## SUMMARY

The Hi Ox gold property is located approximately 50 kilometres north of Savona and is accessible on a good-quality public gravel road north from the Trans-Canada Highway, at a point 7.4 kilometres west of Savona. It is about 60km northwest of Kamloops.

At least two styles of mineralization are present on the property. At the Depression and Lake Zones, mineralization consists of a chalcedonic quartz stockwork and calcite veining within an argillite breccia and a quartz vein hosted in andesite tuff (Assessment Report 15143). Locally disseminated pyrite is found in tuff at the Lake zone. At the Bridge zone, a vein system is hosted by quartz diorite (Assessment Report 15987), where Hole 85-4 ran from 30 to 40 feet 4700 ppb gold. A two foot sections assayed 0.729 oz./ton gold. An assay of 1800 ppb gold was obtained in a rock chip sample from a trench on the Lake zone (Assessment Report 14101).

The Hi Ox claims are underlain by argillite and andesite of the Upper Triassic Nicola Group that are exposed in a window through the Miocene plateau basalts which blanket most of the surrounding area. The argillite is interbedded with andesitic tuffs, augite porphyry and minor agglomerate (Assessment Report 14101). Nicola Group rocks are intruded by biotite quartz diorite which are probably part of the Triassic to Jurassic Thuya batholith (Geological Survey of Canada Memoir 363).

In 1985, a program of rock chip sampling (32 samples), soil sampling (1260 samples), linecutting, induced polarization surveying (14.3 kilometres), magnetometer surveying (28 kilometres), VLF-EM surveying (28 kilometres), reverse circulation percussion drilling (9005 metres in 20 holes) and diamond drilling (183 metres in 4 holes) was carried out. Placer Development Limited optioned the property and in 1986 (Assessment Report 15987) completed additional induced polarization surveys (12 kilometres) and four diamond-drill holes (526 metres). In 1987, Placer Development completed additional rock chip and soil geochemical surveys, geological mapping, magnetometer and VLF-EM surveys (Assessment Report 16617).

In 2010 to 2011, a program of area reconnaissance, road traverses and prospecting was completed by Homegold Resources Ltd. Previously discovered showings were examined and rock samples collected. Assay results confirm the presence of stockwork gold mineralization.

The current program of VLF-EM, ground magnetometer and prospecting was completed between December 1, 2011 and May 20, 2012.

A program of detailed geological mapping, prospecting and follow-up geochemistry and diamond drilling is recommended.

Respectfully submitted,

J. T. Shearer, M.Sc., P.Geo.

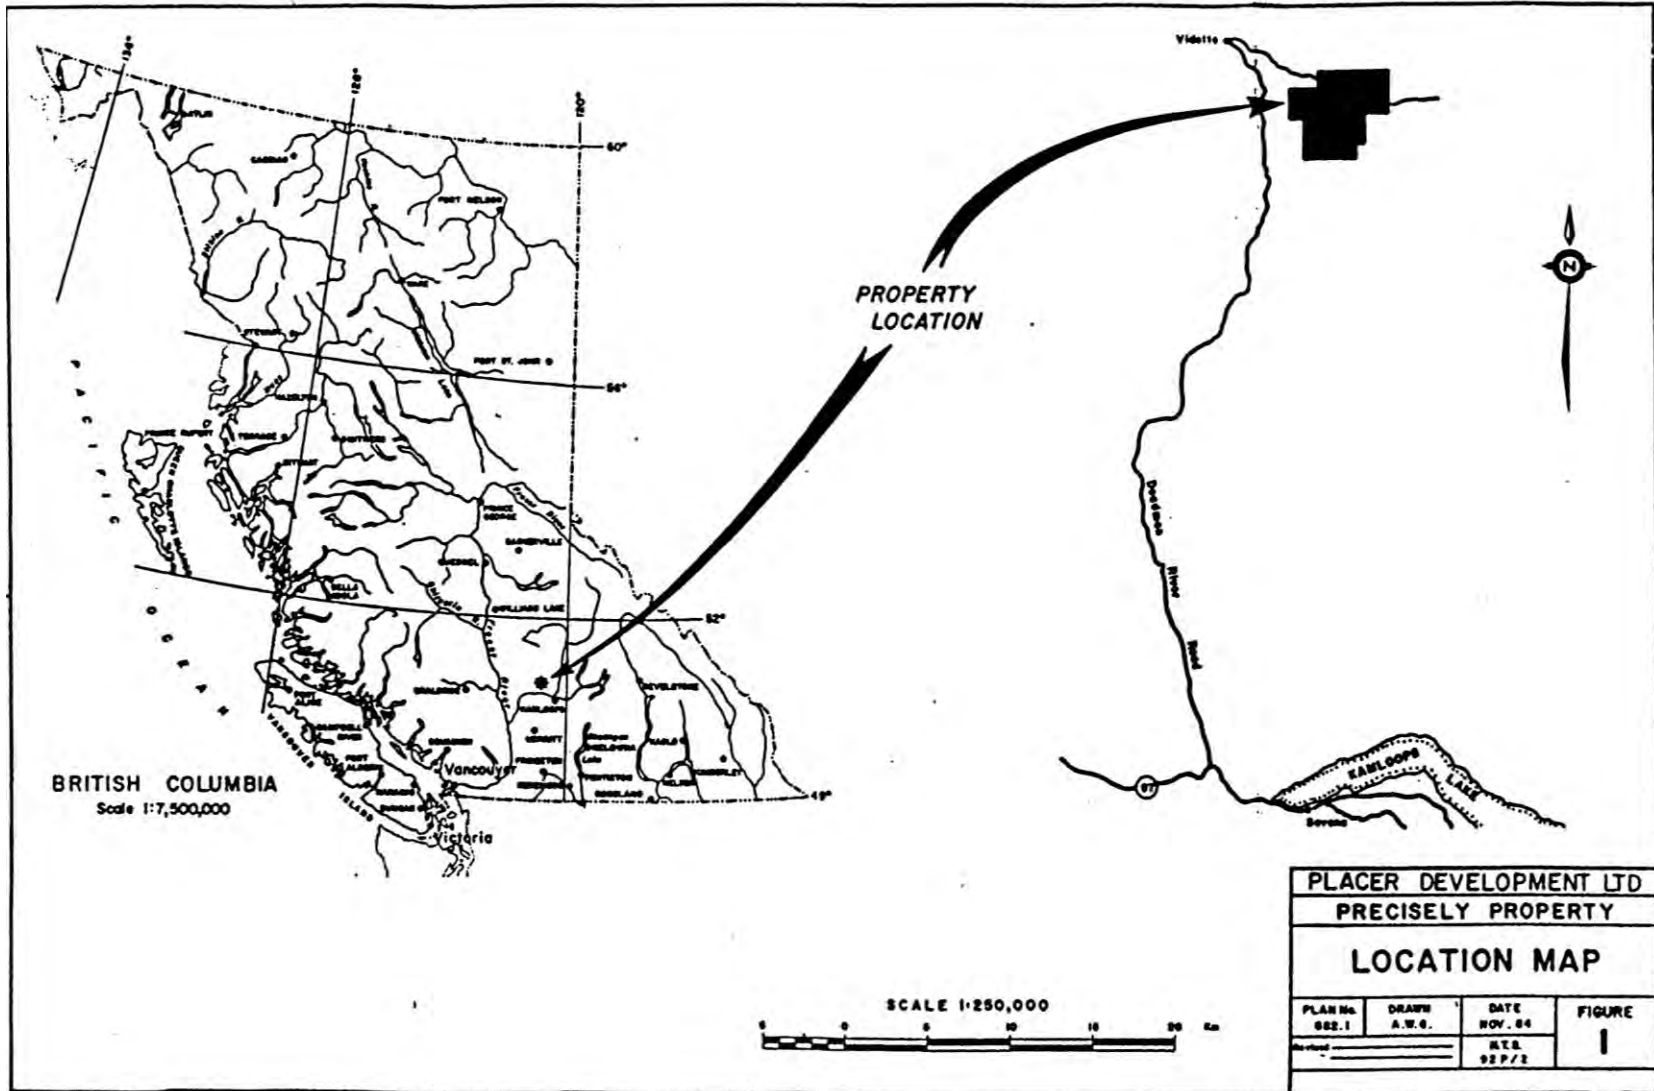

## INTRODUCTION

The Hi Ox claim group consists of ten (10) claims (4,441.88ha) located 62 km northwest of Kamloops, B.C. The claims cover volcanic and minor sedimentary rocks of the Triassic Nicola Group and have been intruded by diorite and granodiorite. Extensive work during the period 1984 through 1986 had found gold values in silicified and brecciated argillites and in quartz veins and alteration envelopes in granodiorite.

A small exploration program in 2010 to 2011 was directed to examine the road access, previously defined gold showings and follow-up of gold in soil results property in an effort to detect new areas of mineralization. The current 2012 program of geophysical surveying (VLF-EM and ground magnetometer) and geological mapping is the subject of this report.

At least two styles of mineralization are present on the property. At the Depression and Lake Zones, mineralization consists of a chalcedonic quartz stockwork and calcite veining within an argillite breccia and a quartz vein hosted in andesite tuff (Assessment Report 15143). Locally disseminated pyrite is found in tuff at the Lake zone. At the Bridge zone, a vein system is hosted by quartz diorite (Assessment Report 15987), where Hole 85-4 ran from 30 to 40 feet 4700 ppb gold. A two foot sections assayed 0.729 oz./ton gold. An assay of 1800 ppb gold was obtained in a rock chip sample from a trench on the Lake zone (Assessment Report 14101).

In 1985, a program of rock chip sampling (32 samples), soil sampling (1260 samples), linecutting, induced polarization surveying (14.3 kilometres), magnetometer surveying (28 kilometres), VLF-EM surveying (28 kilometres), reverse circulation percussion drilling (9005 metres in 20 holes) and diamond drilling (183 metres in 4 holes) was carried out. Placer Development Limited optioned the property and in 1986 (Assessment Report 15987) completed additional induced polarization surveys (12 kilometres) and four diamond-drill holes (526 metres). In 1987, Placer Development completed additional rock chip and soil geochemical surveys, geological mapping, magnetometer and VLF-EM surveys (Assessment Report 16617).

## PROPERTY DESCRIPTION and LOCATION

The Hi Ox claim group consists of ten (10) claims. All the claims are owned by J. T. Shearer.

Total 4,441.88 ha

Under the present status of mineral claims in British Columbia, the consideration of industrial minerals requires careful designation of the product end use. An industrial mineral is a rock or naturally occurring substance that can be mined and processed for its unique qualities and used for industrial purposes (as defined in the *Mineral Tenure Act*). It does not include "Quarry Resources". Quarry Resources includes earth, soil, marl, peat, sand and gravel, and rock, rip-rap and stone products that are used for construction purposes (as defined in the *Land Act*). Construction means the use of rock or other natural substances for roads, buildings, berms, breakwaters, runways, rip-rap and fills and includes crushed rock. Dimension stone means any rock or stone product that is cut or split on two or more sides, but does not include crushed rock.

Claims require \$4 of assessment work per ha (or cash-in-lieu) each of the first three years and \$8 per ha each year after.

## **ACCESSIBILITY, CLIMATE, LOCAL RESOURCES, INFRASTRUCTURE and PHYSIOGRAPHY**

### **ACCESS**

The Hi Ox property is located approximately 62 km northwest of Kamloops, B.C., and 7 km southeast of Vidette Lake. Access is via the all-weather Deadman River road which leaves the Trans-Canada Highway at a point 5 km west of the Thompson River Bridge at Savona, B.C. The Deadman River road crosses the northwest corner of the Hi Ox property. Local ranch and logging roads provide access to most parts of the claim group.

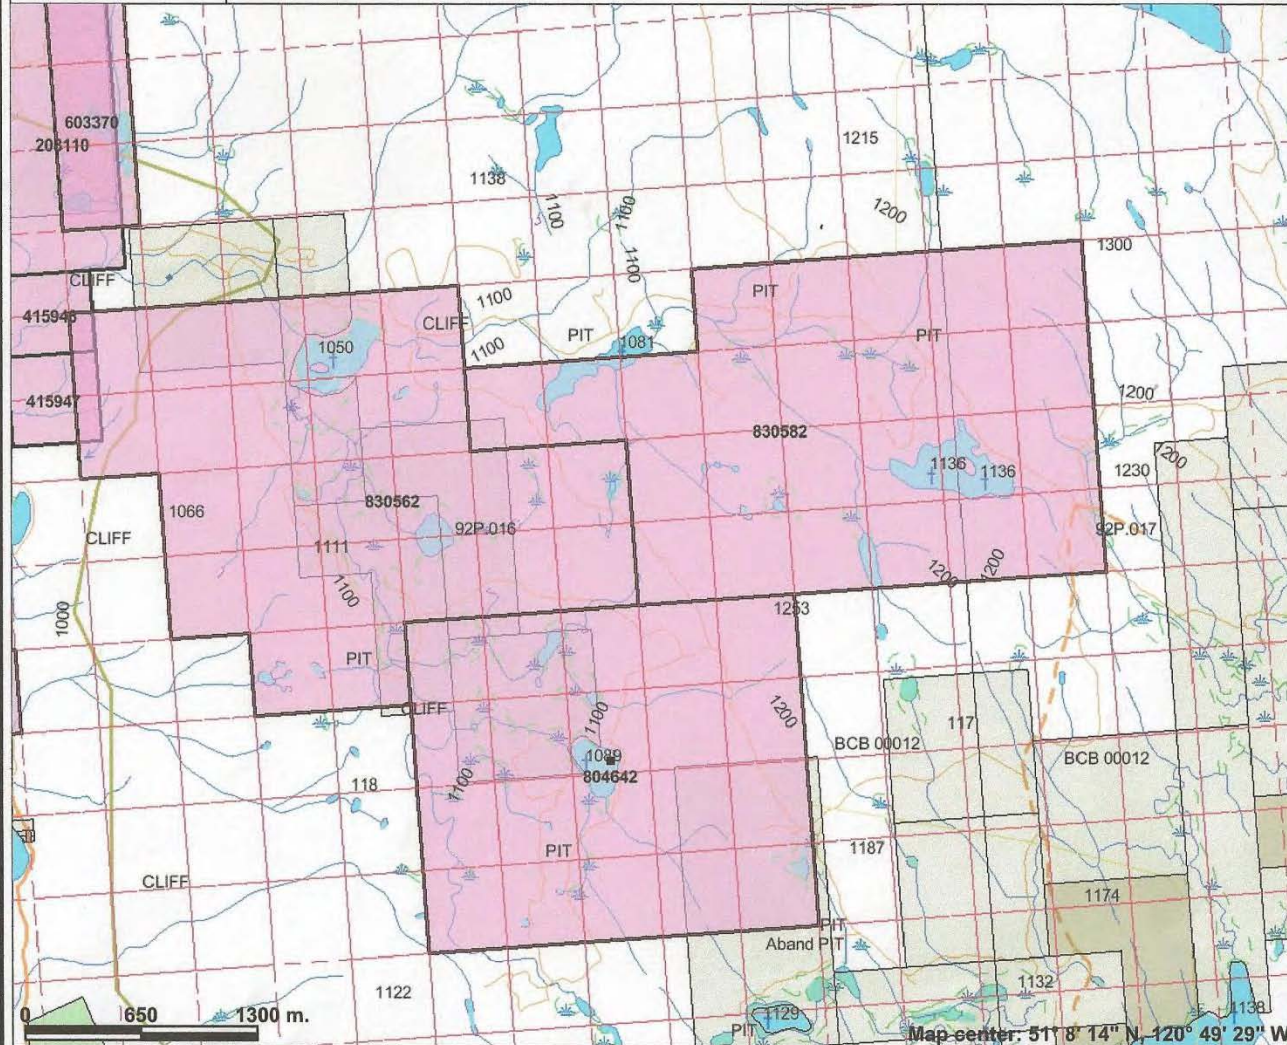

### **CLIMATE**

The property is situated near the south end of the Fraser Plateau at an elevation of about 1,100 meters. Topographic range on the property is approximately 150 meters. Much of the claim group is gently rolling with low ridges and knolls interspersed with gullies, swampy pothole lakes and sloughs. The general trend to this topography is 160'.

### **PHYSIOGRAPHY**

Large sections of the property are covered with open poplar forest and patches of lodgepole pine and spruce. Large firs are scattered about on the higher hills. Much of the forest has been decimated by the mountain pine beetle.

## HISTORY

Initial interest in the area is believed to have occurred during the 1930's when the Vidette Gold Mine, located 7 km to the northwest, was discovered and put into production. The Vidette produced 55,000 tons of ore grading 0.55 oz. Au and 0.86 oz. Ag per ton during the period 1933 to 1940. Several old trenches on the Hi Ox property are believed to date from that era.

In 1984 prospector Michael Dickens found gold in a quartz stockworks and staked the key block of the Hi Ox group. The property was optioned to Inter-Pacific Resource Corporation. In 1984 and 1985 MineQuest Exploration Associates Ltd. carried out an extensive program of mapping, soil sampling, rock chip sampling, geophysics and drilling for Inter-Pacific Resource Corp. Placer Development Ltd. continued work in 1986 with Induced Polarization surveys and diamond drilling.

During this 1984-1986 phase, work became concentrated on three zones referred to as the Depression, Lake and Bridge zones. The first two are quartz-calcite stockworks in brecciated argillite while the Bridge zone is composed of quartz veins with pyrite and arsenopyrite in granodiorite.

### 1987 Exploration Program

The present program concentrated on three areas not previously examined in detail and covered much of the property remaining unexplored following the 1984-1986 programs. The new areas are referred to as the southeast, northwest and northeast extensions and are located relative to the overall claim group and to Beaver Lake in the center of the earlier work.

A very small grid (North) totalling 900 meters was located at the site of diorite intruding augite porphyry 90+00N to 92+00N and 47+00E to 50+00E. In addition, four widely spaced geological reconnaissance lines were run to the east across the Precisely 7 & 8 claims.

The program consisted of establishing 90 km of flagged lines at approximately 100 meter intervals using a compass and hip chain. Stations were located at 20 metre intervals. The lines were then used for control in the mapping of outcrops, the recording of geophysical data and the collection of soil samples. Twenty-nine rock chip samples were collected from outcrop and float containing quartz and/or sulphide mineralization.

An 8 person camp was established at the site of the old camp near Beaver Lake.

In the search for new target areas, the results from previous work are both a guide and a bench mark. On the Hi Ox property work was concentrated on silicified argillite breccias in the Lake and Depression zones and on quartz veins in granodiorite in the Bridge Zone. The Depression and Lake Zones are part of a hydrothermal system with the argillite being a preferred host for gold and arsenic enhancement relative to the tuff and augite porphyry.

Silicification appears related to a low angle fault in both cases and is generally restricted to narrow zones. Gold and arsenic enhancement is apparently greatest in the silicified zones. The maximum values obtained in drilling were 480 ppb Au and 1000 ppm As with the enhanced zones being in the general order of 100 ppb Au and 250 ppm As. Rock chip samples assayed 50 to 140 ppb Au and 100 to 175 ppm As in the Lake zone. In summary, low gold values occur in the system with no indication of improvement with depth.

Soil sample results from the "B" horizon over the Lake and Depression zones ranged from 30 to 140 ppb Au and 50 to 280 ppm As.

Drilling and rock chip sampling on the Bridge zone gave better gold values, particularly, in the quartz veins. The best 10' interval ran 4700 ppb Au and others were in excess of 1000 ppb Au. Silver showed a close correlation with gold and over short lengths assayed up to several ounces per ton.

The Bridge zone is described as being outlined by soil sampling with weak but consistent anomalies in gold and arsenic. Gold values ran from 10 to 30 ppb with peaks to 440 ppb. Coincident arsenic values were up to 20 ppm.

Geophysics in the form of magnetometer, VLF-EM and Induced Polarization surveys were done on parts of the property in 1986 with the most interesting results on the Bridge zone. VLF-EM indicates two structures believed to be faults more or less bounding the Bridge zone. Induced Polarization found anomalous chargeabilities over the Bridge zone which were attributed to pyrite in the granodiorite. A much stronger I.P. anomaly to the north-northeast of the Bridge zone was drilled and found to be caused by several percent pyrite in argillite. There were no gold values.

#### Previous Geochemistry

Soil samples were collected at 40 metre intervals along the gridlines with the "B" horizon as the preferred material. Notes describing the sample site and the material collected were recorded. The samples were placed in the standard kraft paper bags and shipped to the Placer Development laboratory in Vancouver where they were geochemically assayed for gold, silver, arsenic and mercury.

Overburden on the Hi Ox property is widespread with some areas of the glacial till indicated to be thick. Glacial features such as drumlins, ablation till and meltwater channels are present. The maximum observed thickness of till was approximately 10 metres in a bank cut by the Deadman River but some of the surface features appear to indicate a much greater thickness. Ice direction in the area is approximately 160°.

The till material varied to some extent but appears characterized by a high sand silt content. Road cuts and check sampling indicate that there have been local impediments to drainage with the resultant development of local sand and/or silt beds. Where noted, the beds were usually less than a metre thick but there are exceptions. In conclusion, soil sampling conditions may be considered poor over much of the property.

#### Previous Soil Sample Results

##### Gold

A very few soils contained more than 20 ppb Au. These were widely scattered and often failed to repeat in a second assay. There is no grouping of any description to suggest an underlying source or dispersion train in the till.

A single interesting assay occurred at 86+00N; 75+00E on the Northeast grid. The soil assayed an extremely high 10.6 ppm Au and repeated a t 11.0 ppm. This location is on an open, rounded ridge

topped with a thin soil layer covering andesitic bedrock. The andesite at the location is fractured with calcite filling. The soil appears largely residual.

An additional 25 soils were collected from a tight grid centered on the anomalous site. The repeat soil sample taken 30 cm from the original ran 9.3 ppm Au establishing the validity of the original result. Only one other sample could be considered anomalous at 0.15 ppm Au. Broken rubble collected from the two holes at the discovery site assayed 0.03 and 0.04 ppm Au. It is concluded that the gold probably has a local source in the bedrock in the immediate vicinity, but that it is apparently very small.

Two anomalous samples occurred at the east end of lines 51+00N and 52+00N on the southeast grid. These were located in sand on the bank of the Deadman River. The results are attributed to placer gold.

#### Silver

The results for silver were negative with only two assays over 1.0 ppm.

#### Mercury

A total of three scattered samples were considered weakly anomalous for mercury with values of 156 to 300 ppb as compared to a background of <10 ppb. It may be noted that on occasion the assays for a short interval will be elevated 20 to 50 ppb Hg. This is apparently a laboratory problem.

#### Arsenic

Arsenic gave the only semblance of a grouping of moderately anomalous soils and these are still well scattered. Thirteen soils ranging from 21 to 102 ppm as compared to a background of <2.0 ppm are located in the northeast grid between 82+00N and 92+00N and 70+60E to 75+40E. The area is for the most part on the tops or slopes of the hills found in that locality. Outcrop is quite abundant and overburden thin.

The area is underlain by mainly tuffs and augite porphyry intruded by hornblende diorite. Several rock samples collected in the area, usually containing pyrite, assayed only very low values in arsenic.

A contouring of the arsenic values on the northeast grid, using a low level threshold of 6 ppm As, clearly shows an increase in values in the northeast quadrant of the grid and including the area of high assays referred to above. It appears to be a halo effect related to the hornblende diorite intrusion.

A line of low level arsenic "highs" trends northwest from Semlin Lake. The source for these weak anomalies is unknown.

#### Exploration 2010 to 2011

A tent on Fat Ox Lake and prospecting was initiated around the area using a four-wheeler ATV. The approximate area where the 10g.Au soil sample was taken from was located and available was examined float. Collected a few of the more mineral samples and noticed the float seemed to have more mineralization in one area about 50 feet from the GPS points of the 10g area. The ten grams may have come from a small and very old possible drainage. So two holes were dug and sampled the soil

every six inches. Gold values increased with depth. Also took a large bag of soil from the entire hole and panned at the lake with no apparent gold content.

An old logging road was followed into the bridge zone on the four wheeler. An old drill hole was located and soil and float returned anomalous gold values. Climbed a knoll on my way back to the lake zone, while cutting across the hill noticed a distinct change in float indicating geological contacts so I took float and soil samples downhill from assumed contacts (Figures 9 & 10).

A pile of split core was found at the Lake Zone and went through it looking for any high-grade looking zones. Collected a few Quartz and or calcite bearing Argillite samples. Sampled along the Lake on outcrops and float with some interesting veining (Figure 9).

Prospected all around the "10 gram" area but found no evidence of past exploration work but for one area that may have been dug up at one time. Possibly a small trench near the top of a small hill. This matched up the area described in past reports. Found interesting float in hole and mineralized argillite. Kept a close eye on float as excavating continued and noticed a lot of pyrite finely disseminated as well as thin sheets in the argillite. Samples of rock float as well as dirt/soil was collected. Took a large amount of dirt down to the lake and panned the top and bottom half of the hole separately but no visible gold.

Future work should concentrate on the "10 g/tonne soil" and the Bridge Zone.

## Previous Geophysics

Previous geophysical work carried out on the property consisted of ground magnetometer and VLF-EM surveys as well as a two stage Induced Polarization and Resistivity survey. These surveys located a high resistivity, high chargeability zone straddled by VLF-EM conductors.

The present VLF-EM survey was carried out using the transmitting station at Jim Creek, Washington (near Seattle). Readings were taken facing easterly along the lines at 20m intervals.

Magnetometer readings were taken at 10m stations and correction for drift and diurnal changes were made by use of a base station recording magnetometer.

## Survey Results

The surveys were conducted on three grids as follows:

	<u>Mag</u>	<u>VLF</u>
S. E. Grid	22.77km	22.77km
N. W. Grid	9.12km	9.12km
N. E. Grid	52.50km	20.44km

The VLF survey on the N.E. grid did not cover all of the gridlines as the Seattle station shut down for two weeks and then never went back to its normal operating schedule until after the camp was demobilized.

The magnetometer survey results were plotted as plan maps of posted data and stacked profiles at a scale of 1:5000.

The VLF-EM survey results were plotted as stacked profile plan maps of the Fraser Filter data and as posted plan maps of the In-Phase and Quadrature data at scales of 1:5000. The Fraser Filter data was calculated as per the method put forth by D.C. Fraser (1969, Contouring of VLF-EM data; Geophysics V.34 p. 958-967).

## Discussion of Results

### Southeast Grid - VLF Survey

The predominant strike of the detected VLF conductors is 340" to 345" Az. Several barbed wire fences gave strong VLF conductors which overwhelmed all other features in their vicinity. The N-S fence at approximately 5200 E was also detected at the edge of a previous survey. Conductor (1) is detected on the east side of a dyke-like magnetic feature.

### Magnetic Survey

Two prominent dyke-like features numbered 1 and 2 were detected within a noisy magnetic zone between 5000E and 5400E on lines 5100N to 5900N.

### Northwest Grid – VLF Survey

The main conductor direction is approximately N-S with minor conductors at 340" Az. The most prominent feature other than fences is conductor 7 which does not show any relationship to magnetics or geologic contacts.

#### Magnetic Survey

Several weak magnetic features were detected.

#### Northeast Grid – VLF Survey

Minor conductors strike at 340" with the main direction being N-S. Anomaly 8 continues north from a long narrow lake and is thought to reflect a fault or shear zone.

#### Magnetic Survey

A strong magnetic anomaly on lines 9200N, 6300E to 9400N, 6200E, was detected and is the only major anomaly on this grid. A few boulders of magnetic basalt were found in the area indicating the anomaly may be due to a basalt dyke.

Extremely noisy readings were detected on the eastern portion of Lines 8400N to 9100N. These readings are in the sparsely treed hilly areas where there appears to have been numerous lightning strikes over the years and this may have caused isothermal remnant magnetization.

#### ROCK SAMPLES RESULTS

A total of 29 rock samples were collected and assayed for Au, Ag and As in 1987. Five of the samples were from float and the remainder from outcrop. The material was predominantly quartz veining with a few quartz-calcite veins and the remainder rock with variable amounts of pyrite.

The results were essentially negative for all three elements with all gold values <0.01 ppm and a maximum of 17 ppm As.

## GEOLOGY

### Property Geology

The Hi Ox Project is located on a window in the Miocene basalts which form the extensive plateau covering large areas of the southern central interior of British Columbia. The olivine basalts found locally essentially form the western and southern boundaries of the claims. The property is underlain by the Triassic Nicola Group; represented by augite andesite flows and breccia, tuff, argillite, greywacke and grey limestone.

Intrusives mapped in the general area are described as quartz monzonite and granodiorite.

### Local Geology

Rock exposure on the property is rare and poorly distributed. A few areas contain fairly numerous outcrops and sub-outcrops but these are separated by large areas of overburden cover. There is no indication that the overburden covered areas contain rocks different from those areas with outcrop.

The two basic rock types underlying the areas explored are tuffs and augite porphyry similar to those described in previous reports. They are interbedded and occur in roughly equal amounts. The tuffs are generally andesitic to siliceous and fine to medium grained with occasional coarser lapilli sized clasts. Coarse lithic lapilli tuffs and augite tuffs were noted occasionally.

The interbedded flows are almost all augite porphyry with considerable variation in size of the augite phenocrysts. Occasional andesite and quartz and quartz augite porphyry flows were seen. Augite porphyry agglomerate was noted in three locations. The only argillite seen was that previously mapped in the area of the southeast grid.

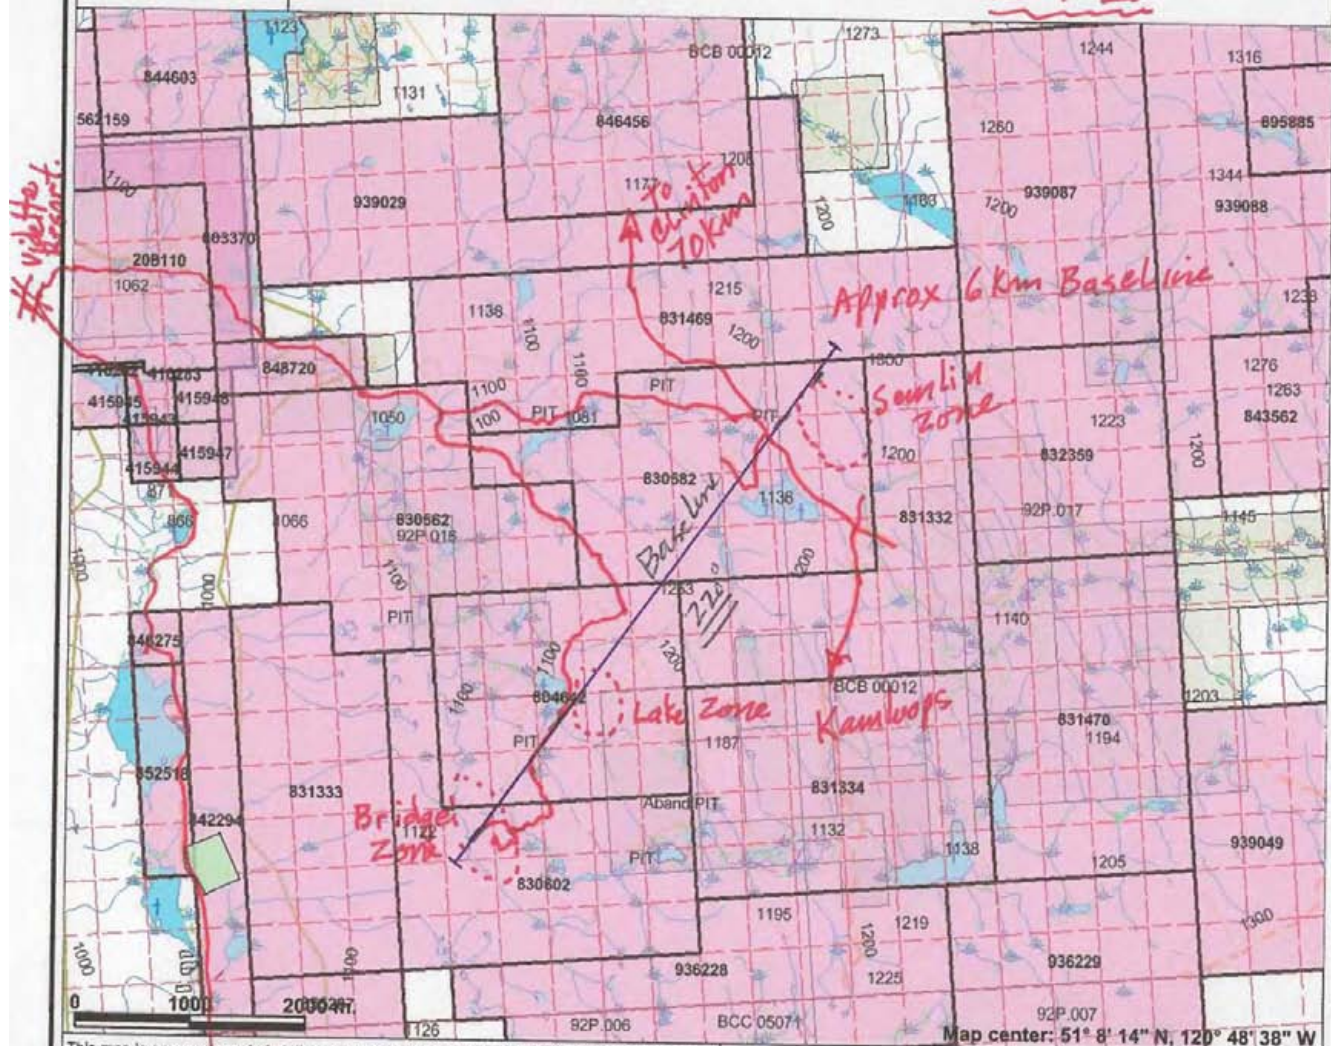

A small intrusion of fine to medium grained unaltered, dark hornblende diorite occurs in the northeast grid to the north of Semlin Lake. Smaller "satellite" exposures of similar material outcrop to the northeast of the main intrusion.

Clear attitudes on bedding are uncommon, but the general indicated strike on the northwest and northeast grids is northeast to east. On the southeast grid the strike is north-south. Shearing is quite widespread on the northeast grid with the development of schist in the more extreme cases. The strike is nearly always southeast with variable dips.

Alteration in the form of weak propylitization is widespread; particularly as to the development of carbonate. Chlorite is also frequently present but in minor amounts. Epidote is variable being most common in the northeast quadrant of the northeast grid. This area is believed underlain at shallow depths by the hornblende diorite intrusion exposed north of Semlin Lake. Outcrops near and to the northeast of this intrusion tend to be very weakly silicified and have a slightly metamorphosed or "cooked" appearance.

Pyrite was the only mineralization noted. It is fairly common as disseminated grains or occasionally as blebs in amounts varying from trace to three percent. In two or three locations pyrite was noted in veinlets and as fine grained massive mineralization over a few centimeters in quantities estimated as high as 25 percent.

Very fine hairline veinlets of quartz were moderately common. White, generally barren quartz veins to 20 cm were noted in several localities on all three grids; usually being exposed in old pits or trenches. A few similar type quartz veins were found in float.

## EXPLORATION 2012

The current VLF-EM, ground magnetometer and prospecting program was completed between December 1, 2011 and May 20, 2012.

Approximately 35 line kilometres of cut grid was established (Figures 9a-9e, pages 21-25). Due to the extreme blow-down and rotten wind-fall as a result of the Mountain Pine Beetle devastation in the forest three line cutters were employed but progress was unusually slow.

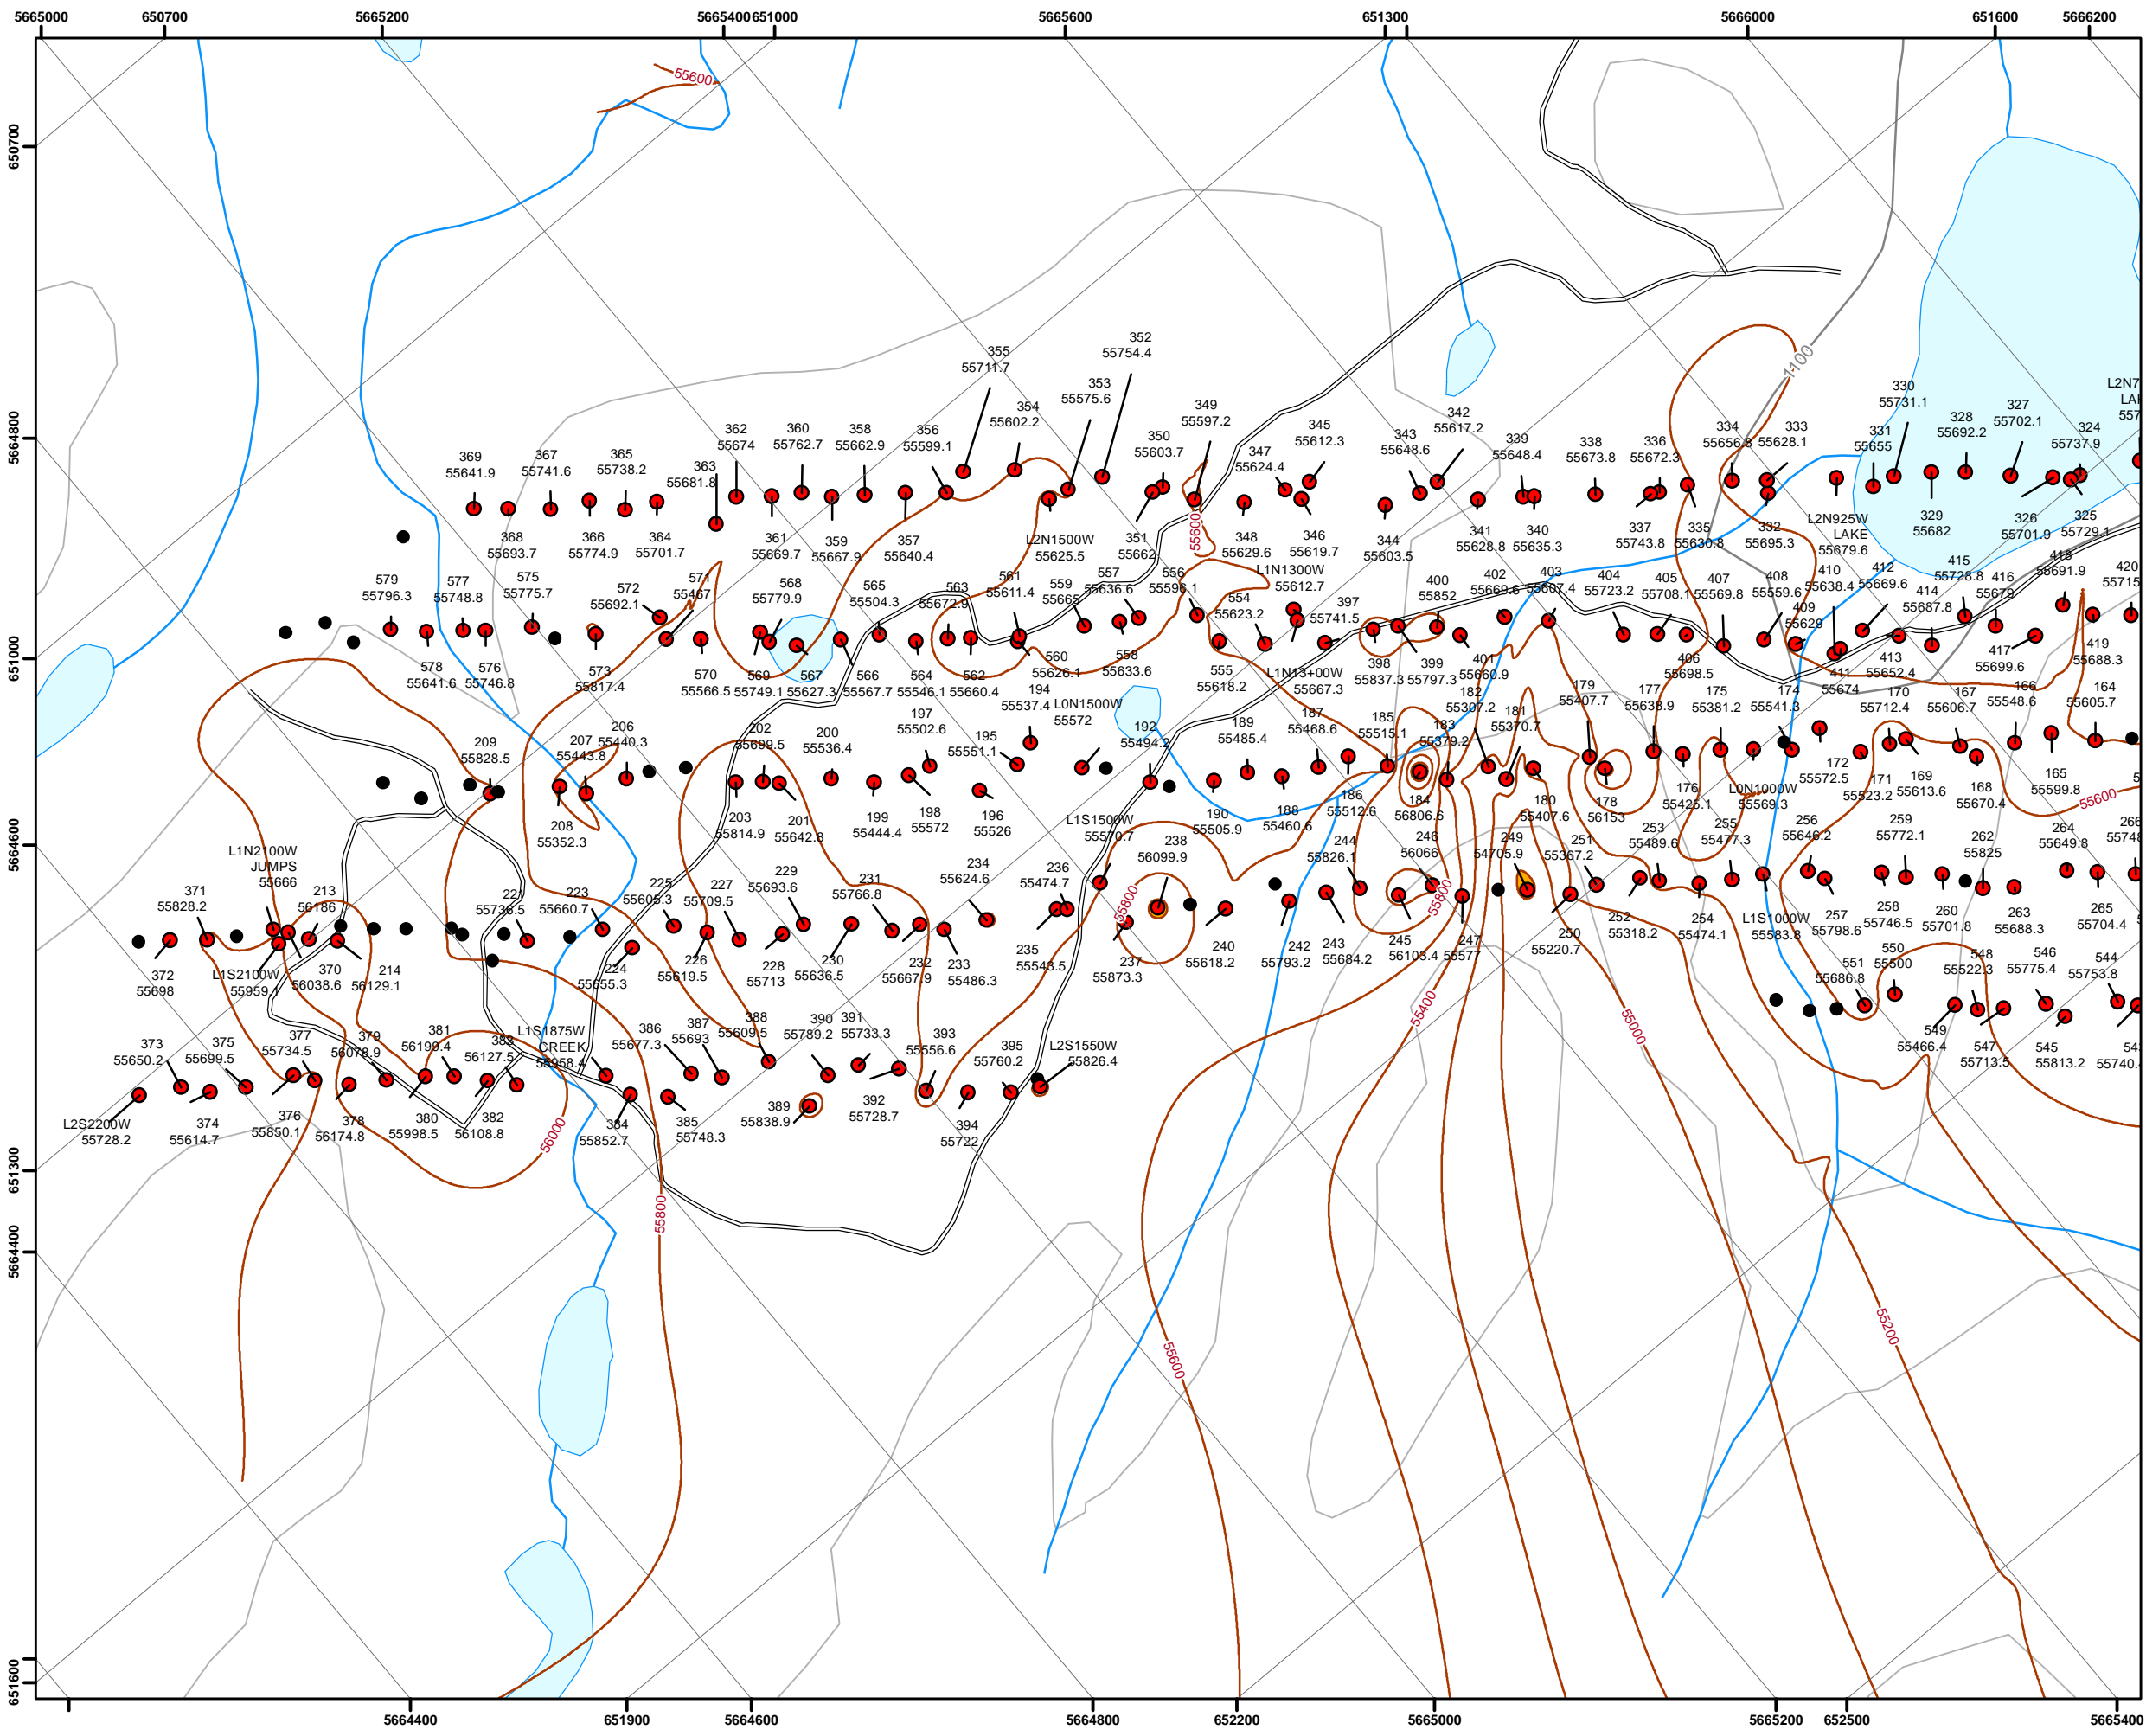

A VLF-EM and ground magnetometer survey was conducted by E. MacKenzie, a very experienced geophysical technician. Readings were taken at 25m intervals using the Seattle signal. Magnetometer readings were also taken at 25m intervals using a Sintrex Proton Magnetometer MX-1 model. Diurnal corrections were made from continuous readings taken from a base station operated at the same time as the mobile unit. Results are plotted on Figures 10a to 10d for the magnetics and Figures 11a to 11d for the VLF-EM.

The magnetics clearly show a complex pattern on the northeast and southwest parts of the grid which correspond to mapped altered (kaolinized) intrusives. Economic gold-bearing quartz veins are known to occur nearby (Vidette Gold Mine) hosted by altered intrusives.

The widespread low pattern of the magnetics in the central part of the grid is reflective of the siliceous argillite breccia which contains low gold values. A possible North Fault Zone is indicated to the south of "Beaver Lake".

The VLF-EM dip angles (Figures 11a-11d) illustrate north trending linear cross-overs on the west and just east of Semlin Lake near the intrusive contact. The most active VLF signature occurs to the south of Beaver Lake and may be related to the siliceous chalcedonic argillite breccia which contains low gold values.

Prospecting and geological mapping is strongly recommended to the south of Beaver Lake.

## **SAMPLE PREPARATION and ANALYSIS**

### **Sample Preparation for Gold analysis by Fire Assay / AAS**

Rock samples are first prepared in the analytical laboratory by ring crushing to -200 mesh. The -200 mesh material is analyzed by employing the following procedures:

(a) 10.00 to 30.00 grams of sample was weighed into a fusion pot which contained a combination of fluxes such as lead oxide, sodium carbonate, borax, silica flour, baking flour or potassium nitrate. After the sample and fluxes had been mixed thoroughly, some silver in quartz and a thin layer of borax was added on top.

(b) The sample was then charged into a fire assay furnace at 2000 F for one hour, at this stage, lead oxide would be reduced to elemental lead and slowly sunken down to the bottom of the fusion pot and collected the gold and silver along the way.

After one hour of fusion, the sample was then taken out and poured into a conical cast iron mould, the elemental lead which contained precious metals would stay at the bottom of the mould and any unwanted materials called slag would float on top and be removed by hammering, a "lead button" is formed.

(d) The lead button was then put back in the furnace onto a preheated cupel for a second stage of separation, at 1650 F, the lead button became liquefied and absorbed by the cupel, but gold and silver which had higher melting points would stayed on top of the cupel.

(e) After 45 minutes of cupellation, the cupel was then taken out and cooled, the dore bead which contained precious metals was then transferred into a test tube and dissolved in hot Aqua Regia solution heated by a hot water bath.

(f) The gold in solution is determined with an Atomic Absorption spectrometer. The gold value, in parts-per-billion, or grams-per-tonne is calculated by comparison with a set of known gold standards.

### **Quality Control**

Every fusion of 24 pots contains 22 samples, one internal standard or blank, and a random reweigh of one of the samples. Samples with anomalous gold values greater than 1000 ppb are automatically checked by Fire Assay/AA methods. Samples with gold values greater than 10000 ppb are automatically checked by Fire Assay/Gravimetric methods.

### **Sample Preparation for 32 element analysis by Aqua Regia digestion/ICP (Soil and Rock Samples)**

(a) 0.50 grams of sample is digested with diluted Aqua Regia solution by heating in a hot water bath, at about 95 Celsius for 90 minutes, then cooled and bulked up to a fixed volume with de-mineralized water, and thoroughly mixed. Digested samples are let to settle over night to separate residue from solution.

(b) The specific elements are determined using an Inductively Coupled Argon Plasma spectrophotometer. All elements are corrected for inter-element interference. All data are subsequently stored onto computer diskette.

## Quality Control

The machine is first calibrated using three known standards and a blank. The test samples are then run in batches.

A sample batch consists of 38 or less samples. Two tubes are placed before a set. These are an in-house standard and an acid blank, which are both digested with the samples. A known standard with characteristics best matching the samples is chosen and placed after every fifteenth sample. After every 38th sample (not including standards), two samples, chosen at random, are re-weighed and analyzed. At the end of a batch, the standard and blank used at the beginning is rerun. The readings for these knowns are compared with the pre-rack knowns to detect any calibration drift.

Note: Some elements may not be completely digested by Aqua Regia,

The International Plasma Labs Ltd. Quality Assurance program includes specifications for sample preparation, analytical quality control using reference materials and standards to check equipment, sample blanks and internal duplicate samples processed at random intervals. Quality Assurance meetings with staff are held regularly to address issues that come up as a result of quality system failures, analytical equipment problems and issues raised by clients

Future Field work (both soils and drill core) at Hi Ox should collect duplicate samples, blanks and standards and insert them in the sample stream before sending them to the lab.

## SECURITY

Clear Creek Gold Corp. personnel collected soil samples at a depth of 10 cm to 25 cm, from the "B" soil horizon which is the generally accepted location within the soil column that is commonly employed by the exploration industry. The samples were placed in water resistant Kraft soil bags. The samples were numbered (LP20 0 + 800) using a property identifier (LP), field map sheet number (20) and station number representing metres from a starting location represented by 0 + 000 where a station such as 1+000 equals 1000 metres from 0+000. The locations of each sample were located on a base map with respect to its position along the various logging roads using a metric calibrated chaining machine and a handheld GPS unit. Clear Creek Gold Corp. personnel to record the UTM coordinates of each sample site. For the most part, soil samples were collected at approximately 50 m intervals along the banks of the numerous access logging haul roads. Where occurrences of sulphide mineralization were identified in adjacent outcrops, the sample interval was changed to 25 metre spacing. No sampling or recovery factors were encountered in the soil sampling program that could have materially impacted the accuracy and reliability of the results

Rock samples were collected as grab samples from the small outcrops that were intermittently exposed along the road cuts. The grab samples were collected by chipping across the small outcrops without repeating the inclusion one part of the outcrop to the exclusion of another part to eliminate sample bias. As the outcrop exposures were small (generally less than 60 cm across) and due to the reconnaissance nature of the exploration program, complete sections of mineralized zones were not exposed. As a result, rock grab samples across specific mineralized widths of the outcrops were not within the scope of work for this program as this would involve extensive trenching using heavy machinery to expose a complete section of mineralized material. The grab samples were collected in

such a manner as to not duplicate any particular portion of the outcrop in order to mitigate against biasing or “high grading” the sample. The rock samples were placed in the standard heavy gauge (6 ml) plastic bags which were sealed using zip straps. The samples were also numbered in the same manner as the soil samples as previously described. The sample locations were also plotted on a base map each day with respect to its position along the various logging roads using a metric calibrated chaining machine and a handheld GPS unit. When plotted on the base map the rock samples were given a different symbol than that used for the soil samples to avoid confusion.

Each sample site was marked using flagging tape so a person could readily return to the exact location where the sample was originally collected. If the flagging was removed, a person could return to the sample location using the GPS coordinates. The samples were transported directly from the field to the laboratory by Clear Creek Gold Corp. exploration contractor Homegold Resources Ltd. experienced senior personnel under a chain of custody form listing the samples by number and the analyses to be performed.

## **ADJACENT PROPERTIES**

A number of claims are situated on all sides of the Hi Ox, extending largely to the north and south. The author is not aware of any significant occurrences in the immediate vicinity of the Hi Ox. Relevant comments are contained in History, Section 6.0.

## **OTHER RELEVANT DATA and INFORMATION**

The author is not aware, at the time of writing, of other relevant data that would further contribute to the understanding of the status or potential of the subject property.

## INTERPRETATIONS and CONCLUSIONS

Mapping on the property has found a generally monotonous sequence of tuffs and flows with propylitic alteration and minor pyritic alteration. No additional beds of argillite were found.

Sampling of quartz and calcite veining and of sulphides in both outcrop and float has proven to return very interesting values of Au, Ag and As.

Soil sampling for Au, Ag, As and Hg shows values up to 10ppm Au. Previous results on the Depression Lake and Bridge zones were weak but anomalous and generally consistent with the drill indicated mineralization.

Magnetometer and VLF-EM surveys have indicated some dyke and fault structures.

At least two styles of mineralization are present on the property. At the Depression and Lake Zones, mineralization consists of a chalcedonic quartz stockwork and calcite veining within an argillite breccia and a quartz vein hosted in andesite tuff (Assessment Report 15143). Locally disseminated pyrite is found in tuff at the Lake zone. At the Bridge zone, a vein system is hosted by quartz diorite (Assessment Report 15987), where Hole 85-4 ran from 30 to 40 feet 4700 ppb gold. A two foot sections assayed 0.729 oz./ton gold. An assay of 1800 ppb gold was obtained in a rock chip sample from a trench on the Lake zone (Assessment Report 14101).

In 1985, a program of rock chip sampling (32 samples), soil sampling (1260 samples), linecutting, induced polarization surveying (14.3 kilometres), magnetometer surveying (28 kilometres), VLF-EM surveying (28 kilometres), reverse circulation percussion drilling (9005 metres in 20 holes) and diamond drilling (183 metres in 4 holes) was carried out. Placer Development Limited optioned the property and in 1986 (Assessment Report 15987) completed additional induced polarization surveys (12 kilometres) and four diamond-drill holes (526 metres). In 1987, Placer Development completed additional rock chip and soil geochemical surveys, geological mapping, magnetometer and VLF-EM surveys (Assessment Report 16617).

In 2010 to 2011, a program of area reconnaissance, road traverses and prospecting was completed. Previously discovered showings were examined and rock samples collected. Assay results confirm the presence of stockwork gold mineralization.

The 2012 program of VLF-EM, ground magnetometer and geological mapping was completed between December 1, 2011 and May 20, 2012.

Respectfully submitted,

J. T. Shearer, B.Sc., P.Geo.

## RECOMMENDATIONS

### Phase 1 to 3 Cost Estimates

#### Phase 1: Soil Geochemistry, Prospecting, Mapping, Geophysics

2 Geologist, 2 Prospectors for 25 days	\$ 40,000.00
Linecutting	15,000.00
Assays	8,000.00
IP and Mag Survey	30,000.00
Support	15,000.00
15% Contingency	14,000.00
Subtotal	<u>\$ 122,000.00</u>

#### Phase 2: Trenching, Geophysics

2 Geologists, 2 Assistants for 25 days	\$40,000.00
Trenching	30,000.00
Assays	17,000.00
IP and Mag Survey Extensions	30,000.00
Support	15,000.00
15% Contingency	20,000.00
Subtotal	<u>\$ 152,000.00</u>

#### Phase 3: Diamond Drilling

1 Geologist, 1 Assistant for 50 days	\$50,000.00
Diamond Drilling, 3,000m @ \$120/m	360,000.00
Assays	20,000.00
Support	25,000.00
15% Contingency	68,000.00
Subtotal	<u>\$ 523,000.00</u>

**TOTAL** **\$797,000.00**

## **STATEMENT of QUALIFICATIONS**

**June 15, 2012**

## STATEMENT of QUALIFICATIONS

I, Johan T. Shearer of Unit 5 – 2330 Tyner Street, in the City of Port Coquitlam, in the Province of British Columbia, do hereby certify:

1. I graduated in Honours Geology (B.Sc., 1973) from the University of British Columbia and the University of London, Imperial College, (M.Sc. 1977).
2. I have practiced my profession as an Exploration Geologist continuously since graduation and have been employed by such mining companies as McIntyre Mines Ltd., J.C. Stephen Explorations Ltd., Carolin Mines Ltd. and TRM Engineering Ltd. I am presently employed by Homegold Resources Ltd.
3. I am a fellow of the Geological Association of Canada (Fellow No. F439). I am also a member of the Canadian Institute of Mining and Metallurgy, the Geological Society of London and the Mineralogical Association of Canada. I am a member in good standing of the Association of Professional Engineers and Geoscientists of British Columbia (P.Geo., Member Number 19,279).
4. I am an independent consulting geologist employed since December 1986 by Homegold Resources Ltd. At Unit #5 2330 Tyner Street, Port Coquitlam, British Columbia.
5. I am the author of the report entitled “Geological and Geophysical Assessment Report on the Hi Ox Gold Property” dated June 15, 2012.
6. I have visited the property January 6, 7, 11, 15, 16, 20 and 30, 2012 and supervised the crew in 2012. I have carried out mapping and sample collection and am familiar with the regional geology and geology of nearby properties. I have become familiar with the previous work conducted on the Hi Ox Gold Project by examining in detail the available reports and maps and have discussed previous work with persons knowledgeable of the area.

Dated at Port Coquitlam, British Columbia, this 15<sup>th</sup> day of June, 2012.

J.T. Shearer, M.Sc., P. Geo.

# **APPENDIX IV**

## **SAMPLE DESCRIPTIONS**

**June 15, 2012**

## Rock Descriptions Hi Ox Project

	Location	Description
(1)	Baseline 0750N (Float)	Slightly rusty weathering, whitish-grey, relatively fine grained, bleached, angular rusty vugs common, traces of oxidized pyrite throughout – ALTERED QUARTZITE
(2)	L1800N + 600W	Brownish weathering, light green, fine grained parallel fractures prominent, small mainly <1cm mafic (chloritic) clots throughout (possibly relict hornblende) – ANDESITIC LAPILLI TUFF
(3)	L1400N + 180E	Slightly rusty weathering, streaked with rust coated fractures, highly kaolinized, fine grained, somewhat friable – EXTREMELY ALTERED INTRUSIVE
(4)	Baseline 0600N (Float)	Brownish weathering, nodular texture, fine to medium grained, light green colour, matrix is slightly darker green – ANDESITIC AGGLOMERATE
(5)	051	Fine grained, dark green colour, sharp hackly fracture, perhaps tuffaceous, siliceous mudstone
(6)	1800N + 950W	Dark grey weathering, greenish-brown colour, very fine grained, minor chloritized hornblende – ANDESITIC TUFF
(7)	L0400N + 50W	Brownish-light rusty weathering, moderately kaolinized, <u>cut by hairline quartz veinlets</u> ; abundant quartz eyes, minor muscovite, traces of argite – KAOLINIZED MONZONITE
(8)	100n + 250W	Dull brown weathering, hypidiomorphic granular, relatively fresh intrusive, dark grey-black colour, over 50% mafics – FRESH HORNBLLENDE DIORITE
(9)	Baseline 0900N	Light brown weathering, dark grey, very fine grained, concave fracture – TUFFACEOUS MUDSTONE
(10)	L1400N + 450E	Light grey, fine grained, minor hornblende, angular fractures – ANDESITIC TUFF
(11)	L1400N + 510E	Light brown to white weathering, dark grey colour, finely crystalline sparse hornblende, fresh appearance – ANDESITE
(12)	L1400N + 150E	Medium grey weathering, siliceous appearance, well fractured – ANDESITIC TUFF
(13)	BL 12-1 Lake Showing	0.009 ppm Au, siliceous black argillite
(14)	BL 12-2 Lake Showing	0.035 ppm Au, siliceous black argillite
(15)	BL 12-3 Lake Showing	0.088ppm Au, 0.6 ppm Au, greenish, andesitic tuff
(16)	BL 12-4 Lake Showing	0.112 ppm Au, silicified black argillite
(17)	BL 12-5 Road Showing	0.007 ppm Au, Andesite tuff
