Assessment Report
Title Page and Summary

TYPE OF REPORT [type of survey(s)]: Drilling, Mapping & Sampling on Schaft Creek Deposit **TOTAL COST:** $4,788,179.27

AUTHOR(S): Elmer B. Stewart **SIGNATURE(S):** Elmer B Stewart

NOTICE OF WORK PERMIT NUMBER(S)/DATE(S): MX-1-647/MARCH 31, 2011 **YEAR OF WORK:** 2012

STATEMENT OF WORK - CASH PAYMENTS EVENT NUMBER(S)/DATE(S): 5433739/2013/FEB/22

PROPERTY NAME: SCHAFT CREEK PROPERTY

CLAIM NAME(S) (on which the work was done): LIST ATTACHED

COMMODITIES SOUGHT: COPPER, GOLD, SILVER, MOLYBDENUM

MINERAL INVENTORY MINFILE NUMBER(S), IF KNOWN: 104G

MINING DIVISION: LIARD MINING DIVISION **NTS/BCGS:** WGS84, ZONE 9N

LATITUDE: 57 ° 9 ' 55 " **LONGITUDE:** 130 ° 53 ' 1 " **(at centre of work)**

OWNER(S):
1) COPPER FOX METALS INC. 2)

MAILING ADDRESS:
SUITE 650, 340 - 12 AVE SW
CALGARY, AB T2R 1L5

OPERATOR(S) [who paid for the work]:
1) COPPER FOX METALS INC. 2)

MAILING ADDRESS:

PROPERTY GEOLOGY KEYWORDS (lithology, age, stratigraphy, structure, alteration, mineralization, size and attitude):
HICKMAN BATHOLITH, MIDDLE TO LATE TRIASSIC-AGE STIKINE PLUTONIC SUITE, ANDESITIC TO BASLTIC VOLCANIC ROCKS

SUMMARY

Schaft Creek Project is a large porphyry copper-molybdenum-gold-silver deposit located in the Iskut-Stikine region of north-western British Columbia, approximately 60 km southwest of Telegraph Creek and 1,050 km north of Vancouver. The Schaft Creek Property was first discovered in the late 1950s, and has an extensive exploration history including the completion of 410 drillholes totalling 98,445.82 m. The Project is at an advanced stage of exploration, with a preliminary feasibility study completed in September 2008 and a feasibility study completed in February 2013.

The Schaft Creek deposit is considered a calc-alkalic copper-molybdenum porphyry system related to an elongate, high-energy, structurally controlled breccia system. Historically the Schaft Creek deposit has been divided into three zones; the Liard (Main) Zone, the Paramount Zone, and the West Breccia Zone. For estimation purposes, and due to the geometry of the mineralization, the West Breccia Zone has been included within the Paramount Zone. The Liard Zone is the largest, measuring ~900 m by 1,300 m and is related to the intrusion of feldspar quartz-porphyry dikes, while the Paramount Zone is a structurally controlled, mineralized zone extends along the west margin of the Main Zone to the north and is closely related to a north-south trending breccia zone.

Mineralization in the Liard Zone consists of irregular sulphide stockworks (chalcopyrite, bornite, molybdenite, and lesser pyrite) forming a tabular zone overlapping all rock types, though preferentially hosted in coarse fragmental volcanic rocks. In the Paramount Zone, mineralization consists of fine veinlets and disseminated patches of sulphides (chalcopyrite, bornite, and molybdenite) hosted predominantly in the altered fine-grained groundmass within the breccia system system.

Copper Fox is the owner and operator of the Schaft Creek project and holds title and a 100% working interest in the Project. Copper Fox has completed a high sensitivity airborne magnetometer survey which is to identify the magnetic signature of the Schaft Creek copper-gold-molybdenum-silver deposit and use this signature to identify two very large, unexplored zones of mineralization exposed in outcrop. The first zone (named the ES Zone) is located approximately 3 km north of the Paramount Zone of the Schaft Creek deposit and measures at least 1,100m long by 300m wide. The second zone (named the GK Zone) is located approximately 3 kms north of the ES Zone and measures at least 1,700m long by 250m wide. These zones exhibit many similarities to the mineralization located in the Paramount Zone at the north end of the Schaft Creek deposit.

The Titan-24 surveyed over an area extending from the north end of the Paramount zone through Mike zone and to the ES zone a distance of 3.0 kilometres and a limited portion 800m long of the GK zone. The chargeability anomalies formed by the Schaft Creek deposit were extended to the north an additional 6 km strike length and located within interpreted these three zones.

The purpose of the 2012 exploration program was to test the chargeability signature that appears within an interpreted northwest trending fault zone. Exploration work completed by Copper Fox includes geophysical survey interpretation, drilling, mapping and sampling.

1.0 INTRODUCTION

This report is prepared by Elmer B. Stewart, P. Geol., and describes the drilling, prospecting, mapping and sampling completed by Copper Fox Metals Inc. ("Copper Fox") over a large portion of the Schaft Creek project. The details of the exploration drilling, field exploration mapping and sampling, and modeling are included in the report. Copper Fox is the owner and operator of the undeveloped Schaft Creek copper (Cu), molybdenum (Mo), gold (Au), and silver (Ag) deposit located in northwestern British Columbia, 1,050 km northwest of Vancouver (Figure 1). Discovered in the late 1950s, the project is at an advanced stage of exploration with 410 drillholes. Copper Fox has recently completed a feasibility study on the project.

Copper Fox holds title and a 100% working interest in the Property, consisting of 184 mineral tenures (Figure 1A) covering 56,267.54 ha (139,040 ac). As of the date of this report, the Schaft Creek project covers the mineral tenures set out in Table 1 below.

This report provides information obtained from the drilling program and small prospecting program undertaken in the summer-fall of 2012. This program was designed to test a chargeability anomaly over a strike potential of the prominent northwest trending shear zone which outline both the Mike and Discovery zones. These areas are located ~1,500-2,000 m northwest of the Paramount Zone.

Sampling and mapping along the west side of Mount LaCasse extended for more than 6 km over the north portion of the Discovery Zone, the central and the north of the ES Zone and area between ES and GK zones.

2.0 PROPERTY GEOGRAPHY/PHYSIOGRAPHIC LOCATION

The Schaft Creek Project is located approximately 130 km southwest of Dease Lake within the Liard Mining Division and the Cassiar Iskut Stikine Land and Resource Management Plan. The Schaft Creek Project is located approximately 1,050 km northwest of Vancouver, British Columbia. The Schaft Creek Project is also located approximately 60 km south of the village of Telegraph Creek, 130 km southwest of Dease Lake, 80 km southwest of the village of Iskut and approximately 375 km northwest of the town of Smithers, BC (Figure 1 and 2).

The Property is located within National Topographic System (NTS) 1:50,000 scale topographic map sheets 104G/6 and 7. The center of the Schaft Creek Project is located at approximately 57°22' N latitude and 131°00' W longitude, or approximate at Universal Transverse Mercator (UTM) coordinates of 379700 E and 6359500 N, North American Datum (NAD83), Zone 9. The map reference sheet is Energy Mines and Resources Canada topographic sheet 104G, Telegraph Creek.

3.0 MINERAL CLAIMS

Copper Fox, as of February 22, 2013, holds title and a 100% working interest in a total of 184 mineral tenures, including claims that overly the Schaft Creek deposit (Figure 3), covering 56,267.54 ha (139,040 ac). Tenure data for each of the claims included in the Schaft Creek project is listed in Table 1.

The Schaft Creek deposit consists of the Paramount and Liard zones and is located in the southern part of tenure number 514603 and the northern part of tenure number 514637. 1,500 m to the northwest from this area was the main area of focus for the 2012 mineral exploration programs completed by Copper Fox. The new expiry dates and total area of the mineral tenures are listed in Table 1. Teck Resources Limited ("Teck") has an underlying ("earn-back" option) interest in the Schaft Creek project. Liard Copper Mines Limited holds a 30% Net Proceeds Interest and Royal Gold Inc. holds a 3.5% Net Profits Interest in the Schaft Creek deposit.

4.0 LOCATION, ACCESS & GEOGRAPHY

The Schaft Creek property is located on the eastern edge of the Coast Mountain Range in northwestern British Columbia, is approximately 45 km due west of Highway 37 and 375 km northwest of Smithers, B.C., the main supply point for the project (Figure 1). The property is approximately 1,050 km northwest of Vancouver, B.C. and is located on 1:50,000 scale topographic sheets 104G/6 and 104G/7. The deposit is centred on approximately 57° 22' N latitude and 131°00' W longitude, or approximate Universal Transverse Mercator (UTM) coordinates of 379700 E and 6359500 N, North American Datum (NAD83), Zone 9 datum.

The Schaft Creek deposit, within the traditional territory of the Tahltan Nation, is about 60 km south of the village of Telegraph Creek, 130 km south west of Dease Lake and 80 km southwest of the village of Iskut (Figure 2). These communities have provided a number of First Nations labourers and machine operators, diamond drillers and camp management services. Dease Lake is the centre of government for the Tahltan First Nation and is a local supply point for basic goods and medical facilities. Dease Lake is serviced by daily flights from Smithers on Northern Thunderbird Air from about mid-spring to mid-fall. The property has been serviced by fixed-wing aircraft from Dease Lake (Tsayta Aviation Ltd.) and by helicopter service based in Dease Lake (Pacific Western Helicopters Ltd.) Surface access to mineralized zones at Schaft Creek is through a network of rough-service bulldozer trails.

The Schaft Creek property covers mountainous terrain just to the east of the junction of Hickman Creek and Schaft Creek. West of the property, rugged coastal mountains and ice fields are present, while to the east lies gentler terrain of the Edziza Plateau. The tops of the surrounding mountains typically have year-round snowfields and small, retreating hanging-valley glaciers. Schaft Creek flows northerly into Mess Creek, which then flows northward to the Stikine River. Elevations in the area range from ~900 m above mean sea level (amsl) in the bottom of the Schaft Creek valley to over 1,990 m on Mount LaCasse, located a short distance northeast of the deposit.

The Schaft Creek project is located within the Liard Mining Division and the Cassiar Iskut-Stikine Land and Resource Management Plan (LRMP) area, approximately 9 km from the southwest edge of Mt Edziza Provincial Park. Topography varies from high plateau between Mess Creek and upper More Creek (Arctic Lake Plateau) to steep serrated ridges in the Hankin Peak – Mathew Glacier area. Elevations range from 800 metres above sea level ("masl") to 2,000 masl in the southern parts of the property.

The Schaft Creek deposit lies on the lower west-facing slopes south of Mount LaCasse, partially in and to the west of a low saddle between the Schaft and Mess Creek valleys, immediately west of Snipe Lake. The deposit lies in southern part of mineral tenure ID 514603 and the northern part of mineral tenure ID 514637. The area of the 2012 mineral exploration program was the focus along the west side of Mount LaCasse extended for more than 6 km over the north portion of the Discovery Zone, the central and the north of the ES Zone and area between ES and GK zones (Figure 3).

Vegetation comprises of areas of boreal spruce-pine-fir forest at lower elevations, with poplar, willow and alder found near streams and bogs. Timberline is about 1,400 masl with subalpine fir and meadow areas above. Summer and winter temperatures are moderate, the temperatures range from 30ºC to -30ºC, averaging about 0ºC. Mean monthly temperatures typically remain above freezing from April to October and drop below freezing from November through March. Annual precipitation averages about 50 cm, with

monthly snow accumulations exceeding 40 cm in January. Field work in the property is possible from the middle of June until the middle of October.

5.0 EXPLORATION HISTORY

Mineral claims were first staked in the Schaft Creek deposit area in 1957 by prospector Nick Bird for the BIK Syndicate. Three diamond drill holes totalling 629 m were drilled in 1965 by Silver Standard Mines Ltd. In 1966, Liard Copper Mines Ltd. consolidated the mineral tenures in the area and optioned the ground to Asarco who constructed an airstrip and drilled 24 diamond drill holes totalling 3,334 m. The option was subsequently acquired by Hecla Mining Company in 1968 who explored the deposit area extensively until 1977. Over that period Hecla completed 30,891 m of diamond drilling, as well as percussion drilling, induced polarization and resistivity surveys, geological mapping, air photography, and engineering studies.

Hecla sold its interest to Teck Corporation (now Teck Resources Limited ("Teck")) in 1978, which in 1980 embarked on an aggressive exploration and drilling program to confirm and expand Hecla's work. Teck completed a total of 24,600 m of diamond drilling in 145 holes by 1981. A resource estimate prepared by Teck at that time reported the Schaft Creek deposit to contain 1 billion tonnes grading 0.30% copper and 0.034% MoS_2 (Bender and McCandlish, 2010). In 2002, Copper Fox Metals optioned the Schaft Creek property from Teck.

Various engineering studies and reviews were carried out over the ensuing years to determine the feasibility of developing the Schaft Creek deposit, with little to no exploration work performed.

Copper Fox acquired an option on the property from Teck in 2002, by which time a total of 230 core holes (totalling 60,200 m) and percussion holes (totalling 6,500 m) had been completed on the property (Copper Fox, 2011c). From 2005 to 2008, Copper Fox carried out exploration programs, which included a total of 25,428 m of drilling in 147 holes. By October 2008, a total of 85,356 m of drilling had been completed on the Schaft Creek property in 382 holes (Bender and McCandlish, 2010). From 2008 to 2010, various holes were drilled for hydrogeological, geotechnical, and condemnation purposes. Prior to the commencement of exploration drilling on the Schaft Creek deposit in early August 2010, 396 holes of various types had been drilled at the Schaft Creek property.

A more complete and detailed exploration history prior to 2008 is provided in the amended technical report by Samuel Engineering Inc. for Copper Fox (Bender and McCandlish, 2010).

Starting in July 2010, the diamond drilling exploration program expanded in scope over the season with the completion of 11 diamond drill holes totalling 3,936.26 m.

During 2011, Copper Fox focused its exploration efforts on evaluating the mineral potential of the Schaft Creek project, completed additional land acquisitions, a large Titan-24 DCIP & MT survey, metallurgical test work on the mineralization from the Paramount zone and 22 diamond drill holes for various purposes totaling 9,662.3 m. Precision GeoSurveys Inc. completed a high resolution aeromagnetic total field magnetic survey over a large portion of the Schaft Creek project.

6.0 GEOLOGICAL SETTING AND MINERALIZATION

6.1 REGIONAL GEOLOGY

The Schaft Creek deposit is classified as a calc-alkaline porphyry Cu-Mo-(Au) deposit formed in a volcanic arc setting, likely on a back-arc rifted continental fragment. The Schaft Creek deposit is hosted by Upper Triassic basaltic to andesitic volcanic rocks of the Mess Lake facies of the Stuhini Group (Stikine Terrane), intruded by dacite to granodiorite dikes emanating from the nearby Hickman batholith (Scott et al., 2008). Regional geology is shown in Figure 4. The regional geology map and following geological description are based primarily on Logan et al. (2000).

The Mess Lake facies is a vent-proximal, submarine to sub-aerial volcanic assemblage that unconformably overlies the Lower Permian limestone. The Mess Lake facies is, in turn, unconformably overlain by Lower Jurassic conglomerate. The Mess Lake volcanic sequence is estimated to be upwards of 800 m thick, but is truncated on the west side by the Hickman and Yehiniko plutons, while the south side is faulted against Paleozoic rocks.

The generalized stratigraphy, as interpreted in Logan et al. (2000), and simplified in Caron et al. (2012), consists of:

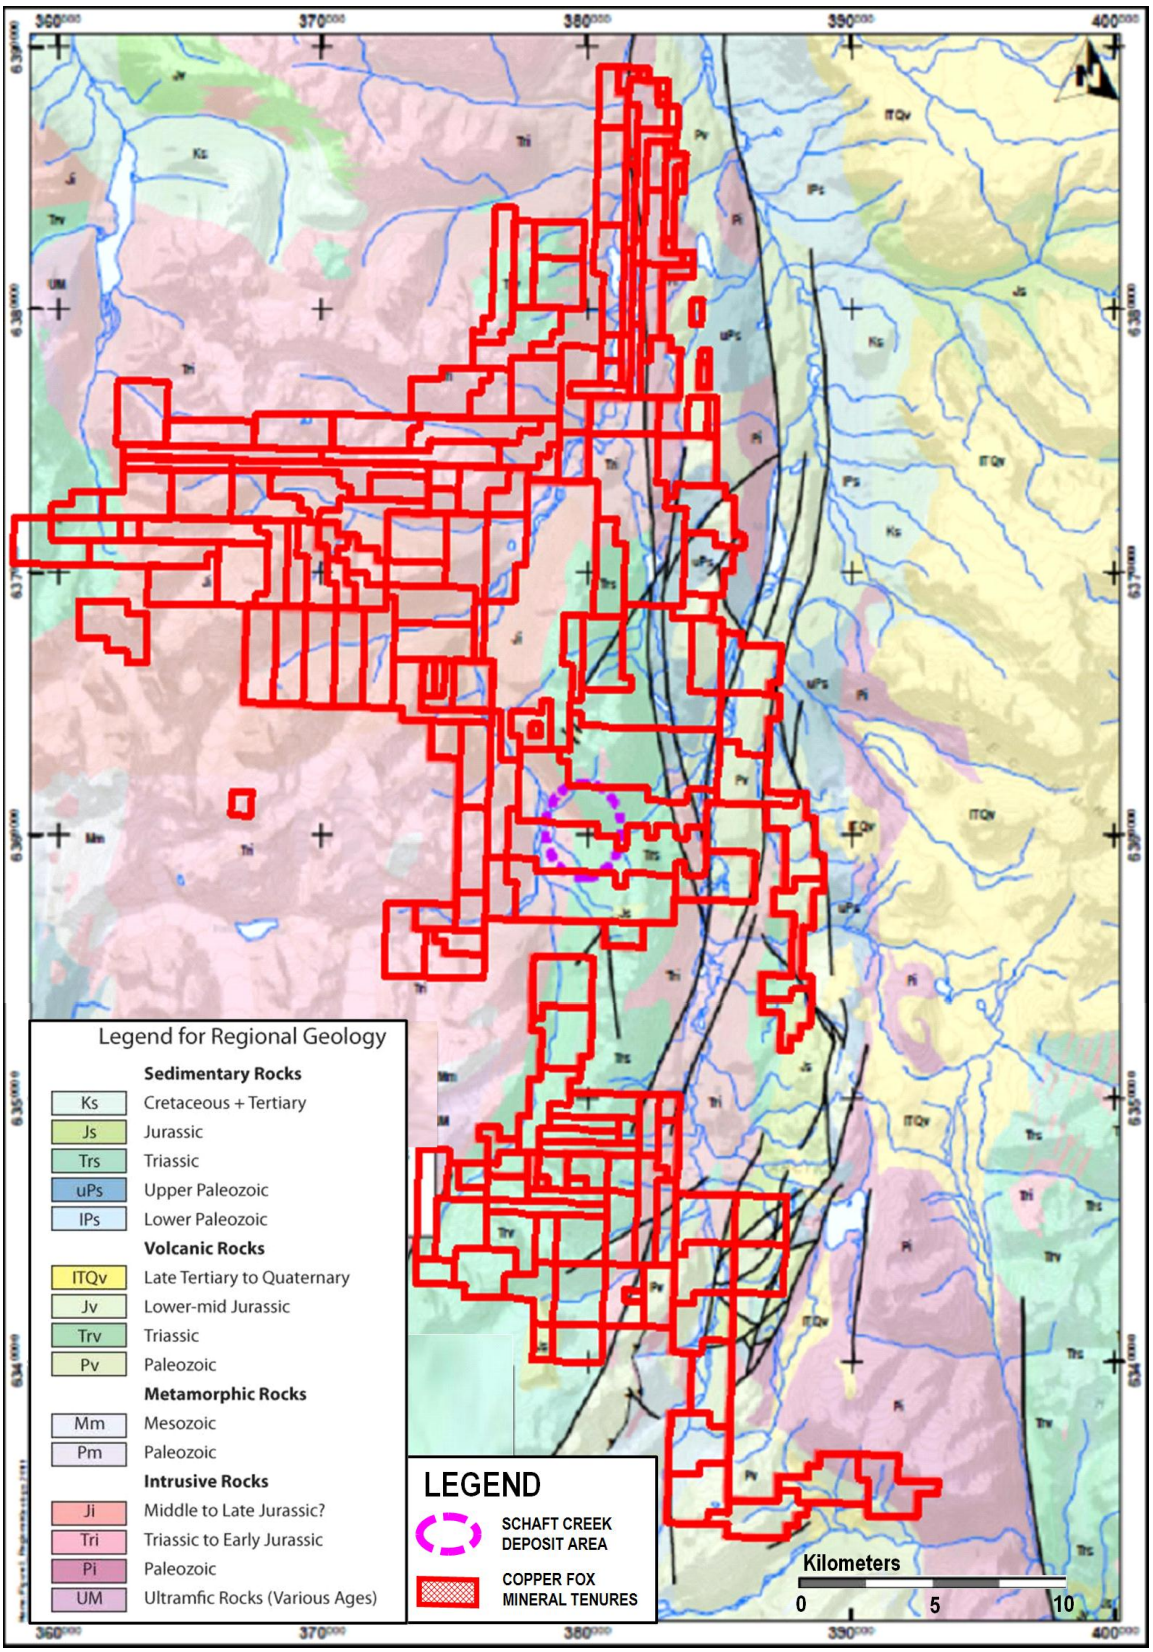
(1) a basal sedimentary succession or mafic tuffaceous succession (uTSmt),
(2) a medial volcanic succession characterized by flows and breccias with a central tuff unit (uTSvb, uTSvt, uTSpp), and
(3) an upper tuffaceous sedimentary succession. West of Mess Creek, maroon to green amygdaloidal plagioclase and pyroxene-phyric basalt flows, breccias and tuffs, and dun-weathering, olivine-rich basaltic tuffs at least 800 m thick are intruded by trachytic sills of coarse-bladed plagioclase and pyroxene porphyry, probable feeders to overlying volcanics.

On Mount LaCasse (7 km north of the Schaft Creek camp), tuffs of the central volcanic unit are observed to overlie basaltic rocks of the medial volcanic unit. These tuffs are mostly massive to weakly bedded, polylithic, grey to mauve lapilli and crystal tuffs, which form thick sections underlying the east-facing slope of the mountain overlooking Mess Creek. Crystal fragments consisting of plagioclase and augite are common constituents of the tuff. Due to the inconsistency of observable beds, measurable attitudes are rare, although those noted indicate steep dips. This same succession of the central volcanic unit underlies the west-facing slopes above Schaft Creek.

The upper tuffaceous sedimentary succession consists of well-bedded, very fine-grained green tuffs, tuffaceous siltstone-sandstones, and wackes. These are exposed on the northwestern flank of Mount LaCasse, 5 km north of the Schaft Creek deposit. The succession is ~150 m thick but along its western margin, the well-bedded section thins considerably where it is faulted against the lower plagioclase porphyry basalt. As the tuffs also thin to the northeast, their usefulness as a marker unit is limited. At 4 km south of the Schaft Creek deposit, the upper succession consists of volcanic conglomerate, interbedded sandstone and siltstone, pyroxene crystal sandstone, and limy siltstone are exposed. Fossils from thin interbedded siltstone, sandstone, and conglomerate layers are identified as the Late Triassic, Upper Norian brachiopod *Monotis Subcircularus* (Logan et al., 2000).

The Hickman batholith is interpreted to be the source of the hydrothermal fluids that formed the mineralization at Schaft Creek. It is a large, complexly zoned felsic to intermediate intrusive body to the west of the deposit. More comprehensive overviews of the regional and property geology are found in works of Scott (2008), Scott et al. (2008), and Logan et al. (2000).

FIGURE 4 REGIONAL GEOLOGY OF THE SCHAFT CREEK PROPERTY



6.2 PROPERTY GEOLOGY

The common interpretation of Schaft Creek as a porphyry deposit remains the working model. Figure 5 below depicts the Property geology. The following description of the Property geology is modified from Caron et al. (2012).

LITHOLOGIES

The Schaft Creek property lies between the Mess Creek valley and Schaft Creek in a north-south oriented complex of intermediate to mainly mafic volcanic rocks (Mess Creek volcanic facies of the Stuhini Group) dominated by basalt and andesite tuffs and flows. The thickest volcanic unit of the medial volcanic succession (Mess Creek facies) (identified by Logan et al. 2000) hosts the Schaft Creek deposit. This unit varies in colour from maroon to green and is comprised of roughly equal amounts of flows and tuffs of variably augite phyric, plagioclase phyric, augite-plagioclase phyric, and aphyric basaltic andesite. Sub-volcanic intrusive rocks are difficult to distinguish from the extrusive volcanics in this sequence. Logan et al. (2000) reported the basaltic andesite is locally pillowed for 3 km north and south of Schaft Creek and bedding attitudes in intercalated tuffs are steeply inclined to the northeast or southwest. In the deposit area, bedding orientations are not obvious; however, in the Main Zone, the bedding orientations are thought to be shallow to moderate, easterly to westerly dipping.

The west facing slopes above Schaft Creek consist of maroon and green, fine ash and plagioclase-rich crystal tuff, intermixed with purple monolithic augite phyric lapilli tuff and thin purple basalt flows. Epiclastic horizons include polylithic cobble to boulder conglomerates with clasts of green and black augite phyric basalt; maroon plagioclase porphyry; green, epidote-rich altered volcanic rock; and purple aphyric basalt.

It is unlikely the chemical composition of the andesitic basalt host rock had significant control, if any, on mineralization at Schaft Creek. Instead, local areas of coarse pyroclastic volcanics with correspondingly greater permeability and porosity may have served as a preferential host for mineralized hydrothermal fluids emanating from nearby the intrusive rocks.

A number of outcrops of aphanitic rhyolitic volcaniclastic rocks are reported (Scott 2008) north of the deposit area and are likely analogous to the roughly 150 m thick succession of tuffaceous siltstone-sandstone and well-bedded, fine-grained tuffs that comprise the upper units of the Stuhini Group.

Between Schaft Creek and Snipe Lake on the lower southwestern slopes of Mount LaCasse, the andesitic to basaltic volcanic rocks are locally intruded and brecciated by narrow and locally discontinuous dikes and apophyses emanating from the Hickman batholith. The most mineralized and altered intrusions are generally proximal to the breccias in the northern portion of the deposit, where breccias cross-cut one of the larger intrusive dikes. Further south, intrusive dikes in the Main Zone are found a few hundred metres to the east of the breccia.

These intrusive bodies follow a series of shatter zones and near-vertical faults that trend north-northwest. The dikes are quartz modal and are predominantly granodiorite in composition. The intrusive rocks exercised significant control on distribution and type of mineralization and alteration, and multiple phases of quartz-modal intrusive rock may be present at Schaft Creek. Both equigranular granitic and feldspar quartz-

porphyritic varieties have been noted, with considerable variation in the degree of alteration and mineralization among individual examples.

Positive identification of the intrusive rocks is hampered by strong to intense, and often overlapping, alteration assemblages that obscure primary textures. Recent work by Cambria has led to the conclusion that many of the sill-like or flat-lying intrusive bodies that have been mapped to the east of the breccia are actually porphyritic volcanic flows that have been overprinted by strong albitic alteration.

Historically, the deposit has been divided into three mineralized zones: the Main (Liard) Zone, the Paramount Zone, and the West Breccia Zone. Cambria has re-interpreted the Paramount Zone and the West Breccia Zone as a single contiguous breccia zone running roughly north-south for approximately 2.1 km (Caron et al. (2012).

The Main Zone is roughly circular in plan view. It lies immediately to the west of Snipe Lake in the saddle zone south of Mount LaCasse. The dominant host rocks of the Main Zone mineralization are andesitic to basaltic fragmental rocks of varying textures and degrees of sorting. These are crosscut by dike-like intrusive bodies. According to Cambria's interpretation, the fragmental rocks form a ring-shaped, pipe-like body with a steep plunge to the north-northwest. The recent re-interpretation suggests that the volcanic pyroclastic rocks, may in fact be hydrothermal breccias.

The West Breccia Zone (to the immediate west of the Main Zone) and the Paramount Zone (to the north) are now interpreted as a single, continuous zone, which is simply named the Paramount Zone. This zone generally consists of variably altered intrusive and volcanic rocks, occurring frequently as heterolithic (polymictic) breccias. The clasts occur in a wide range of sizes from millimetre to cobble-sized, as well as subangular to angular. The matrix consists of altered rock flour, hydrothermal cement, or, in some cases, fine-grained igneous material, which ranges from matrix-supported to clast-supported. The Paramount Zone contains a relative abundance of igneous matrix material when compared with the West Breccia Zone, which could indicate a greater depth within the system. The Paramount Zone also features hypidiomorphic, equigranular to porphyritic granodiorite dikes.

FIGURE 5 GEOLOGY OF SCHAFT CREEK DEPOSIT

ALTERATION

Hydrothermal activity at Schaft Creek was a complex series of overlapping events related to fault reactivation, hydraulic fracturing, intrusion, and fluid degassing. This has resulted in early developed alteration facies being overprinted by later alteration facies, both retrograde and prograde, particularly within the breccia in the Paramount Zone, where field evidence supports several stages of breccia reactivation. Alteration zoning is accordingly complex, with telescoping and overprinting of both pro-grade and retrograde phases. In detail, alteration assemblages sometimes appear contradictory but can generally be appreciated when considered in the light of complex structural reactivation and hydrothermal overprinting.

The work, combined with core re-logging and logging of new core from the 2010 and 2011 drilling programs, has provided sufficient data to define the following general alteration framework for the Schaft Creek deposit, with alteration phases listed from oldest to youngest.

Widespread diagenetic development of chlorite and minor carbonate in the mafic basaltic andesite volcanic pile (this alteration predates hydrothermal alteration and mineralization). Development of hematite in some parts of the volcanic pile (e.g., purple volcanics seen to the northeast of the Main Zone) may also be diagenetic. Ubiquitous weak to moderate phyllic alteration consisting of sericitization of primary feldspar phenocrysts as a precursor to the main sodic alteration and mineralization phase.

Sodic feldspathization, primarily affecting extant feldspar phenocrysts, with alteration ranging from rims of sodic feldspar to complete replacement. The primary pulse of sulphide mineralization (disseminated and fracture-filling chalcopyrite, bornite, and molybdenite) appears to have been synchronous with this prograde alteration, and both alteration and mineralization appear to be closely related to intrusion of irregular sub-vertical, dike-like bodies of quartz-bearing feldspar porphyry. Sodium metasomatism occurred at fairly deep levels in response to increasing temperatures within highly saline fluids as they approached the axis of faulting and intrusion along a prograde thermal path. In the Main Zone at least, this phase of alteration and sulphide mineralization appears to be preferentially hosted, in part, within coarse fragmental volcanics (aerial lapilli tuffs to coarse agglomerates) that have been structurally prepared by faulting that both preceded and was synchronous with intrusion, alteration, and mineralization.

Potassic alteration, consisting of development of fine-grained biotite hornfels proximal to intrusive bodies within the Paramount Zone and orthoclase replacement/veining in the Main Zone and both the West Breccia Zone and Paramount Zone. Some of the potassic hornfels in the Paramount Zone was subsequently incorporated into breccias, where biotite hornfels clasts are locally significant components of polylithic breccias. To a significant degree, potassic alteration (i.e., pink feldspathization) correlates with mineralization in both the Main Zone and the breccia zone. A zone of pink feldspathization that includes most of the Main Zone and extends along the east side of the breccia in the Paramount Zone. Another narrow zone of potassic alteration is coincident with the West Breccia Zone in the area west of the Main Zone but diverges to the northwest from about 6360500N. Perhaps not coincidentally, the attitude of the portion of this alteration zone that diverges to the northwest mirrors the attitude of several zones of northwest-trending steep faulting, including a major fault zone located ~200 m to the northeast.

Patchy phyllic alteration, consisting of local silicification (quartz flooding) and development of local stringer and disseminated pyrite. This alteration, most likely contemporaneous with or slightly later than potassic

alteration, is a lower temperature prograde event. The liberation of abundant hematite due to the destruction of mafic minerals such as hornblende may be part of this alteration event. Hematite is far more abundant than pyrite at Schaft Creek, forming during diagenesis as well as during phyllic alteration.

Retrograde propylitic alteration, resulting in the development of dark (iron-rich?) chlorite and locally strong epidote overprinting. This alteration phase has also resulted in the remobilization of some considerable fraction of the sulfides into veins and fractures.

Late-stage development of ubiquitous carbonate, both within the matrix and as fine irregular stringers. A very weak argillic overprint as sparse alunite within carbonate veins is most likely contemporaneous with carbonate development. Sparse gypsum and anhydrite veins are also part of this late-stage alteration.

STRUCTURE

From Caron et al. (2012), brittle deformation at Schaft Creek is primarily reflected in shattering, shearing, and faulting at all scales, ranging from crushing and grinding of individual rock-forming minerals to very significant large-scale faults that are represented by thick zones of clay gouge and mylonite. As a result, topographic expression of the deposit is generally recessive and the near-surface levels of the deposit (particularly in the Paramount Zone) are strongly broken and rubbly to depths exceeding 100 m, resulting in difficult drilling with poor core recoveries, as well as challenges in correlation of structures between sections. The faults and fault-related structures (shears, shatter zones, etc.) at Schaft Creek can be generally categorized into three sets:

- An en echelon set of shatter zones that trend northwest (319°) and dip steeply to the northeast (~85°). This structural set is congruent with fundamental linear features noted in the resistivity survey and with several strong features that are evident in the topographic lineament study. Additionally, a significant intrusive dike generally follows this trend. The shattering is likely part of early regional faulting.
- A set of faults and shatter zones that trend northeast (44°) and dip moderately to the northwest (45°). Three shatter zones along this trend can be mapped over the Paramount Zone, and two well-defined individual fault planes are found in the Main Zone to the south. These faults and shatter zones appear to slightly displace earlier faulting, including faults that trend to the northwest (described above) and a set of sub-horizontal faults described below. In addition, the breccia zone appears to show local minor displacement along this trend, suggesting that motion along this fault trend was episodic over a period of time.
- An early set of sub-horizontal faults that strike to the northwest and dip gently at ~10° to the northeast. These faults occur in the Main Zone where they appear to provide a general downward bound to both mineralization and alteration. The faults are, in part, stacked and are cut by the northeast-trending fault set described above. It is likely that these faults represent several sub-horizontal planar faults that have been disrupted by normal faulting (i.e., northwest-side down) along faults belonging to the northeast-trending fault and shatter zone set.

Figure 6 depicts a three dimensional model of the fault structures at Schaft Creek, looking to the northwest. A well-defined, contiguous zone of breccias (West Breccia Zone and Paramount Zone) extends along the west margin of the Main Zone and to the north for a total length of at least 2.1 km. Geophysical mapping to the south of the Main Zone shows quite clearly that the breccia extends at least another 1.1 km to the south, for a total of at least 3.2 km. The breccia most likely extends even further to the south, but available

data do not allow additional projections. To the north, drilling and currently available geophysical mapping do not support extending the breccia beyond the current limits of mapping (6361300N), although the breccia may be offset in this area toward the northwest along a steep northwest-trending fault zone.

6.3 MINERALIZATION

INTRODUCTION

Prior to works completed in 2011, mineralization at Schaft Creek has been described in terms of three separate zones: the Main (or Liard) Zone, the Paramount Zone, and the West Breccia Zone. Although mineralization in the Main Zone and the West Breccia Zone is found in two generally spatially separate areas in the southern portion of the Schaft Creek deposit, the same cannot be said for mineralization found further to the north. There, most mineralization is hosted within structurally prepared and altered breccias, with a lesser amount of mineralization found in proximal volcanic units. It seems clear that mineralization at Schaft Creek can be readily described in terms of an earlier phase of mineralization in the Main Zone and a later phase of mineralization related to breccias and proximal volcanics found along the west margin of the Main Zone and extending to the north.

MAIN (LIARD) ZONE

The Main Zone forms a tabular zone that extends up to 1.1 km in the east-west direction and more than 1.2 km in the north-south direction (Caron et al., 2012). The base of this zone dips shallowly toward the north at ~15°, as well as to the west at ~15°. The majority of the mineralization and alteration lies above a series of sub-horizontal faults that dip gently to the northwest.

Some of the mineralization in the Main Zone is related to intrusion of feldspar quartz-porphyry dikes that follow the trend of a series of northwest-trending steep faults and shatter zones that strike at 319°. These dikes show some relatively minor right-lateral offset along faults that strike at 045° and dip 45° to the northwest. Another dike trends north-northeast and appears to be closely associated with the majority of the mineralization found in the Main Zone. This dike cuts the southern and eastern portions of a ring-shaped structure of coarse fragmental rocks that may represent an early breccia pipe. In general, these fragmental rocks are generally closely associated with mineralization and alteration, most likely due to relatively high permeability and porosity. Additional mineralization is also related to younger breccias in the West Breccia Zone, with mineralization hosted within and proximal to the breccias, as well as along relatively flat-lying structures that host significant molybdenite.

Sulphide mineralization in the Main Zone consists of chalcopyrite, bornite, molybdenite, and lesser pyrite, mostly present as irregular stockworks in all rock types, although it is preferentially hosted in coarse fragmental units to some degree. Relatively little disseminated mineralization is found, perhaps due to remobilization of sulphides during subsequent episodes of alteration.

BRECCIA (PARAMOUNT & WEST BRECCIA) ZONE

The Breccia Zone apparently developed relatively late in the evolution of the Schaft Creek hydrothermal system, with linear, contiguous breccias cutting many faults and intrusive bodies (Caron et al., 2012). The only clear exception to this is found in the late northeast-trending, northwest-dipping fault set where small offsets in the breccias are noted.

Much of the mineralization in the Breccia Zone is hosted by the strongly altered and structurally prepared breccias. Some mineralization with fairly good grade is found in volcanic units proximal to the breccias, as well as along the margins of some intrusive dikes. Further removed from the breccias are areas of generally lower grade.

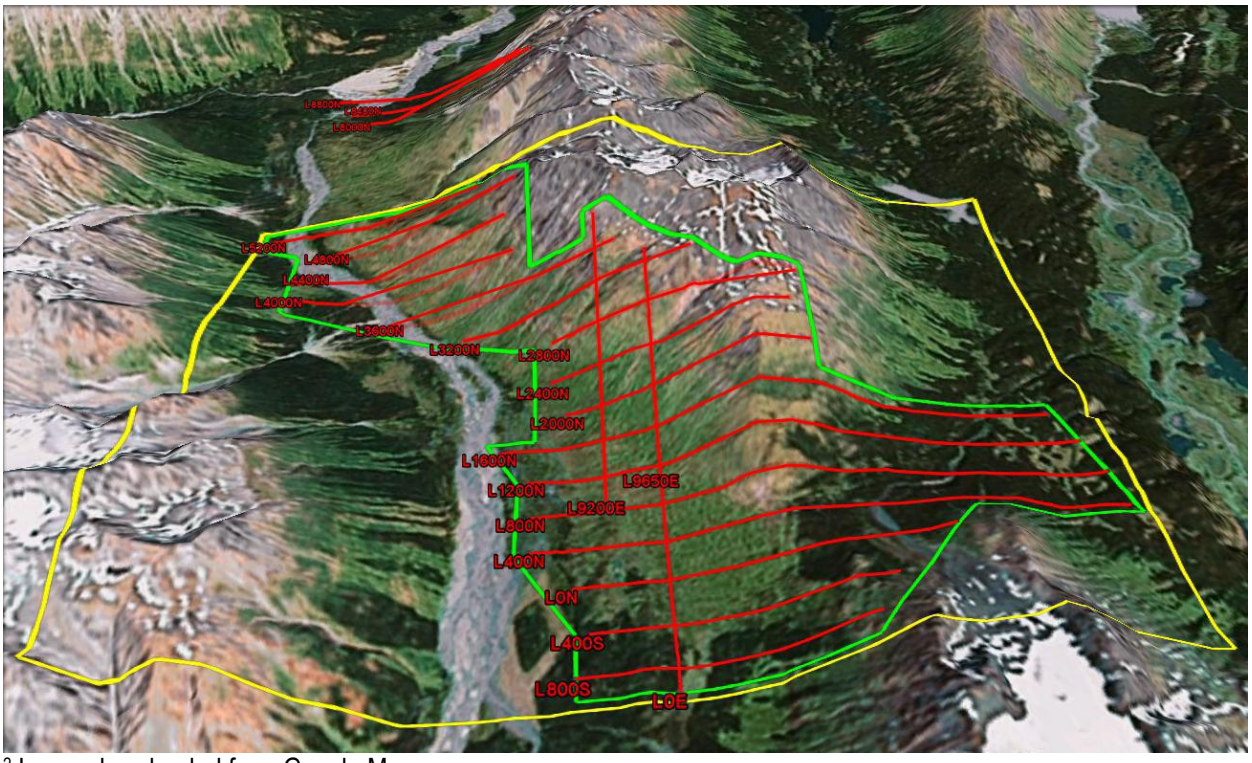
Sulphides in the breccia consist of chalcopyrite, bornite, molybdenite, and pyrite. Chalcopyrite and bornite occur as fine veinlets and disseminated patches in the altered finer-grained matrix of the breccia or as local patches of sulphide matrix, with minor amounts in intrusive and volcanic clasts. Minor grey quartz patches locally accompany Cu sulphides. Pyrite is generally not abundant in the breccia zone, although a few locations are seen where pyrite is dominant. Early quartz-rich veinlets are present in local intrusive clasts. The Cu grades in the breccia zone exceed 0.5% Cu, most notably in the Paramount Zone between 6360700N and 6361050N. These relatively high grades are likely related to greater permeability and porosity, as well as to episodic alteration and mineralization along the breccia zone.

7.0 EXPLORATION

7.1 QUANTEC TITAN-24 DCIP AND MT SURVEYS, 2010-2011

Copper Fox retained Quantec Geosciences Ltd. to conduct a Titan-24 direct current induced polarization (DCIP) and magnetotelluric (MT) survey. Phases I, II, and III were completed in 2010 and 2011. The objective of the survey was to map potential targets to depths of 1,500 m to assist in the definition of drill targets. Data were acquired over nine DC/IP/MT spreads along five lines with 100 m station intervals and approximately 400 m line spacing. A total of 64 km DC/IP survey line (plus current extension) and 64 km of MT survey line were surveyed. Data were acquired over 27 DC/IP/MT spreads along 21 lines with 100 m station intervals and approximately 400 m line spacing. Eighteen survey lines were located in the main grid and three survey lines were located in the northern grid. In the main grid sixteen survey lines were oriented in E-W direction with ~400 m line spacing (Figure 7). Also, two tie-lines were surveyed in N-S direction in this area. For the DC and IP measurements, a pole-dipole configuration was used (Gharibi and Eadie 2010).

FIGURE 7 SURVEY LINES AT SCHAFT CREEK



[2] Image downloaded from Google Map.

Red lines display the lines surveyed in three phases, III, II, and I, respectively. Yellow box marks the 3D inversion area. Green path marks the 3D inversion results illustration area.

PHASE I

The main results of Phase I of the survey are as follows (Gharibi and Eadie 2010):

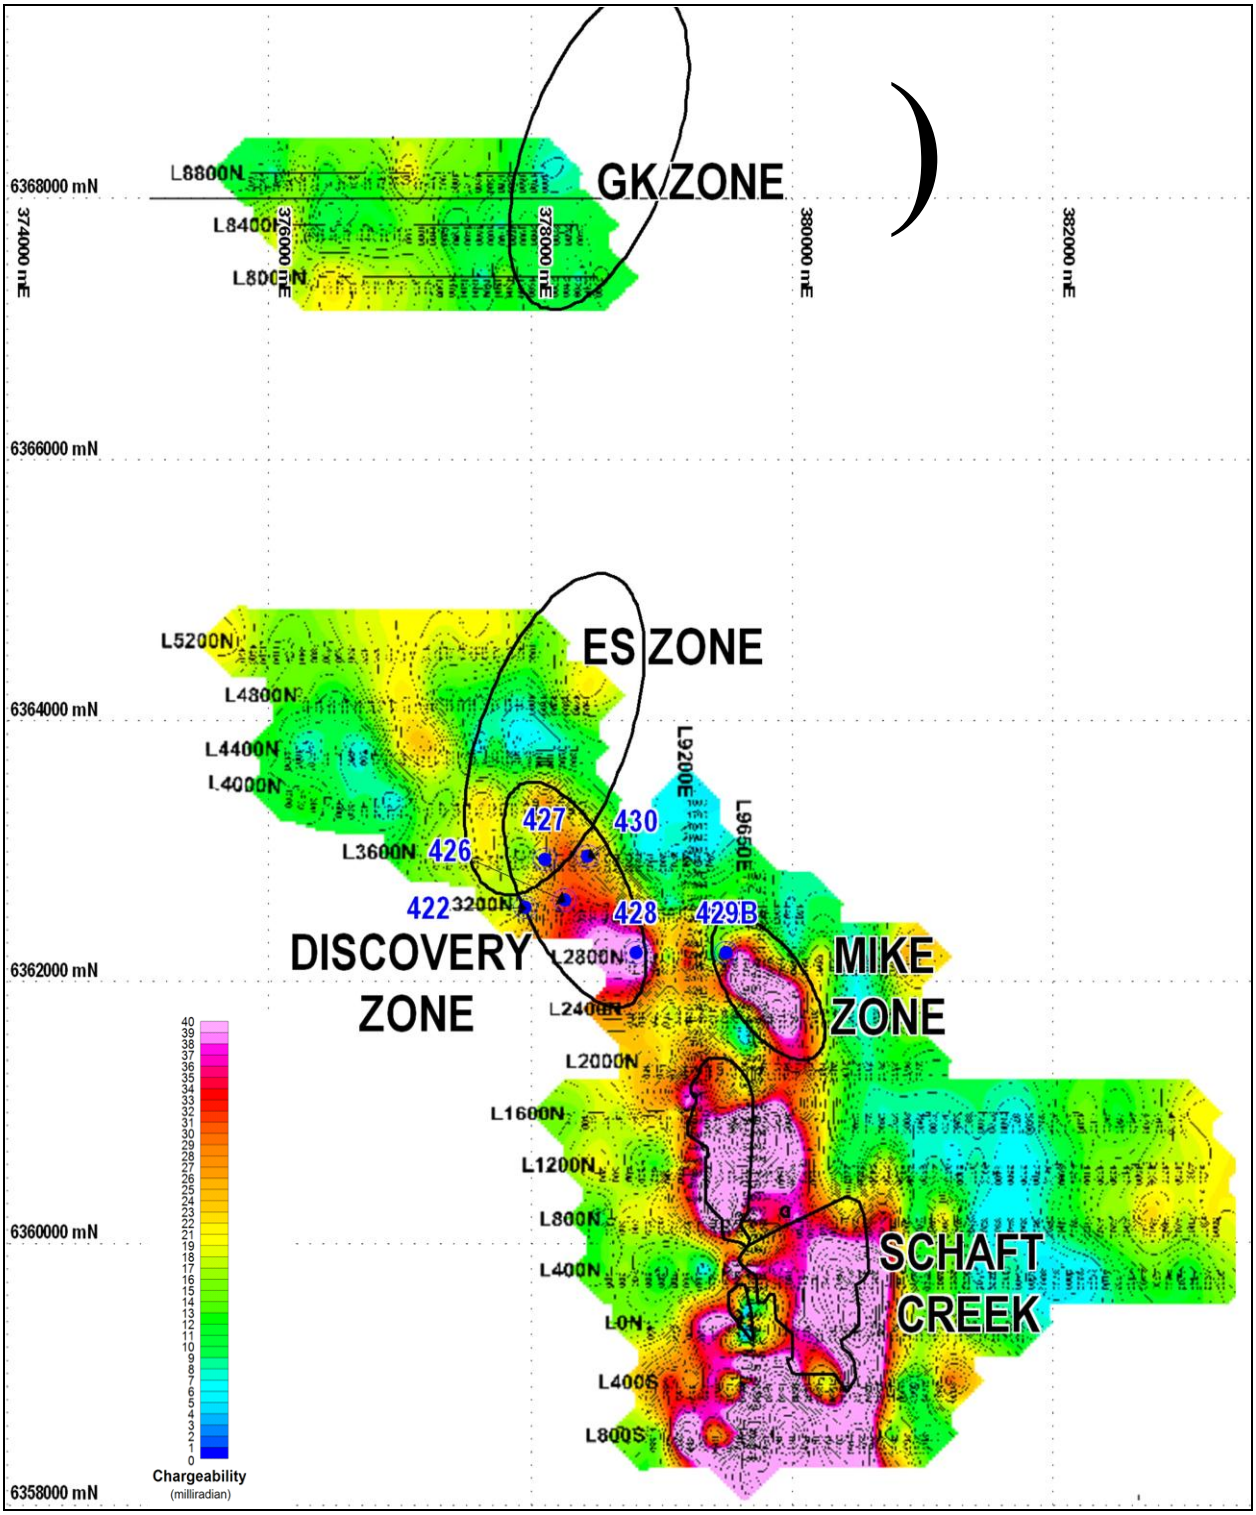
- The chargeability anomaly formed by the Schaft Creek deposit was extended an additional 800 m to the north and 800 m to the south, with the anomaly having a strike length of 3,200 m.
- At a depth of 700 m below surface, the chargeability anomaly located in the center of the Schaft Creek deposit measures 1,000 m long by 500 m wide and is open at depth.
- The chargeability anomaly suggests that the majority of the historical drilling was completed on a possible flank of the deposit (Liard Zone) and was too shallow to test the deeper part of the anomaly.
- The survey failed to reconfirm the chargeability anomaly identified in 2007.

PHASE II

Follow-up work to the Titan-24 DC/IP/MT survey was performed between September 22 and October 11, 2010. Phase II was an extension to the previous survey conducted over the same area, and data were acquired over five DC/IP/MT spreads along five lines with 100 m station intervals. Four survey lines were oriented in east-west direction with approximately 400 m line spacing. One tie-line was surveyed in north-south direction. A total of 12 km DC/IP survey line (plus current extension) and 12 km of MT survey line were surveyed. A pole-dipole configuration was used for DC and IP measurements. The main objective of Phase II was to comprehensively explore the Schaft Creek horizon for geophysical anomalies that had corresponding deposit signatures outlined in Phase I (Gharibi and Faucher 2010). Phase II surveyed the area over the Mike Zone and the recently acquired ES and GK Zones (all within a 6 km strike length) located north of the Schaft Creek deposit Primary results from Phase II are summarized in Gharibi and Faucher (2010).

A large conductive body in the westernmost part correlates with Hickman batholith. The shallow conductive zones resolved in the western part construct an elongated conductive body with a ~NNW-SSE trend (Figure 8). The elevated conductive features in this area associate with outcrop of Hickman rocks and volcanic rocks in the Main Zone and Paramount Zones. The West Breccia Zone is distinct in this area with slightly higher resistivity. This zone partially associates with andesitic volcanic rocks in this area. The chargeability models generally display a very low chargeability in the eastern part of the grid. In the western part of the grid the chargeability cross-sections display elevated chargeability in an area associated with Main, West Breccia, and Paramount Zones. The southern portion of the western part of the grid illustrates a highly chargeable subsurface that extend beyond the survey grid. The two southernmost lines (L800S and L400S) surveyed in the phase II of the Schaft Creek project revealed a large and highly chargeable area. A chargeable anomaly is resolved in the central part of these lines at a depth of ~100m with a chargeability of more than 40 mrads. The anomaly appears to extend to depths greater than 400 m. The northernmost lines (L2000N and L2400N) surveyed in the phase II display a slightly elevated chargeable feature in the central part of the line. The anomaly shows a maximum chargeability of ~20 mrads in a ~N-S orientation. This chargeable zone is the northern extension of the chargeable anomalies resolved in the central part of this area. A total of 16 potential targets with different priority levels have been resolved along the survey lines surveyed in phase II of the Schaft Creek project. The potential targets are prioritized as High, Moderate, or Low, and their intermediate ranges based on the category of the chargeability and conductivity of the anomalies as well as the size.

FIGURE 8 QUANTEC TITAN 24 IP AND MT SURVEY



PHASE III

Phase III of the survey included 13 DC/IP/MT spreads along 12 lines with 100 m station intervals. Ten survey lines were oriented in east-west direction and two tie-lines were surveyed in a north-south orientation. The survey lines were spread over two survey grids. Three of the east-west oriented survey lines were located in the northern grid in an area northwest of the main grid (lines L8000N, L8400N, and L8800N). A total of 30 km DC/IP survey line and 30 km of MT survey line were surveyed. A total of 31 potential targets with different priority levels have been resolved along the survey lines surveyed in phase III of the Schaft Creek project. The potential targets are prioritized as High, Moderate, or Low, and their intermediate ranges based on the category of the chargeability and conductivity of the anomalies as well as the size.

OVERALL SIGNIFICANT RESULTS

In order to better interpret the geophysical responses obtained by the surveys, lithologies, sulphide content and metal grades obtained from the diamond drilling were examined, wherever such data was available. From this, main results of the survey are as follows (press release October 17, 2011):

- A previously unknown chargeability anomaly exists west of the Liard Zone.
- The chargeability anomaly in the Paramount Zone has been extended 1,800 m to the north, and has a width of 400 to 1,000 m.
- The chargeability anomaly in the Mike Zone has been extended 600 m to the north and has a width between 500 to 600 m.
- The chargeability anomalies in the Mike Zone and the Paramount Zone appear to define a circular feature with a zero chargeability core, suggesting the central portion of a porphyry system.
- The ES Zone contains two moderate chargeability anomalies, one of which corresponds to the mineralized zone outlined on surface.
- Only the western portion of the GK Zone could be surveyed due to terrain issues. A 1,000 m long by 200 m wide weak chargeability anomaly has been detected along the western side of the mineralized zone exposed on surface.

A brief discussion on the IP anomalies is described below (press release October 17, 2011).

Paramount Zone
The survey has extended this strong chargeability anomaly (with corresponding resistivity low) a distance of 1,800m to the north of the current drilling. This chargeability anomaly in conjunction with the chargeability anomaly identified on the Mike Zone defines an interpreted circular feature that coincides with a large circular shaped resistivity low. The south side of this circular feature corresponds to the higher-grade zone of copper-gold-molybdenum-silver mineralization intersected by the drilling completed in 2010 and 2011. The northern side of this anomaly has not been tested by diamond drilling. This chargeability anomaly shows excellent correlation with the zone of argillic alteration within the Shaft Creek Mineral Trend.

Mike Zone
This strong chargeability anomaly appears to be a separate anomaly that defines the northeast portion of the interpreted circular feature noted above. It appears that this feature is cut by several north-south oriented faults that exhibit a good correlation with the 20km long magnetic feature defined by the airborne

magnetic survey completed in early 2011. This chargeability target appears to be truncated by a strong northwest trending interpreted fault.

ES Zone

Two moderate chargeability anomalies have been located on this zone. The centre of the chargeability anomaly (with moderate resistivity) that correlates with the mineralized zone outlined on surface exhibits a distinct low chargeability over a distance of approximately 300m, possibly due to an interpreted northwest trending fault zone. The second anomaly (with associated moderate-strong resistivity) is located to the west of the mineralized zone and is interpreted to be the extension of the chargeability anomaly defined on the Paramount zone. The chargeability signature is accompanied by a moderate to strong resistivity signature possibly due to alteration.

GK Zone

Only a limited portion of this zone was surveyed by the Titan-24 system. A broad zone (800m wide) of weak to sometime moderate chargeability (associated with a mixed low-moderate resistivity) was located at the interpreted southwest extension of the GK zone. The limited nature of the survey makes a thorough interpretation of this zone difficult. Additional surveying of this zone will be required to provide a better interpretation and significance of the chargeability anomaly and the mineralized outcrop on surface.

8.0 2012 WORK PROGRAM

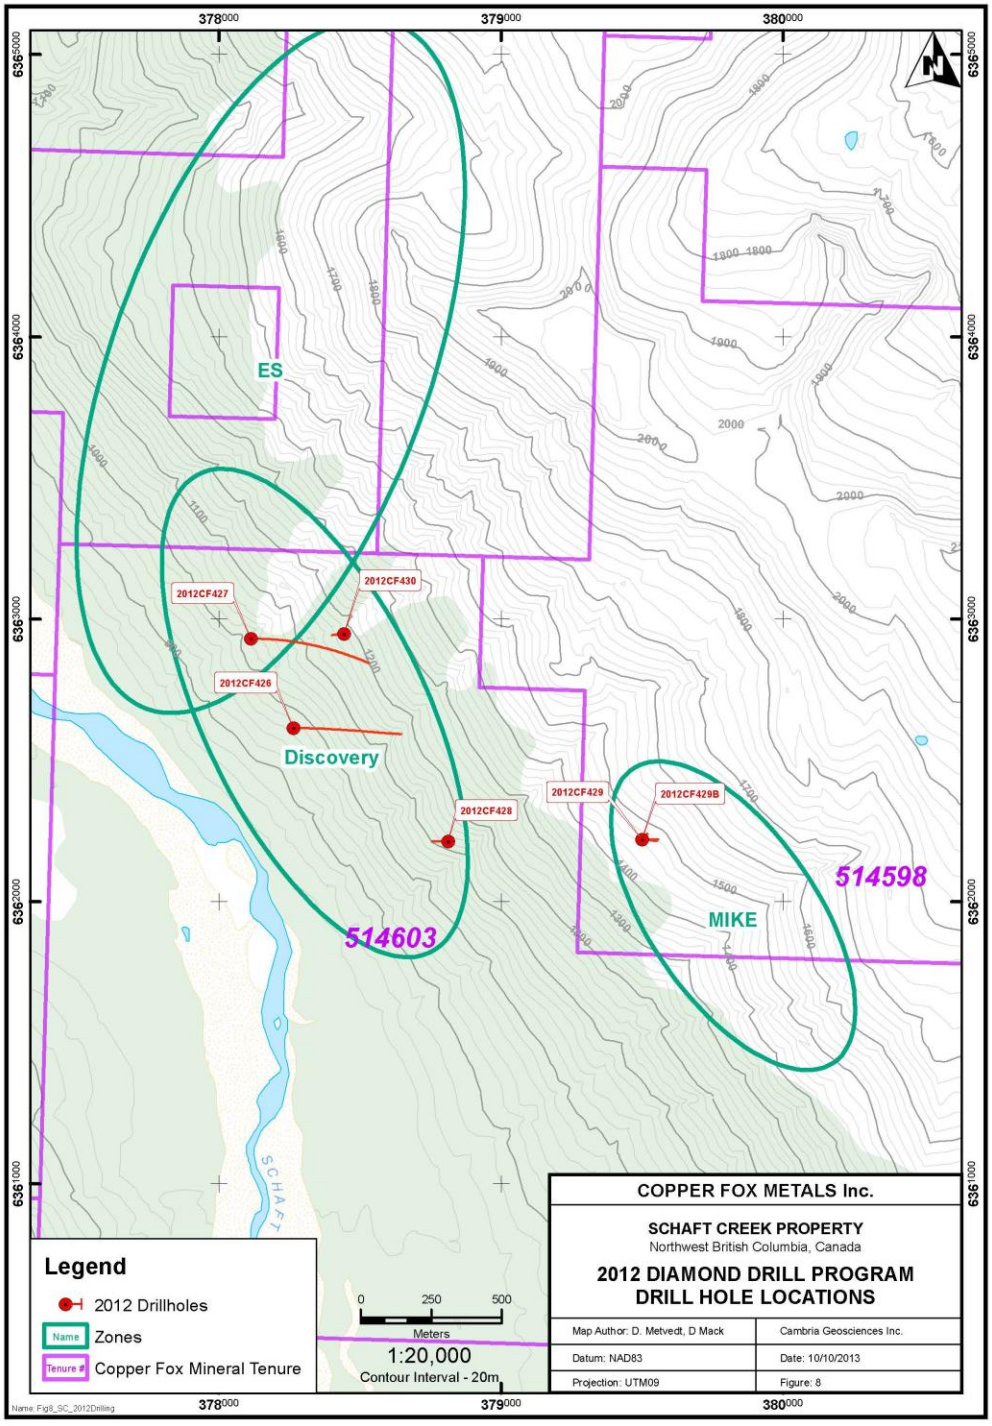
8.1 2012 DRILLING PROGRAM

Copper Fox completed the diamond drilling in August 10, 2012. A follow-up survey to the 2011 helicopter-borne magnetic field survey was completed by Precision GeoSurveys in May 29, 2012. The following report summarizes work completed at Schaft Creek and provides a status report for each of the three elements of technical work that are underway at Schaft Creek during the 2012 field season. These include exploration drilling, field exploration mapping and sampling, and modeling.

During the 2012 program, 6 diamond drillholes, amounting to 2,266.18 m were completed. Four holes targeted the Discovery Zone, and two holes targeted the Mike Zone (see below Figure 8). The program was supervised and executed by Cambria, with primary guidance regarding approval of drillhole locations and orientations provided by Copper Fox. Drilling activities occurred between June and August and were conducted by two diamond drilling contractors:

Tahltan Drilling Services Corporation (TDSC) formed a joint venture with Black Hawk Diamond Drilling Ltd. of Smithers, BC to aid in the drilling supply chain and to provide additional technical expertise. TDSC provided one helicopter-portable, skid mounted Zinex A5 drill rig and one modified A5 hybrid drill, in addition to all drilling equipment, consumables, supplies, and operators.

FIGURE 9 2012 DRILL HOLE LOCATIONS



Core was generally HQ in diameter and reduced to NQ and BQ, when necessary. When oriented core was required, HQ3 diameter core was utilized. The main objectives of the 2012 drill program were test geophysical anomalies to the north of the known deposit area such as Discovery Zone and Mike Zone.

TABLE 2 SUMMARY OF 2012 DRILLING PROGRAM

DDH ID	UTM Coordinates (NAD83, Zone 9)			Length (m)	Start Date	End Date	Azimuth (°)	Dip (°)	Core Size	Target/ Purpose	Drilling Contractor
	Easting (m)	Northing (m)	Elevation (m)								
2012CF426	378264.2	6362615.3	957.5	789.43	6/10/12	7/1/12	91.6	-60.2	HQ	Discovery	TDSC
2012CF427	378113.2	6362931.0	1019.3	769.92	7/10/12	7/19/12	90.1	-59.1	HQ3	Discovery	TDSC
2012CF428	378813.0	6362213.3	1116.8	224.03	7/22/12	8/10/12	270.0	-74.7	HQ	Discovery	TDSC
2012CF429	379498.9	6362219.7	1457.0	132.89	6/20/12	7/1/12	90.0	-65.0	HQ3	Mike Zone	TDSC
2012CF429B	379498.9	6362219.7	1457.0	178.61	7/1/12	7/19/12	90.6	-73.1	HQ3	Mike Zone	TDSC
2012CF430	378442.5	6362948.4	1176.6	171.30	7/25/12	8/1/12	265.0	-76.6	HQ	Discovery	TDSC

The majority of this drilling was in the Discovery Zone. The program included logging all drill core (recording lithology, alteration, mineralogy, and structure) and sampling drill core for geochemical assay, lithogeochemistry, specific gravity, and petrography. The 2012 program also included a comprehensive geological review recorded observations of lithology, alteration, sulphide content, and structure. This is the first year that drilling was completed in these areas. Difficult ground conditions encountered in the Mike zone, (DDH) 2012CF429 and 2012CF429B, and portions of the Discovery zone, (DDH) 2012CF428 and 2012CF430. Due to difficulties with drilling and equipment lost down-hole, one of the holes (2012CF429) was terminated prematurely. In each case, the drill rig was repositioned on the same drill pad in close proximity to the original hole, realigned according to original parameters and completed to depth, with the suffix of “B” added to the drillhole name.

Diamond drill hole ("DDH") 2012CF426 and DDH 2012CF427 tested the 1800m long by 900m wide chargeability anomaly referred to as the Discovery zone. Two diamond drills continue to work on the Discovery zone. Diamond drill hole (DDH) 2012CF426 with a core length of 788.1m located 256m east of (DDH) 2011CF422 was completed to test the Titan-24 chargeability anomaly associated with the Discovery zone. This drillhole intersected visible chalcopyrite mineralization over approximately 90% of its core length along with three intervals of molybdenite mineralization. The drillhole bottomed in weak chalcopyrite-molybdenite mineralization. The analytical results show significant but variable concentrations of copper and low molybdenum concentrations over the majority of the core length of this drill hole. Individual samples returned higher assay results in areas where molybdenite was observed in core.

DDH 2012CF427 with a core length of 769.3m located approximately 400m northwest of (DDH) 2012CF426 was completed to test the northern portion of the chargeability anomaly associated with the Discovery Zone and intersected visible copper +/- molybdenite mineralization from a core interval of 250.0m to the end of the drill hole at 769.9m. The upper portion of this drill hole from 8.0m to 428.12m returned highly variable copper concentration ranging from 0.02 to 0.34% copper over individual sample intervals. The core interval from 428.12m to 764.84m returned relatively consistent copper values with certain zones showing higher grades of copper over variable intervals. The core interval from 511.0m to 523.0m contains significantly higher grades of copper, gold and silver. The molybdenum concentrations in this drill hole are low with individual samples returning higher assay results in areas where molybdenite was observed in core. The chalcopyrite+/-molybdenite mineralization is open at depth.

Highlights are as follows (Press release September 6 & October 17, 2012):

- Diamond drill hole (DDH) CF427-2012 intersected 0.625% copper, 0.59 g/t gold, 2.02 g/t silver and 0.006% molybdenum (1.01% copper equivalent) over a core length of 47 m starting at a core interval of 509.00 m;
- Diamond drill hole (DDH) CF427-2012 intersected 0.24% copper, 0.14g/t gold, 0.006% molybdenum and 0.58g/t silver (0.36% copper equivalent) over an interval of 336.72m m starting at a core interval of 428.12;
- Diamond drill hole (DDH) CF426-2012 intersected 0.16% copper, 0.04g/t gold, 0.003% molybdenum and 0.81g/t silver (0.21% copper equivalent) over an interval of 689.11m starting at a core length of 76.55m;
- In the Mike zone, Diamond drill hole (DDH) CF429-2012 intersected an average of 0.02% copper, 0.02g/t gold and 1.09 g/t silver over a core length of 84.49m starting at a core interval of 94.12 m, with individual maximum sample concentrations of 0.05% copper, 0.15 g/t gold, 16.9 g/t silver and 0.006% molybdenum; and
- In the Discovery zone, DDH CF430-2012 located approximately 300m east of DDH CF427-2012 intersected 0.14% copper, 0.01g/t gold, 0.006% molybdenum and 5.55g/t silver (0.36% copper equivalent) over a core length of 9.40m m starting at a core interval of 122.75m; including a 1.4m core interval that assayed 0.16% copper, 0.03g/t gold and 414 g/t (13.31 ounces per tonne) silver.

Summary of the 2012 exploration drilling results is shown in Table 3 below.

TABLE 3 2012 DIAMOND DRILLING ASSAY RESULTS

DDH ID	From (m)	To (m)	Interval (m)	Copper (%)	Gold (g/t)	Silver (g/t)	Molybdenum (%)	CuEq (%)
2012CF426	76.55	767.66	689.11	0.16	0.04	0.81	0.003	0.21
	76.55	123.65	47.1	0.24	0.05	2.05	0.001	0.29
	476.5	658.4	181.9	0.21	0.05	0.68	0.003	0.26
	702.06	767.66	65.6	0.24	0.04	0.94	0.004	0.29
2012CF427	428.12	764.84	336.72	0.24	0.14	0.57	0.006	0.36
	509	556	47	0.62	0.59	2.02	0.006	1.01
	511	523	12	1.23	2.12	6.36	0.019	3.54
2012CF428	No Significant Assays							
2012CF429	94.12	178.61	84.49	0.02	0.02	1.09	trace	
2012CF430	122.75	132.14	9.4	0.14	0.01	5.55**	trace	

Note: The core intervals listed in the above table do not represent true widths. Copper Equivalent for the metals in DDH 428, 429 and 430 were not estimated due to either the low grade nature or the narrow intervals of the mineralization.
** silver assay cut from 414g/t to 31.1 g/t to estimate weighted average of interval.

All drill logs, drillholes assay data and lab certificates are provided in a .pdf format for use in Adobe Reader (Appendix 4).

8.2 2012 EXPLORATION MAPPING AND SAMPLING

Field work to date has made it clear that some areas will be inaccessible due to extremely steep terrain. Additionally, landslide debris and thick colluvium has buried many of the drainages, especially in area on the western flanks of Mount LaCasse. In these areas, samples will collected as far upstream as practical, and additional samples may be collected in the high alpine areas above the band of inaccessible cliffs and/or thick colluvium. Logistical support for the mapping and sampling is supplied by Copper Fox out of its Schaft Creek camp and with a combination of helicopter and road support.

Two-way FM communications have proven unreliable or not functioning in the northern and eastern portions of the exploration areas. This has been flagged in camp safety meetings. The fly drills have poor signal strength, as well. Satellite telephones have been tried and are unreliable. These points to an urgent need for two rental FM repeaters and power source. These are available at Coast Mountain Wireless Communications Ltd., 2809 Kalum St. Terrace, BC V8G 2M4 for $1,000/mo. and can be shipped on one day notice to Schaft Creek. One repeater should be positioned on high on the eastern side of the Schaft Creek valley, facing Mount LaCasse. The other should be places so as to cover the eastern side of Mount LaCasse.

HEAVY MINERAL AND HIGH ENERGY STREAM SEDIMENT SAMPLING

The stream sediment sampling program focused on the collection of 11 heavy mineral (HMS) and 33 high energy stream sediment (HESS) samples in 2012.

High priority was given to areas below prospective zones (GK zone, ES zone, Discovery zone), drainages and drainages with no historical data. Most of the sampling program was helicopter-supported. The old road along the west side of Mount LaCasse was also used when possible.

Both the HMS and HESS samples were collected within the fast moving water column in the centre of the stream, away from channel banks. The HESS samples were collected at approximately 200m intervals along the streams. Some areas of the streams sampled were inaccessible due to extremely steep terrain. In these areas, samples were collected as far upstream as practical. The HMS samples were collected at the base of major drainages where the stream flow transitions from high energy to low energy. In addition, when multiple drainages converging into one, one sample was collected downstream of the convergence and one sample was collected from each arm upstream.

A crew consisting of three personnel was transported via helicopter to the first sample location. GPS readings and thread chain were used to locate sample sites. At the sample location, large amounts of high-energy streambed sediment were wet sieved to obtain about 3 kg (minimum 10 kg for HMS samples) of coarse sand and silt. The samples were collected by carefully shoveling the sediments into a minus 20 mesh stainless steel sieve (diameter 36 cm, depth 17 cm) that rests in a large aluminum pan containing water. Some liquid detergent was added to the wash water to prevent flotation of small metallic mineral grains. Using handles on the sieve, a rotary-type motion was used to sieve the sediments. The heavy mineral samples were further processed in camp, discussed below. Using the same procedure used for drill core and rock samples the stream sediment samples were placed in labeled 12 in. by 20 in. (HMS in 18

in. by 24 in.) clear poly (plastic) bags with a pre-numbered perforated sample tag. Aluminum tags labeled with sample number and pieces of blue and pink flagging tapes affixed to nearby tree to mark the sample location. The information including sample number, UTM coordinates, sample location in stream, creek type, azimuth, and general flow rate was recorded and later entered into the acQuire database under the corresponding sample ID.

Heavy mineral samples were processed in camp prior to shipment to laboratories for separation and analysis. Each HMS sample was separated by wet sieve into three size fractions: 20-40 mesh fraction, 40-80 mesh fraction, and <80 mesh fraction. The <80 mesh fraction was sent directly to Acme Laboratories for a multi-element ICP analysis, which includes Au and Ag (Analytical Package IF04 [53-element ultra-trace ICP-MS]). The 40-80 mesh fraction was sent to CF Minerals in Kelowna, BC, for a heavy liquid separation, followed by a magnetic separation of the heavy portion into magnetic, para-magnetic, and non-magnetic fractions. Each of these separates were sent to Acme Labs for the same ICP analysis noted above, except that a fusion for barite was also carried out on the non-magnetic fraction. The 20-40 mesh fraction was retained in the core shack at Schaft Creek for future needs.

All stream sediment samples were organized in batches, similar to drill core and rock samples, for inserting blanks, certified reference standards, field duplicates, and laboratory duplicates.

Analyses for heavy mineral sampling carried out at Schaft Creek are now complete. Cu (ppm) and Au (ppb) analyses are shown on Figures 9 and 10, respectively. Analytical results from the non-magnetic separate from the heavy mineral samples are displayed on these figures.

As noted on Figure 9, significant Cu values (i.e., greater than 1,000 ppm Cu) are found on both sides of Mount LaCasse. Sampling on the east side of Mount LaCasse was limited to two samples at the direction of Copper Fox but it may be significant that one of those samples contains more than 2,000 ppm Cu. Sampling along the west side of Mount LaCasse extended for more than 6 km, with Cu analyses in excess of 1,000 ppm found over the entire length sampled. The highest analysis exceeds 10,000 ppm Cu (1% Cu) from a sample collected from a stream that drains the northern portion of the ES Zone. Samples in the range of 6,000 to 7,000 ppm Cu are found in streams draining the GK Zone, located to the north on Mount LaCasse.

As noted on Figure 10, several quite significant Au analyses are found in the non-magnetic fraction of the heavy mineral samples. The highest value is coincident with the Cu value that exceeds 10,000 ppm Cu noted above. This sample returned an assay of 36,290 ppb (36 ppm) Au. One stream draining the GK zone returned an assay of 840 ppb Au and one of the two streams sampled on the east side of Mount LaCasse returned an assay of 778 ppb Au.

FIGURE 10 COPPER ANALYSIS (PPM) FROM NON-MAGNETIC FRACTION OF HEAVY MINERAL SAMPLES

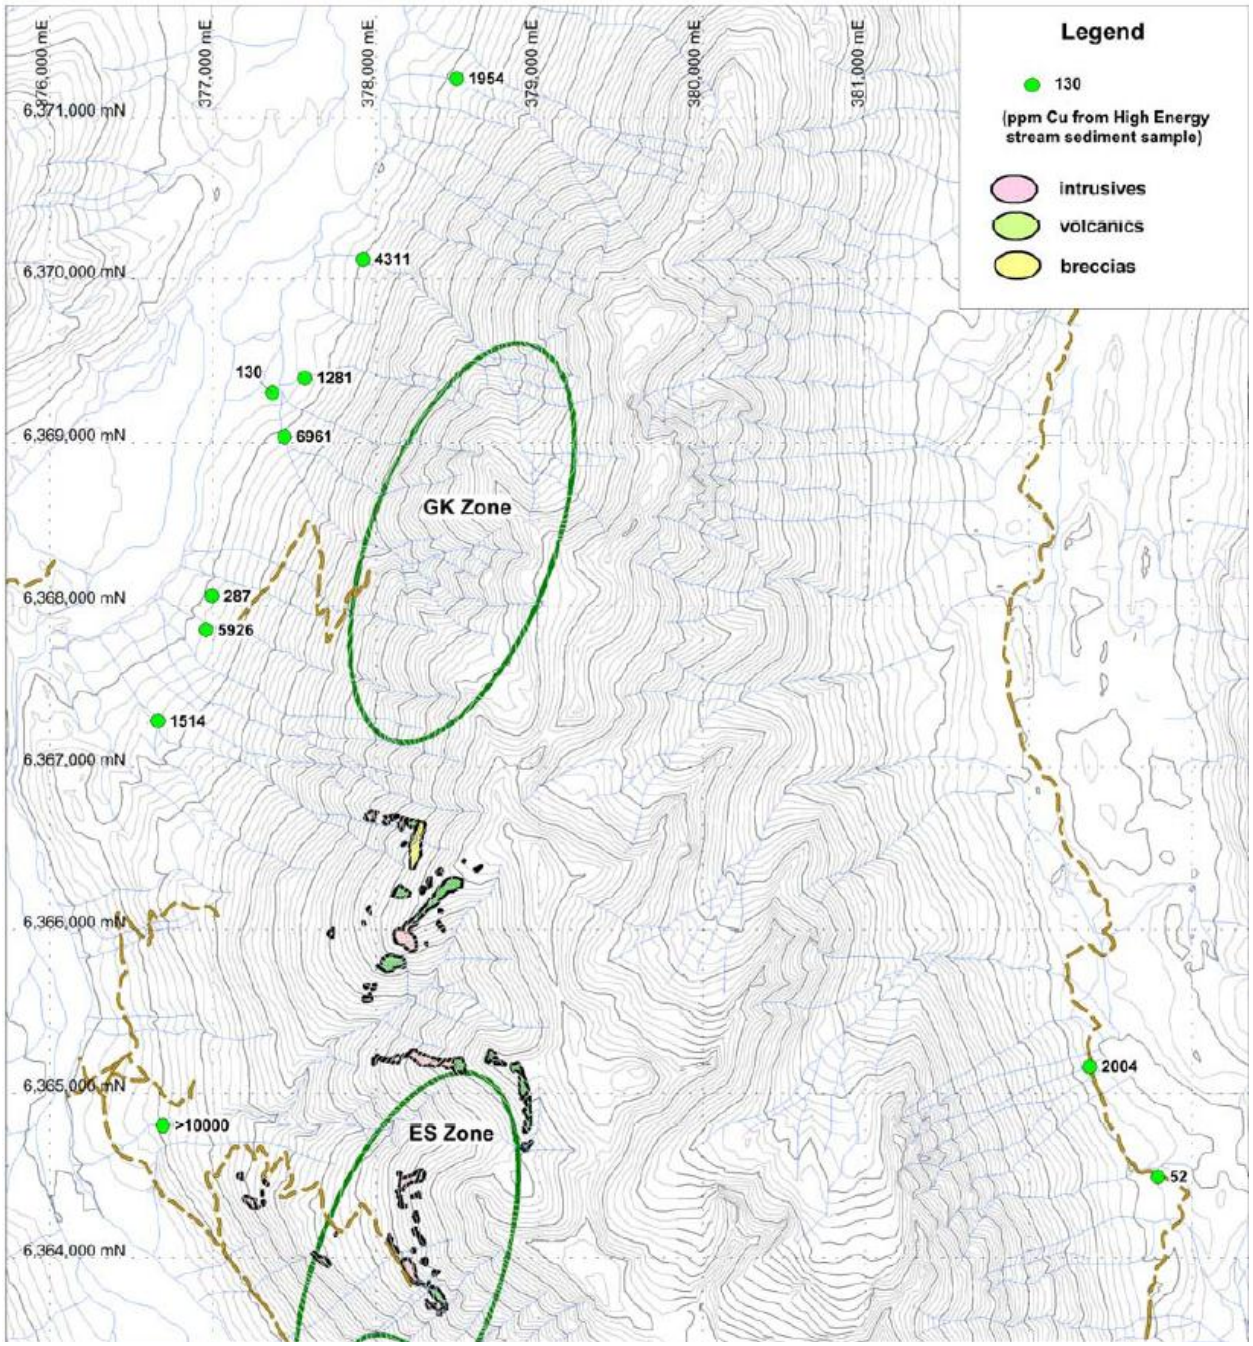


FIGURE 11 GOLD ANALYSIS (PPM) FROM NON-MAGNETIC FRACTION OF HEAVY MINERAL SAMPLES

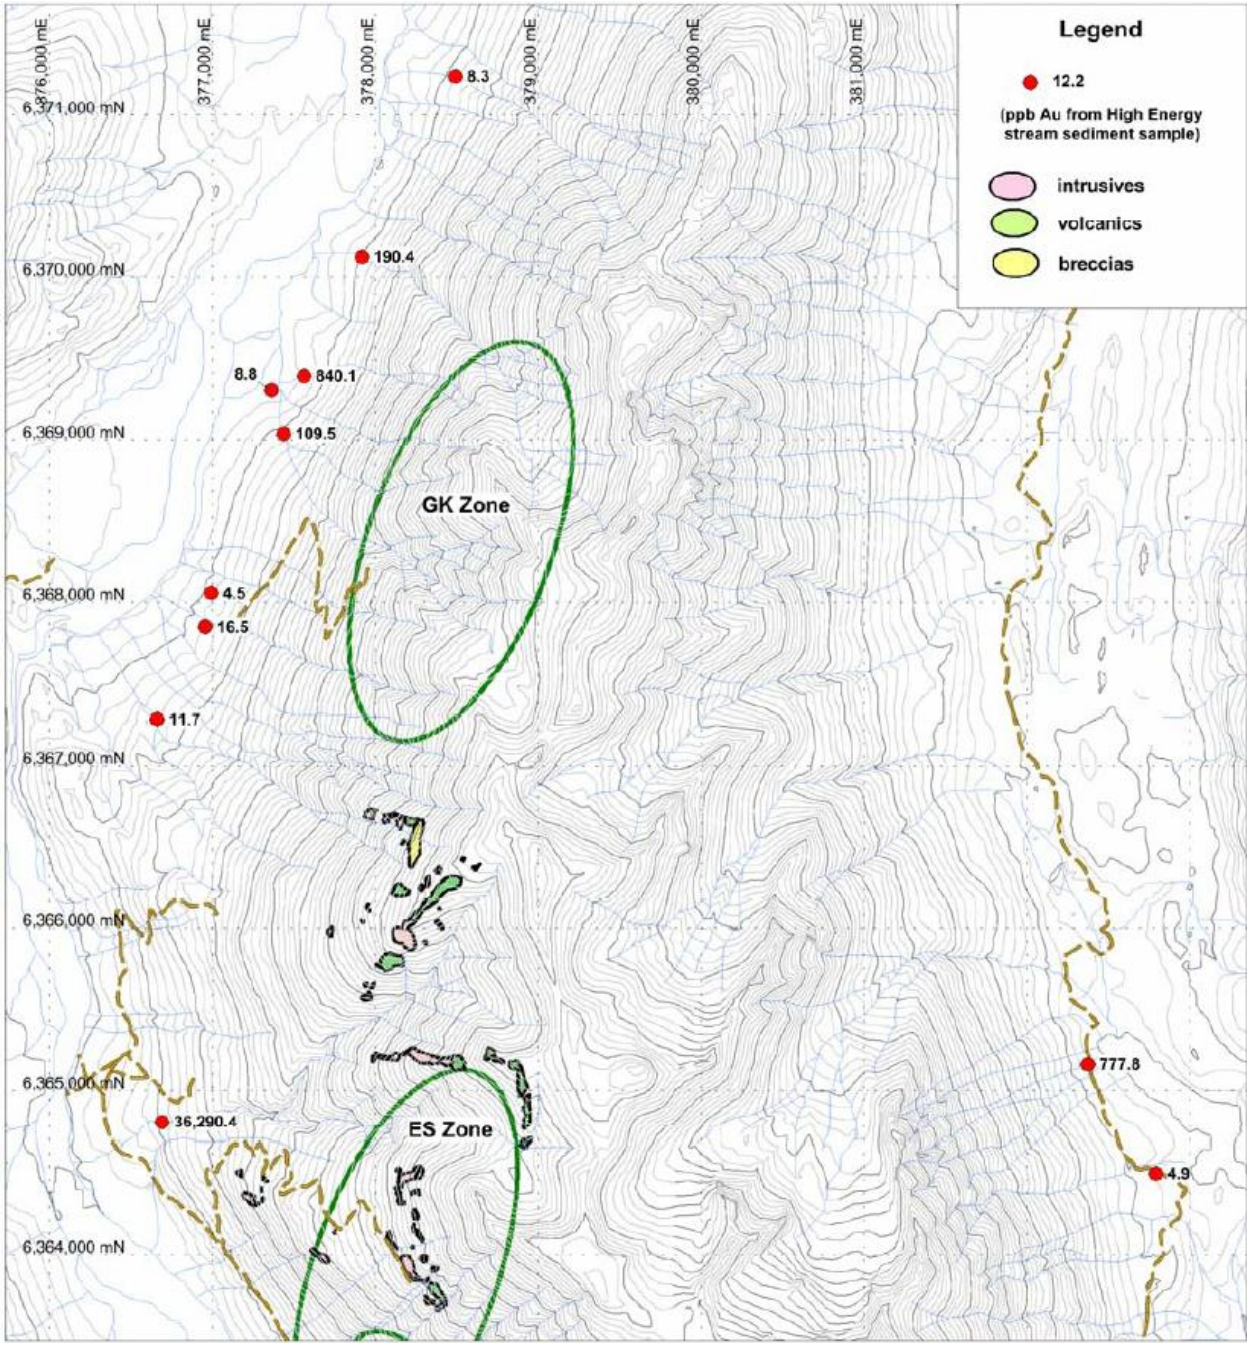

Analyses for high energy stream sediment sampling carried out at Schaft Creek are now complete. Cu (ppm) and Au (ppb) analyses are shown on Figures 11 and 12, respectively.

As shown on Figure 11, a strong and well-defined Cu anomaly, with values ranging up to 665 ppm Cu, is found in streams draining the northern portion of the ES Zone. This anomaly corresponds well with the single point heavy mineral analysis of more than 10,000 ppm Cu from the major stream draining this area. Further north, most of the streams draining the GK Zone, as well as the area of Mount LaCasse to the north of the GK Zone, are anomalous in Cu, with most samples containing more than 100 ppm Cu. In addition, both samples collected on the east side of Mount LaCasse returned more than 100 ppm Cu.

Figure 12 shows that several quite strong Au anomalies in high energy stream sediments are found along the west side of Mount LaCasse. The strongest anomaly is coincident with the well-defined strong Cu anomaly in streams draining the northern portion of the ES anomaly, with Au reaching a maximum of 1,270 ppb in this area. Anomalous Au values are also found in streams draining the GK Zone.

FIGURE 12 COPPER ANALYSIS (PPM) FROM HIGH ENERGY STREAM SEDIMENT SAMPLES

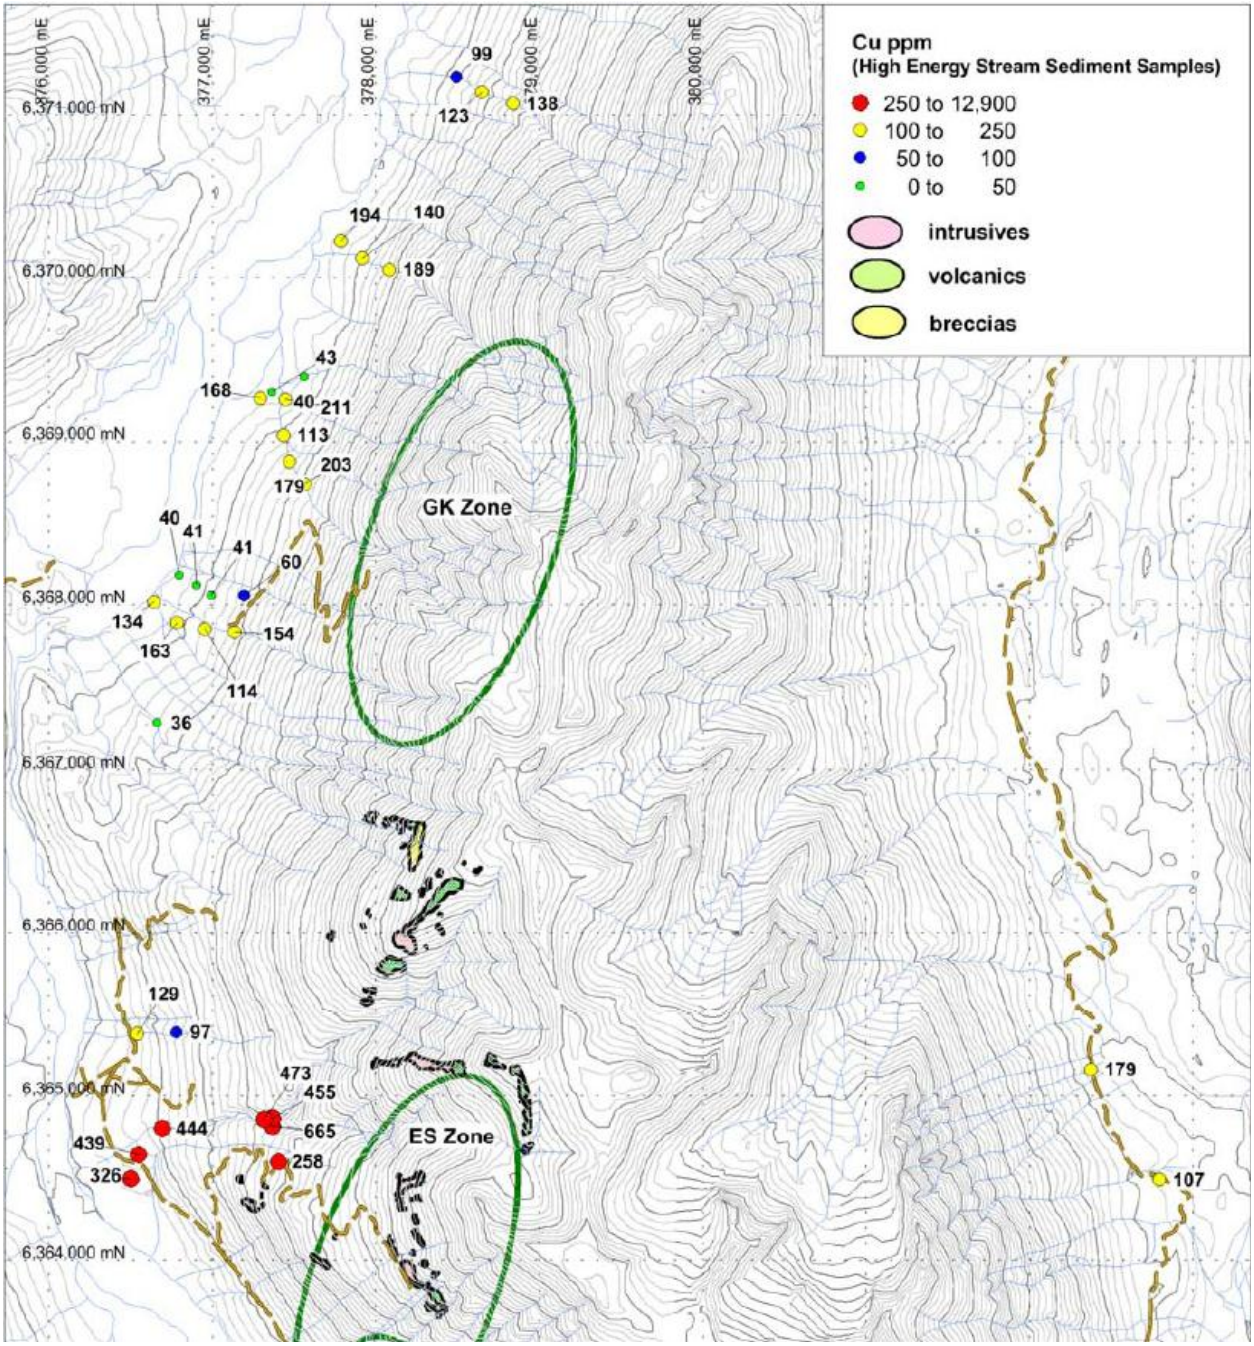

FIGURE 13 GOLD ANALYSIS (PPB) FROM HIGH ENERGY STREAM SEDIMENT SAMPLES

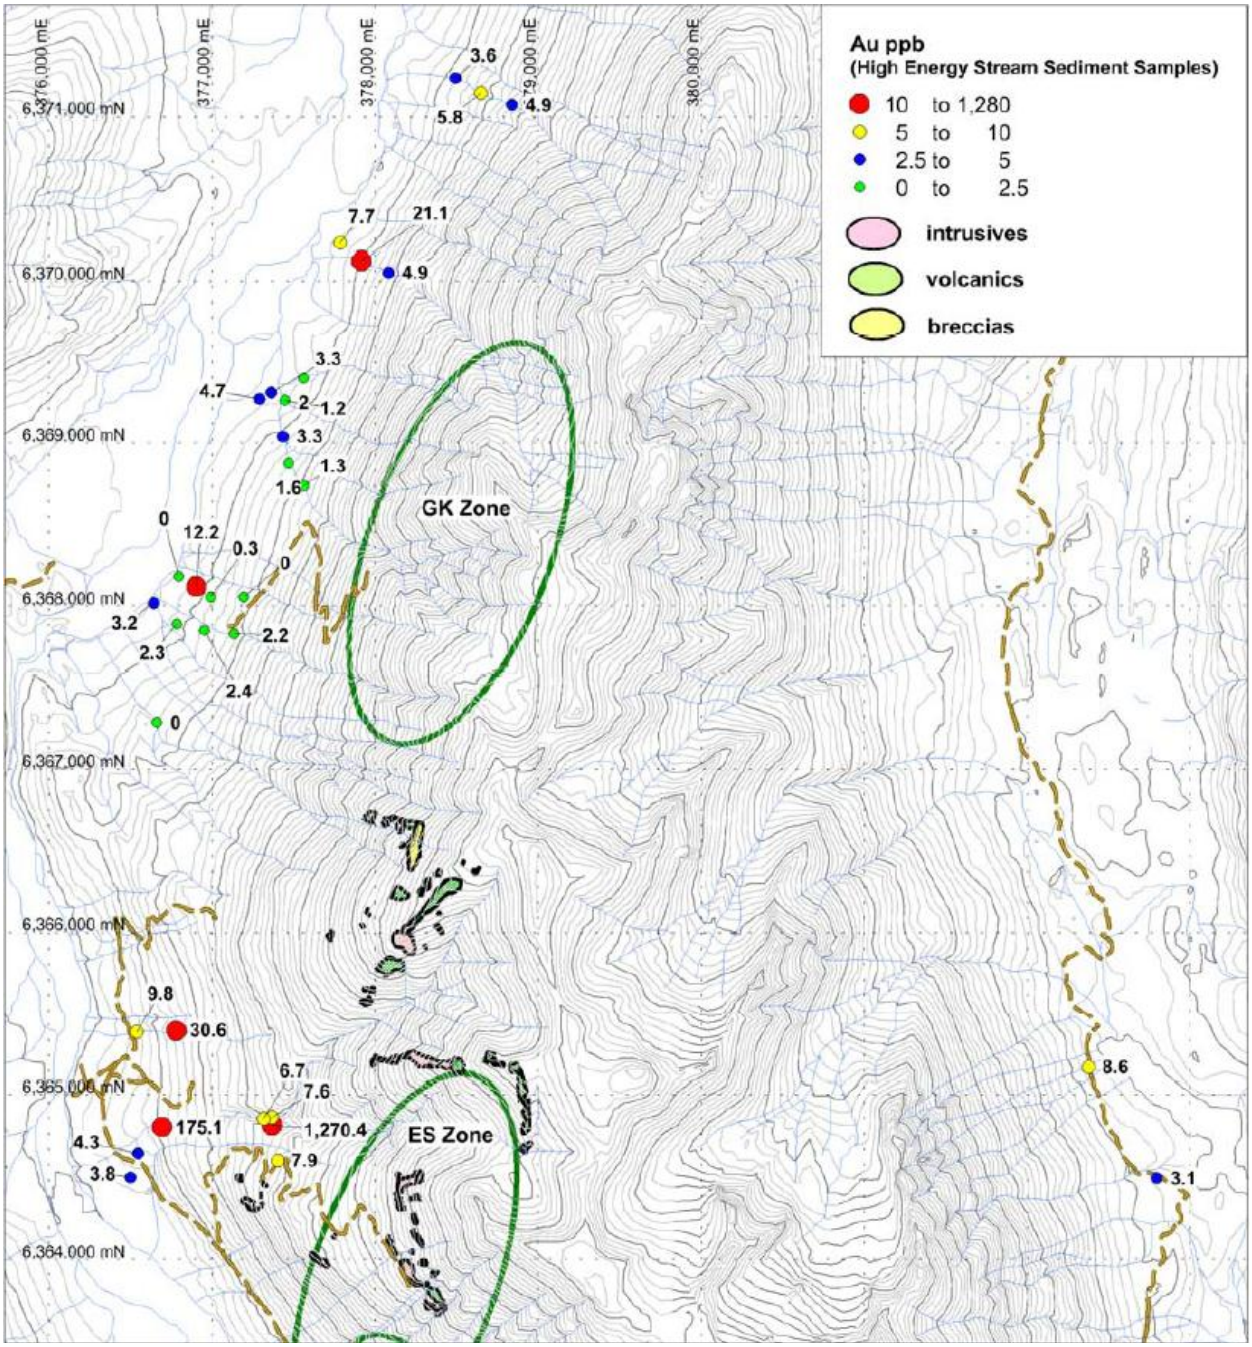

MAPPING AND PROSPECTING

A total of 52 samples in 2 batches were submitted in 2012 to Acme Analytical Laboratories Ltd. (Acme) Smithers sample preparation facility for sample preparation. Analysis for all samples were carried out at Acme's main Vancouver, British Columbia laboratory facility. A total of 46 primary samples of outcrop, 2

certified reference standards, 2 blanks and 2 laboratory duplicates (from split of coarse rejects). All samples were submitted for the same assay analysis as the drill core samples from the 2012 Diamond Drilling Program. One batch was not analyzed for total sulphur by LECO analysis.

Samples were analyzed by inductively coupled plasma mass spectrometry (ICP-MS) (Acme code 1EX). All samples were analyzed by fire assay for Au with ICP-ES from a 50 g sample and a detection limit of 0.005 g/t (ACME code G601 + G610). Samples with Au results >10 g/t were fire assayed with the same method as above but with a gravimetric finish (ACME code G601 + G612). Samples were also analyzed for total sulphur by LECO combustion analysis with a detection limit of 0.02% sulphur (ACME code 2A13).

Mineralized outcrops (fresh or least weathered) containing visible sulphides including chalcopyrite, malachite, and/or pyrite were sampled. Grab samples were collected in areas of localized significant mineralization or small outcrop and consisted of near fist-sized, sometimes larger, rock fragments broken from one position on the outcrop. Chip samples were collected in areas of broad significant mineralization over widths ranging from 5 to 15 m. Rock fragments a few cm wide and usually no greater than 5 cm wide were chipped from the outcrop approximately every 0.5 to 1 m along the interval or sample area. The sample types collected were recorded in field notes and included a description of the size of the area chip sampled (e.g., 10 x 10 m), the length and orientation of the chip sample.

Rock samples were sent for analysis in a set format of batches to allow insertion of blanks, certified reference standards, field duplicates, and laboratory duplicates. Pre-numbered sample tag books from Acme were used to generate sample numbers. For each sample, a unique sample number was assigned from the tag book, and that number was written onto a 12 in. by 20 in. clear poly (plastic) bag with a black permanent marker. One of the perforated tags was placed in the bag along with the rock sample. The sample UTM coordinates, station identification and short rock description were recorded in sample tag book and field notes that was later entered into the acQuire database under the corresponding station ID. A labeled piece of flagging tape was tied around a large rock fragment or branch to mark the sample location site. The flagging tape was labeled with the sample identification, year, and company initials in black permanent marker. Samples were transported back to camp and organized in batches as noted above.

Although analyses for rock chip/grab samples collected during mapping and prospecting work at Schaft Creek are not yet complete, available Cu and Au data are shown on Figures 13 and 14, respectively.

A strong rock chip Cu anomaly is located along the volcanic-intrusive contact in the northcentral portion of the ES Zone (Figure 22). In this area, twelve samples collected over a strike length of approximately 700 meters average 1.32% Cu. Although this average is biased by one sample that contains 10.16% Cu, removal of that sample from the sample set still results in an average grade of 0.51% Cu for the remaining samples. A number of anomalous rock chip samples are also located to the north of the ES Zone.

Figure 23 shows Au analyses in grams per tonne for the same suite of rock chip samples. Several samples that are centrally located in the EZ Zone are clearly anomalous, ranging up to 0.56 gpt Au.

All grab samples geology description, rock samples assay data, and lab certificates for grab samples, stream sediments, heavy minerals are provided in a .pdf format for use in Adobe Reader (Appendix 4).

APPENDIX 1 STATEMENT OF QUALIFICATIONS

STATEMENT OF QUALIFICATION

I, ELMER B STEWART, MSc., P. Geol, certify that:

1. I am President and CEO for Copper Fox Metals Inc. with a business address located at: 650, 340 – 12 Avenue SW, Calgary, AB T2R 1L5

2. I am a member in good standing of the Association of Professional Engineers and Geoscientists of Alberta (Member Number 34563).

3. I graduated from Acadia University in Wolfville, Nova Scotia in 1974 and from Acadia University with a Master of Science degree in 1977.

4. Since 1977 I have been continuously employed in exploration for base and precious metals in North America, Central America, South America, Africa, Central Europe and Central Asia.

5. I supervised the 2011 exploration program at the SCHAFT CREEK property and am therefore familiar with the geology of the SCHAFT CREEK property and the work conducted in 2011. I have prepared all sections of this report.

Dated this 22nd day of February 2013

_____

Signature

Lithology

[0 - 7.2 m] OVER - Overburden. Over burden of mixed lithologies.

[7.2 - 107.6 m] ANAP - Andesite - Aug+Felds phyric. Dark purple-gray to green-gray aphanitic to medium grained plagioclase-pyroxine-porphyritic fragmental andesite. Early patchy, moderate to intense magnetite+hemetite alteration (mineral replacement of pyroxine and amphiboles producing irridesent purple-blue patches and octahedral xtals. Late zoned weak to intense epidote overprinting. Local zones of bleached carbonate fracture selviging evident. Where sheared, unit is annealed by pervasive strong to intense carbonate and epidote alteraton. Unit contains weak to moderate hairline and fracture fill carbonate veining. Two distinct generations of carbonate veining are evident. Early carbonate veining is epidote altered and cross cut by unaltered late carbonate veining. Mineralization consists of fracture controlled semi-massive chalcopyrite and pyrite, limonite and rare malachite. Unit is crosscut by numerous gray-white to pinkish gray hypidiomorphic plag-amphibole granodiorite-diorite dikes. These appear to most often propagate within shear zones and faults. These dikes have plag-microphyric ground masses with local interstitial gray quartz which becomes more quartz flooded and more pink towards dike boundaries (possibel interstitial K spar component). These dikes often brecciate andesites and also form cuspate contacts with the host rock.Andesite country rock and granodiorite-diorite dikes and faults cross cut and intruded by several events of mafic gabbroic-andesitic dikes. Some are propilitized others are not. Dikes intruding granodiorite-diorite dikes are post propilitic alteration.102.7m: 4cm wide pink planer dikelet of plag.-porphyrophyric granodiorite intercept core at 75 deg. TCA. Silica altered (flooded).

Sub Lithology

[26.35 - 32.1 m] DIKE - Mafic plagioclase-bearing dike. Light gray hornblend-porphyritic mafic dike. No visible mineralization.

Lithology

[7.2 - 107.6 m] ANAP - Andesite - Aug+Felds phyric. Dark purple-gray to green-gray aphanitic to medium grained plagioclase-pyroxine-porphyritic fragmental andesite. Early patchy, moderate to intense magnetite+hemetite alteration (mineral replacement of pyroxine and amphiboles producing irridesent purple-blue patches and octahedral xtals. Late zoned weak to intense epidote overprinting. Local zones of bleached carbonate fracture selviging evident. Where sheared, unit is annealed by pervasive strong to intense carbonate and epidote alteraton. Unit contains weak to moderate hairline and fracture fill carbonate veining. Two distinct generations of carbonate veining are evident. Early carbonate veining is epidote altered and cross cut by unaltered late carbonate veining. Mineralization consists of fracture controlled semi-massive chalcopyrite and pyrite, limonite and rare malachite. Unit is crosscut by numerous gray-white to pinkish gray hypidiomorphic plag-amphibole granodiorite-diorite dikes. These appear to most often propagate within shear zones and faults. These dikes have plag-microphyric ground masses with local interstitial gray quartz which becomes more quartz flooded and more pink towards dike boundaries (possibel interstitial K spar component). These dikes often brecciate andesites and also form cuspate contacts with the host rock.Andesite country rock and granodiorite-diorite dikes and faults cross cut and intruded by several events of mafic gabbroic-andesitic dikes. Some are propilitized others are not. Dikes intruding granodiorite-diorite dikes are post propilitic alteration.102.7m: 4cm wide pink planer dikelet of plag.-porphyrophyric granodiorite intercept core at 75 deg. TCA. Silica altered (flooded).

[107.6 - 121.6 m] GRHI - Hypidiomorphic inequigranular granodiorite. Gray and pinkish white plagioclase-hornblende porphyritic intrusive granodiorite/diorite. Rock consist of 2-5mm hypidiomorphic plag. xtals in a fooded grey and pink microphyric groundmass of white plag. microlites in pink quartz phyric groundmass (plag hardness 6.5-6.8; pink groundmass hardness>7). Amphibole phenocrysts are anhedral and altered to chlorite (green, waxy, soft) some amphibole cores are altered to cpy and py. Locally, chloritized amphiboles have been set into solution to contribute to pervasive chlorite flooding, narrow veining and slickenside fracture fillings. Possibel granodiorite protolith since quartz appears to have been remobilized by albite flooding producing albite fracture selvages and patchy flooded grey and pink silica. Rare andesite zenoliths, 2 to 20cm diameter from host rock. Footwall of dike is sheared by a fault and is blended with andesite host rock.

[121.6 - 132.1 m] ANAP - Andesite - Aug+Felds phyric. Andesite continues from above. 126.35-128.2: Purple plag-porpyritic andesite flow with 5-10% sub-euhedral 2-3mm plag. phenocrysts in a purple aphanitic groundmass. Contains coarse disseminated pyrite. Non magnetic. Weak epidote altered.

Sub Lithology

[92.8 - 97.5 m] FAUL - Fault Zone - unrecognizable lithology - gouge with crushed zones. Fault with annealed mylonitic shear textures bounding a core of crumbly angular cataclasete. (See structures) Mylonitic zones include late intense carbonate filling of tension fractures. (20deg TCA). Fault boundaries are annealed by chlorite and late epidote.

[102.5 - 102.7 m] GRHI - Hypidiomorphic inequigranular granodiorite. White and pinkish gray hypidiomorphic plag-amphibole granodiorite dike. Pinkish gray margins with brilliant white plag. xtals in core of dike. Xtal. morphology is anheadral along 10-15cm margins of dike with euhedral plag. and amphibole xtals in a gray-pink quartz phyric groundmass with variable anorthite>albite component. (moh's hardness 5.8-6.5 and flooded quartz 7-7.5) Trace medium disseminated pyrite. Cuts core at 75deg. TCA.

[121.6 - 123.65 m] FAUL - Fault Zone - unrecognizable lithology - gouge with crushed zones. Annealed fault truncating granodiorite-diorite dike. Fault of blended cataclasts of granodiorite-diorite purple porphyritic sericiteized andesite and augit-plag porpyritic magnetit altered andesite with intense chlorite and carbonate veining at 45 deg TCA. Fault annealed by intense calc-epidote overprinting. Locally intens carbonate alteration has obliterated prtolith textures leaving soft zones of nearly solid matt gray coloring. Fault intruded by gray aphanitic mafic dike.

[123.65 - 126.35 m] BSDI - Fine-grained mafic dike. Greenish black aphanitic mafic dike. Non magnetic. Contains 3 cm wide epidote +calcite vein. Cross cut by 3mm wide unaltered carbonate veins at 45-85 deg tca at 90 deg azimuth to earlier vein. Large vein contains 0.2% blebby pyrite. Heavily jointed at random angles and random azimuth.

Project: Schaft Creek — Drillhole: 2012CF426

Lithology

[121.6 - 132.1 m] ANAP - Andesite - Aug+Felds phyric. Andesite continues from above. 126.35-128.2: Purple plag-porpyritic andesite flow with 5-10% sub-euhedral 2-3mm plag. phenocrysts in a purple aphanitic groundmass. Contains coarse disseminated pyrite. Non magnetic. Weak epidote altered.

[132.1 - 136.9 m] GRHI - Hypidiomorphic inequigranular granodiorite. Gray and pinkish white plagioclase-hornblend porphyritic intrusive granodiorite dike. Very similar to previously encountered dikes (geneticaly the same). Contains hypidiomorphic plag, and amphiboles in a plag-micropyric groundmass with vitrious interstitial or flooded quartz. Hanging wall shares a sheared contact with andesite host rock. Footwall is brecciated into cuspate crackle breccia from granodiorite intrusion into host rock. Dike material pennetrates up to 20 cm into brecciated andesite footwall. Dike contains 10-30 cm wide zenoliths of andesite wall rock with cuspate edges from exposure to dike. Dike is pinkish orange colored within 20cm of footwall contact (hemetite from wall rock or possible quench zone).Amphiboles in dike are altered to chlorite, rare mica are altered to sericite. Chlorite has mobilized forming arcuet veins at 0-30 deg. TCA. Dike has late epidotization of chlorite veins.

[136.9 - 146.05 m] ANAP - Andesite - Aug+Felds phyric. Dark purple-gray to green-gray aphanitic to medium grained plagioclase-pyroxine-porphyritic fragmental andesite continues from above. Early patchy, moderate to intense magnetite+hemetite+chlorite alteration mineral replacement of mafic xtals. Zoned moderate sericitization of plag. and intense sericitization of shear zones.

[146.05 - 164.2 m] GRHI - Hypidiomorphic inequigranular granodiorite. Light gray green medium to fine grained hypidiomorphic granodiorite dike. Slight plag porphyritic texture with plag-microphyric groundmass with interstitial pink and gray quartz.

Sub Lithology

[123.65 - 126.35 m] BSDI - Fine-grained mafic dike. Greenish black aphanitic mafic dike. Non magnetic. Contains 3 cm wide epidote +calcite vein. Cross cut by 3mm wide unaltered carbonate veins at 45-85 deg tca at 90 deg azimuth to earlier vein. Large vein contains 0.2% blebby pyrite. Heavily jointed at random angles and random azimuth.

[132.4 - 133.55 m] BSDI - Fine-grained mafic dike. Dark gray green aphanitic mafic dike. barren. Intense calc-epidote altered. Distinct gray green microcrystaline chill margins. Cross cutting granodiorite dike near hanging wall at 45 deg. TCA. Inducing mineralization at footwal contact.

[137.2 - 151.2 m] FAUL - Fault Zone - unrecognizable lithology - gouge with crushed zones. Fault with with zoned mylonitic and anastimosed chlorite and carbonate veining. 45 deg TCA. Contains chlorite mylonitic banding with boudinage and intensly fractured blocks of andesite and granodiorite. Fault is locally anealed by intense carbonate alteration. Fractures and veins express carbonate selvages. Fault has concentrated a high percentage of sulfids.

Lithology

[164.2 - 250.15 m] ANAP - Andesite - Aug+Felds phyric. Massive andesite flow unit continues, Locally fragmental. Dark gray green aphanitic andesite with local zones of augite-plag porphyritic textures. 5% Fine grained magnetite. Local fine to medium grained equigranular. Contacts at 30-40 deg. TCA. Equigranular zones are less, to non, magnetic.

Sub Lithology

[219.15 - 219.35 m] DIKE - Mafic plagioclase-bearing dike. Gray and pinkish gray, granodiorite dike. Hypidiomorphic plag-amphibole porphyrocrysts in a plag-microphyritic groundmass with pink to gray interstitial phyric quartz and flooded with chlorite. Hardnes scratch tested. Amphiboles are alered to chlorite with magnetite cores. Appears similar to other felsic dikes. Weakly sericitized. Overprinted by calcite+epidote. Contacts brecciating andesites.

[231.95 - 239.1 m] DIKE - Mafic plagioclase-bearing dike. Gray green calc-epidote altered aphinitc mafic dike. Andesitic in composition. Intruded by successive mafic dikes with variable ranges in granularity and plag porphyrocrysts. Dikes cut core at 60 deg TCA. Weakly carbonate fracture filling. Fracture with kayolinite clay slickensids. Brecciating andesite wall rock.

Lithology

[314.8 - 344.44 m] ANAP - Andesite - Aug+Felds phyric. Coarse fragmental augite-plag-phyric andesite. Possible pseudobreccia caused by early feldspar alteration of spherules with later chlorite, magnetite alteration of perlitic fractures.Autolithic clast supported to jigsaw fit breccia. Breccia are lighter gray in color and occasionally are hematite altered with dark magnetite haloes. Locally sheared and brecciated by shear zone which includes breccia blocks of different types of andesites as well as feldspar porphyritc breccia.

[344.44 - 365.55 m] ANTF - Andesite tuff. Grey green and blue green, recrystalized, fine to medium grained plag-pyroxene andesitic(?) lapilli tuff. Locally pyroxine-plag. porphyritic with cryptocrystaline groundmass, Contains relict recrystalized pink pummice (?) and fiomme (?) of graphic quartz, feldspar and hornblend. Local faint bedding evident. Interbedded with plag,-porphyroaphanitic beds with 3-10 cm reddish orange subangular plag. porphyro-cryptocrystaline lapilli. Unit is crosscut by rare 10 cm basaltic dikes. Unit is underlain by massive andesite flows.

[365.55 - 376.5 m] ANAP - Andesite - Aug+Felds phyric. Dark blue gray massive, pyroxene-porphyroaphanitic allotrimorphic to hypidiomorphic andesite.

Sub Lithology

[336.44 - 342.65 m] DIKE - Mafic plagioclase-bearing dike. Gray green fine grained plagioclase-pyroxine porphyritic dike. Contains pink rutilated amigdals.

[343.1 - 344.44 m] BSDI - Fine-grained mafic dike. Grey fine grained plag phyric mafic dike. Modarate to strong zoned epidote alteration. Epidote locally forming amoebiodal patches with sharp and difuse boarders.

[352.53 - 352.6 m] BSDI - Fine-grained mafic dike. Melenocratic aphanitic dike with fine grained amidaloids in core of dike. barren

375	[365.55 - 376.5 m] ANAP - Andesite - Aug+Felds phyric. Dark blue gray massive, pyroxene-porphyroaphanitic allotrimorphic to hypidiomorphic andesite.	[375.92 - 376.5 m] BSDI - Fine-grained mafic dike. Black melenocratic aphanitic dike with bands of fine grained plag. phenocrysts. Cuts core at 60 deg. tca	50 100	50 100	CH	PV	2.5 5.0 7.5 10.0			
380	[376.5 - 464.4 m] GRDR - Granodiorite - equigranular and crystalline. Grey and white plag-amphibole hypidiomorphic porphyritic quartz diorite. Plagioclase>amphibole>chloritized pyroxine, biotite, sericite. Unit consists of anhedral plag. adularia intergrown with euhedral andesine and lesser albite laths in green grey granophyric to cyptocrystaline groundmass with intersertial quartz, chlorite. Possible rare intergrown actinolite laths present? Edges of unit expresses 0.5-1 m wide dark gray chill margins forming ragged and migmatitic contacts with wall rock. Upper margin of unit has nebulitic texture. Chill margins are cryptocrystaline with anhedral plag. with faint nebulitic texture. Unit is intruded by, and locally brecciated by, material of similar crystalenitity and composition. Silicious bake zones of successive intrusive bodies are 1-2 m wide. Overall mineralization of intrusive bodies appears as patchy fine to coarse disseminated cpy and py. Core of unit has brilliant white albite crystals along 1cm margins of perthitic fractures froming along trachitic banding. Unit is cross cut by multiple pyrite bearing melenocratic aphanitic dikes with few anhedral plag phenocraysts in thier cores. Peripheral to dikes, the host rock expresses 0.5-1 m orange bake zones that are exolved of intersertial chlorite producing a rough texture. Orange color is interstitial to poikilitic feldspar. Hematitic? Bake zone width is proportional to the width of the dikes. Locally crackle brecciation caused by mafic dikes. Hanging wall above dike has stylolitic chlorite-hemetite-magnetite veining and chlorite flooding away from dikes. Older order of felsic dike has patchy epidote alteration. Increased mineralization along footwall of most mafic dikes.	[381.25 - 383.3 m] BSDI - Fine-grained mafic dike. Black aphanitic dike. 0.3% fracture fill and coarse disseminated pyrite.			SE	PV		PY	CP	MO
385		[388.3 - 388.7 m] BSDI - Fine-grained mafic dike. Melenocratic aphanitic dike with intense patchy propilitization. Contains 2% very coarsly disseminated pyrrotite and pyrite.								
390										
395		[392.9 - 402.9 m] FSDI - Felsic Dike. Felsic dike of similar composition and texture to host rock. Ragged hanging wall contact 30 deg. TCA. and brecciated footwall contact with host rock. Dike has faint autolithic brecciation along margins.								
400		[402.9 - 404.75 m] BSDI - Fine-grained mafic dike. Grey green intense pervasive epidote, calcite altered aphanitic mafic dike. Barren. Intersepts core at 50 deg. TCA

Lithology

[376.5 - 464.4 m] GRDR - Granodiorite - equigranular and crystalline. Grey and white plag-amphibole hypidiomorphic porphyritic quartz diorite. Plagioclase>amphibole>chloritized pyroxine, biotite, sericite. Unit consists of anhedral plag. adularia intergrown with euhedral andesine and lesser albite laths in green grey granophyric to cyptocrystaline groundmass with intersertial quartz, chlorite. Possible rare intergrown actinolite laths present? Edges of unit expresses 0.5-1 m wide dark gray chill margins forming ragged and migmatitic contacts with wall rock. Upper margin of unit has nebulitic texture. Chill margins are cryptocrystaline with anhedral plag. with faint nebulitic texture. Unit is intruded by, and locally brecciated by, material of similar crystalenitity and composition. Silicious bake zones of successive intrusive bodies are 1-2 m wide. Overall mineralization of intrusive bodies appears as patchy fine to coarse disseminated cpy and py. Core of unit has brilliant white albite crystals along 1cm margins of perthitic fractures froming along trachitic banding. Unit is cross cut by multiple pyrite bearing melenocratic aphanitic dikes with few anhedral plag phenocrayst in thier cores. Peripheral to dikes, the host rock expresses 0.5-1 m orange bake zones that are exolved of intersertial chlorite producing a rough texture. Orange color is interstitial to poikilitic feldspar. Hematitic? Bake zone width is proportional to the width of the dikes. Locally crackle brecciation caused by mafic dikes. Hanging wall above dike has stylolitic chlorite-hemetite-magnetite veining and chlorite flooding away from dikes. Older order of felsic dike has patchy epidote alteration. Increased mineralization along footwall of most mafic dikes.

[464.4 - 493.5 m] GDXX - Intrusive rocks that cannot be readily categorized due to strong alteration and/. GRDR continues from above. Intensly sheared and brecciated by multiple faults and dikes. Breccia fabric ranges from jigsaw fit to crackle breccia with chlorite veining and dike material groundmass. Migmatitic textures

Sub Lithology

[433.52 - 434.32 m] BSDI - Fine-grained mafic dike. Back aphanitic mafic dike. Sans mineralization.

[437.4 - 449.5 m] BSDI - Fine-grained mafic dike. Massive black aphanitic mafic dike. Non altered.

[457.08 - 459.05 m] BSDI - Fine-grained mafic dike. Green grey amygdaloidal aphanitic dike intruding shear. Texture looks like the stippling on the skin of a pair with 5% 1-3mm larger amidaloids. Amiddaloids at base of dike contain cpy in cores. Dike contains planer hairline fracture fillings and 1-3mm wavy veins of siderite. Dike and veins react strongly to dilute HCl. Dike cuts unit at 45 deg. tca. Crosscut by 3cm wide late dark blackish green amigdaloidial dikelet with cpy forming in amigdaloidal cores.

[464.4 - 466.1 m] DIOR - Dioritic hypabyssal or intrusive - early syn-mineralization. Black and white Diorite Dike. Consists of medium grained, graphic equigranular, plag and magnetite rich hornblend. Appears to be a medium grained analogue to plag-pyroxine pegmatite river clasts found in schaft creek near camp.

Lithology

[464.4 - 493.5 m] GDXX - Intrusive rocks that cannot be readily categorized due to strong alteration and/. GRDR continues from above. Intensly sheared and brecciated by multiple faults and dikes. Breccia fabric ranges from jigsaw fit to crackle breccia with chlorite veining and dike material groundmass. Migmatitic textures

[493.5 - 504.58 m] ANAP - Andesite - Aug+Felds phyric. Dark green grey coarse fragmental plag-pyroxine phyric andesite. Locally brecciated and cross cut by diorite aphophasis dikes. Jigsaw fit brecciation as part of large fault.

Sub Lithology

[464.4 - 466.1 m] DIOR - Dioritic hypabyssal or intrusive - early syn-mineralization. Black and white Diorite Dike. Consists of medium grained, graphic equigranular, plag and magnetite rich hornblend. Appears to be a medium grained analogue to plag-pyroxine pegmatite river clasts found in schaft creek near camp.

[471.3 - 472.5 m] BSDI - Fine-grained mafic dike. Black medium grained plag-pyroxine gabbroic dike with banded aphanitic core. Footwall of dike is crushed and healed by calcite.

[479.78 - 481.8 m] BSDI - Fine-grained mafic dike. Black to gray plag-augite porphyro microgranular mafic dike. Trace py. footwall 60 deg. TCA

[483.78 - 485.15 m] BSDI - Fine-grained mafic dike. Gray green pyroxine-phyric mafic dike. Contains abundant calcite and epidote amidaloids. Sparse amidaloids contain rims of cpy. Footwall intersects GRBX host rck at 30 deg. TCA with ragged embayed edges altered to epidote.

Project: Schaft Creek

Drillhole: 2012CF426

Lithology

[582.2 - 599 m] BRVL - Intrusive Breccia - volcanic fragments dominate. Fragmental andesite continues from above. Locally brecciated by multiple diorite dikelets and fracture propegations. Breccia texture is predominanlty crackle with diorite infiltrating joints shears and fractures in the fragmental andesite. Diorite dikelets up to 10 cm wide tend to propagate inside sheares and adjacent fault breccia of brittle shears. Diorite matrix and dikelets appear to lack mineralization.

[599 - 622.21 m] GRDR - Granodiorite - equigranular and crystalline. Light grey and white hypidiomorphic seriate to plag-amphibole-phyric granodiorite with insertial pink, green and grey quartz. Myriad of grey and purple grey quartz veining and local grey quartz flooded. Quartz is purple grey from micronic magnetite inclusioins- locally visible disseminations of magnetite and rare magnetite stylolitic veins and slickensides. (Shavings are magnetic). Previously identified as MoS2 in last years holes. Amphiboles are altered to chlorite, cpy, py, and rare magnetite. Unit contains rare pink quartz halos near shears forming poikilitic and interstitial groundmass textures (Mohs pick hardness #7.5). Unit is penetrated by multiple mafic dikes that propagate along shears. (Footwalls of mafic dikes are crushed against shears)

Sub Lithology

[591.54 - 595.4 m] BSDI - Fine-grained mafic dike. Grey green aphanitic mafic dike. barren.

[600.15 - 604.24 m] BSDI - Fine-grained mafic dike. Grey green plag-phyric dike. Fine grained graphic equigranular plag-pyroxine groundmass. Contains 10% 3-5mm plag-porphyrocrysts intensly sauseritised. Groundmass is unaltered. Footwall is crushed by shear @ 45 deg. TCA. Barren.

[604.8 - 609.68 m] BSDI - Fine-grained mafic dike. Dark grey aphanitic mafic dike with 10% sauseritized 3-4mm anhedral plag. porphyrocrysts. Barren. Footwall is crushed by intense shearing @ 70 deg. TCA.

Lithology

[599 - 622.21 m] GRDR - Granodiorite - equigranular and crystalline. Light grey and white hypidiomorphic seriate to plag-amphibole-phyric granodiorite with insertial pink, green and grey quartz. Myriad of grey and purple grey quartz veining and local grey quartz flooded. Quartz is purple grey from micronic magnetite inclusioins- locally visible disseminations of magnetite and rare magnetite stylolitic veins and slickensides. (Shavings are magnetic). Previously identified as MoS2 in last years holes. Amphiboles are altered to chlorite, cpy, py, and rare magnetite. Unit contains rare pink quartz halos near shears forming poikilitic and interstitial groundmass textures (Mohs pick hardness #7.5). Unit is penetrated by multiple mafic dikes that propagate along shears. (Footwalls of mafic dikes are crushed against shears)

[622.26 - 626.94 m] ANDS - Andesite - fine grained. Coarse fragmental plag-pyroxine andesite septum. Magnetic and hornfelsed, crosscut and brecciated by GRDR/DIOR. Hanging wall @55 deg. TCA Footwall has melt contact with intrusive GRDR at 35 deg. TCA. Silica rich fluids from the GRDR have altered 20 cm into host rock.

[626.94 - 641.8 m] GRDR - Granodiorite - equigranular and crystalline. Continued from above. Hanging wall has very sharp quenched margin at 30 deg. TCA. Footwall contact is 60 deg. TCA and diffuse, cuspate and crackle brecciating andesites of footwall. Footwall is hornfelsed with abundant fracture filling cpy from 611.08 m to a shear at 644.27m.

[641.8 - 689 m] ANLP - Andesite lapilli tuff. Fine grained fragmental andesite lapilli tuff unit within-situe and ex-situe finely laminated (locally massive-to normal graded, perthitcally fractured vitric ash tuff. Unit contains multiple beds of crystaline lapilli tuff with sparse to dense acumulate of light grey and light tan 1cm -5cm lapilli of coarse andesites and rare pumice. Unit is intensely sheared and crosscut by multiple intermediate lamprophyre dikes. Unit is locally quartz-biotite hornfelsed within .5-1m of dike margins. Overall unit is tan-feldspar altered (lapilli and fine crystalline ash tuff beds are preferentially feldspar altered. Later overprinted by propylitic alteration then biotite and quartz flooded by dike swarm. Dikes are very dark greenish black with brown and plack stippling. (have the appearance of trout skin) Interpreted to be interemediate to gabbroic lamprophyre dikes. Dikes are aphanitic-microcrystaline with 10% 1mm sub-euhedral pyroxine phenocrysts, 10% anhedral-subhedral, amphibole phenocrysts and 1-3mm anhedral orthocumulate fine plag crystals. (interpreted as dalmationite in other holes drilled in the paramount zone) Plag are slighly brown altered by biotite (locally microlites are green), mafic minerals are all altered to chlorite and deeply embayed. Contains rare orange plag-hornblende schlieren. Dike is non magnetic. First of many intermediate lamprophyre dikes encountered throughout units below. Due to the many similar dikes crossing this unit, each will be described in brief reference to this description.

Sub Lithology

[630.35 - 633.07 m] BSDI - Fine-grained mafic dike. Grey fine grained mafic dike with faint fine grained plag, pyrite, cpy schlieren. Contacts are strongly cuspate strongly chilled at 60 deg. tca

[648.8 - 652.5 m] BSDI - Fine-grained mafic dike. Very dark greenish black intermediate (lamprophyre) dike. Aphanitic with 10% 1mm sub-euhedral pyroxine, 10% anhedral-subhedral, amphiboles and 1-3mm anhedral orthocumulate plag crystals. (interpreted as dalmationite in other holes drilled in the paramount zone) Plag are slighly brown altered by biotite (locally microlites are green), mafic minerals are all altered to chlorite and deeply embayed. Contains rare orange plag-hornblend schlieren. Dike is non magnetic. First of many intermediate lamprophyre dikes encountered throughout units below.

Lithology

[641.8 - 689 m] ANLP - Andesite lapilli tuff. Fine grained fragmental andesite lapilli tuff unit within-situe and ex-situe finely laminated (locally massive-to normal graded, perthitcally fractured vitric ash tuff. Unit contains multiple beds of crystaline lapilli tuff with sparse to dense acumulate of light grey and light tan 1cm -5cm lapilli of coarse andesites and rare pumice. Unit is intensely sheared and crosscut by multiple intermediate lamprophyre dikes. Unit is locally quartz-biotite hornfelsed within .5-1m of dike margins. Overall unit is tan-feldspar altered (lapilli and fine crystalline ash tuff beds are preferentially feldspar altered. Later overprinted by propylitic alteration then biotite and quartz flooded by dike swarm. Dikes are very dark greenish black with brown and plack stippling. (have the appearance of trout skin) Interpreted to be interemediate to gabbroic lamprophyre dikes. Dikes are aphanitic-microcrystaline with 10% 1mm sub-euhedral pyroxine phenocrysts, 10% anhedral-subhedral, amphibole phenocrysts and 1-3mm anhedral orthocumulate fine plag crystals. (interpreted as dalmationite in other holes drilled in the paramount zone) Plag are slighly brown altered by biotite (locally microlites are green), mafic minerals are all altered to chlorite and deeply embayed. Contains rare orange plag-hornblende schlieren. Dike is non magnetic. First of many intermediate lamprophyre dikes encountered throughout units below. Due to the many similar dikes crossing this unit, each will be described in brief reference to this description.

Sub Lithology

[648.8 - 652.5 m] BSDI - Fine-grained mafic dike. Very dark greenish black intermediate (lamprophyre) dike. Aphanitic with 10% 1mm sub-euhedral pyroxine, 10% anhedral-subhedral, amphiboles and 1-3mm anhedral orthocumulate plag crystals. (interpreted as dalmationite in other holes drilled in the paramount zone) Plag are slighly brown altered by biotite (locally microlites are green), mafic minerals are all altered to chlorite and deeply embayed. Contains rare orange plag-hornblend schlieren. Dike is non magnetic. First of many intermediate lamprophyre dikes encountered throughout units below.

[652.5 - 652.8 m] BSDI - Fine-grained mafic dike. Dark greenish black aphanitic dike. Lower contact quenched against shear at 45 deg. tca

[654.4 - 655 m] BSDI - Fine-grained mafic dike. Very dark greenish black intermediate lamprophyre dike. Aphanitic with 10% 1mm sub-euhedral pyroxine, 10% anhedral-subhedral, amphiboles and 1-3mm anhedral orthocumulate plag crystals. Rare fine brilliant white anhedral plag. Contains rare orange and black stippled schlieren. Barren. Follows shear fabrick at 50 deg. tca

[659.2 - 660 m] BSDI - Fine-grained mafic dike. Very dark greenish black intermediate lamprophyre dike. Aphanitic with porphyrocrysts of 5% 1mm anhedral pyroxine, 5% subhedral, amphiboles, 10-15%1-2mm anhedral orthocumulate plag crystals and 5% 1-2mm anhedral oikiolitic quartz in pink plag piokiolitic haloes. Rare fine brilliant white anhedral plag. (trout skin appearance.) Barren. Follows shear fabric at 40 deg. tca

[660.7 - 664.75 m] BSDI - Fine-grained mafic dike. Dark greenish black intermediate lamprophyre dike. (trout skin appearance similar to above). Barren. Follows shear fabric, at 30 deg. tca.

[664.75 - 665.39 m] BSDI - Fine-grained mafic dike. Plag-pyroxine phyric lamprophyre dike with cryptocrystaline to vitric groundmass. (chill margin of trout skin dike). barren.

[665.54 - 666.17 m] BSDI - Fine-grained mafic dike. Faulted trout skin lamprophyre dike. Contacts follow shear and fault fabric at 45 deg tca.

[666.66 - 668.1 m] BSDI - Fine-grained mafic dike. Dark grey green trout skin appearing lamprophyre dike. barren. contacts follow shear texture at 30 deg. tca.

[673.1 - 675.73 m] BSDI - Fine-grained mafic dike. Dark greenish black trout skin appearing lamprophyre dike. Similar to others of this interval. Contains 30% brown and grey anhedral orthocumulate plag., 15% subhedral amphibole, 10% chloritized and embayed pyroxine. Center 10 cm of dike contains 5% 2mm anhedral qtz with brown and black stippled haloes. Collect Petro and Litho of unit. barren.

[679.55 - 681.4 m] BSDI - Fine-grained mafic dike. Dark grey green trout skin appearing lamprophyre dike. barren. Contains breown schlieren with calcite inlusions foring at 40deg. tca. Upper contact with pummacious lapili tuff is cuspate and wavy. Lower contact is also cuspate at 40 deg.

Due to the many similar dikes crossing this unit, each will be described in brief reference to this description.

[689 - 789.43 m] ANLP - Andesite lapilli tuff. Fine grained fragmental andesite lapilli tuff unit with in-situe and ex-situe finely laminated (locally massive-to normal graded, perthitcally fractured vitric ash tuff and albite altered pummice. continued from above. Interbeded and deposited in plag-augite phyric andesite flows. Same fragmental andesite unit found in the bottom of all of the holes drilled in 2011. Andesite fragental flows and lapilli tuffaceous textures in those holes were obscured by intense chlorite darkening of the rock. Chlorite is less pronounced in this hole revealing similar textures. 740-744.1m: Very apparent albitized bedded pumiceous lapilli andesite. Bedding at 60 deg. tca. Matrix of dark grey plag-pyroxine phyric andesite.

Sub Lithology

[683.35 - 685 m] BSDI - Fine-grained mafic dike. Dark grey green trout skin appearing lamprophyre dike. barren. contacts follow shear texture at 30 deg. tca.

[687.8 - 689 m] BSDI - Fine-grained mafic dike.

[695.15 - 696.13 m] BSDI - Fine-grained mafic dike. Aphanitic orthoglomorophyritic mafic dike or sill. plag glomoropyres grade from sub mm. to 4mm towars base of intrusive body. Looks like bubbles forming in soda. 2% 2-3mm blebs of black calcite present near bottom of inrusive. Barren, Base of dike truncated by biotitic shear at 40 deg. tca

[701.1 - 702.06 m] BSDI - Fine-grained mafic dike. Aphanitic orthoglomorophyritic mafic sill. plag glomoropyres grade from sub mm. to 4mm towards center of unit. Looks like bubbles forming in soda in upper half of unit. Center of unit to bottom consists of plag-pyroxine prophyroaphanitic texture. (possible early basil flow.) 2% 2-3mm blebs of black calcite present near bottom of inrusive. Barren

Project: Schaft Creek

Drillhole: 2012CF426

Lithology

[689 - 789.43 m] ANLP - Andesite lapilli tuff. Fine grained fragmental andesite lapilli tuff unit with in-situe and ex-situe finely laminated (locally massive-to normal graded, perthitcally fractured vitric ash tuff and albite altered pummice. continued from above. Interbeded and deposited in plag-augite phyric andesite flows. Same fragmental andesite unit found in the bottom of all of the holes drilled in 2011. Andesite fragental flows and lapilli tuffaceous textures in those holes were obscured by intense chlorite darkening of the rock. Chlorite is less pronounced in this hole revealing similar textures. 740-744.1m: Very apparent albitized bedded pumiceous lapilli andesite. Bedding at 60 deg. tca. Matrix of dark grey plag-pyroxine phyric andesite.

Sub Lithology

[744.03 - 745.62 m] BSDI - Fine-grained mafic dike. Grey green sauseritized aphanitic dike. Barren. Cut by 1mm irregular weak gypsum veining. Weakly calcarious. Contains 3cm wide tension gash dolomitized carbonate vein. Faint light tan schlieren.

[757.55 - 758.6 m] BSDI - Fine-grained mafic dike. Black aphanitic dike with faint pyrite and rare plag xtals in core. Plumos miaroles increasing in abundance towards top of dike. Host rock above dike is strongly silicified and biotite altered. (incipient hornfelse)

[767.66 - 787.13 m] BSDI - Fine-grained mafic dike. Blue grey to grey aphanitic dike with rare pyrrotite filled nodules near the upper contact. barren. 30 deg. tca upper and lower contact. Hanging wall is intensly hornfelsed within 1 meter of dike.

Lithology

[8.35 - 70.04 m] GRDR - Granodiorite - equigranular and crystalline. Pink, hematite stained intergranular granodiorite. Moderate propylitic alteration with moderate to strong chloritization in the shear zones overprinted by moderate silicification. Weak to moderate patchy epidote. Copper staining from malachite and very fine to fine disseminated chalcopyrite and pyrite. Overall weak cross cutting calcite veining trending 10-30 deg TCA. Strong chlorite veining in shear zones. Abundant rubbly core from top of hole to 58.4m. Unit has been sheared throughout to varying degrees.

[70.04 - 77.15 m] BSDI - Fine-grained mafic dike. Augite-plagioclase porphyroaphanitic andesitic dike; upper contact 45 deg TCA, lower contact 15 deg TCA. Pervasive carbonate alteration. Epidote and chlorite mineral replacement of plagioclase and augite. Hematite on fracture surfaces. No visible sulphides. Early calcite veins cross cut by quartz carbonate veins. Shear with broken core starting at 73.60 to the end of the dike.

[77.15 - 82.03 m] GRDR - Granodiorite - equigranular and crystalline. Pink, hematite stained intergranular granodiorite. Strong overprinting of quartz-sericite over moderate propylitic alteration. Moderate chloritization in the shear zones. Weak patchy epidote. Copper staining from malachite and very fine to fine disseminated chalcopyrite and pyrite. Overall weak cross cutting calcite veining trending 15-40 deg TCA. Strong chlorite veining in shear zones. Unit has been sheared throughout to varying degrees.

[82.03 - 94.13 m] BSDI - Fine-grained mafic dike. Dark green-grey augite-plagioclase porphyroaphanitic andesitic dike. Moderate propylitic carbonate alteration with epidote replacing plagioclase and chlorite replacing augite. Carbonate alteration strengths near dike margins. Weak patchy hematite staining. No visible sulphides. 5 cm felsic xenolith at 87.70m with abundant 1mm long needle-like horblende crystals. 0.5 cm hematite stained quartz vein at 90.43m cross cut by calcite veins.

Sub Lithology

[63 - 63.08 m] BSDI - Fine-grained mafic dike. Andesitc Dike, grey green, fine grained, with upper and lower contacts at 35 degrees TCA.

[66.9 - 66.94 m] BSDI - Fine-grained mafic dike. Andesitic Dike, grey green, fine grained, with upper contact at 30 degrees TCA.

Lithology

[82.03 - 94.13 m] BSDI - Fine-grained mafic dike. Dark green-grey augite-plagioclase porphyroaphanitic andesitic dike. Moderate propylitic carbonate alteration with epidote replacing plagioclase and chlorite replacing augite. Carbonate alteration strengths near dike margins. Weak patchy hematite staining. No visible sulphides. 5 cm felsic xenolith at 87.70m with abundant 1mm long needle-like horblende crystals. 0.5 cm hematite stained quartz vein at 90.43m cross cut by calcite veins.

[94.13 - 143 m] GRDR - Granodiorite - equigranular and crystalline. Return to pink, hematite stained intergranular granodiorite. Moderate overprinting of quartz-sericite over moderate propylitic alteration. Moderate chloritization in the shear zones. Weak patchy epidote. Chalcopyrite and pyrite occur as fracture fillings and very fine to fine disseminations. Overall weak cross cutting calcite veining trending 40 deg TCA. Unit has been sheared throughout to varying degrees.

Sub Lithology

[97.6 - 99.9 m] BSDI - Fine-grained mafic dike. Green, grey saussuritized augite-plagioclase porphyroaphanitic andesitic dike, with upper contact at 15 degrees TCA and lower contact at 10 deg TCA.

[112.94 - 113.69 m] BSDI - Fine-grained mafic dike. Green, grey sheared and saussuritized augite-plagioclase porphyroaphanitic andesitic dike, with upper contact at 35 degrees TCA and lower contact at 40 deg TCA.

Lithology

[94.13 - 143 m] GRDR - Granodiorite - equigranular and crystalline. Return to pink, hematite stained intergranular granodiorite. Moderate overprinting of quartz-sericite over moderate propylitic alteration. Moderate chloritization in the shear zones. Weak patchy epidote. Chalcopyrite and pyrite occur as fracture fillings and very fine to fine disseminations. Overall weak cross cutting calcite veining trending 40 deg TCA. Unit has been sheared throughout to varying degrees.

[143 - 169.94 m] BRIG - Intrusive Breccia - intrusive fragments dominate. Sheared and deformed granodiorite breccia, more intensely fractured near dike contacts. Clasts mostly pink, hematite stained intergranular granodiorite (similar to above unit). Moderate overprinting of quartz-sericite over moderate propylitic alteration. Moderate chloritization in the shear zones and matrix. Weak patchy epidote. Chalcopyrite and pyrite occur as fracture fillings and very fine to fine disseminations. Overall weak cross cutting calcite veining trending 40 deg TCA. Unit has been sheared throughout to varying degrees.

Sub Lithology

[129.73 - 131.86 m] BSDI - Fine-grained mafic dike. Dark green grey, strongly epidotized amygdoloidal andesitic dike. Top contact at 50 deg TCA. Bottom contact at 40 deg TCA. Fracture filling pyrite (0.2%).

[136.24 - 140.9 m] BSDI - Fine-grained mafic dike. Dark grey, calcite amygaloidal basaltic dike. No visible mineralization. Pervasive carbonate. Sharp irregular upper and lower contacts.

[141.65 - 143 m] BSDI - Fine-grained mafic dike. Dark grey, calcite amygaloidal basaltic dike. No visible mineralization. Pervasive carbonate alteration. Sharp irregular upper and lower contacts.

[146.72 - 147.1 m] BSDI - Fine-grained mafic dike. Dark green grey hornfelsed andesitic dike.

190	[169.94 - 199.2 m] BSDI - Fine-grained mafic dike. Dark grey to green-grey porphyroaphanitic andasitic dike. GRDR intrusive from176.24 to 176.76m, most likely host rock. Some limonite staining along fractures. Weak to moderate propalytic calcite alteration throughout most of the dike. Weak to moderate magnatisum in various places throughout the dike. Trace disseminated py at 174.8m. Weak (3-5%) cross cutting calcite veins. Trace hemitite stained quartz vein at 170.3m. Discontinuous moderatly fractured with zones of intense fracturing.				CA	PV		PY		
195										
200	[199.2 - 268.28 m] GRDR - Granodiorite - equigranular and crystalline. Light pinkish grey to greyish pink intergranular GRDR. Cross cut by multiple dikes and fault/shears. Propylitic alteration overprinted by silica. Locally albitized. Locally weakly magnetic. Very weak to no HCl reaction. Traces of cpy, py, malachite, and molybdonite. Weak to moderate calcite veining. Trace silica veins. Shearing throughout to varying degrees of intensity.	[199.2 - 213.58 m] FAUL - Fault Zone - unrecognizable lithology - gouge with crushed zones. Zone of very broken and rubbly core with abundant gouge. Locally annealed fault gouge with breccia.			SI	PV		CP	PY	MO
205										
210										
215		[213.58 - 213.88 m] BSDI - Fine-grained mafic dike. Dark green grey porphyroaphanitic andesitic dike. Chlorite replaced phenocrysts. Some haloing. Calcite veining. Upper contact lost in rubble. Lower contact at 50 deg. TCA.

Lithology

[199.2 - 268.28 m] GRDR - Granodiorite - equigranular and crystalline. Light pinkish grey to greyish pink intergranular GRDR. Cross cut by multiple dikes and fault/shears. Propylitic alteration overprinted by silica. Locally albitized. Locally weakly magnetic. Very weak to no HCl reaction. Traces of cpy, py, malachite, and molybdonite. Weak to moderate calcite veining. Trace silica veins. Shearing throughout to varying degrees of intensity.

Sub Lithology

[218 - 220.45 m] BSDI - Fine-grained mafic dike. Dark green grey porphyroaphanitic andesitic dike. Epidote and hemitite replacement of phynocrysts, with hemitite haloes. Calcite veining. Localized cpy.

[223.7 - 224.08 m] BSDI - Fine-grained mafic dike. Dark green grey aphanitic andesitic dike with calcite veining. Contacts lost in rubble.

[225.47 - 228.19 m] BSDI - Fine-grained mafic dike. Dark green aphanitic andesitic dike. Calcite veining. Weak magnatisum.

[235.51 - 240.9 m] GABB - Gabbro. Dark grey, medium grained gabbroic dike. Epidote and chlorite replacement. Some haloing. Weakly magnetic. Slight HCl rxn near upper contact. Calcite veining. Upper contact at 30 deg TCA. Lower contact at 70 deg TCA.

[242.5 - 242.53 m] FSDI - Felsic Dike. Small pink aplite micro dike at 50 deg TCA.

[244.51 - 244.62 m] BSDI - Fine-grained mafic dike. Dark green grey porphyroaphanitic andesite dike. Epidote and chlorite replacement of phynocrysts. Albitization. Disseminated cpy and py. Calcite veining. Localized magnetisum.

Lithology

[268.28 - 391.77 m] BRIG - Intrusive Breccia - intrusive fragments dominate. Mottled light pink to grey granodiorite breccia. Breccia clasts are 0.5-50cm in diameter, are sub-angular to rounded. Matrix is dark gray and vitrious. Rare xenoliths of andesite up to 5cm. Intensely hematized from 306.22 to 319.3m, with continued hematization to 386m, decreasing in intensity downhole. Overall, unit has a stong overprinting of quartz and with moderate chlorite and epidote alteration. Moderate late albitization from 359 to 360m. More intense late silica alteration 363.2-364.6m, 366-367 and. Mineralization locally up to 0.35% total sulfides consisting of very fine to fine disseminations of cpy in breccia with rare fracture filling moly. Overall moderately fractured core.

Sub Lithology

[293.5 - 294.65 m] BSDI - Fine-grained mafic dike. Dark green grey augite-plagioclase-phyric andesite dike with abundant epidote. 0.2% cpy fracture filling associated with calcite veining. Upper contact at 25 deg TCA. Lower contact at 10 deg TCA.

[304.08 - 306.22 m] BSDI - Fine-grained mafic dike. Dark green grey saussuritized andesitic dike. Top contact at 35 deg TCA.

Lithology

[268.28 - 391.77 m] BRIG - Intrusive Breccia - intrusive fragments dominate. Mottled light pink to grey granodiorite breccia. Breccia clasts are 0.5-50cm in diameter, are sub-angular to rounded. Matrix is dark gray and vitrious. Rare xenoliths of andesite up to 5cm. Intensely hematized from 306.22 to 319.3m, with continued hematization to 386m, decreasing in intensity downhole. Overall, unit has a stong overprinting of quartz and with moderate chlorite and epidote alteration. Moderate late albitization from 359 to 360m. More intense late silica alteration 363.2-364.6m, 366-367 and. Mineralization locally up to 0.35% total sulfides consisting of very fine to fine disseminations of cpy in breccia with rare fracture filling moly. Overall moderately fractured core.

Sub Lithology

[312.41 - 312.75 m] BSDI - Fine-grained mafic dike. Grey-green honblende porphyroaphanitic dike. Very chloritized. Cross cut by calcite veins. Very broken core

[319.28 - 321.87 m] BSDI - Fine-grained mafic dike. Dark green-grey plagioclase porphyroaphanitic andesitic dike. Weakly propelytic with hematite stained fractures. Irregular fracture filling calcite veins cross cutting the unit.

[324.1 - 325.54 m] BSDI - Fine-grained mafic dike. Dark green-grey sauceritized augite-plagioclase porphyroaphanitic andesitic dike. Weak to moderate propelytic alteration. Irregular fracture filling calcite veins cross cutting the unit. Hematite found on fractures.

[327.44 - 327.97 m] BSDI - Fine-grained mafic dike. Dark green-grey plagioclase porphyroaphanitic andesitic dike. Weakly propylitic with trace hematite stained fractures. Irregular fracture filling calcite veins cross cutting the unit.

[329.98 - 333.19 m] BSDI - Fine-grained mafic dike. Dark green-grey sauceritized augite-plagioclase porphyroaphanitic andesitic dike. Weak to moderate propelytic alteration. Irregular fracture filling calcite veins cross cutting the unit. Hematite found on fractures.

[335.73 - 343.2 m] FAUL - Fault Zone - unrecognizable lithology - gouge with crushed zones. Fault zone generally 10-20 deg TCA with abundant gouge and broken core. Lower contact at 20 deg TCA.

	[391.77 - 418.05 m] BSDI - Fine-grained mafic dike. Intermediate dike or sill. Aphanitic texture towards top of unit, looks like fizzing bubbles forming in soda pop. Center of unit consists of fine-medium grained hypidiomorphic texture. Plag xtals grade from sub mm. to 4mm towards center of unit. Upper section is weakly magnetic fading out at 403.7m. Unit is moderately calcareous to 405.77m, at which depth only the calcite veins react to HCl. Weakly to moderately chloritzed and saussuritzed. Trace disseminated pyrite throughout. 0.5% blebby cpy from 404.16 to 405m within calcite veins. Upper contact with BRIG is sharp and irregular at 20 deg TCA.										1578841	2	391.77	393.77	0.025	<0.001	0.1	<0.005	0.04

[609 - 629.17 m] GRDR - Granodiorite - equigranular and crystalline. Light pinkish grey to greyish pink intergranular GRDR. Cross cut by multiple dikes and fault/shears. Propylitic alteration overprinted by silica. Locally albitized. Weakly magnetic. Very weak to no HCl reaction. 0.5% sulphides with cpy, py, and moly occuring as fracture fillings. Weak calcite veining. Weak silica veining. Sheared throughout to varying degrees of intensity. Locally brecciated.		SI	FL		CP	PY	MO	1578978	1.85	620.15	622	0.17	<0.001	0.2	0.009	0.24

Lithology

[635.25 - 717 m] GRDR - Granodiorite - equigranular and crystalline. Granodiorite as above; equigranular, moderately propylitic altered with siliceous overprint.Still strongly fractured with healed chloritized fractures. 715.05-716.57m series of thin dikes up to 25cm inthickness and contacts varying from 25 to 50 deg to CA.

[717 - 764 m] BRIG - Intrusive Breccia - intrusive fragments dominate. Light pink to grey sheared (30-40 deg TCA) and brecciated granodiorite. Increased silicification and weak to moderate propylitic alteration. Moderately calcareous. Patchy albite as halos along chloritized fractures. Lesser hematite staining. Locally increased calcite veining generally at shallow angles TCA. Pyrite appears to be increasing over chalcopyrite. Increasing moly from 764 to 769.92m.

Sub Lithology

[721.68 - 724.2 m] BSDI - Fine-grained mafic dike. Dark green black basaltic dike. Weakly calcareous. Irregular qtz-carbonate veining. No visible sulphides. Upper contact at 40 deg TCA. Lower contact sheared.

[737.82 - 738.53 m] BSDI - Fine-grained mafic dike. Fn gr, grey gren andesitic dike; upper contact @40deg to CA; lower contact @35deg. Minor calcite veining at shallow angles to CA.

	[0 - 3 m] OVER - Overburden. Rubbly rock, generally fine grained andesite with sections of dirt.																		
	[3 - 6.86 m] ANDS - Andesite - fine grained. Dark grey green fine grained andesite. Unit is generally massive with weak to moderate pervasive chlorite alteration. Core is rubbly and broken with limonitic and iron staining along fractures surfaces. Also, local patches and bands of epidote alteration associated with veining. Local basaltic dike with fine grained chill margins between 3.98-4.25 m. Unit contains trace to 1% pyrite as fine sub-mm veinlets and fractures with loal rare fine cpy associated with quartz. 	[6.86 - 68.83 m] ANLP - Andesite lapilli tuff. Green grey feldspar crystal rich andesitic tuff to pyroclast. Generally unit is finer grained and tuffaceous towards top of the section over approx. 36 m, but locally contains lithics of the same composition or altered fragments a few mm to 2 cm wide. Also, variable feldspar crystal concentration from 15-40%. Unit is moderately silica altered within the top 10 m and locally strong in association with possible areas of shearing or brecciation. These areas contain trace to 1% py and local cpy and po along fractures or as minor patches. Below the unit is weak to moderately altered by epidote on fractures and lesser patches. Unit becomes a more coarser fragmental below approx. 43.5 m with a higher concentration of fragments, which are typically epidote or silica altered within a crystal rich tuffaceous matrix. Also, core is broken and rubbly with limonite and hematite staining along fractures which decreases downhole. Unit is locally magnetic with zones containing visible fine specks of magnetite. Local breccia zone with angular intensely epidote and albite altered fragments within a chloritic matrix with patches of pyrite from 63.76 to 63.86 m above the contact with the mafic dike.										1143620	2	6.86	8.86	0.002	<0.001	<0.1	0.009	0.14

Lithology

[6.86 - 68.83 m] ANLP - Andesite lapilli tuff. Green grey feldspar crystal rich andesitic tuff to pyroclast. Generally unit is finer grained and tuffaceous towards top of the section over approx. 36 m, but locally contains lithics of the same composition or altered fragments a few mm to 2 cm wide. Also, variable feldspar crystal concentration from 15-40%. Unit is moderately silica altered within the top 10 m and locally strong in association with possible areas of shearing or brecciation. These areas contain trace to 1% py and local cpy and po along fractures or as minor patches. Below the unit is weak to moderately altered by epidote on fractures and lesser patches. Unit becomes a more coarser fragmental below approx. 43.5 m with a higher concentration of fragments, which are typically epidote or silica altered within a crystal rich tuffaceous matrix. Also, core is broken and rubbly with limonite and hematite staining along fractures which decreases downhole. Unit is locally magnetic with zones containing visible fine specks of magnetite. Local breccia zone with angular intensely epidote and albite altered fragments within a chloritic matrix with patches of pyrite from 63.76 to 63.86 m above the contact with the mafic dike.

[68.83 - 77.75 m] FAUL - Fault Zone - unrecognizable lithology - gouge with crushed zones. Fault zone with rubbly broken core and clay gouge zones hosted within the andesite fragmental unit. Generally the rock is chlorite altered with minor epidote alteration and hematite along fractures. The clays gouge seams also contain minor talc and are at variable angles tca from low angled noticed at the top of the fault zone to high angles tca.

[77.75 - 172.65 m] ANLP - Andesite lapilli tuff. Coarse fragmental gray green feldspar-rich andesitic crystal lapilli tuff continues from above. Contains 0.5-5 cm subrounded autolithic lapilli sized tephra and pyroclasts. Overall, unit is moderately pervasive chlorite altered with zones of moderate carbonate alteration. Contains zones of preferentially epidote altered lapilli. Lapilli tend to express thier own variable silica, albite chlorite and magnetite alteration. Unit continues to be very friable and rubbly containing numerous brittle shears and faults. Contains local hematized and chloritezed shears with traces of malachite.

Sub Lithology

[63.86 - 67.67 m] BSDI - Fine-grained mafic dike. Green mafic dike with carbonate amygdules and fine grained chill margins. Unit is moderately chl altered and weak to moderately carbonate altered. Upper contact is also possibly sheared with minor clay and above the contact is a 10 cm wide matrix supported breccia zone with angular intensely epidote and albite altered fragments within a fine chloritic matrix with pyrite patches.

[77.75 - 81.42 m] BSDI - Fine-grained mafic dike. Gray black amygdaloidal mafic dike with rare reddish brown schlieren. Hanging wall contact at 20 deg tca. footwall contact at 90 deg tca.

[81.42 - 88.8 m] FAUL - Fault Zone - unrecognizable lithology - gouge with crushed zones. Fault continues from above. Contains zones of matrix supported clay gouge and very intense shearing. Fracture patterns appear to trend in two fields, see structure.

[88.8 - 89.9 m] BSDI - Fine-grained mafic dike. Grayish black aphanitic amygdaloidal mafic dike with 10% fin anhedral plag phenocrysts and 10-15% 2-3mm subhedral pyroxene phenocrysts. Weak hematite haloes around rare carbonate veins. Intense carbonate altered.

[89.9 - 104.2 m] FAUL - Fault Zone - unrecognizable lithology - gouge with crushed zones. Fault continues from above. Zones of intense to very intense fracturing at multiple angles. Contains local hematitic clay gouge with faint shear banding at 55 deg. tca.

Lithology

[77.75 - 172.65 m] ANLP - Andesite lapilli tuff. Coarse fragmental gray green feldspar-rich andesitic crystal lapilli tuff continues from above. Contains 0.5-5 cm subrounded autolithic lapilli sized tephra and pyroclasts. Overall, unit is moderately pervasive chlorite altered with zones of moderate carbonate alteration. Contains zones of preferentially epidote altered lapilli. Lapilli tend to express thier own variable silica, albite chlorite and magnetite alteration. Unit continues to be very friable and rubbly containing numerous brittle shears and faults. Contains local hematized and chloritezed shears with traces of malachite.

Sub Lithology

[124.5 - 128.8 m] BSDI - Fine-grained mafic dike. Black amygdaloidal mafic dike. Barren. Contacts lost in fault.

[139.1 - 147 m] BSDI - Fine-grained mafic dike. Fine grained eqigranular to amphibole-pyroxine phyric basaltic dike (flow?). Upper chill margin is aphanitic microcrystaline and not as vitrious as most other dikes on the property. Unit cntains 1.5-3% 0.5-1cm long prismatic amphibole porphyrocrysts. Lower 6 meters contains 5-15% 3mm subhedral pyroxine porphyrocrysts. Locally centers of amphiboles are altering to magnetite and pyrite. May contain traces of cpy. Moderate to intense chlorite altered with rare epidote fracture selvaging.

[150.7 - 157.5 m] FAUL - Fault Zone - unrecognizable lithology - gouge with crushed zones. Chloritic fault zone. Core consists of crushed breccia blocks, supported by very soft clay gouge matrix. Margins are mylonitic consisting of intense chlorite banding with carbonate augen. 157.2-157.5m: Lower mylonitic shear zone contains 35% semmimassive pyrite and 0.5% massive blebby cpy.

Lithology

[172.65 - 196.3 m] BSDI - Fine-grained mafic dike. Dark purple to gray fine grained allotrimorphic granular dike with 10% plag-pyroxine phenocrysts. Intruding black amphibole-pyroxine phyroaphanitic mafic dike (flow?). Contains 5% 0.5-1cm prismatic amphibole phenocrysts. Locally, ampiboles containing pyrite. ontains xenoliths of diorote. Heavily sheared. Patchy strong to intense carbonate alteration with local hematite flooding in shears.

[196.3 - 213 m] ANLP - Andesite lapilli tuff. Dark green grey fragmental andesite crystaline lapilli tuff continues from above dike. Contains 0-5% sub-well rounded 1-5cm autolithic lapilli. Unit is moderately pervasive chlorite, and carbonate altered (locally intense in fault zones.) Locally moderately silica altered near shears and dikes. Weak hematite vein selvaging associated with local silica alteration near faults.

[213 - 224.03 m] MYLN - Mylonite zone - unrecognizable lithology - laminated/banded with augens. Chloritic mylonitic fault with clay banding with subangular cataclasite.

Sub Lithology

[194.6 - 202.2 m] MYLN - Mylonite zone - unrecognizable lithology - laminated/banded with augens. Mylonitic fault with chlorite, calcite, gypsum banding wth a 5cm wide soft clay gouge band. Sections of fault are moderately to intesly annealed. Shear contains abundant siderite veining folowing mylonitic texture. Lower 20 cm of faut is brecciated consisting of 0.5-1cm angular clast supported breccia pieces with biotite matrix. (hardness 3.5-4). Footwall of falut is strongly silicified with biotite fracture filings with 2-4mm brown hematite haloes. Core of biotite veins conain trace fine patchy pyrite.

[211.18 - 213 m] BSDI - Fine-grained mafic dike. Black aphanitic amigdaloidal dike. Barren.

Lithology

[0 - 17.07 m] OVER - Overburden. Overburden composed of multiple lithologies.

[17.07 - 35.52 m] DACE - Dacite. Pinkish grey to tan, QTZ-PLAG-Biotite-hornblende-phyric dacite with weak patchy sericite alteration. Phenocrysts sizes are 1-2mm. Rare very thin (<1mm) carbonate veins. No visible sulfides. Lower contact is fault bounded with faint mylonitic shearing (55-65 deg TCA). Very broken, rubbly core.

Sub Lithology

[24.32 - 28.93 m] FAUL - Fault Zone - unrecognizable lithology - gouge with crushed zones. Light brown clay gouge matrix with cataclasite clasts up to 3cm.

[0 - 23.75 m] OVER - Overburden. Overburden consists of reddish gray clays with weathered fine gravels and boulders of mixed lithologies.

[23.75 - 112.95 m] ANLP - Andesite lapilli tuff. Dark purple grey to dark gray unit with pistacio colored patches. Unit consists of plag-pyroxine-phyric to fine gained equigranular andesitic matrix dominant lapilli crystal tuff with subrounded lapilli volcaniclasts of plag-phyric andesites and fine grained andesites. Clasts express early albite and hemetite-silica alteration and are preferentially altered by late epidote. Clasts have rare orange-tan hematitic haloes in top 65 meters of unit. ContainsLocal intervals of very well rounded to subangular 10-15 cm lapilli. (pyroclasts?). Unit is strong to intensly sheared and faulted consisting of angular dissagregated rubble with abundant zones of strong brown colored clay cataclasite with matrix suported angular cataclasts. Fracture surfaces are strongly weathered with srong brown colored clay coatings.Unit contains up to 0.5% fracture contrlled sulfides with abundant showings of malachite around 150 m. unit is weak to moderate silica altered near dikes. 66.82-67.3m: hematized matrix in crystal lapilli tuff.

Lithology

[23.75 - 112.95 m] ANLP - Andesite lapilli tuff. Dark purple grey to dark gray unit with pistacio colored patches. Unit consists of plag-pyroxine-phyric to fine gained equigranular andesitic matrix dominant lapilli crystal tuff with subrounded lapilli volcaniclasts of plag-phyric andesites and fine grained andesites. Clasts express early albite and hemetite-silica alteration and are preferentially altered by late epidote. Clasts have rare orange-tan hematitic haloes in top 65 meters of unit. ContainsLocal intervals of very well rounded to subangular 10-15 cm lapilli. (pyroclasts?). Unit is strong to intensly sheared and faulted consisting of angular dissagregated rubble with abundant zones of strong brown colored clay cataclasite with matrix suported angular cataclasts. Fracture surfaces are strongly weathered with srong brown colored clay coatings.Unit contains up to 0.5% fracture contrlled sulfides with abundant showings of malachite around 150 m. unit is weak to moderate silica altered near dikes. 66.82-67.3m: hematized matrix in crystal lapilli tuff.

Sub Lithology

[64.15 - 64.85 m] BSDI - Fine-grained mafic dike. Fine grained plag-phyric mafic dike. barren.hanging wall contact at 40 deg. tca.

Lithology

[23.75 - 112.95 m] ANLP - Andesite lapilli tuff. Dark purple grey to dark gray unit with pistacio colored patches. Unit consists of plag-pyroxine-phyric to fine gained equigranular andesitic matrix dominant lapilli crystal tuff with subrounded lapilli volcaniclasts of plag-phyric andesites and fine grained andesites. Clasts express early albite and hemetite-silica alteration and are preferentially altered by late epidote. Clasts have rare orange-tan hematitic haloes in top 65 meters of unit. ContainsLocal intervals of very well rounded to subangular 10-15 cm lapilli. (pyroclasts?). Unit is strong to intensly sheared and faulted consisting of angular dissagregated rubble with abundant zones of strong brown colored clay cataclasite with matrix suported angular cataclasts. Fracture surfaces are strongly weathered with srong brown colored clay coatings.Unit contains up to 0.5% fracture contrlled sulfides with abundant showings of malachite around 150 m. unit is weak to moderate silica altered near dikes. 66.82-67.3m: hematized matrix in crystal lapilli tuff.

[112.95 - 171.3 m] ANLP - Andesite lapilli tuff. Blue green gray pyroxine-plag phyric fragmental andesite lapilli tuff. Unit consists of fine grained plag-pyroxine microphyritic matrix with 10-20% 2-3mm euhedral pyroxine xtals and 3-5% anhedral to subhedral 2-3mm plag. phenocrysts. Volcaniclasts and,or lapilli consists of similar composition with more fine grained matrix and rare lapilli with 4-6mm anhedral plag. phenocrysts. Lapilli are sub-well rounded ranging from 1-5cm diameter.Unit is crosscute by an early generation of carbonate veins altered and partly replaced by epidote. Cpy associated with generation of epidotized carbonate veins. Late veining includes tension gash and fracture opening calcite.Upper 25m of unit contains 0.2% fracture fill copper sulfides including chalcopyrite, sub-metalic to resinous chalcocite, earthy cuprite and malachite. Unit also includes abundant fracture fill hematite, limonite and siderite. 139.95-140.00m: 2cm wide vein of epidote inside shear with semi-massive chalcopyrite, red earthy cuprite, plebby sub-metalic chalcocite, and late open space filling of malachite. Cuprite showings in other parts of shear zone. Test for Cu using HCl and steel nail. (not hematite-limonite).

Sub Lithology

[93.57 - 96.2 m] BSDI - Fine-grained mafic dike. Olive grey green pyroxine phyric dike. Weak siderite veining. Crushed by fault. Margins of dike are lost in rubble and gouge. Hanging wall is strongly hematized with intense siderite and limonite anastimosing veining. (visible in fault breccia).

[101.65 - 112.95 m] BSDI - Fine-grained mafic dike. Dark gray to black Plag-glomerophyric mafic dike. Contains local amigdules and banded schlieren. at 40 deg. tca.Moderate to strong carbonate and epidote altered. Barren. Base of dike is weakly magnetic.

12SFR001	Granodiorite with Cu staining.				
12SFR002					
12SFR003	Silicified granodiorite with sulphides.		Silicified		
12SFR004	Gossaneous andesite? outcrop with limonite stain.		Limonite stain, gossan.		
12SFR005	Strongly oxidized, gossaneous, probable andesite.		Strongly oxidized gossan.		
12SFR006	Strongly oxidized, gossaneous, probable andesite.		Strongly oxidized gossan.		
12SFR007	Very strongly minonite stained andesite (?) pyroclastic with disseminated pyrite.		Very strongly limonite stained.		
12SFR008	Pyroclastic andesite with tr malachite.				
12SFR009	Gossanous pyroclastic andesite.		Gossanous samples		
12SFR030	Granodiorite with malachite and cpy mineralization. The granodiorite contains a diorite sill ~ 5 to 6 m to the south of the station location.				
12SFR031	Oxidized unmineralized granodiorite.				
12SFR032					
12SFR043	Augite phyric andesite.				
12SFR044	Mapped as augite phyric andesite, but probably feldspar porphyry or granodiorite.				
12SFR045					

HOLEID	SAMPLE_ LITH_DESC	SAMPLE_ MIN_DESC	SAMPLE_ ALT_DESC	SAMPLE_ STRUC_DESC	SAMPLE_ VEIN_DESC
12MEC003	3 m thick rhyloite? dike. Fine to coarse grined, some good flow-banding with epidote clots throughout and coarse material has albite roses" growing. 0.1-0.2% disseminated cpy and lesser py."	0.1-0.2% disseminated cpy and leser py.	Epidote clots throughout and coarse materail has albite roses" growing."	Trend of rhyolite? dike	
12MEC004	Medium grained granodiorite - passes down slope into (in contact with) fine grained diorite. Locally strong malachite staining and 0.1-0.2% disseminations and stringers of cpy. Relatively minor ep + chl and weak hematite staining.	Locally strong malachite staining and 0.1-0.2% disseminations and stringers of cpy and lesser py.	Relatively minor ep + chl and weak hematite staining.		
12LAB005	Granodiorite exposure with local mineralized fracture zone. Also felsic dike in the area striking 75 (N75E) and near vertical.	Collected sample along fracture zone within granodiorite. malachite and chalcopyrite occur as coatings on surfaces and as vein filling in fracture zone.		Two fracture sets noted in area. One set evident along cliff face strikes 10 (N10E). Local fracture set with mineralization strikes 30 (N30E).	
12LAB007	andesite near granodiorite/quartz diorite contact.	Mineralization occurs along fracture zone and extends approx 2-3 m in length. Chalcopyrite		Noted prominant joint set striking N50W, dipping 74NE	

HOLEID	SAMPLE_ LITH_DESC	SAMPLE_ MIN_DESC	SAMPLE_ ALT_DESC	SAMPLE_ STRUC_DESC	SAMPLE_ VEIN_DESC
		veins found in some alteration areas.			
12LAB008	Andesite with a fracture gouge zone approximately 0.5 m wide.	mineralized vein is only about.3 cm wide and pinches out within 4-5 m within gouge zone.			
12LAB010	Baked zone of uncertain lithology occurring between intrusive (qtz diorite/granodiorite) and andesite.	localized pyrite mineralization			
12LAB013		Malachite occurs on joint/fracture surfaces. Chalcopyrite is disseminated within granodiorite host rock. Mineralization is very localized.		Joint set with qtz veining striking N20E, dipping 45E. Other joint set striking N70W and dipping 69NE.	
12LAB015	Andesite within silicified zone along fracturing.	Mineralized zone approximately 0.3m wide only extends 1-2 m.	Silicification zone along fracturing. Hematite and limonite in areas.	Jointing is N65W (295), vertical dip	

HOLEID	SAMPLE_ LITH_DESC	SAMPLE_ MIN_DESC	SAMPLE_ ALT_DESC	SAMPLE_ STRUC_DESC	SAMPLE_ VEIN_DESC
12ALR003	Blue green feldspar phyric andesite similar to previous stations 12ALR001 and 002. Locally the rock contains fine black sub-mm thin by 3mm to 1cm long hornblende lath and appears more medium grained. The outcrop maybe a medium grained diorite. The outcrops contains trace to 1% malachite along fractures and rare to trace pyrite and cpy along veinlets and fractures. Epidote alteration froms along fractures and locally patchy.	Trace to 1% malachite along fractures. Rare to trace cpy and py along fractures and in veinlets.	Weak to moderate epidote alteration along fractures and locally as patches.		
12ALR003	Blue green feldspar phyric andesite similar to previous stations 12ALR001 and 002. Locally the rock contains fine black sub-mm thin by 3mm to 1cm long hornblende lath and appears more medium grained. The outcrop maybe a medium grained diorite. The outcrops contains trace to 1% malachite along fractures and rare to trace pyrite and cpy along veinlets and fractures. Epidote alteration froms along fractures and locally patchy.	Trace to 1% malachite along fractures. Rare to trace cpy and py along fractures and in veinlets.	Weak to moderate epidote alteration along fractures and locally as patches.		

HOLEID	SAMPLE_ LITH_DESC	SAMPLE_ MIN_DESC	SAMPLE_ ALT_DESC	SAMPLE_ STRUC_DESC	SAMPLE_ VEIN_DESC
12ALR006	Blue green fine grained andesite locally contains visible plagioclase phenocrysts and black possible augite phenocrysts. Unit contains local trace to 1% malachite along fractures and traces of cpy and py along veins.	Local trace to 1% malachite along fractures and rare to trace cpy in veins and minor py.			Local quartz-carbonate veins.
12ALR021	Fine grained blue andesite moderatly oxidized and gossaneous.	Traces of malachite, cpy, and py along fractures and as fine veinlets.			
12ALR008	Pink to green granodiorite with moderate patchy to pervasive pink potassic or hematite albite alteration and fractures to patchy chl alteration. Also, weak epidote alteration along fractures/veins and less patchy. Unit contains malachite along fracutres and typically associated with quartz-carb veining and zones of thin shearing or fractures with hydrothermal alteration. Also, traces of cpy associated with malachite and may form as veins. To the south end of the outcrop contains a local pinkbanded rhyolite or felsic dike ~ 1.5 m wide. Also, the unit contains a 10-12 cm wide andesitic to basaltic dike with traces of cpy	Malachite along fracutres and typically associated with quartz-carb veining and zones of thin shearing or fractures with hydrothermal alteration. Also, traces of cpy associated with malachite and may form as veins.	Moderate patchy to pervasive pink potassic or hematite albite alteration and fractures to patchy chl alteration. Also, weak epidote alteration along fractures/veins and less patchy.	Structure 1 and 2 is the trend and lineation of supposed bands of the felsic rhyolitic? dike. Structure 3 is the trend of the andesitic dike.	Quartz-carb veining which may be associated with zones of shearing and hydrothermal alteration. Some veins contain malachite and lesser cpy.

HOLEID	SAMPLE_ LITH_DESC	SAMPLE_ MIN_DESC	SAMPLE_ ALT_DESC	SAMPLE_ STRUC_DESC	SAMPLE_ VEIN_DESC
	disseminations.				
12ALR010	Light pink and locally green granodiorite same as 12ALR008 generally with rare to trace malachite and cpy. Unit contains local quartz veins. One quartz vein measures 5-15 cm wide of massive quartz with traces of malachite and a tranished metallic purple to black mineral of possible hematite. Samples was taken of the vein.	Rare to trace malachite and cpy, same as 12ALR005.	Moderate patchy to pervasive pink potassic or hematite albite alteration and fractures to patchy chl alteration. Also, weak epidote alteration along fractures/veins and less patchy.	General trend of the 5-15 cm wide quartz vein.	Local quartz veins; one vein measures 5-15 cm wide of massive quartz with traces of malachite and traces of tranished metallic purple to black mineralization of possible hematite.
12LAB036	Andesite with a shear zone.		shear zone with moderate limonite alteration.		

HOLEID	SAMPLE_ LITH_DESC	SAMPLE_ MIN_DESC	SAMPLE_ ALT_DESC	SAMPLE_ STRUC_DESC	SAMPLE_ VEIN_DESC
12LAB037	Bottom of andesite is more altered than top of granodiorite at contact.	sample from shear zone in this area showed chalcopyrite and malachite associated with blebs of epidote and mafics minerals within the hose rock.	Two shear/fracture zones in this immediate area. One at granodiorite - andesite contact and another in the granodiorite. Samplle taken from shear within granodiorite (near contact). Epidote and chlorite alteration more assoicated with shear in granodiorite where sample was collected. Top of granodiorite less altered than bottom of andesite at contact.	sample taken in another shear zone in the area near contact with granodiorite. Strike N-S, dip 75E.	
12LAB035		Noted sparce chalcopyrite associated with bleb-like concentrations of epidote, mafic minerals and K-spar. Minor chalcopyrite in veins with epidote and mafic minerals. Some localized malachite on fracture surfaces.			
12LAB039	Some exposures in the area show hornblende phenocrysts.	Chalcopyrite specks on fracture fill or submillimeter veining.			

HOLEID	SAMPLE_ LITH_DESC	SAMPLE_ MIN_DESC	SAMPLE_ ALT_DESC	SAMPLE_ STRUC_DESC	SAMPLE_ VEIN_DESC
12ALR018	White pink to green granodiorite with weak feldspar alteration and weak to moderate chlorite alteration along fracturing and locally more patchy. Unit contains rare to trace malachite and cpy. Locally the unit is cut by crackle brecciation ~1-2 m wide with a fine grained green chl matrix. Generally fragments of the intrusive are angular to subangular and fragment supported, but locally the breccia is matrix supported by chl. The matrix also contains trace to 1% py and traces of cpy. Generally the alteration especially the chlorite alteration decreases away from the breccia zone. Sample was taken from the brecciated portion of the outcrop	Rare to trace malachite and cpy. Also, trace to 1% py and traces of cpy within the local breccia matrix.	Weak to moderate chlorite alteration along fracturing and locally more patchy associated with the breccia. Also, weak pinkish feldspar alteration.	The trend of the breccia zone.	

HOLEID	SAMPLE_ LITH_DESC	SAMPLE_ MIN_DESC	SAMPLE_ ALT_DESC	SAMPLE_ STRUC_DESC	SAMPLE_ VEIN_DESC
12ALR020	White to green altered granodiorite with epidote on fracturesand patches of weak to moderate chlorite alteration. Unit contains traces of cpy and malachite along fractures and sub-mm veinlets. A metre or so up slope and to the east is a shear zone possibly marking the contact between the andesite and the granodiorite. The shear zone is ~3-7 m wide and contains a 30 cm wide portion of shear medium green fine grained chloritic, below the fine chlorite the shear/fault is composed of subangular to subrounded few mm to 10 cm wide fragments of granodiorite within the green slightly bluish chloritic matrix. The fragments are possibly rotated. Above the shear the rocks are generally altered, locally rusty and fine grained with local visible plagioclase phenocrysts.	traces and locally up to 1% cpy and malachite along fractures and sub-mm veinlets.	patches and fractures of weak to moderate chlorite alteration more dominantly associated with the shearing. Also, epidote on fractures and patches of weak to moderate chlorite alteration.	Structure 1 is the large shear zone possibly marking the contact and it measured the strike of the fine grained chloritic portion of the shear. Structure 2 meaures another shear up slope that is 20-30 cm wide and is rusty.	

HOLEID	SAMPLE_ LITH_DESC	SAMPLE_ MIN_DESC	SAMPLE_ ALT_DESC	SAMPLE_ STRUC_DESC	SAMPLE_ VEIN_DESC
12AML003	Blue green andesite fragmental with gossanous shears and fine grained andesite locally with augite phenocryst found downslope to the southwest. Contact is undefined possibly around the shearing. Generally the andesite fragmental is similar to 12AML001 with gossan zones. The gossan contains trace to 1% pyrite associated with fracturing and veinlets.		Pervasive strong chlorite alteration. Weak patchy epidote domminantly associated with andesite fragmental. Local intense fracture controlled hematite alteration assoicated with intense fracturing and possible shearing.	Outcrop contains shear with gossan 0.5 to 2m wide.	
12AML003	Blue green andesite fragmental with gossanous shears and fine grained andesite locally with augite phenocryst found downslope to the southwest. Contact is undefined possibly around the shearing. Generally the andesite fragmental is similar to 12AML001 with gossan zones. The gossan contains trace to 1% pyrite associated with fracturing and veinlets.		Pervasive strong chlorite alteration. Weak patchy epidote domminantly associated with andesite fragmental. Local intense fracture controlled hematite alteration assoicated with intense fracturing and possible shearing.	Outcrop contains shear with gossan 0.5 to 2m wide.	
12AML005	Pale fine graind equigranular altered andesite.	Disseminated and fracture filling pyrite.	Patchy intense silica alteration. Contains silica vein haloes. Strong fracture controlled hematite alteration. Outcrop has overall red and light tan splotchy appearance.	Strong planer and local hackly jointing.	

HOLEID	SAMPLE_ LITH_DESC	SAMPLE_ MIN_DESC	SAMPLE_ ALT_DESC	SAMPLE_ STRUC_DESC	SAMPLE_ VEIN_DESC
12LAB017	highly fractured/breccciated, appears to be diorite to granodiorite in composition.	Mineralization primarily concentrated in a zone 1-2 m wide.	Outcrop is very distinct from surrounding rock. Forms prominant reddish brown ridge.	Altered brecciated rock forms resistant ridge striking approximately N20E.	
12LAB018	Highly fractured and altered but appears to be diorite to qtz diorite (granodiorite intrusive grouping).				
12LAB019		More malachite mineralization in this area than previous two sampling areas. Mineralization noted on weak fracture planes when breaking rock.			
12LAB020					
12LAB021	Andesite with qtz veining and some hematitic alteration.				
12LAB022		mineralization localized in blebs. Very finely crystalline.			
12LAB023	fresh surface appears to be diorite to quartz diorite. Some locations look andesitic.		rock appears altered and weathered		
12LAB024	may be diorite or quartz diorite (group with granodiorite?)

CERTIFICATE OF ANALYSIS SMI12000272.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-205
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	33	Split samples by riffle splitter			SMI
R200-CRU90	1	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	35	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN
2A13	35	Total S Analysis by Leco	0.1	Completed	VAN

CERTIFICATE OF ANALYSIS SMI12000270.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-131
P.O. Number 90153 Copper Fox
Number of Samples: 4

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	4	Split samples by riffle splitter			SMI
R200-CRU90	0	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	4	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	4	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	4	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN
2A13	4	Total S Analysis by Leco	0.1	Completed	VAN

CERTIFICATE OF ANALYSIS SMI12000269.2

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-130
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	33	Split samples by riffle splitter			SMI
R200-CRU90	1	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	35	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN
2A13	35	Total S Analysis by Leco	0.1	Completed	VAN
G6	1	Lead collection fire assay fusion - Grav finish	30	Completed	VAN

ADDITIONAL COMMENTS

Version 2 : G613 included.

CERTIFICATE OF ANALYSIS SMI12000172.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-204
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	33	Split samples by riffle splitter			SMI
R200-CRU90	1	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	35	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN
2A13	35	Total S Analysis by Leco	0.1	Completed	VAN

ADDITIONAL COMMENTS

CERTIFICATE OF ANALYSIS SMI12000170.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-126
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	33	Split samples by riffle splitter			SMI
R200-CRU90	1	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	35	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN
2A13	35	Total S Analysis by Leco	0.1	Completed	VAN
G6	1	Lead collection fire assay - Grav finish	50	Completed	VAN

CERTIFICATE OF ANALYSIS SMI12000155.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-125
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	33	Split samples by riffle splitter			SMI
R200-CRU90	1	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	35	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN
2A13	35	Total S Analysis by Leco	0.1	Completed	VAN

ADDITIONAL COMMENTS

CERTIFICATE OF ANALYSIS SMI12000152.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-122
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	33	Split samples by riffle splitter			SMI
R200-CRU90	1	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN

CERTIFICATE OF ANALYSIS SMI12000149.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-123
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
R200-CRU90	1	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
RIFL2	33	Split samples by riffle splitter			SMI
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	35	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN
2A13	35	Total S Analysis by Leco	0.1	Completed	VAN

CERTIFICATE OF ANALYSIS SMI12000127.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-118
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	33	Split samples by riffle splitter			SMI
R200-CRU90	1	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	35	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN
2A13	35	Total S Analysis by Leco	0.1	Completed	VAN

CERTIFICATE OF ANALYSIS SMI12000126.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-117
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	33	Split samples by riffle splitter			SMI
R200-CRU90	1	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	35	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN

CERTIFICATE OF ANALYSIS SMI12000123.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-115
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	33	Split samples by riffle splitter			SMI
R200-CRU90	1	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	35	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN
2A13	35	Total S Analysis by Leco	0.1	Completed	VAN

CERTIFICATE OF ANALYSIS SMI12000122.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-114
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	33	Split samples by riffle splitter			SMI
R200-CRU90	1	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	35	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN
2A13	35	Total S Analysis by Leco	0.1	Completed	VAN

CERTIFICATE OF ANALYSIS SMI12000116.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-109
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	33	Split samples by riffle splitter			SMI
R200-CRU90	1	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	35	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN

CERTIFICATE OF ANALYSIS SMI12000093.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-202
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	33	Split samples by riffle splitter			SMI
R200-CRU90	1	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	35	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN
2A13	35	Total S Analysis by Leco	0.1	Completed	VAN

CERTIFICATE OF ANALYSIS SMI12000092.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-103
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	35	Split samples by riffle splitter			SMI
R200-CRU90	35	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	35	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN
2A13	35	Total S Analysis by Leco	0.1	Completed	VAN

ADDITIONAL COMMENTS

CERTIFICATE OF ANALYSIS SMI12000090.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-107
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	33	Split samples by riffle splitter			SMI
R200-CRU90	1	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	35	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN
2A13	35	Total S Analysis by Leco	0.1	Completed	VAN

CERTIFICATE OF ANALYSIS SMI12000087.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-201
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	33	Split samples by riffle splitter			SMI
R200-CRU90	1	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	35	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN
2A13	35	Total S Analysis by Leco	0.1	Completed	VAN

ADDITIONAL COMMENTS

CERTIFICATE OF ANALYSIS SMI12000052.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-101
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	33	Split samples by riffle splitter			SMI
R200-CRU90	1	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	35	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN

CERTIFICATE OF ANALYSIS SMI12000051.1

CLIENT JOB INFORMATION

Project: Schaft Creek
Shipment ID: 12-CUU-102
P.O. Number 90153 Copper Fox
Number of Samples: 35

SAMPLE DISPOSAL

RTRN-PLP Return
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
RIFL2	33	Split samples by riffle splitter			SMI
R200-CRU90	1	Crush to 90% passing 10mesh, split and pulverize drill core			VAN
G601+G610	35	Fire Assay fusion Au by ICP-ES	50	Completed	VAN
7TD2	35	4 Acid digestion ICP-ES analysis.	0.5	Completed	VAN
1EX	35	4 Acid digestion ICP-MS analysis	0.25	Completed	VAN
2A13	35	Total S Analysis by Leco	0.1	Completed	VAN
