INTRODUCTION

The Tagai property is being explored for copper±gold porphyry potential. It lies within Stikine Terrane, which hosts numerous, significant bulk-tonnage, base and precious metal deposits. The Tagai property is located in central British Columbia and is wholly owned by Strategic Metals Ltd.

This report describes property access and geomorphological surveys, geochemical surveys, line cutting and reverse circulation drilling (557.78 m in 23 holes) that were conducted between September 28 and October 15, 2012 by Archer, Cathro & Associates (1981) Limited on behalf of Strategic Metals. A. Mitchell participated in and directed the field work and interpreted all resulting data, under the supervision of S. Drechsler. Their Statements of Qualifications are provided in Appendix I. The Statement of Costs is given in Appendix II.

PROPERTY LOCATION, MINERAL TENURE DATA AND ACCESS

The Tagai property is located in central British Columbia at latitude 53°29' north and longitude 123°54' west on NTS map sheet 093G/05 (Figure 1). The property comprises seven contiguous mineral tenures covering approximately 3450 ha (34.5 km²). The mineral tenures are registered in the name of Archer Cathro, which holds them in trust for Strategic Metals. Specifics concerning the mineral tenures are tabulated below, while the locations of individual tenures are shown on Figure 2.

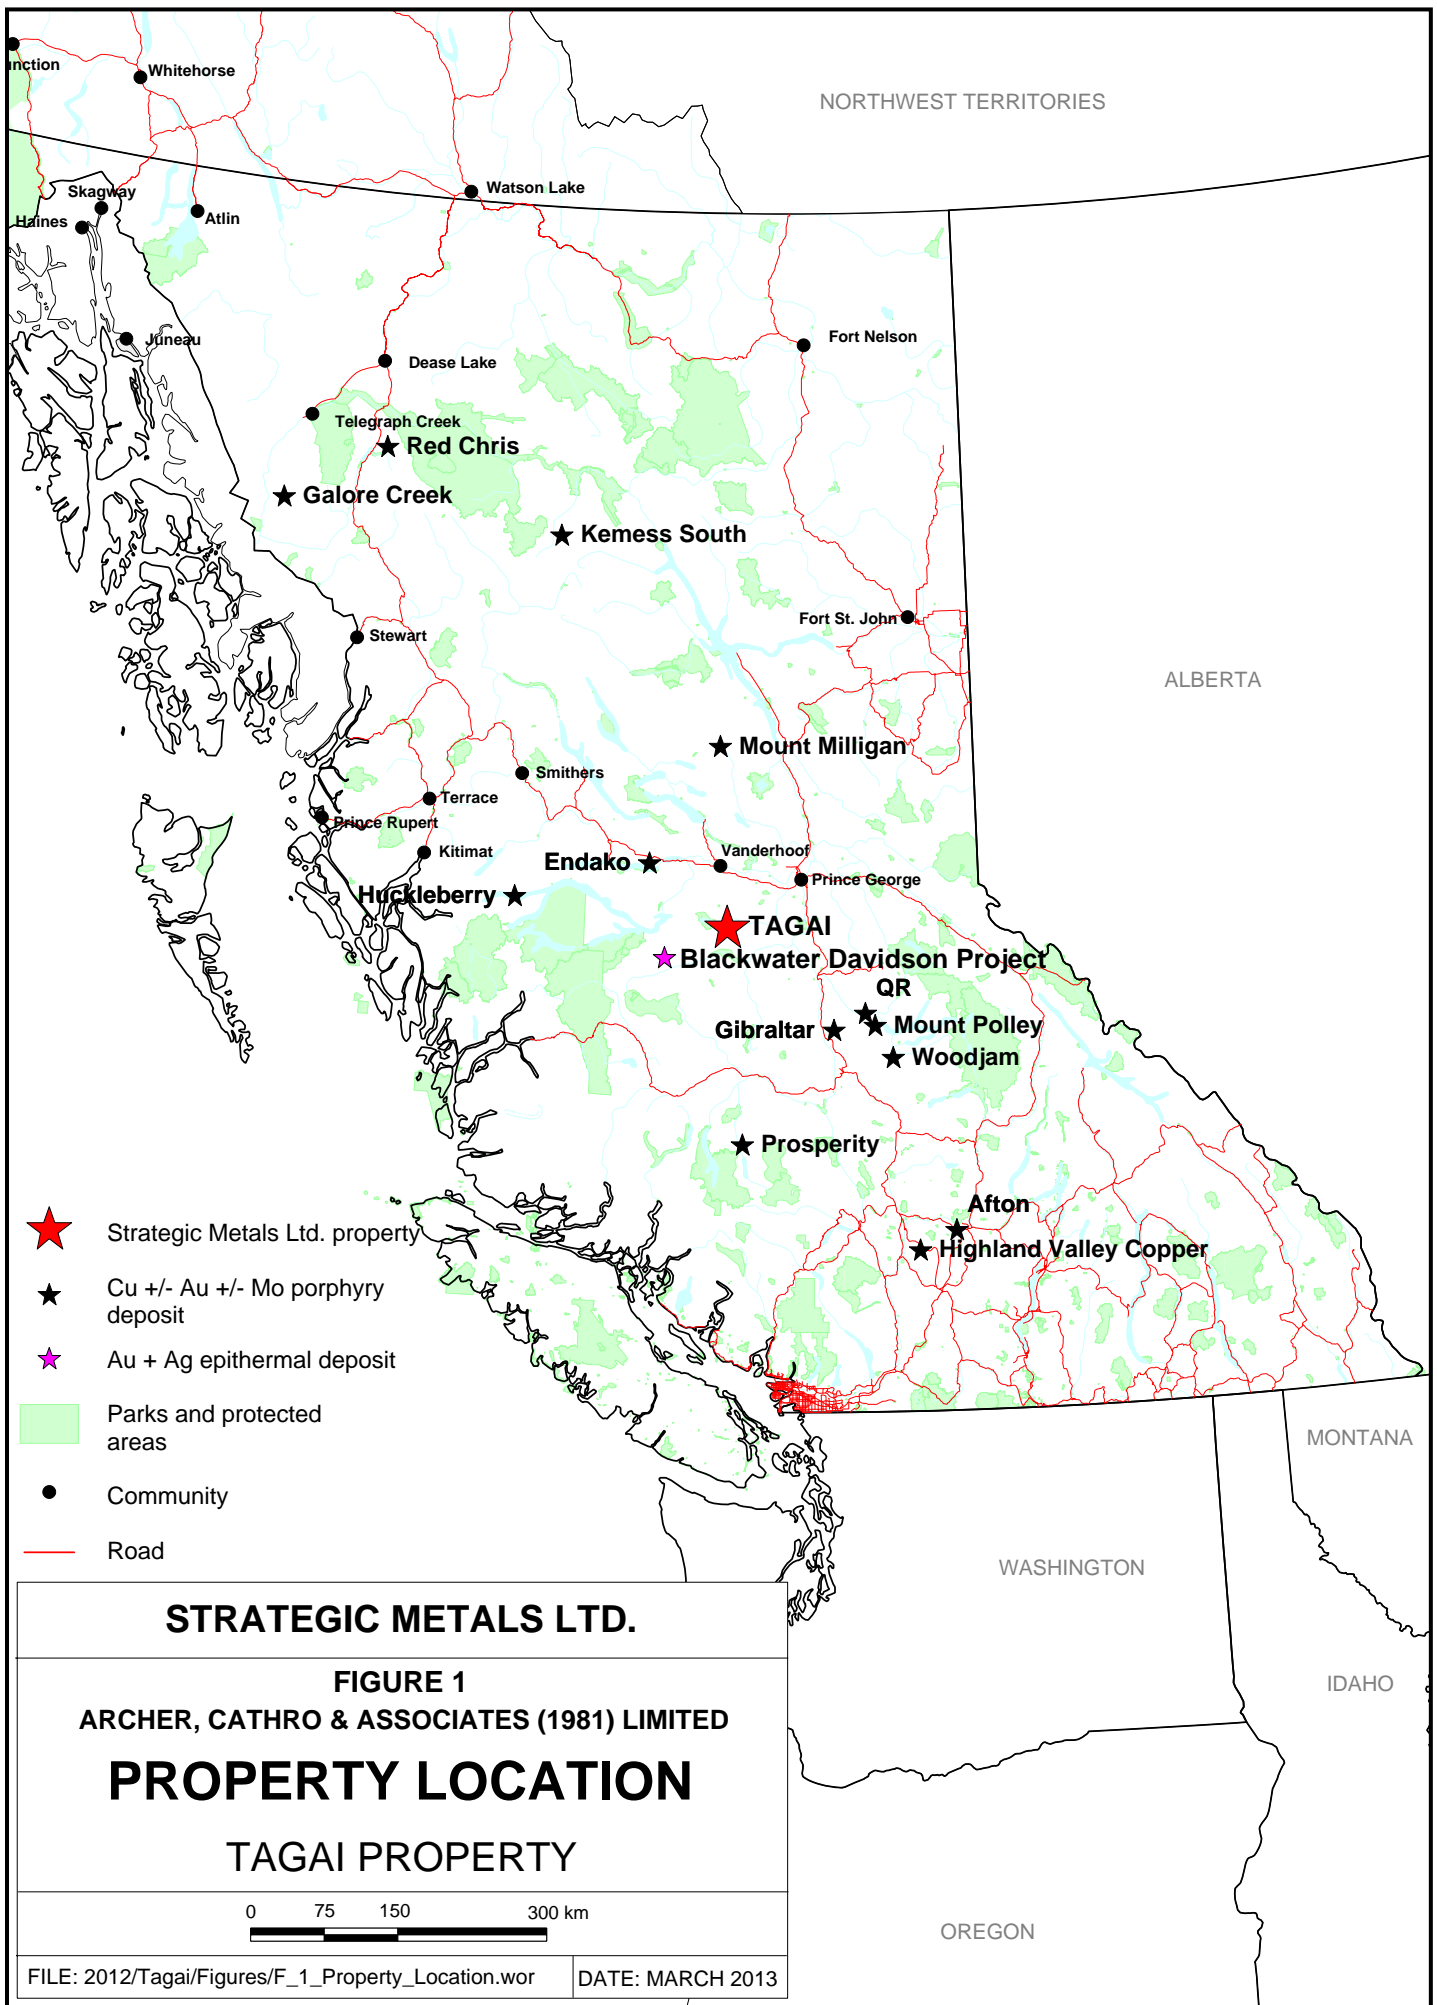

<u>Tenure Name</u>	<u>Tenure Number</u>	<u>Expiry Date*</u>
Tagai 1-2	551136-551137	Feb 6, 2023
3	551140	Feb 6, 2023
4	551146	Feb 6, 2023
5	551149	Feb 6, 2023
6	705476	Feb 6, 2023
7	705477	Feb 6, 2023

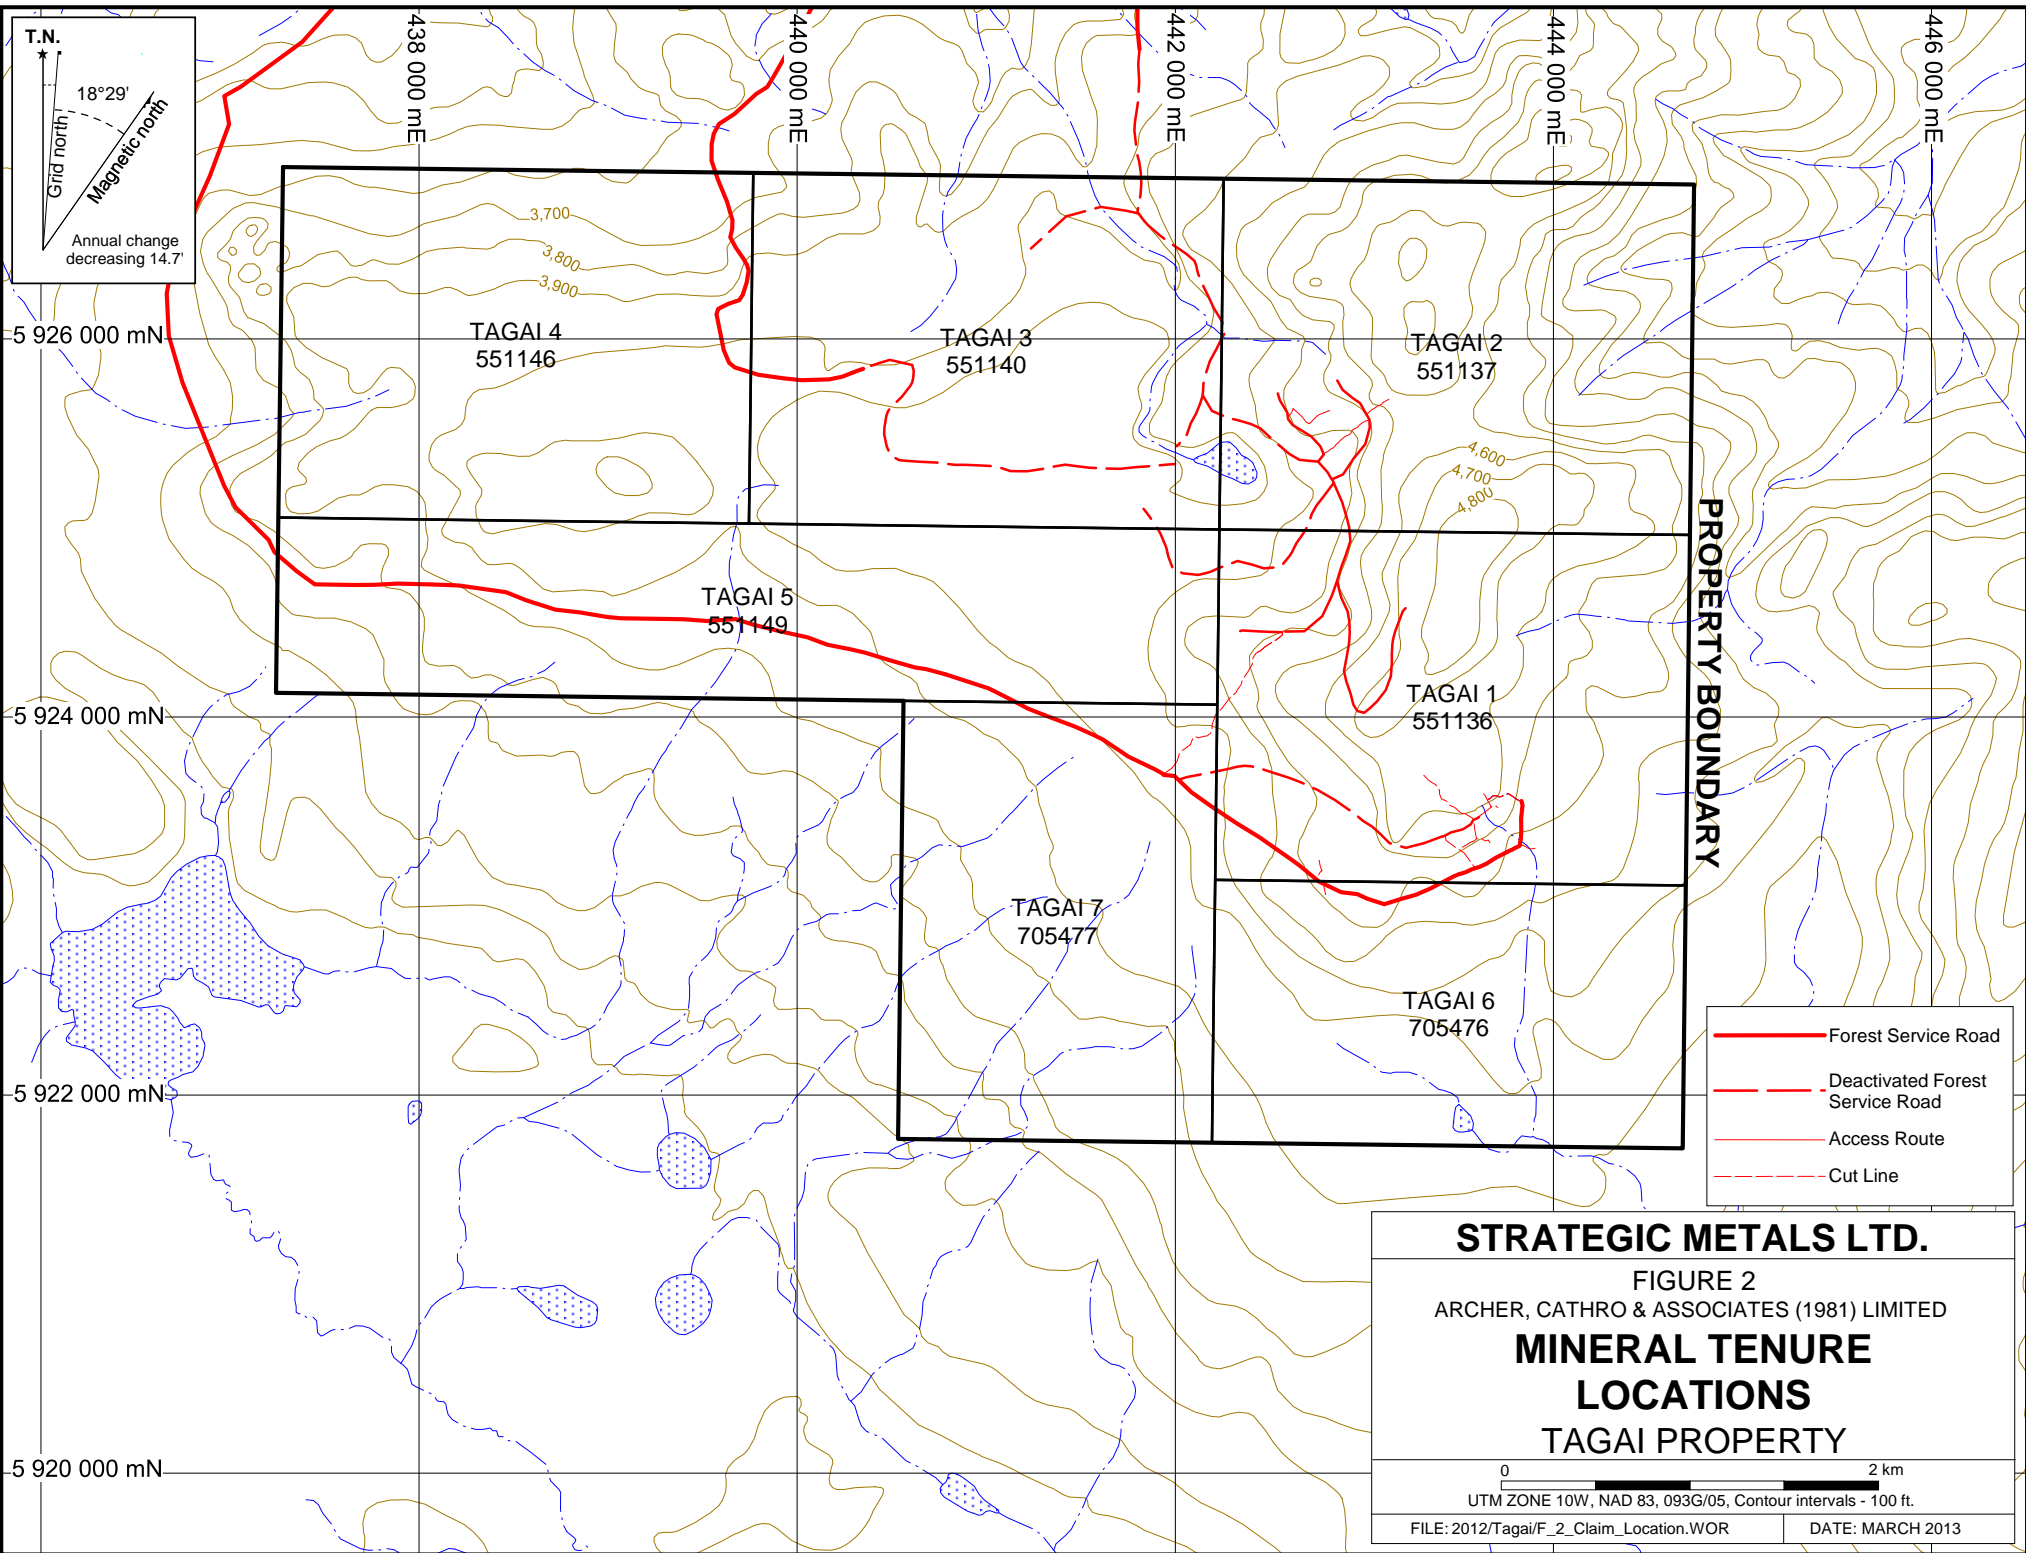

* Expiry dates include 2012 work that has been filed for assessment credit but not yet accepted.

Access to and from the property was by four-wheel drive trucks using an extensive system of logging roads that extend south from Highway 16. This highway connects the nearby communities of Endako, Fraser Lake, Fort Fraser and Vanderhoof with Prince George to the east and the ports of Kitimat and Prince Rupert to the west. The property lies about 145 km west-southwest of Prince George, which is located 784 km by road north of Vancouver. Prince George is the major supply centre and transportation hub for the region. All personnel stayed at the Finger Lake Wilderness Resort, situated 90 km by road from the property and 55 km southwest of Vanderhoof. Vanderhoof is accessible in all seasons using two-wheel drive vehicles.

HISTORY AND PREVIOUS WORK

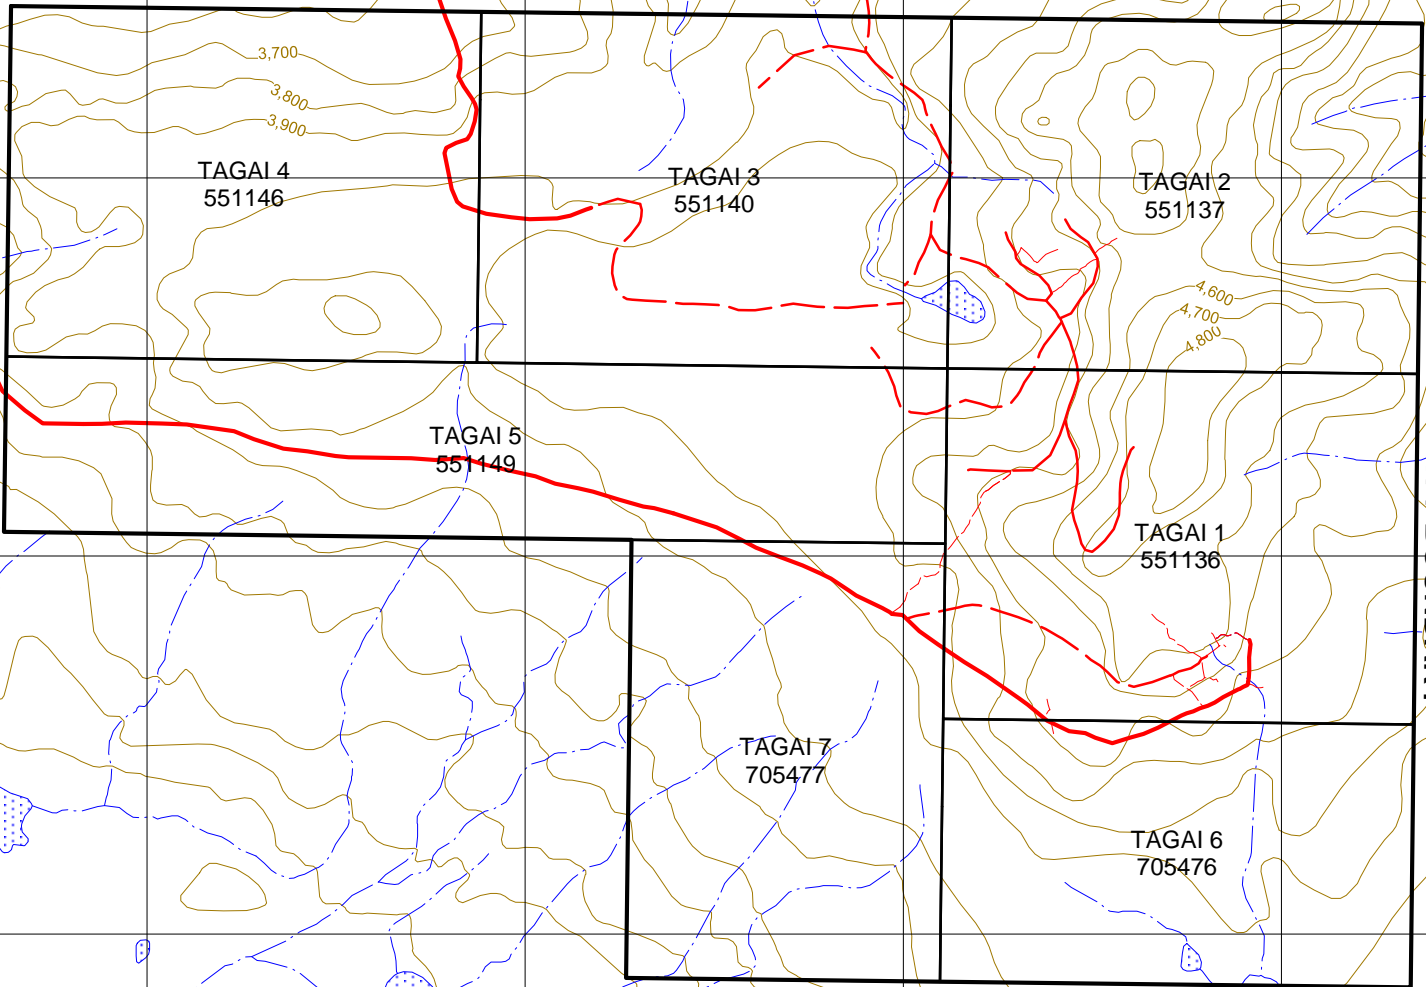

In March 2007, Strategic Metals optioned the Tagai 1 to 5 mineral tenures from F. Critchlow, an independent prospector who had previously discovered mineralized float in the area. That year,

Strategic Metals conducted reconnaissance-scale soil/till geochemical sampling and prospecting (Wengzynowski, 2008).

In August 2008, Strategic Metals commissioned Geotech Ltd. to fly helicopter-borne magnetic and variable time domain electromagnetic (VTEM) surveys across the property (Wengzynowski and Smith, 2009).

In spring 2009, Condor Consulting Ltd. completed a brief interpretation of Strategic Metals' geophysical data. Later that year, Strategic Metals performed minor prospecting and deep-profile, grid till geochemical sampling to follow up geophysical targets in the eastern half of the property (Wengzynowski and Smith, 2009).

In fall 2010, Korax Explorations Inc. cut five northeasterly oriented lines across the Chilako and Tagai zones, along which Aurora Geosciences Ltd. performed induced polarization and resistivity surveys (Smith and Eaton, 2011).

In winter 2010, Condor Consulting processed the induced polarization and resistivity data on behalf of Strategic Metals, and integrated it with data from the 2008 versatile time domain electromagnetic and magnetic surveys (Smith and Eaton, 2011).

In February 2010, Strategic Metals staked two additional, contiguous mineral tenures (Tagai 6 and 7) along the southern edge of the property.

In October 2011, Strategic Metals earned a 100% interest in the Tagai 1 to 5 mineral tenures.

Results from all programs are described in the Mineralization, Soil Geochemistry and Geophysical Surveys sections.

GEOMORPHOLOGY

The property is located on the Interior Plateau, which is characterized by rolling hills separated by broad, often poorly drained valleys with many small lakes and glacial features such as drumlins, eskers and till grooves. The area has been extensively glaciated, with the local ice movement directed mainly northeasterly to easterly (Tipper, 1963).

The property lies within the Chilako River watershed. Creeks on the property drain into the Fraser River, which ultimately discharges into the Pacific Ocean. The Chilako River area is usually snow free from early May until mid to late October.

The southwestern two-thirds of the property covers gentle, relatively flat-lying terrain, while the northeastern third is characterized by low-lying hills. Local elevations range from about 1100 to 1460 m above sea level. Outcrop is rare and is limited to road cuts and steep slopes along ridges and hilltops. Soil/till cover typically ranges from 1 to 20 m thick. Low lying areas on the property are defined by swamps with small lakes and ponds.

Several deactivated cut blocks are present within the property and an area within the Tagai 3 mineral tenure is actively being logged. Vegetation primarily comprises spruce and pine trees with an understory of moss and grass.

GEOLOGY

The Tagai property lies in the Nechako Basin within Stikine Terrane (Figure 3). Stikine Terrane is an exotic terrane that was accreted to the ancestral North American continent in the Early Mesozoic. It extends the length of British Columbia and comprises rocks of almost exclusively intra-oceanic island arc affinity (Anderson, 1993).

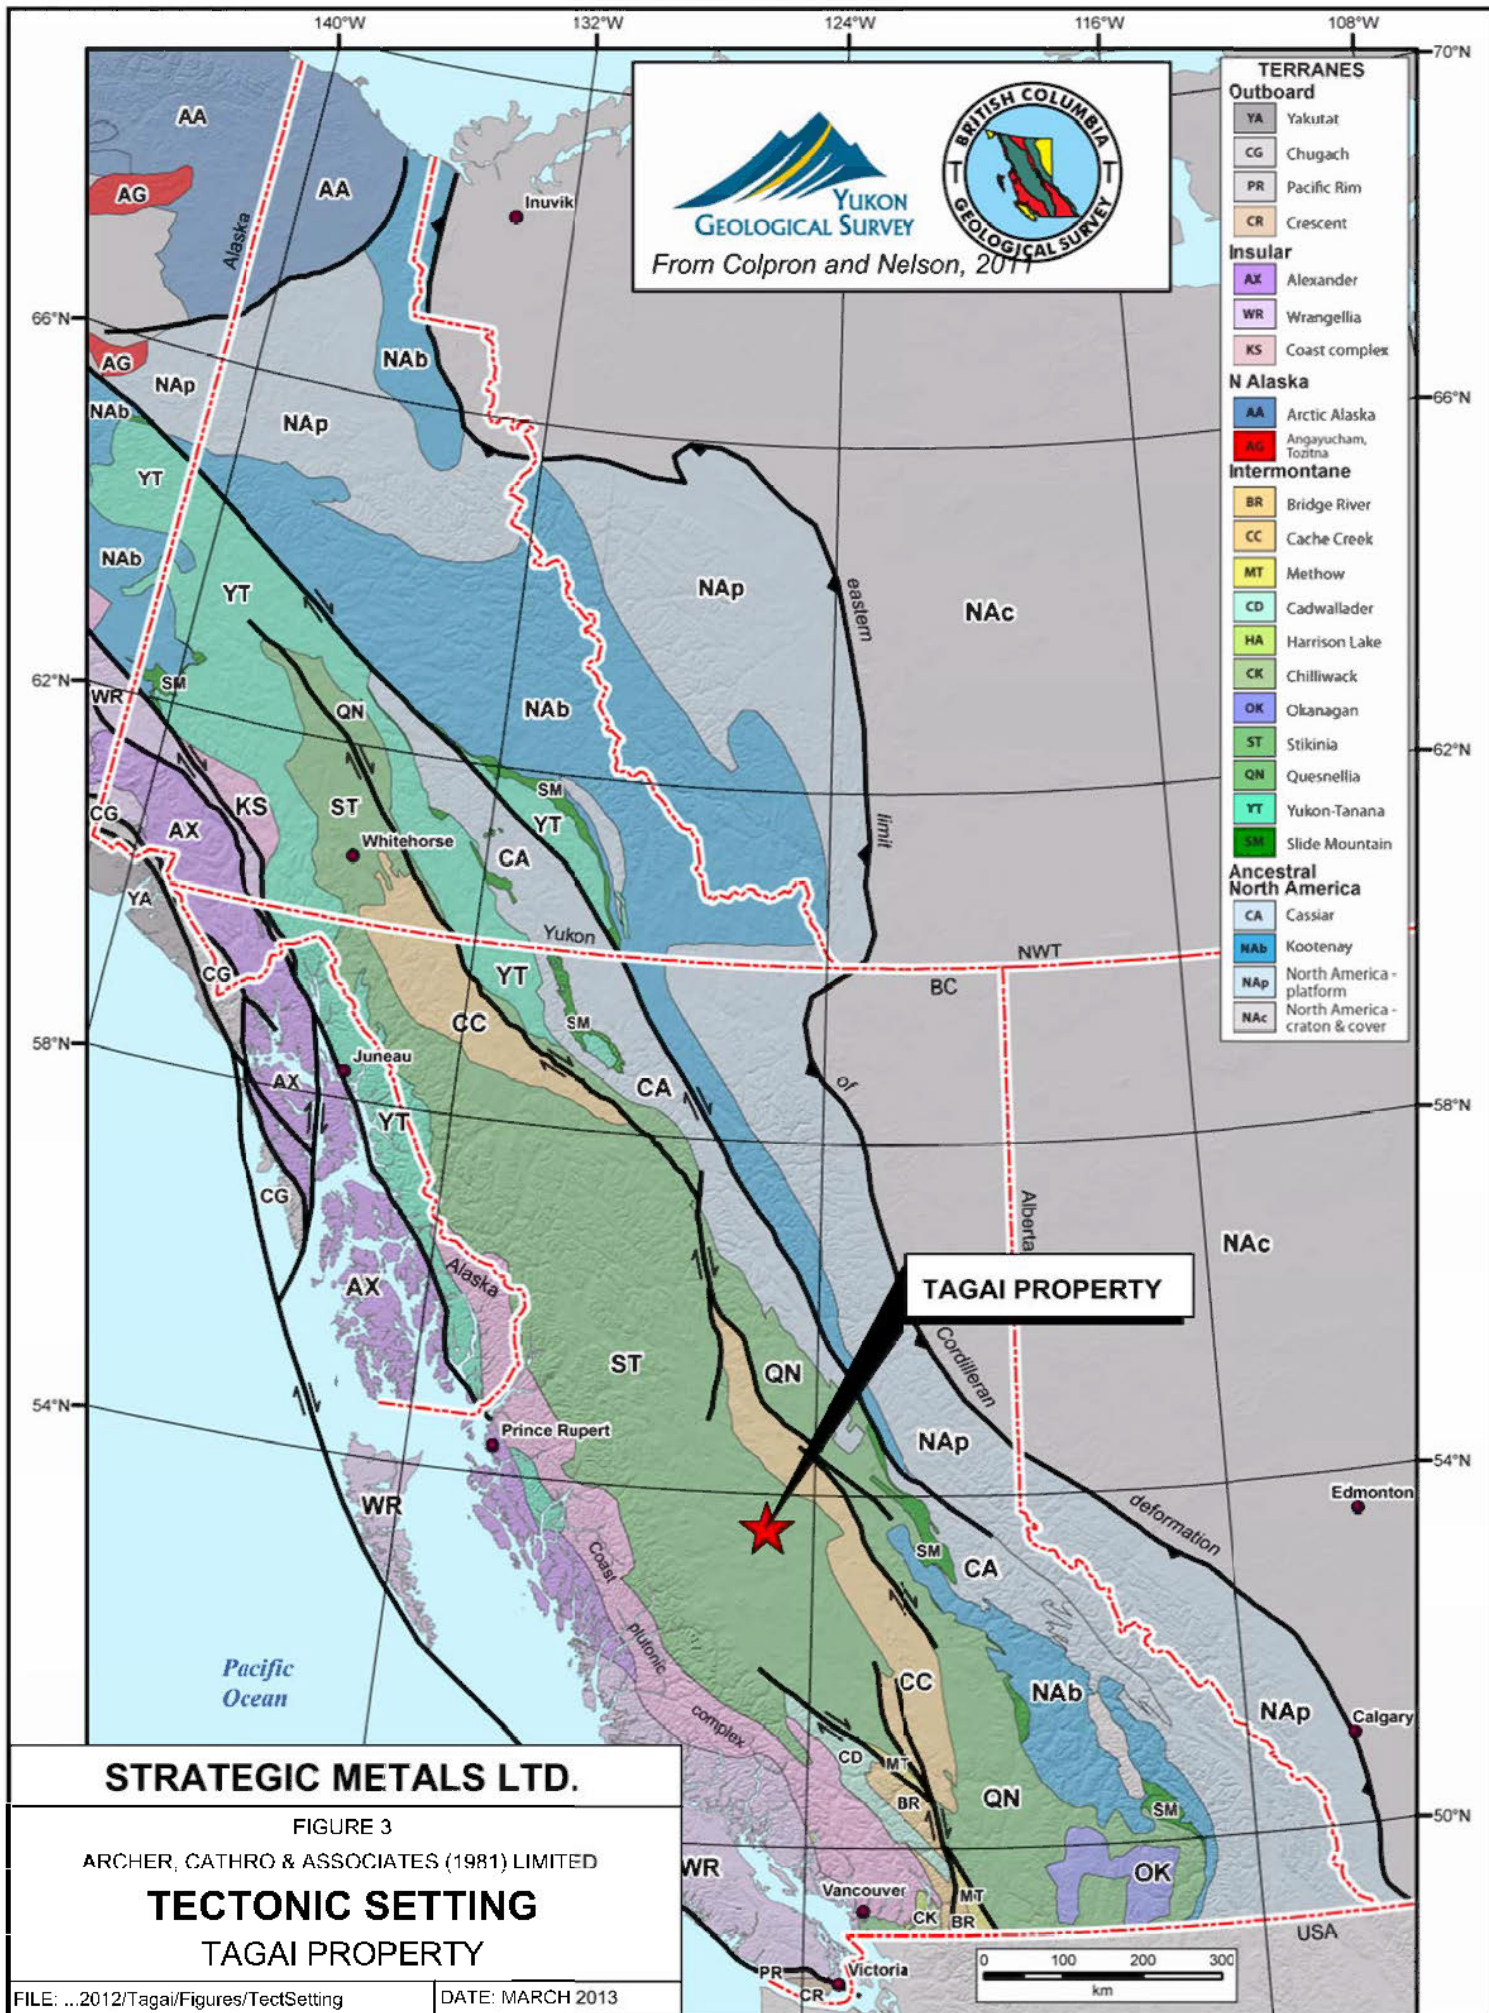

The Nechako Basin formed as Middle Jurassic terrane collisions elevated the Skeena Arch, separating the Nechako Basin from the Bowser Basin to the north. Cretaceous compressional and transform tectonism caused bordering uplands to shed coarse clastic debris into the Nechako Basin. Tertiary strike-slip faulting laterally displaced surrounding terranes, and numerous volcanic events mantled much of the basin with basaltic flows (Hayes, 2004).

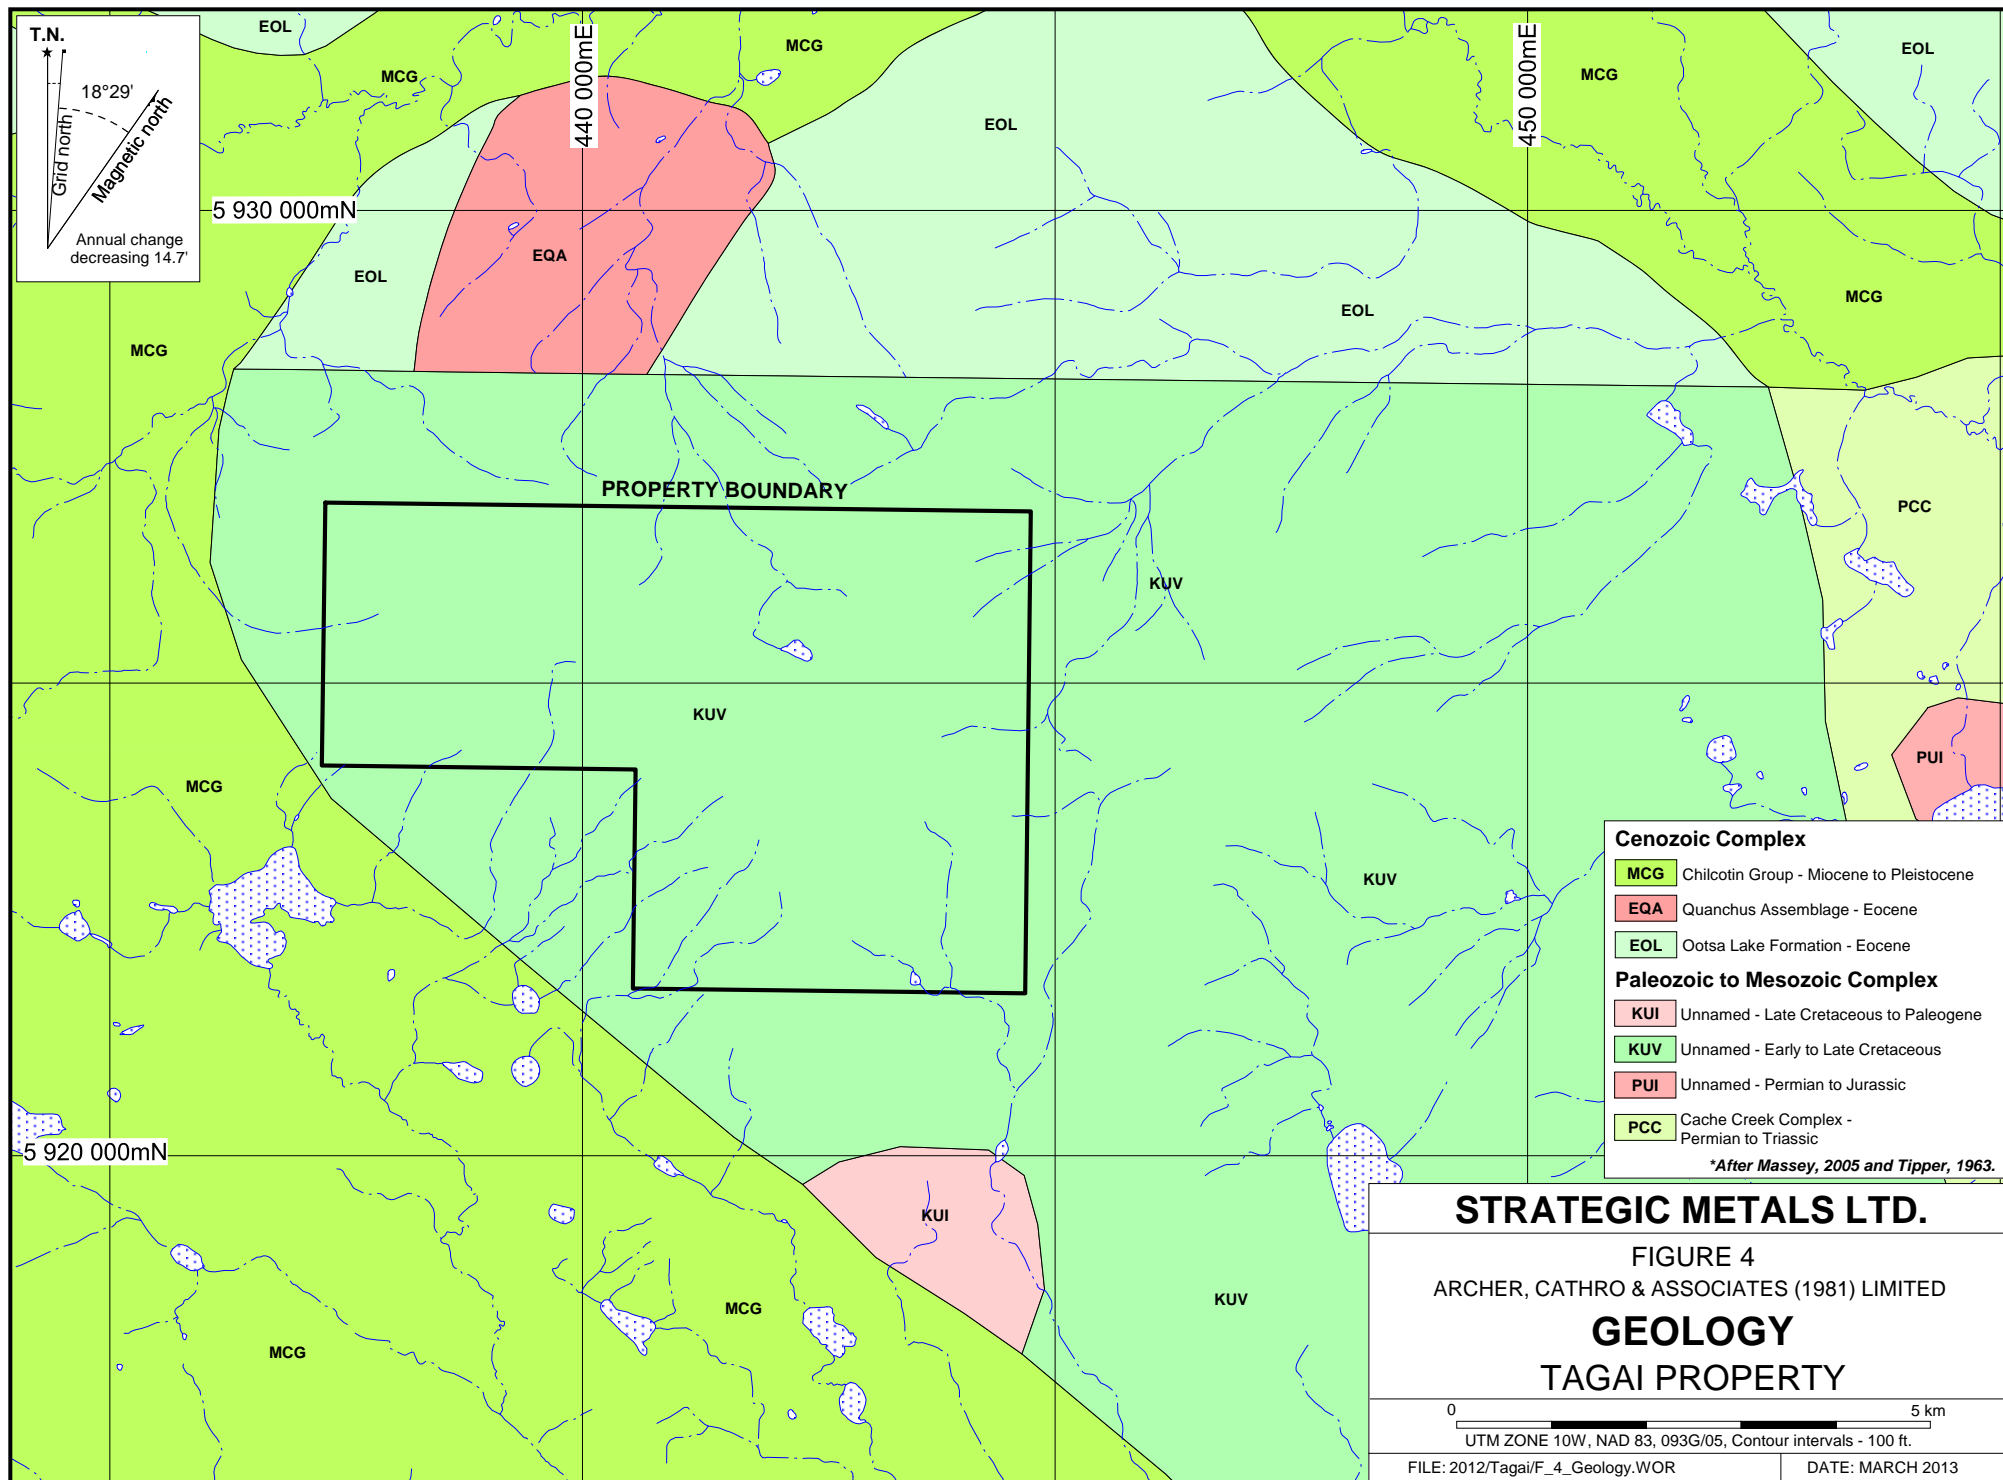

Regional mapping on NTS map sheet 093G has been performed by various geologists including: Tipper (1963), Anderson et al. (1997) and Anderson and Snyder (1998). Strategic Metals has not performed any property-scale mapping due to paucity of bedrock exposure. The following geological descriptions are based on a compilation done by Massey in 2005 (Figure 4).

The oldest mapped rocks in the immediate vicinity of the Tagai property are Permian to Triassic Cache Creek Complex (PCC) mafic volcanic breccias and flows (Figure 4). Cache Creek Complex is unconformably overlain by an unnamed Cretaceous volcanic unit (KUV) composed of rhyolite, rhyodacite, ash and lapilli tuff. Both of these older units are unconformably capped by Eocene Ootsa Lake Formation (EOL) intermediate to felsic volcanics. The volcanic units are intruded by unnamed Permian to Jurassic granodioritic orthogneiss (PUI), Late Cretaceous to Paleogene granite to tonalite (KUI) and Eocene Quanchus Assemblage granodiorite (EQA). The entire package is capped by widespread Neogene Chilcotin Group olivine basalt flows (MCG). These units are briefly described in Table I.

Table I – Lithological Units (after Massey, 2005)

Unit Name	Map Name	Age	Description
MCG	Chilcotin Group	Miocene to Pleistocene	Olivine basalt; minor andesite, tuff, breccia, conglomerate, sandstone, siltstone, shale and diatomite.
EQA	Quanchus Assemblage	Eocene	Hornblende biotite granite, granodiorite
EOL	Ootsa Lake Formation	Eocene	Dacite, andesite, rhyolite.
KUI	Unnamed	Late Cretaceous to Paleogene	Granite, granodiorite, tonalite.
KUV	Unnamed	Early to Late	Basalt, andesite, and related tuffs and

Geozoic Complex

- MCG Chilcotin Group - Miocene to Pleistocene
- EQA Quanchus Assemblage - Eocene
- EOL Ootsa Lake Formation - Eocene

Paleozoic to Mesozoic Complex

- KUI Unnamed - Late Cretaceous to Paleogene
- KUV Unnamed - Early to Late Cretaceous
- PUI Unnamed - Permian to Jurassic
- PCC Cache Creek Complex - Permian to Triassic

		Cretaceous	breccias; minor rhyolite, argillite, arkose and conglomerate.
PUI	Unnamed	Permian to Jurassic	Granodioritic orthogneiss.
PCC	Cache Creek Complex	Permian to Triassic	Mafic volcanic breccia and flows; greenstone; minor limestone, argillite and chert.

Based on the regional geological map (Massey, 2005), the property is entirely underlain by KUV volcanics and volcanoclastics. No large-scale structures have been recognized in the area.

REGIONAL MINERALIZATION

There are two main metallogenic episodes of porphyry-style mineralization in central British Columbia. The first is of Late Triassic to Middle Jurassic (215 -180 Ma) age with two clusters around 205-200 and ~185 Ma. The second is of Early Cretaceous to Miocene age. All known deposits lie within Quesnellia and Stikinia terranes, which are accreted volcanic arcs of Late Triassic and Early Jurassic age (Panteleyev, 1995).

Classic copper-gold porphyry deposits fit a magmatic-hydrothermal model, in which the deposits show temporal and genetic relationships to intrusions. During waning stages of hydrothermal activity, the magmatic-hydrothermal systems collapse inward and are replaced by meteoric waters. Redistribution and possibly further concentration of metals may occur during these waning stages. Principal ore mineralogy includes copper in the form of chalcopyrite, bornite, chalcocite and tennantite, while gold occurs as electrum and in its native form. Other associated minerals include pyrite, arsenopyrite, magnetite, quartz, potassium feldspar, anhydrite, epidote, chlorite, calcite, fluorite and garnet (Sinclair, 2007).

Ore zones within alkali porphyry deposits with high gold contents are frequently found in association with magnetite-rich rocks and can be located by magnetic surveys. Pyritic haloes surrounding cupriferous rocks respond well to induced polarization surveys. The more intensely hydrothermally altered rocks produce resistivity lows (Panteleyev, 1995).

The Tagai property is situated within a belt of rocks that hosts numerous copper±gold porphyry deposits. The interpreted property geology comprises rocks whose age falls within the time period of the younger metallogenic episode. No large intrusive bodies have been identified on the Tagai property, but narrow quartz-feldspar porphyry dykes are known and larger bodies could be hidden by glacial till.

Figure 1 illustrates the locations of the Blackwater epithermal-type gold-silver deposit and a number of porphyry deposits including Huckleberry, Mount Polley, Mount Milligan, Galore Creek, Red Chris, QR, Woodjam, Gibraltar and Prosperity. Of these deposits, the Woodjam and Blackwater deposits and Mount Polley Mine exhibit the most similarity to geochemical, geophysical and geomorphological characteristics of the Tagai property.

The Woodjam property hosts an advanced copper-gold-silver porphyry prospect located about 220 km southeast of the Tagai property. The deposit lies in a heavily glaciated area within the Quesnel Trough of the Quesnel-Stikine Terrane (Consolidated Woodjam Copper, 2013). Mineralization occurs in Late Triassic Nicola Group volcanic and associated sedimentary rocks near the edge of a Jurassic monzodiorite to quartz monzonite batholith. There are five main mineralized zones on the Woodjam property but, of these, only Woodjam South had a mineral resource estimate. As of January 1, 2012 the Woodjam South deposit has an inferred mineral resource of approximately 146.5 Mt grading 0.33% copper (Sherlock et al, 2012).

The Mount Polley copper-gold porphyry deposit lies approximately 180 km southeast of the Tagai property. It is situated within heavily glaciated terrain that has less than five percent exposed bedrock (McAndless, 2005). The deposit is hosted by a Late Triassic diorite stock that intrudes compositionally similar volcanic rocks in the Quesnel-Stikine Terrane. Hydrothermal breccias contain most of the ore in this deposit. A prominent north-trending fault bisects the deposit and is a controlling factor in mineralization (Fraser, 1994). As of March 2012, the Mount Polley Mine had a measured and indicated mineral resource of 361.1 Mt grading 0.284% copper, 0.297 g/t gold and 0.846 ppm silver and a proven and probably mineral reserve of 87.3 Mt grading 0.292% copper, 0.302 g/t gold and 0.407 g/t silver (Imperial Metals, 2013).

The Blackwater epithermal-type gold-silver project is located approximately 70 km southwest of the Tagai property. It lies within a structurally raised block that juxtaposes older Jurassic arc-related rocks (Hazelton and Bowser Lake groups) with younger Eocene extensional-related rocks (Ootsa Lake and Endako groups). Late Cretaceous felsic plutons locally intrude the arc-related rocks. Within the project area, the volcanic rocks form a wedge of stratigraphically chaotic and laterally discontinuous strata that host low-grade, disseminated gold and silver mineralization (New Gold, 2013). Mineralization has been traced over a 1200 m strike length and has a width of 700 m. Gold is mainly associated with sulphide minerals (primarily pyrrhotite, sphalerite and chalcopyrite). As of December 31, 2012, the Blackwater deposit has an indicated mineral resources of 174 Mt averaging 0.98 g/t gold and 4.6 g/t silver at a cut-off grade of 0.4 g/t gold (Simpson, 2012). An additional 91.6 Mt grading 0.78 g/t gold and 3.8 g/t silver is classified as inferred.

MINERALIZATION

The only known area of mineralization on the property (Tagai Showing) is exposed in a road cut at the end of a forest service road in the southern part of the property. A total of six rock samples were collected from this showing in 2007 and 2009. The Tagai Showing location is plotted with geology on Figure 4.

Of the six samples that have been collected from Tagai Showing, two returned elevated results, while the remainder yielded trace to weak gold and copper values. All of the rock samples returned subdued molybdenum values (Wengzynowski, 2008 and Wengzynowski and Eaton, 2010). The two anomalous samples comprised medium to coarse grained quartz-feldspar porphyry with disseminated malachite and azurite. They were collected 190 m apart, from about 10 cm wide, northerly striking, gougey shear zones. One sample yielded 0.677 g/t gold and 1.43% copper, while the other returned 0.898 g/t gold and 0.37% copper.

SOIL GEOCHEMISTRY

In 2012, Strategic Metals collected 307 grid soil/till samples on the property. The 2012 sampling program connected 2007 and 2009 grids in the eastern part of the property and extended coverage in the southern part of the property.

The 2012 sample locations are plotted on Figure 5, while results for copper, gold, silver, lead and zinc from all soil/till samples are plotted on Figures 6 to 10, respectively. Soil/till samples collected in 2007 were not tested for gold. Certificates of Analysis for the 2012 samples are provided in Appendix III.

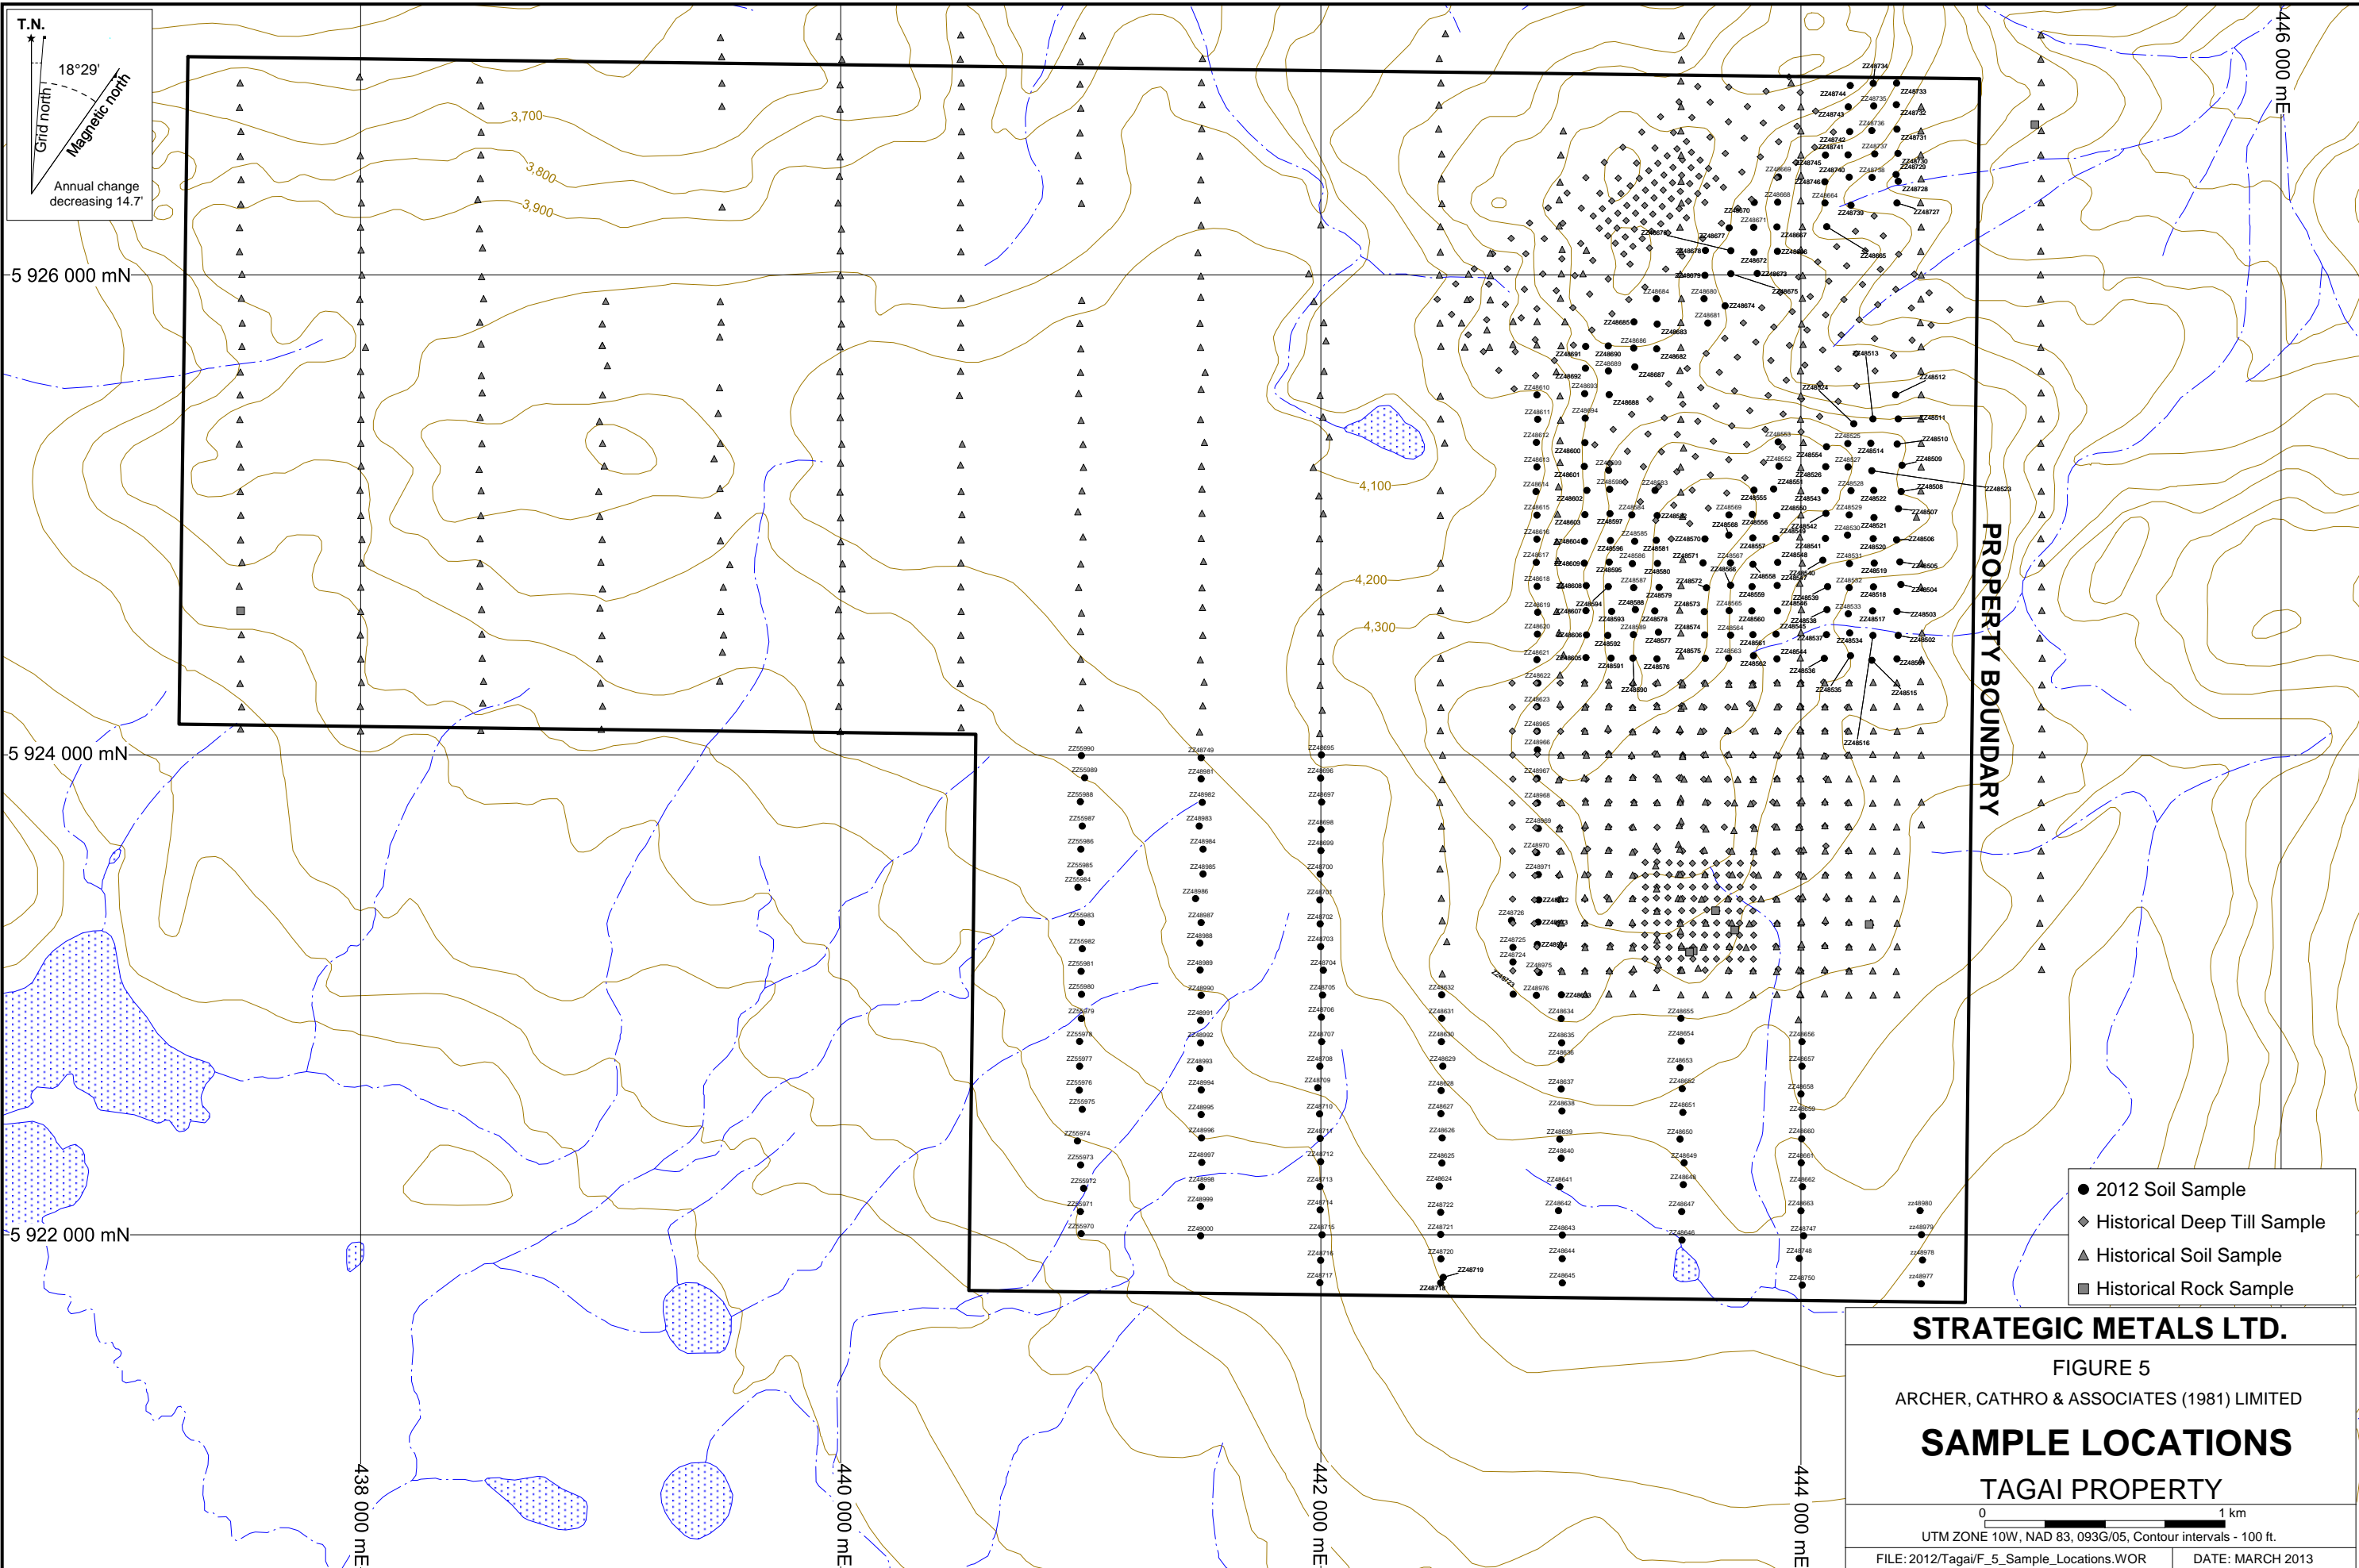

The infill samples were collected at 100 by 100 m spacings, while the southern extension samples were taken at 100 m spacings on lines situated 500 m apart. Sample locations were recorded using hand-held GPS units. Sample sites are marked by aluminium tags inscribed with the sample numbers and affixed to 0.5 m wooden lath that were driven into the ground. The samples were collected from 15 to 70 cm deep holes using hand-held augers. They were placed into individually pre-numbered Kraft paper bags. The samples were bussed to ALS Minerals in North Vancouver, where they were dried and sieved to -180 microns (80 mesh). The fine fraction was analyzed for gold using fire assay followed by inductively coupled plasma-atomic emission spectroscopy analysis (Au-ICP21) and for 35 elements using an aqua regia digestion followed by inductively coupled plasma combined with atomic emission spectroscopy (ME-ICP41).

Anomalous thresholds and peak values for 2007, 2009 and 2012 soil/till samples are listed in Table II.

Table II – Soil/Till Geochemical Threshold and Peak Values

Element	Weak	Moderate	Strong	Very Strong	2007 Peak (soil/till)	2009 Peak (deep)	2012 Peak (soil/till)
Copper (ppm)	≥ 50 < 100	≥ 100 < 200	≥ 200 < 500	≥ 500	258	1,290	238
Gold (ppb)	≥ 10 < 20	≥ 20 < 50	≥ 50 < 100	≥ 100	n/a	488	40
Silver (ppm)	≥ 1 < 2	≥ 2 < 5	≥ 5		1.6	5.2	2.4
Lead (ppm)	≥ 20 < 50	≥ 50 < 100	≥ 200		270	277	58
Zinc (ppm)	≥ 100 < 200	≥ 200 < 500	≥ 500 < 1,000	≥ 1,000	1,440	1,635	416

Four variably sized copper-zinc±gold±silver±lead±molybdenum soil anomalies (Tagai, Turf, Tatuk and Chilako Zones) have been outlined on the Tagai property. Tagai Zone encompasses Tagai Showing. The dimensions of the zones and peak values for the elements of interest within each zone are given in Table III.

GEOPHYSICAL SURVEYS

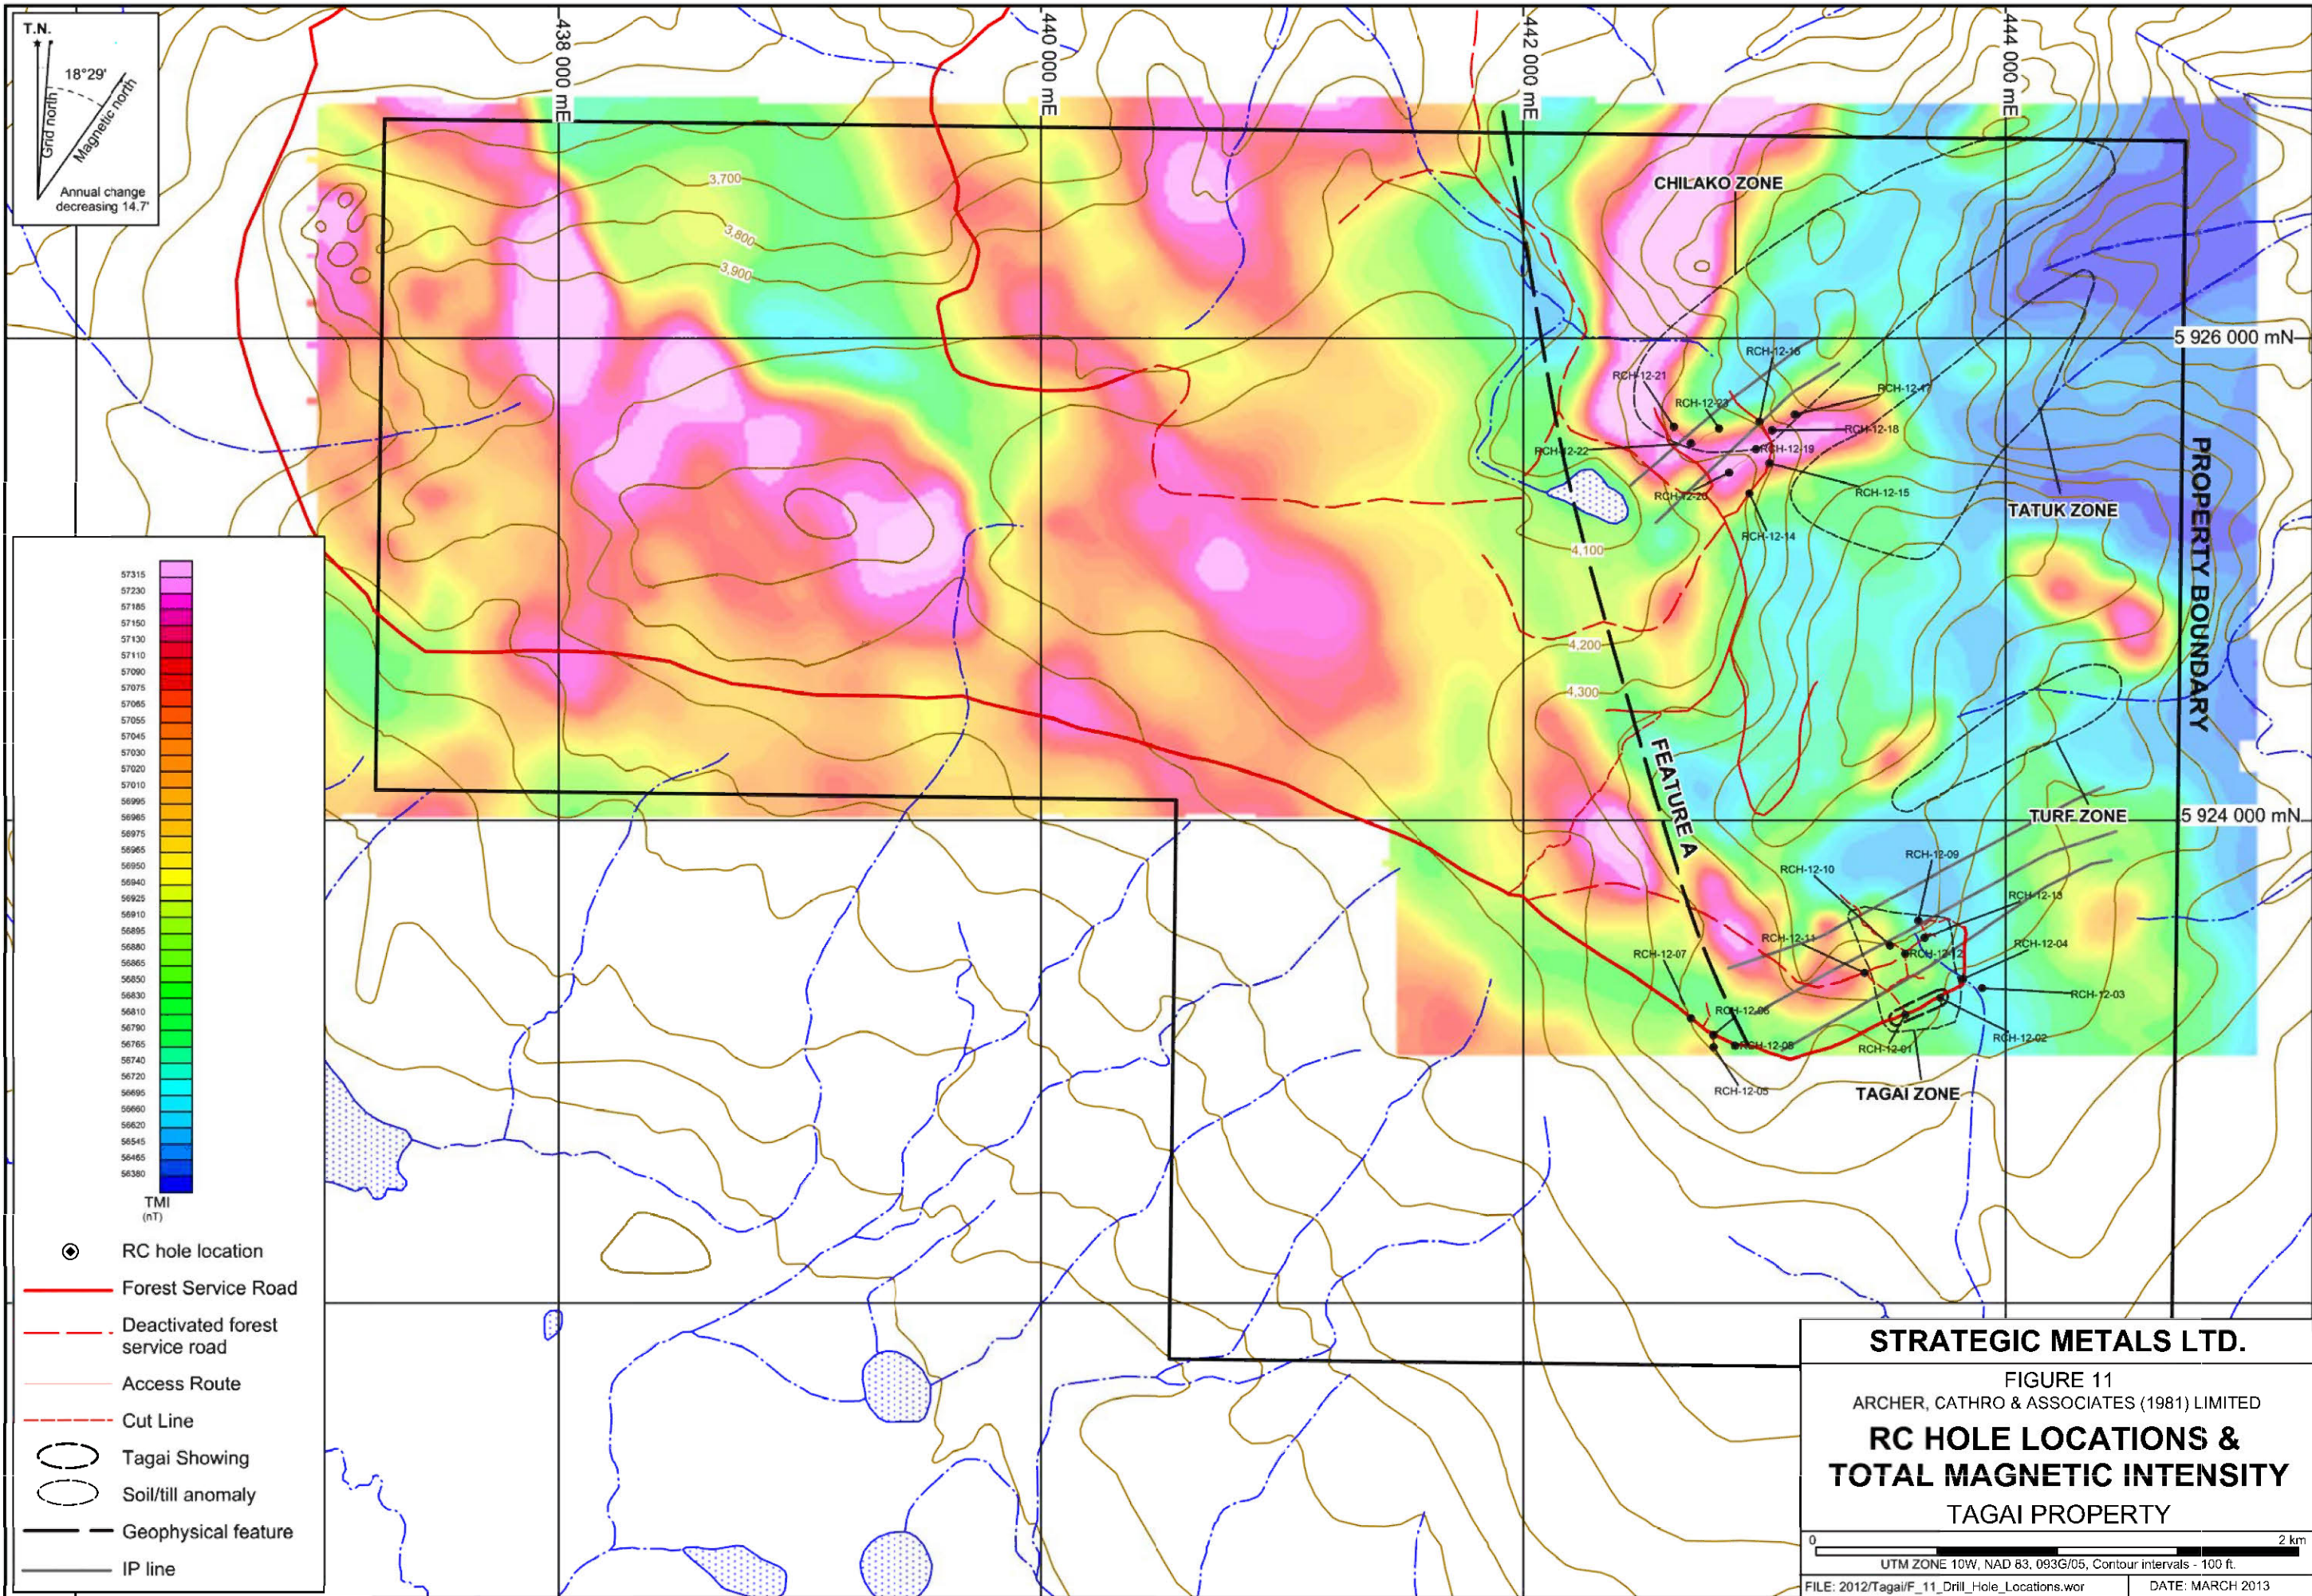

Helicopter-borne VTEM and magnetic surveys were conducted in August 2008 by Geotech Ltd. of Aurora, Ontario. Condor Consulting Ltd. reprocessed Geotech's geophysical data and completed a preliminary interpretation in spring 2009. In fall 2010, Aurora Geosciences Ltd. of Whitehorse performed 5.75 line km of induced polarization and resistivity surveys on five lines oriented northeast across the Chilako and Tagai zones. In winter 2010, Condor Consulting processed the IP-resistivity data, and integrated it with data from the 2008 VTEM and magnetic surveys.

Interpretation of the airborne magnetic data suggests that a north-northwest trending contact (Feature A) divides a domain with a strong magnetic response to the west from another domain with a weak magnetic signature to the east (Figure 11). This contact may represent a fault. On the western side of this contact, there are a number of northwest trending, linear magnetic high features that are separated by areas of moderate magnetic response. Three areas of elevated magnetic susceptibility in the eastern domain have more complex shapes. One of these areas lies directly up-ice of Chilako Zone and another alongside Tagai Zone. These features have been interpreted by Condor to be folded magnetic stratigraphy.

Interpretation of the EM Channel B-field (21) data suggests that a broad, formational-style zone of conductivity trends northwesterly across the centre of the property. The Tagai Showing and all four anomalous soil zones lie within a region of low conductivity in the eastern part of the property.

The northern two IP-resistivity survey lines straddle a magnetic anomaly at Chilako Zone (Figure 11). Interpretation of the IP-resistivity data revealed a central resistivity high that has a chargeability high on its southern edge. While the chargeability high is distinct, the absolute values are very low (less than 5 mv/V), which suggests a low sulphide content.

The three southern IP-resistivity survey lines cross Tagai Zone. A resistivity high trends north to south across all three lines. This resistivity high shows a direct correlation with three small chargeability highs. Again, the absolute chargeability values are quite low.

PROPERTY ACCESS AND GEOMORPHOLOGICAL SURVEYS

In spring 2012, Strategic Metals commissioned Korax Exploration Limited of Smithers, BC to complete a reconnaissance property access and geomorphological survey for the Tagai property. The primary objective of the survey was to determine if the main areas of interest, which encompass the Tagai and Chilako zones could be tested using a track mounted drill.

The survey was conducted between March 5 and 8 and included mapping of pre-existing roads to and within the property; vegetation abundance, types and distribution, with emphasis on outlining areas that have been logged; and terrain analysis of slope gradients.

Korax determined that Tagai Zone was vegetated with new growth and that much of Chilako Zone was within a cut block. Korax concluded that although the terrain was locally too steep, the areas of interest could be effectively tested using a track mounted drill.

REVERSE CIRCULATION DRILLING

In 2012, a total of 557.78 m of reverse circulation diamond drilling was completed in 23 holes on the Tagai property. The first hole was collared on September 29 and the final hole was completed on October 14. The work was done using a self-propelled, track-mounted reverse circulation drill, which was operated by Midnight Sun Drilling Inc. of Whitehorse. The drill was operated by a three person crew on a single, 12 hour/day shift. Drill hole locations are plotted on Figure 11.

The drill travelled on existing roads and within cut blocks as much as possible to minimize line cutting. The access routes were ground truthed prior to drilling. Trees were felled by hand and routes were constructed as short and narrow as possible. Lines were cut up to four metre wide and bypassed trees where possible. Drill sites did not require leveling. A total of 2230 m of access routes/cut lines were cleared (Figure 11). An all-terrain vehicle was used to transport fuel from a central cache to the drill sites.

The reverse circulation drill program was designed to test bedrock and overlying glacial till (ranging from 1.5 to 28 m thick) in order to test geophysical features and to identify sources for previously identified soil/till geochemical anomalies. The objective was to sample 9.14 m (30 ft.) of bedrock in each hole at the Tagai and Chilako Zones and geophysical Feature A. Nine holes were drilled within Tagai Zone and 10 holes within Chilako Zone, while an additional four holes tested Feature A about 400 m southwest of Tagai Zone (Figure 11). Terrain at the Tagai and Chilako zones is steep, which resulted in fewer holes being drilled than were originally planned. Holes within Tagai Zone were drilled at an azimuth of 225°, holes within Chilako Zone were drilled at 045° and holes testing Feature A were drilled at 260°. All holes were drilled using a dip of -60°. Key data concerning the 2012 drill holes are listed in Table IV.

Table IV– RC Drill Hole Data

Hole-ID	Easting	Northing	Length (m)	Zone
RCH-12-01	443582	5923195	12.19	Tagai

RCH-12-23	442812	5925626	13.72	Chilako

All drill collar locations were marked with flagged 2"x4" posts, to which metal tags listing the hole numbers were secured. Survey control was established by handheld GPS and chain and compass measurements. All holes were sampled continuously from top to bottom. Pulverized cuttings were automatically split at the collar, resulting in samples containing 12.5% of the cuttings from each 1.52 m (five foot) interval. One blank and one standard sample were inserted into each batch of 36 samples. The samples were bussed to ALS Minerals in North Vancouver, where they were fine crushed to better than 70% passing -2 mm. A 250 g split was then pulverized to better than 85% passing 75 microns. One split from the pulverized fraction of each sample was dissolved using aqua regia digestion and analyzed for 35 elements using inductively coupled plasma-atomic emission spectroscopy (ME-ICP41). Another split was analyzed for gold by fire assay followed by inductively coupled plasma-atomic emission spectroscopy (Au-ICP21). Approximately 200 g of chip material from each interval was washed, sieved to 8-mesh and transferred into a labeled chip tray for logging purposes. Chip samples from every sample interval in all drill holes were examined under an optical microscope. Certificates of Analysis are given in Appendix III, Reverse Circulation Drill Logs are provided in Appendix IV, and cross-sections showing geology and geochemical results for the metals of interest are in Appendix V.

All holes intersected overburden and quartz-feldspar porphyry or rhyodacite, which rarely host quartz veins, pyrite, limonite and magnetite. All holes returned subdued values for the metals of interest, with the exception of one interval in hole RCH-12-16 at southwest end of Chilako Zone. This interval comprised rhyodacite with abundant chalcopyrite and returned 0.183 g/t gold and 0.42% copper over 1.52 m between 18.28 and 19.81 m.

DISCUSSION AND CONCLUSIONS

The Tagai property is located within a district of major precious and base metal deposits. Soil sampling and prospecting on the Tagai property have identified four zones that are anomalous for copper±gold±zinc. Metal values for soil/till samples collected within these zones are comparable to values obtained from major deposits in the area, specifically the Mount Polley and Woodjam deposits.

In 2012, parts of the Tagai and Chilako zones and adjacent, possibly associated magnetic highs were tested by reverse circulation drilling. A nearby, unrelated, property-scale magnetic feature (Feature A) was also locally drill tested. The drill results were low for all elements of interest, with the exception of one short interval of strongly elevated gold and copper that was obtained from rhyodacite at the southwest end of Chilako Zone.

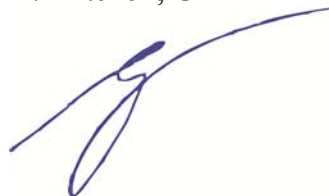

Despite its favourable location, future work at the Tagai property should be done on a low priority basis and is predicated on positive results from exploration by other parties in the district. Reverse circulation drilling appears to be an effective technique to test beneath the thick overburden cover. Many soil geochemical and geophysical features are untested.

Respectfully submitted,

APPENDIX I
STATEMENTS OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, Andrew Mitchell, geoscientist in training, with business addresses in Whitehorse, Yukon Territory and Vancouver, British Columbia and residential address in Vancouver, British Columbia, hereby certify that:

1. I graduated from the University of British Columbia in 2010 with a B.Sc. in Earth and Environmental Sciences.
2. From 2010 to present, I have been actively engaged in mineral exploration in Yukon Territory.
3. I am a Geoscientist in Training (GIT) with the Association of Professional Engineers and Geoscientists of British Columbia (Member Number 169067)
4. I have personally participated in the field work reported herein and have interpreted all data resulting from this work.

A. Mitchell, B.Sc., GIT

STATEMENT OF QUALIFICATIONS

I, Sarah Drechsler, geologist, with business addresses in Whitehorse, Yukon Territory and Vancouver, British Columbia and residential address in Squamish, British Columbia, hereby certify that:

1. I graduated from the University of British Columbia in 2007 with a B.Sc. in Honours Geological Sciences.
2. From 2002 to present, I have been actively engaged in mineral exploration in Yukon Territory, British Columbia and Northwest Territories.
3. I am a Professional Geoscientist (P.Ge.) with the Association of Professional Engineers and Geoscientists of British Columbia (Member Number 154922).
4. I have interpreted all data resulting from this work.

CERTIFICATE VA12234446

Project: TAGAI
 P.O. No.: RCH- 12- 03/ 04/ 05
 This report is for 36 Rock Chip samples submitted to our lab in Vancouver, BC, Canada on 4- OCT- 2012.
 The following have access to data associated with this certificate:
 SARAH EATON JOAN MARIACHER

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/ o BarCode
CRU- 31	Fine crushing - 70% < 2mm
PUL- QC	Pulverizing QC Test
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85% < 75 um
LOG- 23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
Au- ICP21	Au 30g FA ICP- AES Finish	ICP- AES
ME- ICP41	35 Element Aqua Regia ICP- AES	ICP- AES

CERTIFICATE VA12240730

Project: TAGAI
 P.O. No.: RCH- 12- 07/ 08
 This report is for 36 Rock Chip samples submitted to our lab in Vancouver, BC, Canada on 11- OCT- 2012.
 The following have access to data associated with this certificate:
 SARAH EATON JOAN MARIACHER

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/ o BarCode
PUL- QC	Pulverizing QC Test
CRU- 31	Fine crushing - 70%<2mm
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85%<75 um
LOG- 23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
Au- ICP21	Au 30g FA ICP- AES Finish	ICP- AES
ME- ICP41	35 Element Aqua Regia ICP- AES	ICP- AES

CERTIFICATE VA12240731

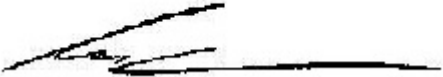

Project: TAGAI
 P.O. No.: RCH- 12- 08/ 09/ 10/ 11
 This report is for 36 Rock Chip samples submitted to our lab in Vancouver, BC, Canada on 11- OCT- 2012.
 The following have access to data associated with this certificate:
 SARAH EATON JOAN MARIACHER

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/ o BarCode
PUL- QC	Pulverizing QC Test
CRU- 31	Fine crushing - 70%<2mm
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85%<75 um
LOG- 23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
Au- ICP21	Au 30g FA ICP- AES Finish	ICP- AES
ME- ICP41	35 Element Aqua Regia ICP- AES	ICP- AES

CERTIFICATE VA12244587

Project: TAGAI
 P.O. No.: RCH- 12- 19/ 20/ 21
 This report is for 36 Rock Chip samples submitted to our lab in Vancouver, BC, Canada on 16- OCT- 2012.
 The following have access to data associated with this certificate:
 SARAH EATON JOAN MARIACHER

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/ o BarCode
CRU- 31	Fine crushing - 70% < 2mm
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85% < 75 um
LOG- 23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
Au- ICP21	Au 30g FA ICP- AES Finish	ICP- AES
ME- ICP41	35 Element Aqua Regia ICP- AES	ICP- AES

CERTIFICATE VA12244588

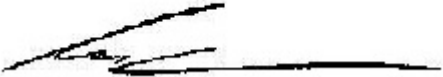

Project: TAGAI
 P.O. No.: RCH- 12- 16/ 17/ 18
 This report is for 36 Rock Chip samples submitted to our lab in Vancouver, BC, Canada on 16- OCT- 2012.
 The following have access to data associated with this certificate:
 SARAH EATON JOAN MARIACHER

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/ o BarCode
CRU- 31	Fine crushing - 70% < 2mm
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85% < 75 um
LOG- 23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
Au- ICP21	Au 30g FA ICP- AES Finish	ICP- AES
ME- ICP41	35 Element Aqua Regia ICP- AES	ICP- AES

CERTIFICATE VA12234443

Project: TAGAI
 P.O. No.:
 This report is for 139 Soil samples submitted to our lab in Vancouver, BC, Canada on 4- OCT- 2012.
 The following have access to data associated with this certificate:
 SARAH EATON JOAN MARIACHER

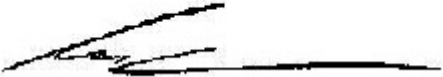

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/ o BarCode
SCR- 41	Screen to - 180um and save both

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
ME- ICP41	35 Element Aqua Regia ICP- AES	ICP- AES
Au- ICP21	Au 30g FA ICP- AES Finish	ICP- AES

To: **STRATEGIC METALS LTD.**

RC Drilling Log

Project:

Property: Tagai

Zone:

Northing: 6E+06 Dip: -60 Drilling Dates: 13-Oct-12 Comments: _____
 Easting: 442622 Diameter: 3" to 13-Oct-12
 Azimuth: 45 Depth: 70 Elevation: _____

RHY-DAC = Rhyodacite.

Hole: RCH-12-21

Logger Name: L. Flavelle

Date: February 1, 2013

INTERVAL				Magnetic Susceptibility	LITHOLOGY					ALTERATION					MINERALS					DESCRIPTION		
From (ft)	To (ft)	From (m)	To (m)		Unit	Rock Type	Grain Size	Shade	Colour	Oxidation	Argillic	Propylitic	Phyllic	Potassic	Py	Po	As	Gn	Cp		% of Run	
0	5	0	1.524			OVB														#		
5	10	1.524	3.048			OVB															#	
10	15	3.048	4.572			OVB															#	
15	20	4.572	6.096			OVB															#	
20	25	6.096	7.62			OVB															#	
25	30	7.62	9.144			OVB															#	
30	35	9.144	10.668			OVB															#	
35	40	10.668	12.192			OVB															#	Mixed overburden and rhyodacite.
40	45	12.192	13.716			RHY-DAC		MD	GY												#	Rhyodacite with chips of quartz-feldspar porphyry dyke. Slight K-feldspar alteration and oxidation in some chips.
