REPORT KEYWORDS (lithology, age, stratigraphy, structure, alteration, mineralization, size and attitude. **Do not use abbreviations or codes**) Structurally controlled hydrothermal alteration zones are related to a Cretaceous (?) diorite, and Tertiary, Ootsa Lake felsic dykes. Zones are enriched in Au, Cu, Zn, Ag, Bi, Sb, As, Ba, and Hg.

Introduction

During the summer of 2012 a program of rock sampling was conducted on the Hottie Mineral claims in central BC. The property is underlain by a large structurally controlled hydrothermal alteration zone that is enriched in base and precious metals. The purpose of the program was to enhance results obtained by previous workers in the early 1990s.

Property

The property is comprised of six mineral titles claims wholly owned by Tom Kennedy of South Slocan BC. The property is currently operated by Kootenay Silver Inc.

Tenure Number	Claim Name	Area (ha)
841205	HOTTIE1	467.278
841206	HOTTIE2	467.4116
841207	HOTTIE3	467.2914
841223	HOTTIE4	272.5201
942294	NAUGHTY 1	467.3095
942295	NAUGHTY 2	350.5821

Location and Access

The Hottie claims are located in the Interior Plateau of central British Columbia. The property is approximately 100 km's west of the city of Quesnel and 25 km's west of the village of Nazko. Access is given by paved highway from Quesnel to Nazko, from there a network of all-season gravel/forestry haul roads give access to much of the property.

Physiography

The property overlies an area of gently rolling topography with elevations ranging from 1,100 to over 1400 meters. Much of the property was clearcut logged in the 1980s and early 1990s. Forest cover is comprised mainly of lodgepole pine that is now beetle killed. Outcrop exposure is scarce on the property and is largely confined to gullies and steep slopes.

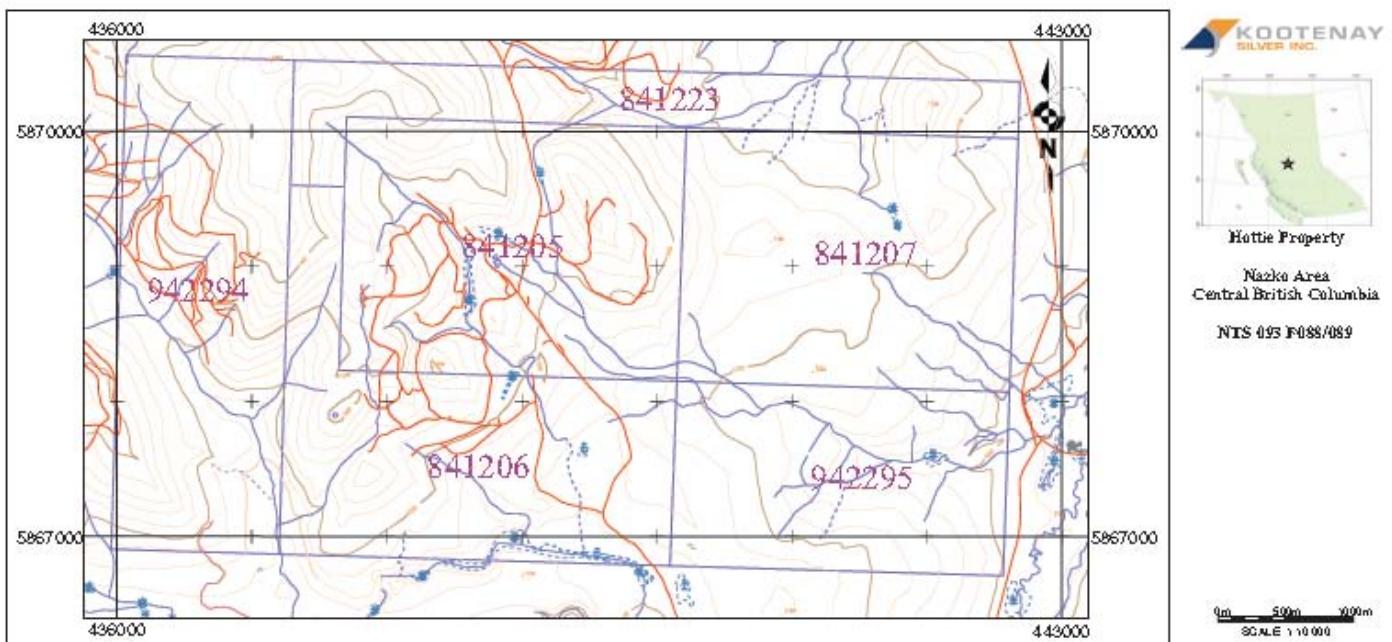

Figure 1: Property Map, regional location top right

History

The property covers the QFP minfile occurrence. The claims were initially staked in 1989 to cover a pyritic quartz-feldspar intrusion that was recognized to have epithermal characteristics. Geochemical surveys (soil) identified large zones of anomalous gold, and arsenic in soils. Geological mapping outlined two major alteration zones consisting of fracture/fault controlled breccias consisting of carbonate-limonite alteration with quartz veining. A roof pendant was also identified where chert pebble conglomerate is locally brecciated and veined with quartz-calcite-pyrite stringers. Rock geochemistry from the pendant returned anomalous gold, arsenic, barium, copper, antimony and zinc. One sample from this area of chalcedonic quartz and calcite gave values of 3.82 g/t Au (minfile # 093B 066). Rock sampling completed over the other alteration zones returned six samples with values over 100 ppb Au with the highest being 1.6 g/t Au. Trenching was carried out based on these results along a quartz-eye dyke that was shown to host mineralization. One sample containing chalcopyrite from this area returned over 3% copper with 377.5 g/t silver and 98,109 ppm arsenic (Assessment Report 20022). This work took place from 1990-1994. In 1994 an aerial geophysical survey was completed on the property (mag/em).

In 1995 two holes were drilled (378 meters) in the vicinity of the trenching. Pyritic/chlorite altered siltstone and pyritic biotite hornfels were encountered with widely spaced quartz-pyrite-chalcopyrite veinlets (5-10 meters apart). The most geochemically anomalous zone returned was 610 ppb Au over 2 meters (Assessment Report 24177).

For a complete list of work see: Assessment Report 20022, 20277, 20874, 21594, 22400, 23045, 23695, 24177, and Property File Rimfire (Heberlein, D. (1992-01-23): QFP Epithermal Au Property report.

Regional Geology

The Interior Plateau of central BC is bounded on the northeast and southwest by the Yalakom and Fraser Faults respectively. The plateau is underlain by the Intermontane Belt which consists of Paleozoic to Tertiary sedimentary and volcanic rocks of the Stikinia, Cache Creek, and Quesnellia Terranes. The plateau is dissected by the Anahim Volcanic belt; an east-west trending belt of Miocene-Quaternary mafic volcanoes.

The area appears to be part of a large caldera complex marked by numerous felsic flow-dome complexes and tilted/faulted structural blocks. Regional epithermal precious metal mineralization appears to be related to the caldera complex and spans ages from late Cretaceous to late Tertiary.

Property Geology

Geological mapping conducted during previous programs is paraphrased below:

'The property is underlain by Jurassic Hazelton Group sedimentary rocks including; siltstone, chert, argillite, lithic-pebbly greywacke, conglomerate, and chert pebble conglomerate. Hazelton volcanics consist of andesitic to basaltic flows and pyroclastic rocks. Fine grained pyroxene-diorite stock and marginal biotite-diorite dykes of middle to upper Cretaceous (?) age intrude and hornfels the host

Hazelton sediments. Small felsites intrusions of possible Eocene Ootsa Lake Group, pale green to white with local quartz eyes intrude the package and are locally associated with breccias and quartz stockworks. Two major zones of alteration (North and South Zones) are located on the property. These zones consist of carbonate-limonite staining and local quartz veining associated with faults and shear zones. Strongly silicified outcrops in the South Zone form resistant ribs of breccias which resemble jasperoid.'

Rock Geochemistry

During the program 100 rock samples were collected and analyzed for a 36 element ICP including Au in ppb. Sample locations, descriptions, and assay certificates are included in the appendix. A 1:10,000 map with Au plotted in ppb is included at the end of the report.

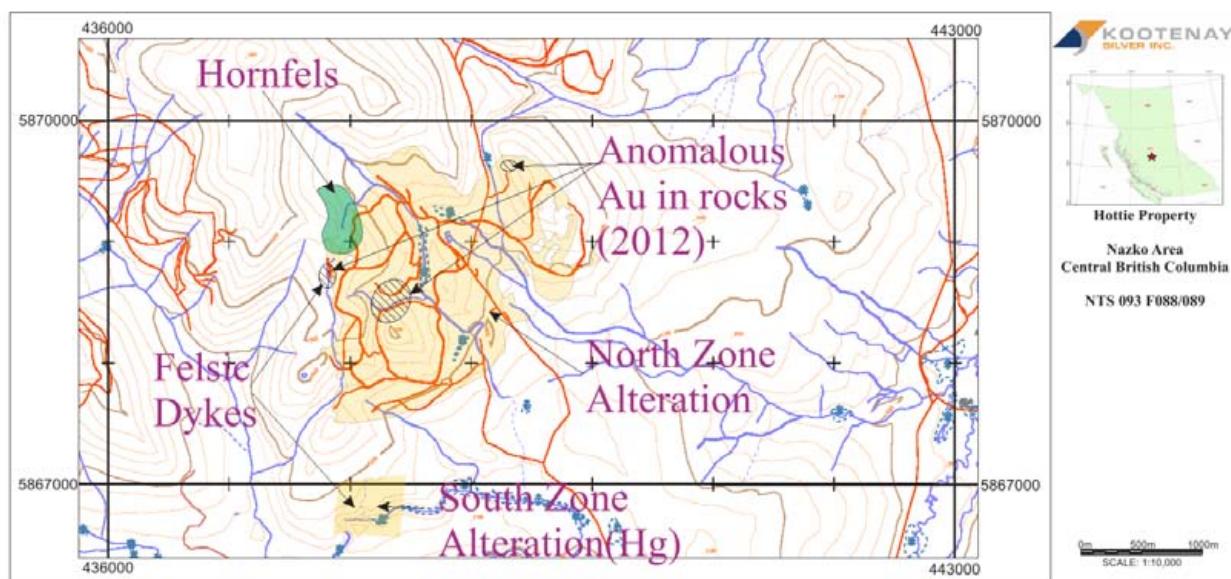

Figure 2: Generalized alteration map.

Sampling on the property was largely focused on the previously identified North and South Zones. Anomalous gold (>10 ppb Au) was returned in 19 of the collected samples with four samples assaying over 100 ppb. The highest gold value returned was 426.1 ppb (SK12-48). Numerous samples returned highly anomalous copper up to 1.232% (MK12-55) with nine samples greater than 1000 ppm and 34 samples with over 100 ppm. Anomalous values were given for numerous elements, including multiple sample strings with anomalous Au, Cu, Zn, As, Sb, Bi, Ba, and Hg. Individual high values include: Mo (211.7 ppm, MK12-59), Zn (1181 ppm, MK12-64), Ag (15.1 ppm, MK12-55), As (>10,000 ppm, SK12-48, 54, MK12-55), Sb (218 ppm, MK12-55), Bi (1064.6 ppm, MK12-52), Ba (1730, SK12-62), and Hg (11.23 ppm, MK12-64).

Anomalous (Au) samples are related to large zones of hydrothermally altered crackle breccia. Alteration assemblages include; Fe-oxides (goethite, hematite, magnetite), manganese, sericite, Fe-carbonate, calcite, jasper, and quartz. Open space quartz veins within the larger alteration zones are

often sheeted with Fe-oxide wad. Late chalcedonic and druse quartz was noted in a few locations possibly indicating late stage high elevation hot springs overprinting or resurgence of the system. Host rocks that appear most affected by this style of alteration are restricted to Hazelton Group sediments and volcanics.

Cretaceous (?) diorite has locally hornfelsed host sediments (pyrite, chalcopyrite, and chlorite). Wide spread anomalous copper values returned from Fe-oxide bearing crackle breccias may be related to this Cretaceous diorite and are possibly indicative of a lower level Cretaceous porphyry system.

Within the largest zone (North Zone) of alteration there is at least one quartz-eye dyke. The dyke resembles Eocene Ootsa Lake Group felsic volcanic rocks that are regionally recognized. Locally the dyke is altered and brecciated similar to the larger zones possibly indicative of a later Tertiary mineralizing event (resurgent hot spring). In the South Zone an intensely clay altered feldspar porphyry dyke (Tertiary?) was found within the larger zones of altered breccias and may be related to the Ootsa Lake Group rocks observed in the North Zone. Highly anomalous values for Hg, Sb, Ba, and As returned from both the North and South alteration zones may be related to the Tertiary dykes.

Conclusions and Recommendations

During the summer of 2012 a program of rock sampling was conducted on the Hottie mineral claims in central BC. 100 samples were collected and anomalous results were obtained for Au, Ag, Cu, Mo, Zn, Sb, Bi, Ba, and Hg. Anomalous values are related to widespread zones of structurally controlled hydrothermal alteration that are spatially related to a Cretaceous diorite (?) and late felsic dykes (Ootsa Lake Group). The geological setting is consistent with a Cretaceous porphyry system overprinted by a Cretaceous-Tertiary caldera related epithermal system. Geochemically the system marries well to this model with anomalous pathfinder elements associated with late stage chalcedonic and druse quartz.

At this point further work is warranted on the property. This would entail a full compilation of existing data, including compilation of the airborne survey completed in 1994. Old logging and exploration roads should be brushed out to facilitate further ground work. Detailed soil sampling in the North Zone is warranted particularly near where gold was encountered in outcrop. Further detailed prospecting and mapping is recommended both on the north zone and south zone. The goal of this work would be to define trench targets for follow up work in 2013.

Statement of Costs

Rock Samples	100 @ \$30/sample	\$3,000
Sean Kennedy August 3-8 2012	6 days @ \$350/day	\$2,100
Mike Kennedy August 3-8 2012	6 days @ \$500/day (vehicle inclusive)	\$3,000
Craig Kennedy August 8 2012	1 day @ \$350/day	\$350
ATV Rental	6 days @ \$150/day	\$900
Travel/living out		\$2,260
<u>Report and Maps</u>		<u>\$1,000</u>
Total		\$12,610

Statement of Qualifications

I, Sean Kennedy, certify that:

1. I am an independent prospector residing at 107 6th Ave, Kimberley, BC.
2. I have been actively prospecting throughout BC, Nevada, Mexico, and Arizona for the past 15 years
3. I have been employed as a professional prospector by junior mineral exploration companies.
4. I own and maintain mineral claims in BC.

APPENDIX

ROCK SAMPLE LOCATIONS AND DESCRIPTIONS

Sample	UTM E	UTM N	Description
SK12-25	438851	5868934	Subcropping? Bleached felsic rock w/M/goe fractures, thin qtz veins with goethite
SK12-26	438962	5869537	Mafic volcanic, fractured with thin qtz-carb veins, goe, calcite, Mn
SK12-27	439283	5869610	Pebble conglomerate, rusty goethite/hem rich thin open space qtz veins, veins trend 260/80 N
SK12-28	439289	5869606	Same as last
SK12-29	439319	5869608	Less coars pebble conglomerate with thin qtz veins with goe, hem, Mn wad
SK12-30	441810	5869455	Pebble conglomerate, goe/hem wad veins 4 pieces of angular milky qtz vein float in pebble conglomerate and siltstone till, ser, goe,
SK12-31	442491	5869601	open space, strong alteration of pebble conglomerate
SK12-32	442323	5870530	Abundant felsic crystal shard tuff, thin, druse qtz veins, ser/hem alt. Subcropping carb punk altered fractured siliceous fine grained rock, possibly intruding
SK12-33	438335	5868214	pebble conglomerate or a finer grained member of the section, goe/carb/bleached, green clay
SK12-34	438320	5868246	Same as last
SK12-35	438229	5868369	Intensely sericite/bleached bx with goe/hem mottling and thin qtz veins
Sk12-36	438200	5868263	Andesite bx in talus, fractures with qtz and goe/hem/carb
SK12-37	438289	5868119	Andesite bx with epidote and magnetite, qtz vein with magnetite wad
SK12-38	437743	5868076	Drust qtz vein stockwork float
SK12-39	437721	5868118	Milky qtz vein in aphanitic rock, some goe/ser alteration
SK12-40	437899	5867958	Carb/phyllitic altered grey volcanic conglomerate, milky qtz veins with goe/ser/Mn/carb
SK12-41	437757	5869349	Siliceous hornfels bx float qtz ven stockwork, fractures with Cpy/py in matrix Same unit, grey siltstone, hornfels, fractures with Cpy/mal related to calcite and qtz
SK12-42	437819	5868932	fractures Carb/goe/Mn altered and fractures andesite, some milky qtz-calcite veins with magnetite
SK12-43	437842	5868904	and pyrite
SK12-44	437903	5868854	grey siltstone, brecciated with thin qtz-calcite-chlorite gashes, rare cpy, fracture py Silicified bx/crush zone related to zone of goe/hem/carb/mn/ser alteration, yellow green
SK12-45	437985	5868922	stain
SK12-46	437985	5868922	Same as last
SK12-47	437824	5868683	Qtz eye porphyry/felsite, old trenches, thin qtz veins with goe/hem/mag wad, sericite flakes
SK12-48	438044	5869760	Subcropping brown alteration zone with qtz veins with goethite Strongly altered zone with goe/hem/ser/Mn/carb breccias, forming a 30 degree trending rib
SK12-49	439085	5868295	> 3 m wide, flanked by Mn/carb altered fractures Zone of bleaching and fractures with goe/hem/carb/mn, thin xtalline qtz veins w/goe/hem
SK12-50	438532	5868269	wad and ser
SK12-51	438245	5868422	Same as last
SK12-52	438246	5868426	Same as last
SK12-53	438268	5868433	Same as last, qtz vein are 8/52 E
SK12-54	438375	5868471	Series of qtz veins in highly altered zone of goe/hem/carb/ser/Mn, qtz is 306/36 e 330/40 E qtz veins, same as last, vein has been rebrecciated and has some druse qtz
SK12-55	438411	5868488	overprinting with a brown jasper
SK12-56	438580	5868558	Same as last, patch qtz veins and alteration in this area

SK12- 57	438519	5868654	Same as last, more Mn, the zones are poddy and intensify then disappear quickly, distal alteration is typically calcit-chlorite-pyrite into bleaching with goethite-carbonate-Mn into sericite-goethite-hematite-magnetite-Mn-carbonate-qtz
SK12- 58	437971	5866814	Hard brown rock in a tectonic bx, siliceous goethite/hematite veins in a highly milled zone, green waxy clay, Mn
SK12- 59	437971	5866814	Same as last
SK12- 60	437968	5866812	Same as last
SK12- 61	437933	5866799	Crushed bx with Fe-carbonate matrix, goe, ser
SK12- 62	437946	5866756	NE trending breccia zone with goethite and hematite, bleaching, milled/tectonized Strongly clay altered dyke, waxy white clay, looks like a feldspar porphyry, thin grey water qtz
SK12- 63	438010	5866779	veins, trends 340/56 E

CC:

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
** asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.
