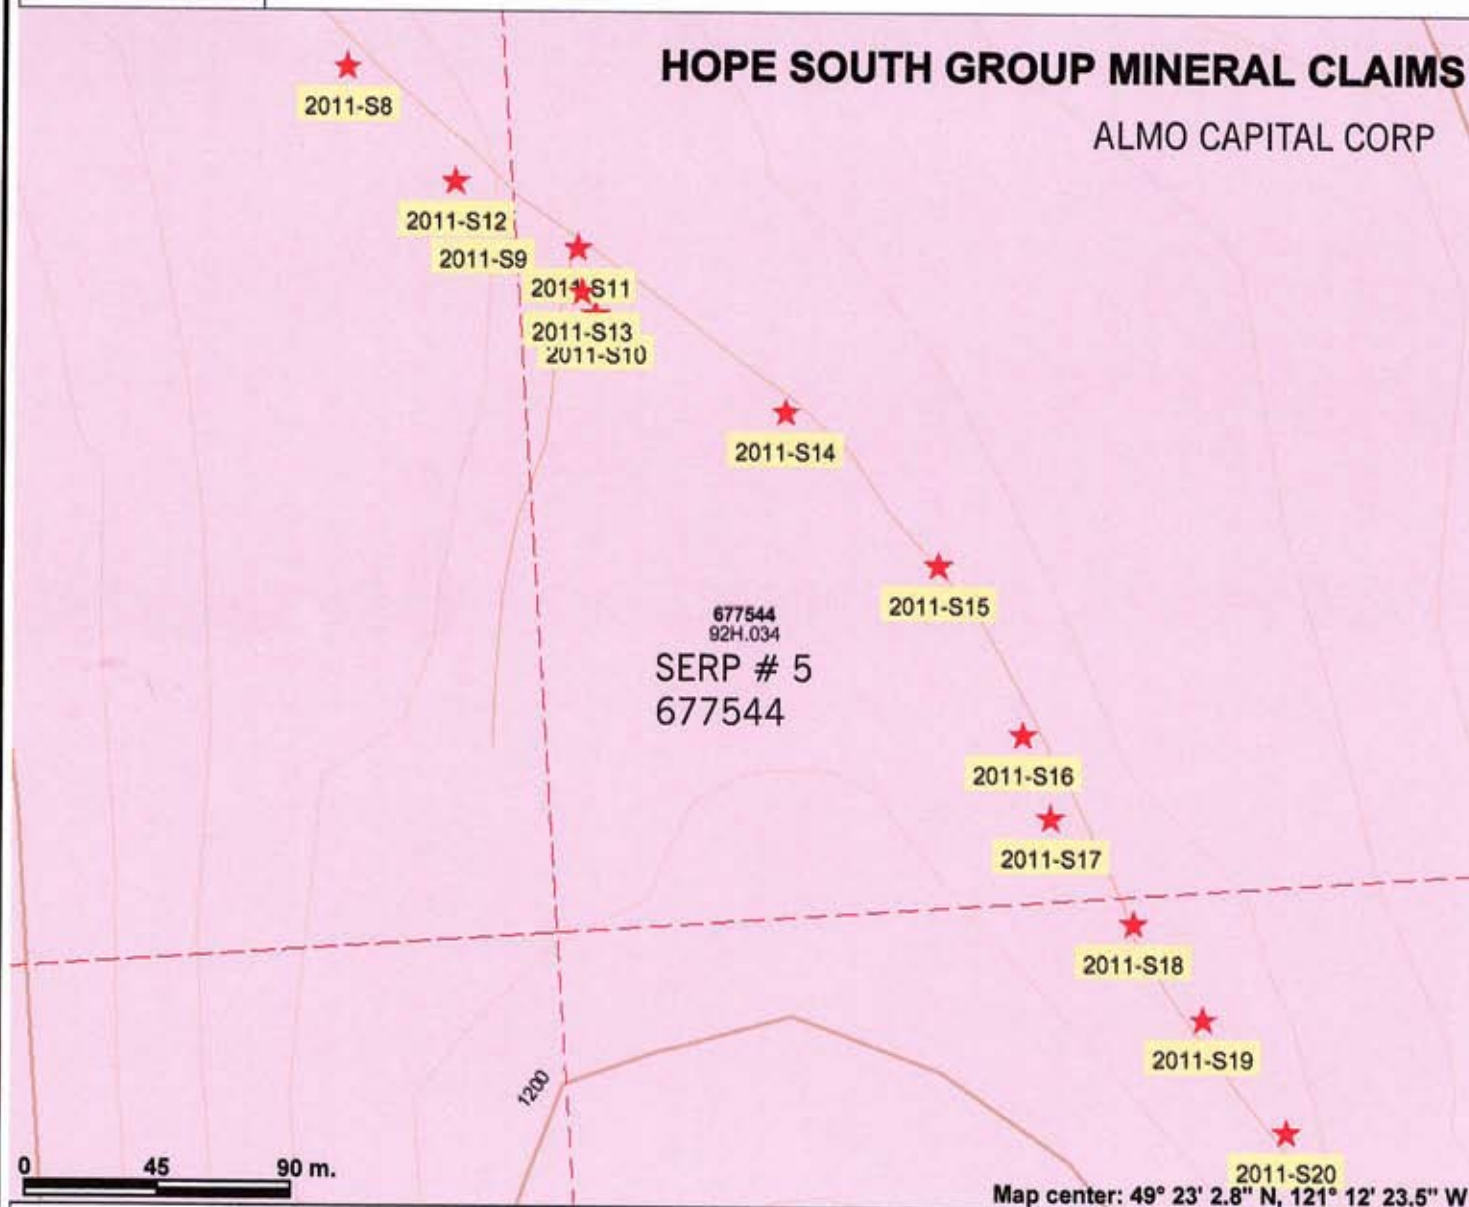

2011-R17	1576801	0630224E 5471695N	Grey	Grey fine-grained compact rock turned to reddish brown (oxidized). quartz carbonate vein has sulphides quartz veins and mineralized sulphides present
2011-R18	1576802	0630222E 5471697N	Grey	Grey fine-grained compact rock
2011-R19	1576803	0630222E 5471699N	Grey	Grey fine-grained compact rock turned to reddish brown (oxidized). quartz carbonate vein has sulphides quartz veins and mineralized sulphides present
2011-R20	1576804	0630221E 5471700N	Grey	Grey fine-grained compact rock turned to reddish brown (oxidized). quartz carbonate vein has sulphides quartz veins and mineralized sulphides present
2011-R21	1576805	0630220E 5471705N	Black	Grey fine-grained compact rock turned to reddish brown (oxidized). quartz carbonate vein has sulphides quartz veins and mineralized sulphides present
2011-R22	1576806	0630220E 5471710N	Grey	Grey fine-grained compact rock turned to reddish brown (oxidized). quartz carbonate vein has sulphides quartz veins and mineralized sulphides present
2011-R23	1576807	0630219E 5471713N	Grey	Grey fine-grained compact rock.

The geological soil and rock sampling was done on the property to find the major elements of interest in the property. A total of 20 soil samples and 23 rock samples were collected in the field and were later geochemically analyzed for Gold, Copper, Nickel, Cobalt, Magnesium, Chromium, Manganese, and Zinc etc

Figure 5a, 5b, 6a and 6b illustrate geochemical Locations for soil and rock samples.

FIGURE: 6b

**METHODS AND SPECIFICATIONS FOR ANALYTICAL PACKAGE
GROUP 1E & 1EX – ICP & ICP-MS ANALYSIS – 4-ACID DIGESTION**

Comments

Sample Preparation

All samples are dried at 60°C. Soil and sediment are sieved to -80 mesh (-180 µm). Moss-mats are disaggregated then sieved to yield -80 mesh sediment. Vegetation is pulverized or ashed (475°C). Rock and drill core is jaw crushed to 70% passing 10 mesh (2 mm), a 250 g riffle split is then pulverized to 85% passing 200 mesh (75 µm) in a mild-steel ring-and-puck mill. Pulp splits of 0.25 g are weighed into Teflon test tubes.

Sample Digestion

A 10 mL aliquot of the acid solution (2:2:1:1 H₂O-HF-HClO₄-HNO₃) is added, heated until fuming on a hot plate and taken to dryness. A 4 mL aliquot of 50% HCl is added to the residue and heated using a mixing hot block. After cooling the solutions are transferred to polypropylene test-tubes and made to a 10 mL volume with 5% HCl.

Sample Analysis

Group 1E: solutions aspirated into a Spectro Ciros Vision or Varian 735 ICP emission spectrometer are analysed for 35 elements: Ag, Al, As, Au, Ba, Be, Bi, Ca, Cd, Co, Cr, Cu, Fe, K, La, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Sb, Sc, Sn, Sr, Th, Ti, U, V, W, Y, Zn and Zr.

Group 1EX: solutions aspirated into a Perkin Elmer Elan 6000 or 9000 ICP mass spectrometer are analysed for 41 elements: Ag, Al, As, Au, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cu, Fe, Hf, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, S, Sb, Sc, Sn, Sr, Ta, Th, Ti, U, V, W, Y, Zn and Zr.

Quality Control and Data Verification

QA/QC protocol incorporates a sample-prep blank (G-1) as the first sample in the job which is carried through all stages of preparation to analysis. An Analytical Batch comprises 36 client samples and incorporates a pulp duplicate to monitor analytical precision, a -10 mesh rejects duplicate to monitor sub-sampling variation (drill core only), a reagent blank to measure background and aliquots of Certified or in-house Reference Material like STD DST6, Oreas 24P or Oreas 45P. Data undergoes a final verification by a British Columbia Certified Assayer who then validates results before it is released to the client.

Group 1E_1EX version 1.77 Revision Date: December 18, 2008

METHODS AND SPECIFICATIONS FOR ANALYTICAL PACKAGE GROUP 3A - AU BY WET EXTRACTION

Comments

Sample Preparation

All samples are dried at 60°C. Soil and sediment are sieved to -80 mesh (-180 µm). Moss-mats are disaggregated then sieved to yield -80 mesh sediment. Vegetation is pulverized or ashed (475°C). Rock and drill core is jaw crushed to 70% passing 10 mesh (2 mm), a 250 g riffle split is then pulverized to 85% passing 200 mesh (75 µm) in a mild-steel ring-and-puck mill. Pulp splits of 15 and 30 g splits are weighed into beakers.

Sample Digestion

A modified Aqua Regia solution of equal parts concentrated ACS grade HCl and HNO₃ and de-mineralised H₂O is added to each sample to leach for one hour in a hot water bath (>95°C). After cooling the solution is made up to final volume with 5% HCl. Sample weight to solution volume is 1 g per 20 mL.

Sample Analysis

Solutions are aspirated into a Perkin Elmer Elan 6000 or 6000 ICP mass spectrometer for the determination of Au.

Quality Control and Data Verification

QA/QC protocol incorporates a sample-prep blank (G-1) as the first sample in the job which is carried through all stages of preparation to analysis. An Analytical Batch comprises 36 client samples and incorporates a pulp duplicate to monitor analytical precision, a -10 mesh rejects duplicate to monitor sub-sampling variation (drill core only), a reagent blank to measure background and aliquots of Certified or in-house Reference Material like STD DS7 or Rocklabs STD OxDS7. Data undergoes a final verification by a British Columbia Certified Assayer who then validates results before it is released to the client.

Group 3A version 1.3 Revision Date: December 19, 2008

Item 7: CONCLUSION

The geological soil and rock sampling was done on the property to find the major elements in the property. A total of 20 soil samples and 23 rock samples are geochemically analyzed for Gold, Copper, Nickel, Cobalt, Magnesium, Chromium, Manganese, and Zinc etc

Geochemical results of 4 rock samples shows the gold values 14 ppb, Fe 17.89% - 21.16%, Silver 1.3g/t

The Geochemical results of the Nickel-Cobalt- Magnesium-Gold Property indicates that this area is a good prospect of Gold, Copper, Nickel, Cobalt, Magnesium, Chromium, Manganese, Zinc etc. Future surveys in the area should be orientated toward heavy metal sampling and detail examination of the serpentine and associated diorite intrusive including the greenstone Volcanics and fault contact structures.

Item 8: COST STATEMENT OF EXPLORATION

Costs of Exploration on the south group claims of Nickel-Cobalt-Magnesium-Gold Property.

Geologist fee for two geologists (For field work done on September 26 th , 27 th and 28 th 2011 and report preparation (56 hrs * 2 @\$33.75/hr)	\$ 3,780.00
Report preparation (54 hrs *2 @\$33.75/hr)	\$ 3,645.00
Transport, vehicle rentals	\$ 400.00
Gas expenses	\$ 156.08
Deakin equipment (filled pens, markers, Plastic Bags , Paper Bags etc)	\$ 124.77
Expenditure on food (3 days @\$50/day/person)	\$ 300.00
Sampling and assaying (\$200 spent rest to be spent)	\$ 2,500.00
Total Expenditure (already incurred)	<u>\$ 10,905.85</u>

Item 9: Statement of Authors Qualifications

I, Ram Vallabh, of 603 East 30th Avenue, Vancouver, British Columbia, Canada V5V 2V7, hereby certify that:

1. I am a graduate and post graduate from, University of Lucknow, India. B.Sc. in 1952, L.L.B. in 1955, and M.Sc. in 1957, both B.Sc. and M.Sc. Degrees are in Geology.
2. I am the registered owner of mineral claims held under Almo Capital Corp.
3. I had practiced geology for more than forty years in Canada.
4. This report is based on assessment, government, and private reports listed in the references, and field examination.
5. I am a qualified person.
6. The assessment report has been prepared in conformity of Canadian mining industry practice.

Dated at Vancouver: January 31, 2013
