1.0 SUMMARY

The mineral claims comprising the property are owned by and registered in the name of Barker Minerals Ltd. During the summer of 2012 a total of 76 soil samples and 7 outcrop rock samples were collected and GPS'd along 1.85 km of the Shinev Mineral Road. The samples were conducted as a follow up to the discovery of high grade float mineralization in 2011 described below. The purpose of the 2012 program was also conducted to determine the gold, and gold pathfinder, in soil environment with the use of a hand held XRF analyzer. The soil samples were collected and once at camp they were dried, sieved and prepared for initial XRF analysis. (Appendix C - XRF Soil and Rock Sample Locations and Descriptions)

The Likely/Cariboo Lake 2008/2009 GSC Geophysical Airborne survey results were reviewed around the Spanish Creek project and results are incorporated in the body of the report as figures.

During prospecting in 2011 a 60cm x 50cm angular high grade massive sulphide float boulder was found near outcrop. Two separate representative samples of the boulder assayed 15.3% and 17.6% copper respectively; 6.2% and 7.0% zinc respectively; .17% and .17% lead respectively; 158g/t and 183 g/t silver respectively; 11.7 ppm and 5.6 ppm gold respectively by ICP-MS; and 9.6 g/t gold and .14 g/t gold respectively by fire assay.

2.0 INTRODUCTION

This report describes assessment work performed on Barker Minerals Ltd. Spanish Creek mineral property in 2012. Soil collection, rock sampling, sample preparation and analysis were done between August 31, and April 15, 2013 on the Spanish Creek property.

In this report chemical abbreviations are used for the elements discussed. The elements and abbreviations are

Ag	Silver
As	Arsenic
Au	Gold
Ba	Barium
Co	Cobalt
Cu	Copper
Fe	Iron
Mn	Manganese
Pb	Lead
Sb	Antimony
Zn	Zn

3.0 PROPERTY DESCRIPTION and LOCATION

The Spanish Creek Property's location in British Columbia is indicated in Figure No. 1 – Main Property Location in British Columbia, and the mineral claims are outlined in Figure No. 2 – Barker Minerals Ltd. Mineral Claims. The properties have excellent access and infrastructure nearby and are located approximately 70 kilometres east of Williams Lake and 20 kilometres from the community of Likely in the Cariboo Mining Division in British Columbia and are 100% owned by Barker Minerals Ltd. of Prince George, B.C.

The geographic coordinates of the Spanish Creek Property are: 52.60° Latitude and -121.29° Longitude or 615745.81 E and 5829333.10 N UTM coordinates (NAD 83). The relevant maps are: N.T.S. Map No. 93A/11W.

4.0 MINERAL CLAIMS

The Spanish Creek Property consists of contiguous claims that are 717.86 Ha in size and which are listed in Appendix B – Barker Minerals Ltd. – Spanish Creek Property - Mineral Claim Details

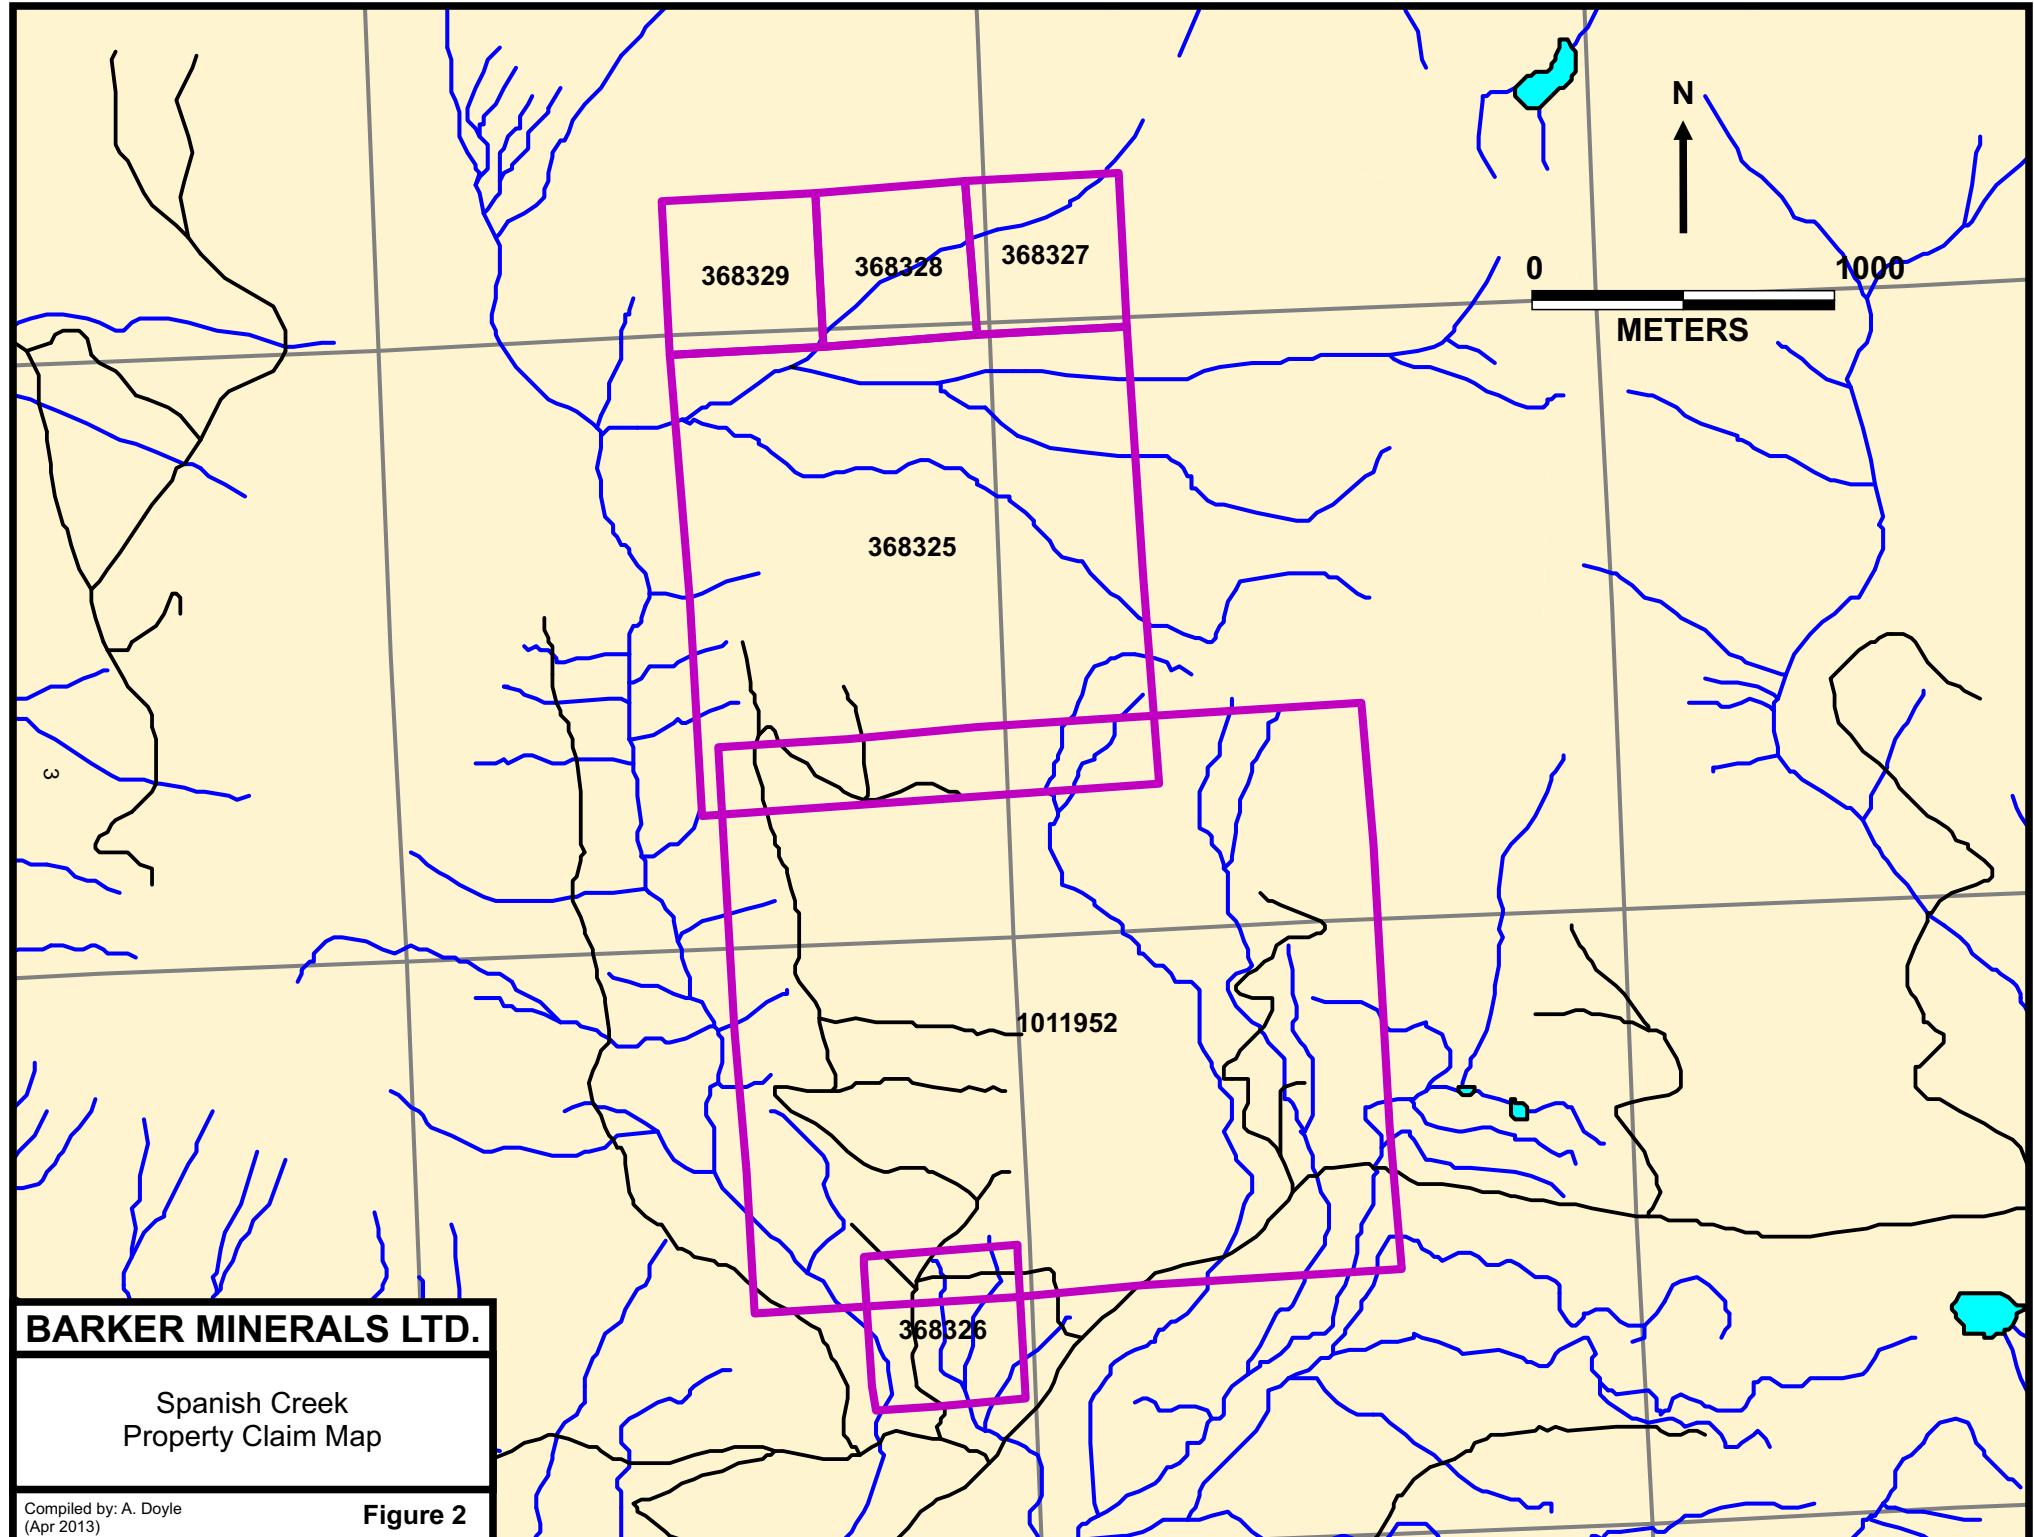

Map Center: 54.4781N 124.7082W

Figure No. 1 – Spanish Creek Property Location in British Columbia.

5.0 PHYSIOGRAPHY and ACCESSIBILITY

The following description in *italics*, is after McKinley, 2004:

The property is situated in the central part of the Quesnel Highland between the eastern edge of the Interior Plateau and the western foothills of the Columbia Mountains. This area contains rounded mountains that are transitional between the rolling plateaus to the west and the rugged Cariboo Mountains to the east. Pleistocene and Recent ice sheets flowed away from the high mountains to the east over these plateaus and down to the southwest (Cariboo River), west (Little River) and northeast (Quesnel Lake), carving U-shaped valleys. The elevation ranges from 700-1650 m. Precipitation in the region is heavy, as rain in the summer and snow in the winter. Drainage is to the west via the Cariboo, Little and Quesnel Rivers to the Fraser River. Quesnel Lake, the main scenic and topographic feature in the region, is a deep, long, forked, glacier-carved lake with an outlet at 725 m elevation. Vegetation is old-growth spruce, fir, pine, hemlock and cedar forest in all but the alpine regions of the higher mountains (mainly above 1400 m elevation). Weldwood has been actively logging fir, spruce and pine in the area.

6.0 HISTORY

6.1 Spanish Creek Property

Historic information indicates placer mining exploration was conducted perhaps since the turn of the 20th century and possibly earlier on the lower portion of Spanish Creek. Historically there has been prospecting, hand trenching, minor geological mapping and a geochemical soil survey conducted on the claims. Significant logging has now opened up the area with easier access in order to further exploration efforts in the area.

7.0 2012 EXPLORATION PROGRAM

Significant log harvesting activities were planned by logging companies during the 2012 - 2013 winter months on the project area. Sample collections were conducted on roads near where high grade massive sulphide float was found in 2011.

Seventy-six soil samples and 7 rock samples were collected and analyzed by XRF method. Analytical soil and rock results are in Appendices D and E - Analytical Results.

7.1 Economic Target

The economic target at Spanish Creek is polymetallic volcanogenic massive sulphide (VMS) and/or gold quartz vein deposits.

7.2 Sampling Method and Approach

A total of 76 soil samples were collected in 2012 along the Shiney Mineral road for a length of 1850 meters. The spacing between each sample was approximately ten to 20 metres, determined by meter-marked hip-chain. Each hole was flagged with pink flagging tape and a GPS coordinate (with a waypoint name identical to the sample number) was taken. (Figure 3 - Location of 2012 Work Area)

Collected soils were placed into plastic sample-bags, marked a corresponding number and zip-tied. Holes were dug to a minimum depth of the shovel head (22cm). Care was taken to remove large clasts and organics.

Soils were sampled and/or collected from the flanks of logging roadside. A pick and shovel were used to recover soil from a depth of 15-25cm. Soils were predominantly coarse-grained (coarse grained and matrix with gravel-cobble sized clasts). The soils collected are interpreted to be predominantly colluvial (derived from erosional processes above) as clasts are large and angular and represent the lithologies found in outcrop on location. At each sample location, a GPS waypoint was taken and marked in notebook, the area was flagged with tape and any pertinent observations were noted.

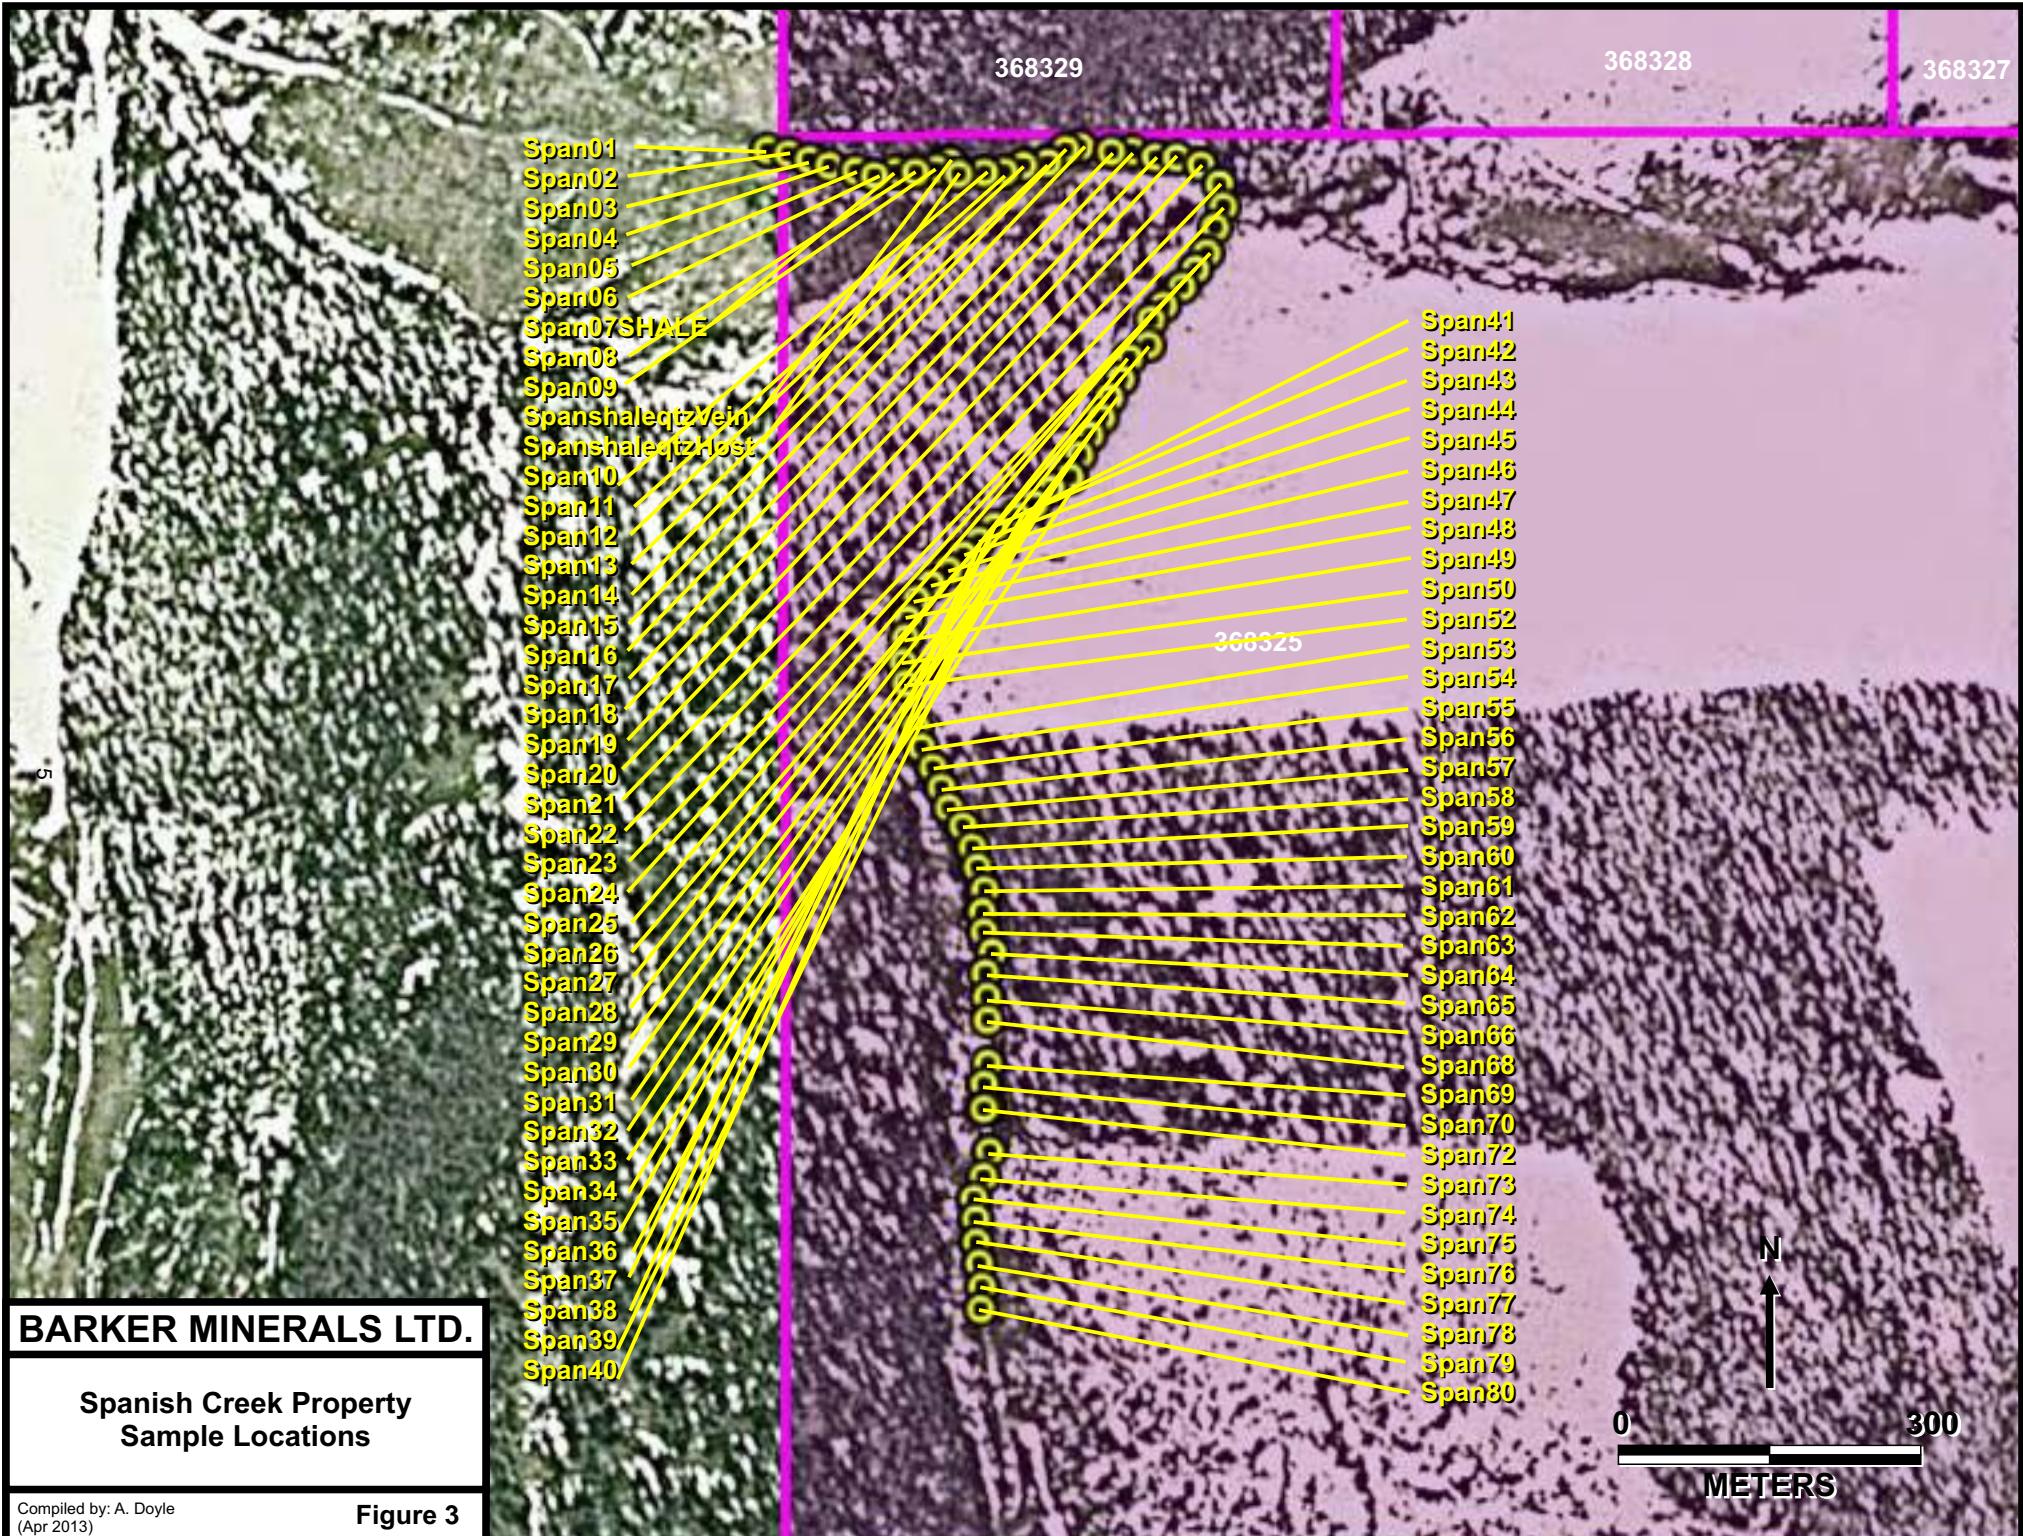

7.3 Sample Preparation and Analysis

The Niton XL3t XRF analyzer was used to conduct the analysis in the soil survey study.

The initial samples were sieved down to as fine a matrix as possible. Each soil was then analyzed twice using the 'Soils Mode' for an average of 120 - 180 seconds each. Each sample was further analyzed twice with the "Mining mode" to provide a comparison between each analysis method.

Samples of interest for follow up comparison analysis will be further crushed and pulverized in order to homogenize the samples as much as possible.

Known standards were also used for calibration and quality control purposes.

8.0 GSC AIRBORNE SURVEYS

Barker's compilation of the extensive GSC airborne surveys results included placing Barker's Spanish Creek property claims onto a background overlying the first derivative magnetics, (Figure 8) residual magnetics, (Figure 9) thorium/potassium (Figure 10) and potassium (Figure 11) results from portions of the GSC maps from Open File 6157.

The Spanish Creek property is underlain by a large broad Th/K low and K high. The magnetic highs may represent important intrusive host rocks while the magnetic lows may represent hydrothermally altered areas associated with mineralizing processes. This geophysical signature style is typical of important gold bearing environments elsewhere in the world.

9.0 GEOLOGY

9.1 Regional Geology

The geological descriptions below derive mainly from Struik (1988), Panteleyev et al. (1996) and Payne and Perry (2001).

During the mid-Jurassic the North American continental plate collided with a group of island arcs to the west. Regional deformation and metamorphism are related to these events.

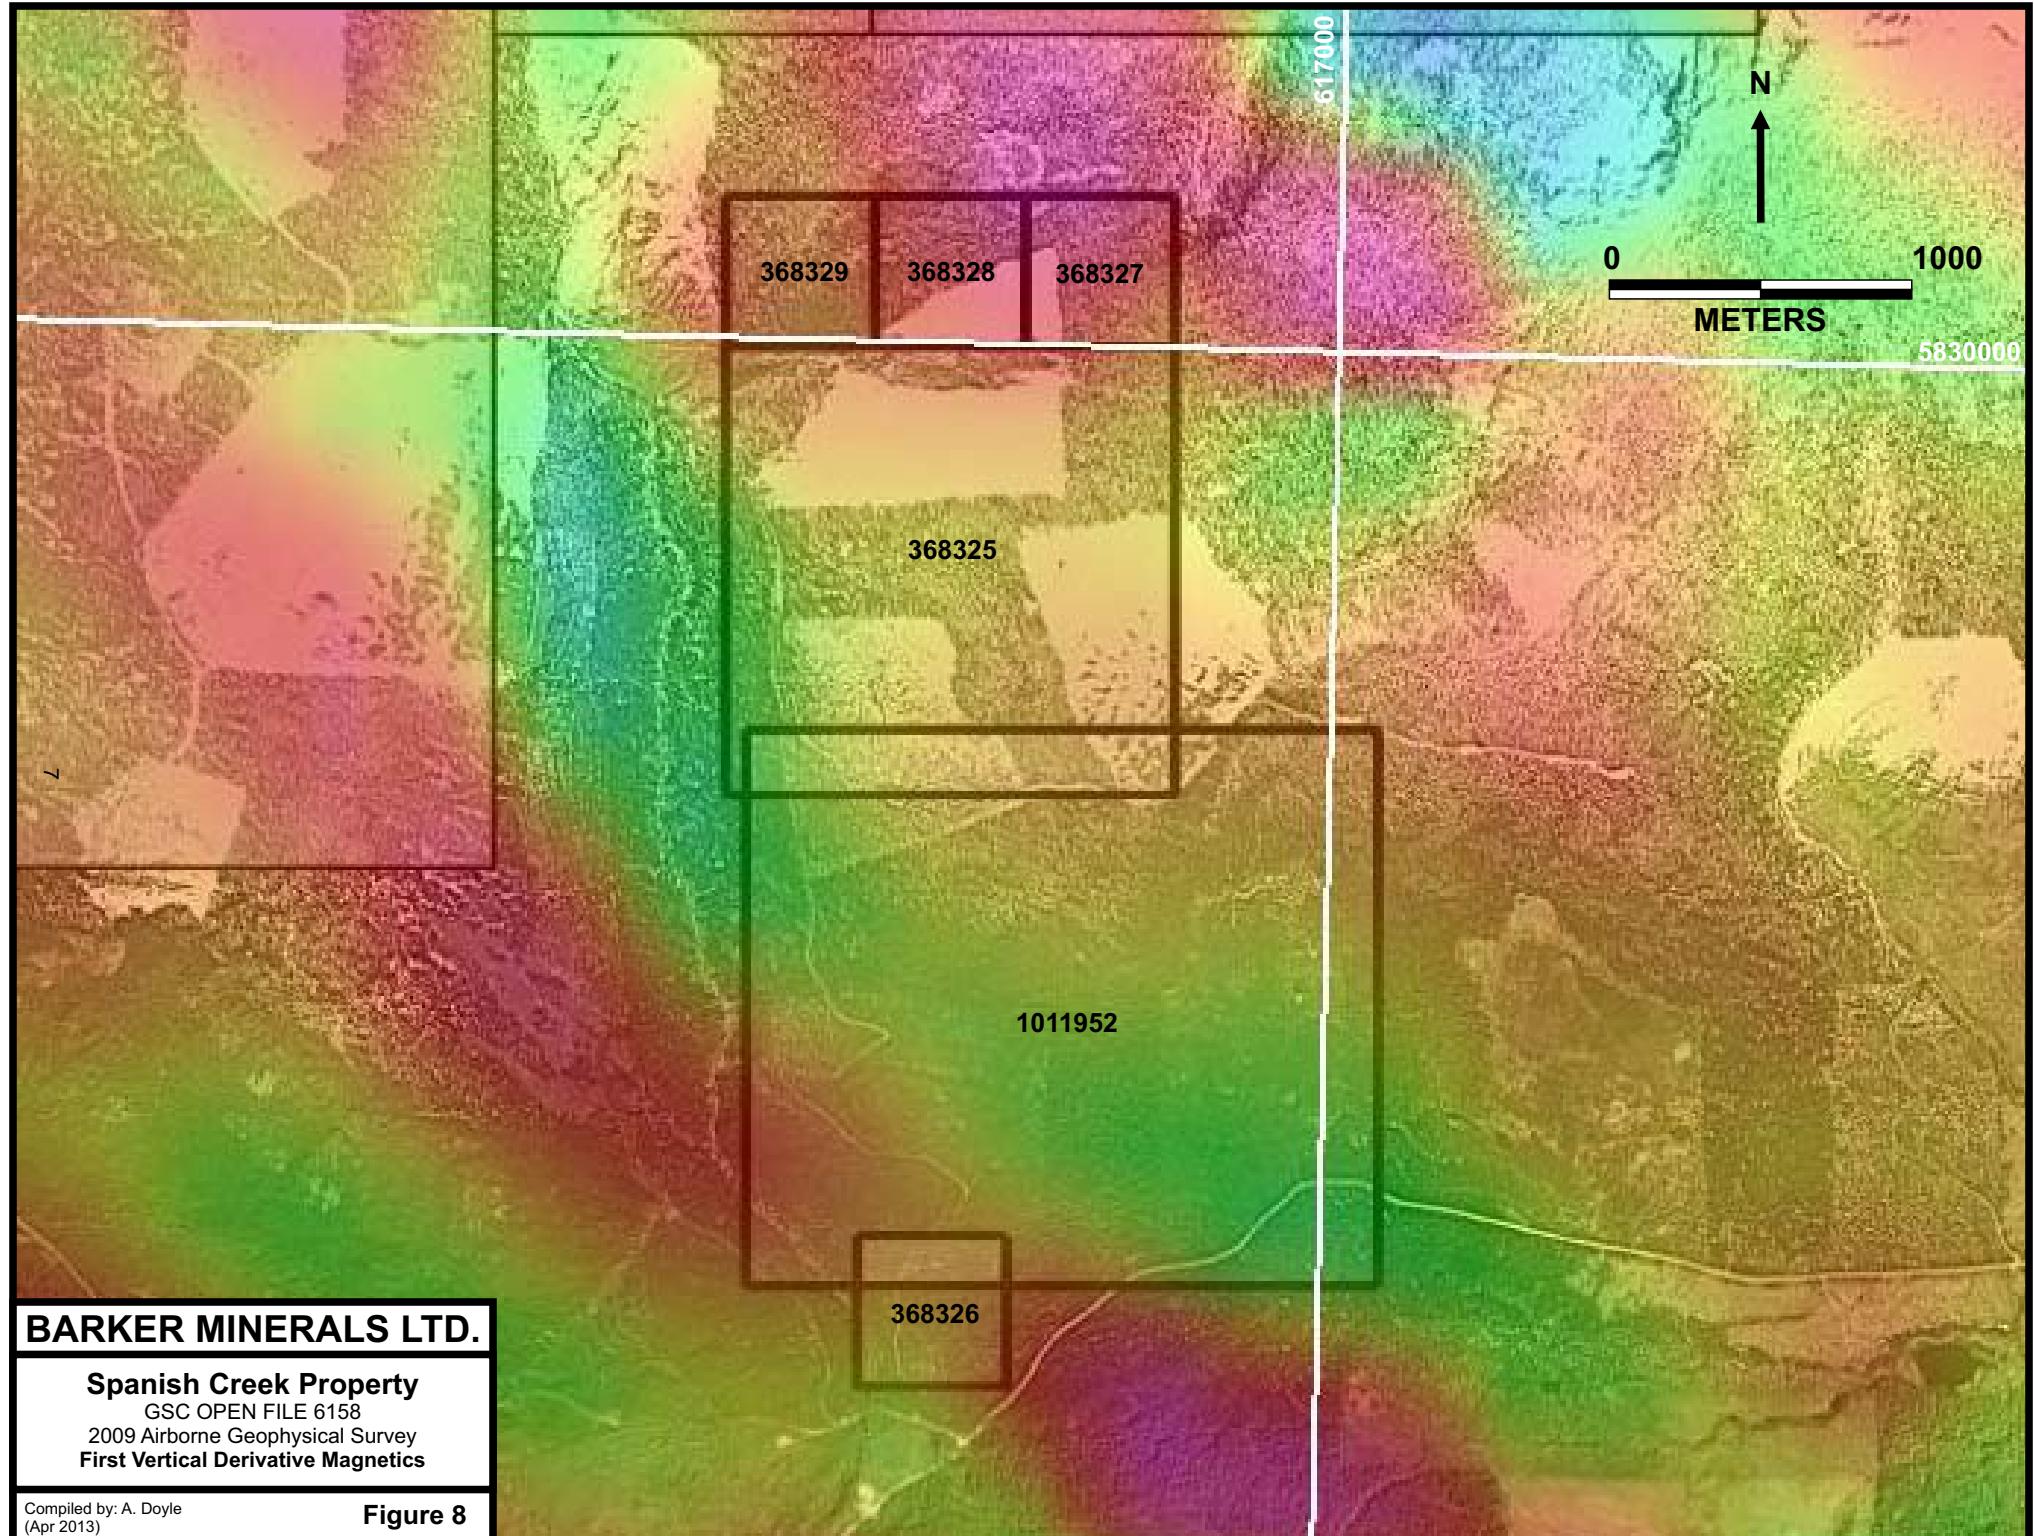

9.1.1 Quesnel Terrane

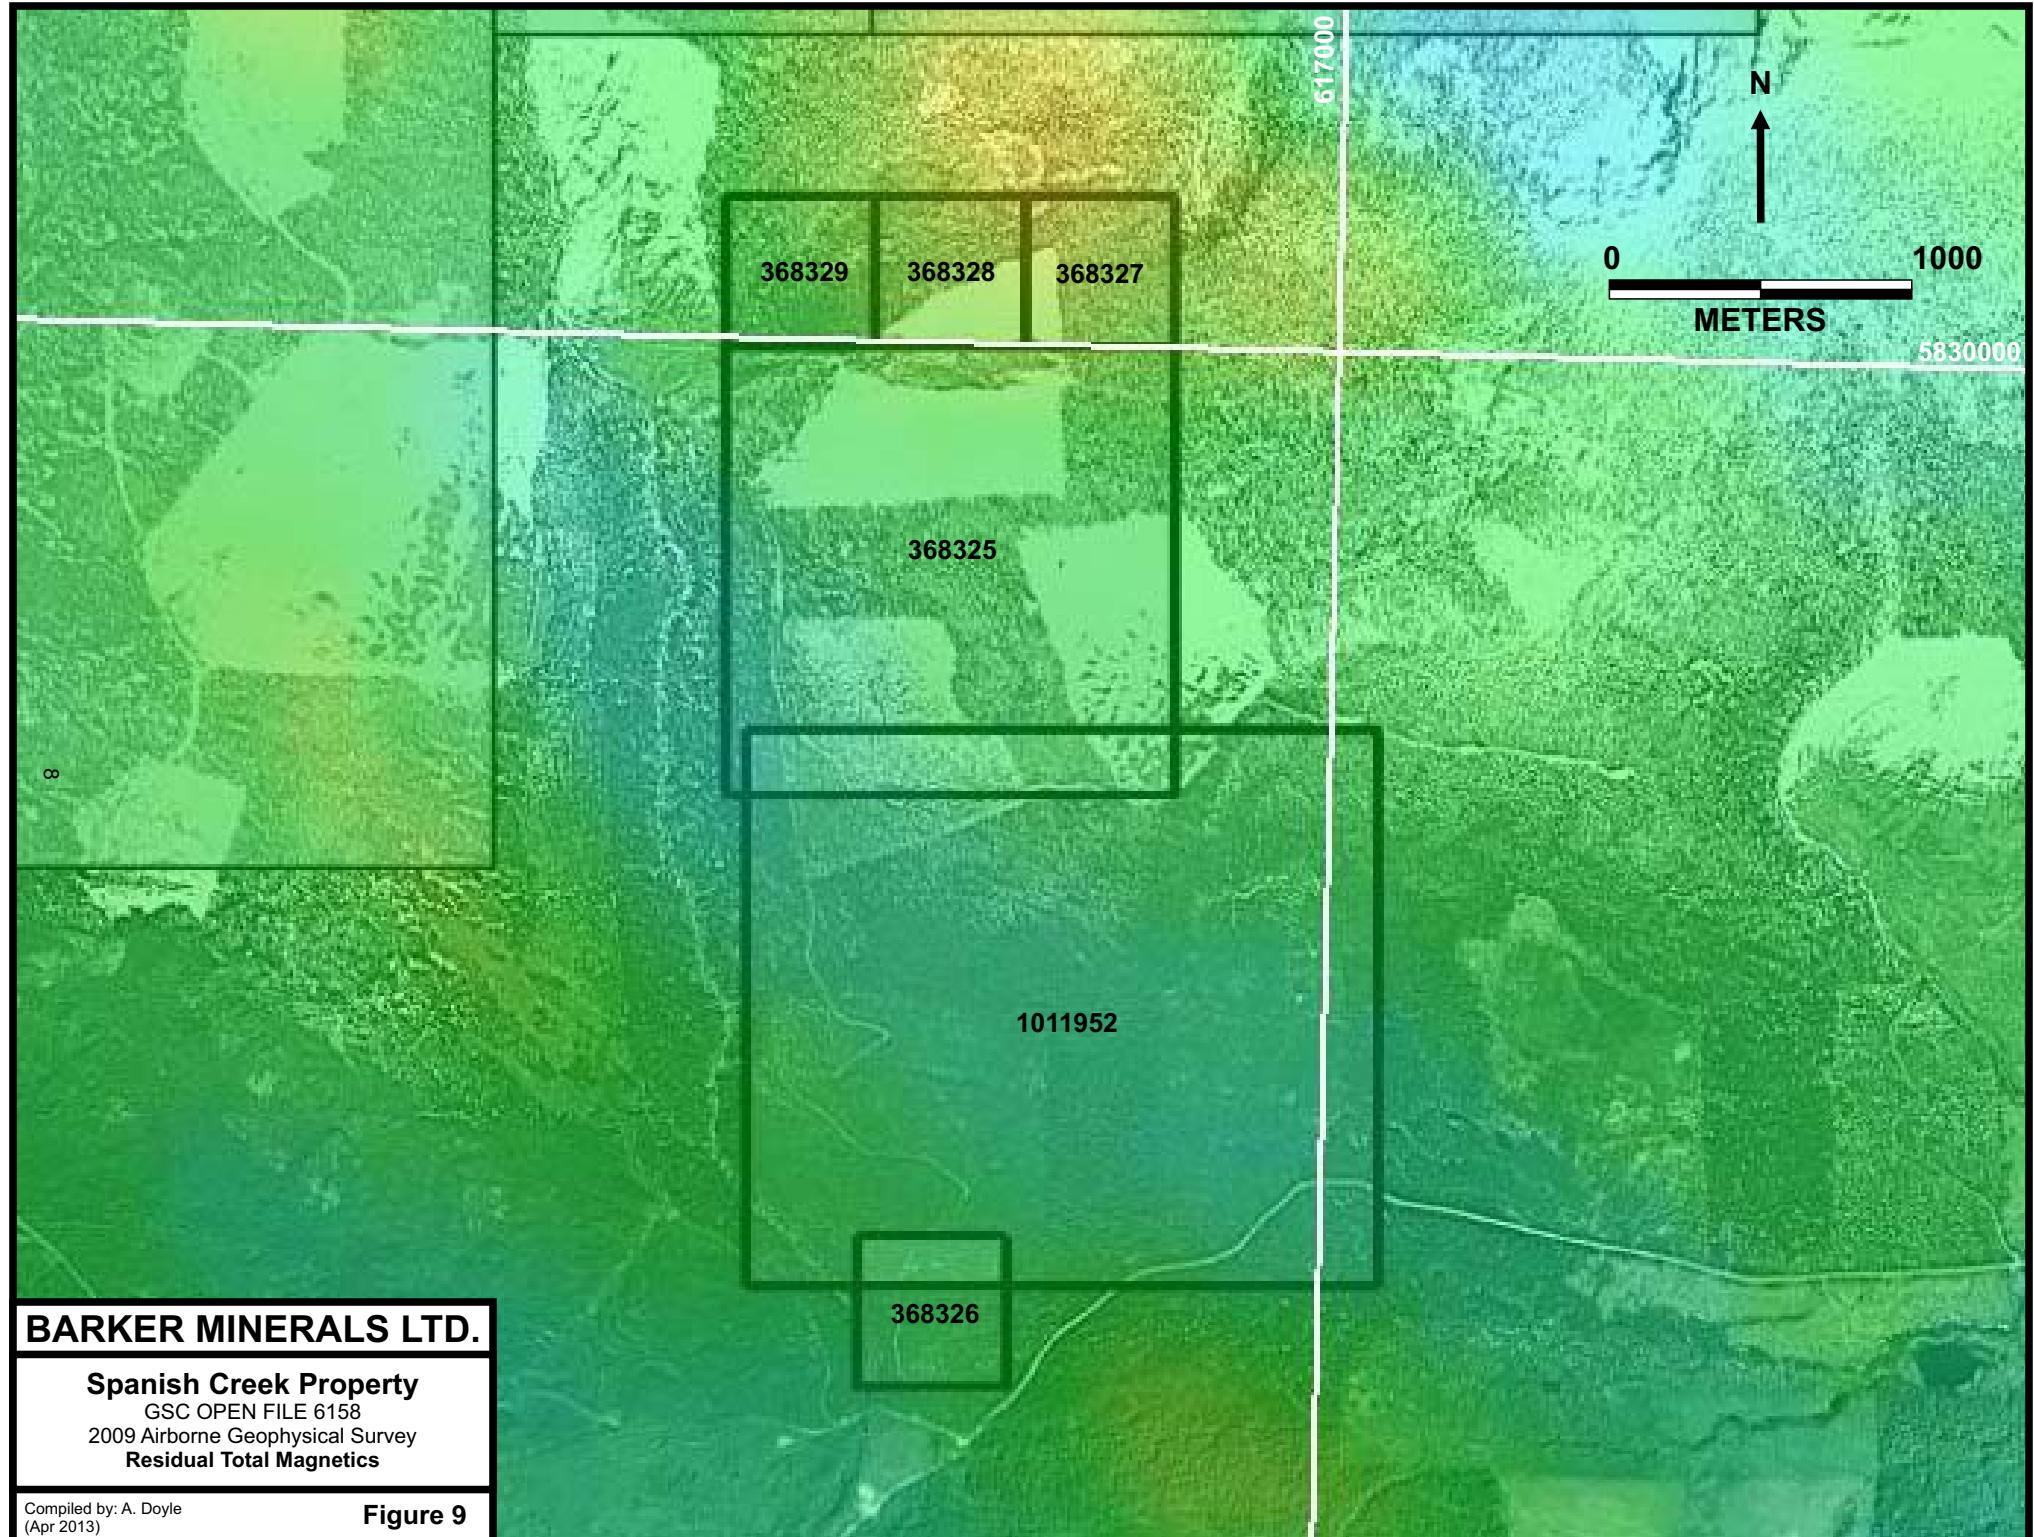

The Late Triassic to Early Jurassic Quesnel terrane...was accreted to the North American continent, in part by subduction and in part by obduction. The Eureka thrust fault marks the boundary between the Quesnel and Barkerville terranes. The terrane is partly submarine and partly subaerial, consisting of volcanic and volcanioclastic rocks and co-magmatic intrusions, with minor carbonate lenses and related sedimentary rocks.

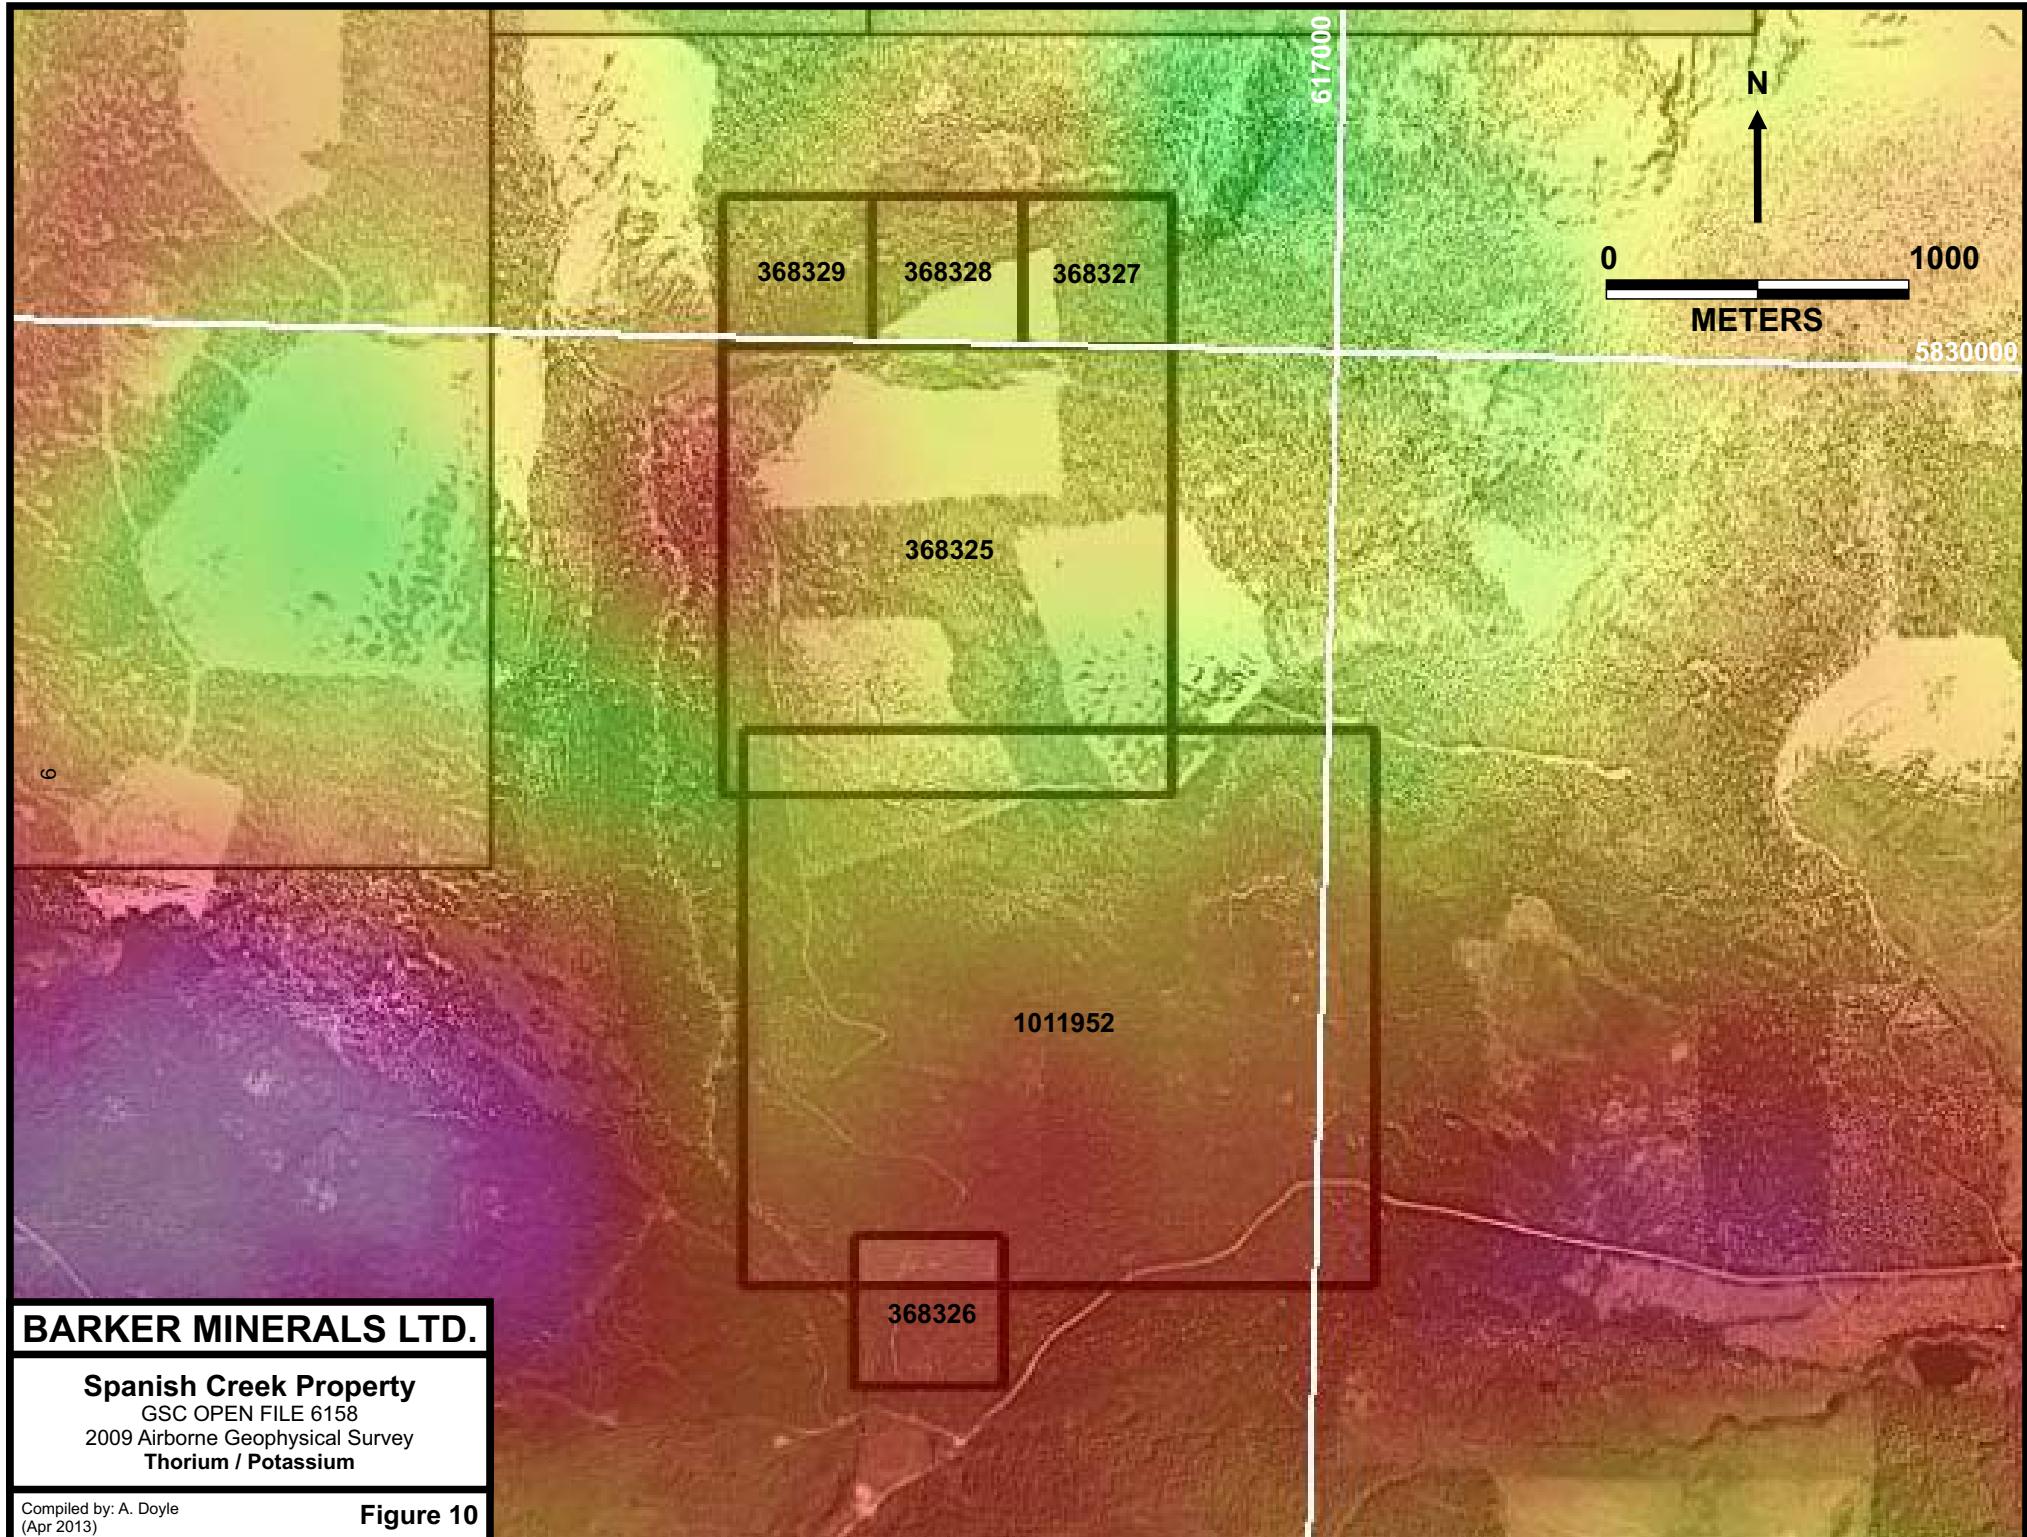

The principal assemblage in the Quesnel Terrane is the Triassic-Jurassic Nicola island arc – marginal basin sequence. The underlying rocks are the Crooked amphibolite, part of the Slide Mountain assemblage, a mylonitized mafic and ultramafic unit of oceanic marginal basin volcanic and sedimentary rocks. Rocks of Quesnel Terrane and Crooked amphibolite are structurally coupled and tectonically emplaced by the Eureka Thrust onto the Barkerville Terrane, to the east.

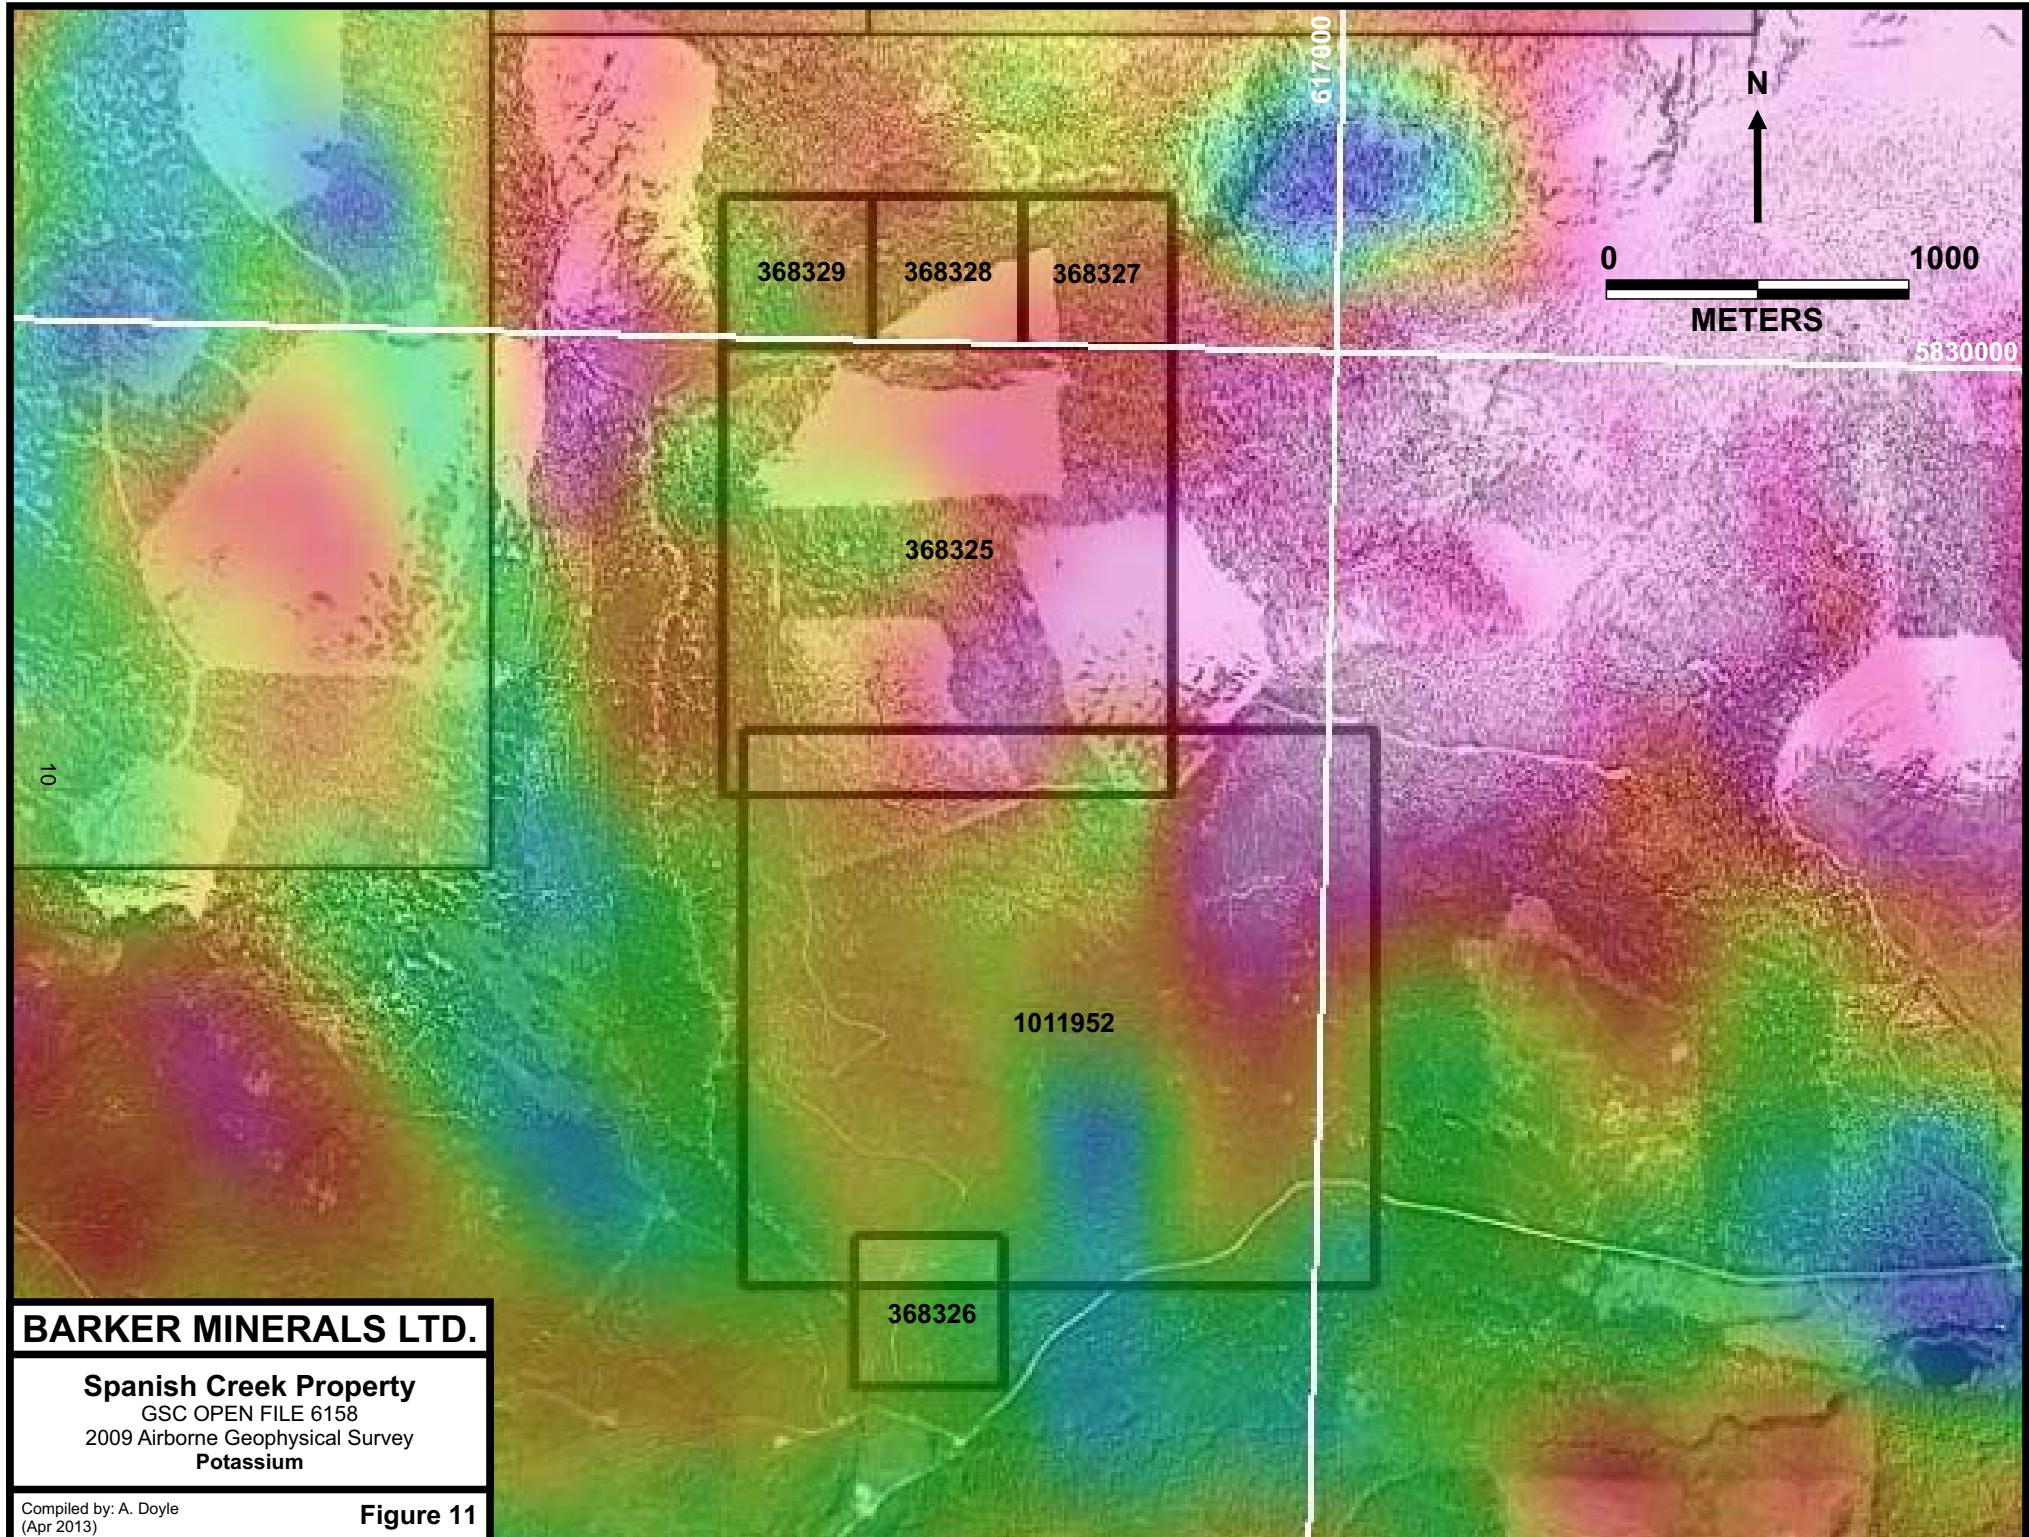

Two lithostratigraphic subdivisions of the Quesnel Terrane consist of: a basal Middle to Late Triassic metasedimentary unit of dominantly black phyllitic rocks, approximately 7 km thick, and an overlying Late Triassic to Early Jurassic volcanic arc assemblage, approximately 9 km thick. The overlying volcanic rocks outline a northwesterly trending belt of subaqueous and subaerial volcanic rocks, deposited along a series of volcanic-intrusive centres that define the Quesnel island arc of predominantly alkalic basalts.

Within...the northern extension of the Quesnel Trough, the term...Takla Group has been applied to rocks identical to the Quesnel belt rocks...Equivalent rocks to the south...are generally referred to as Nicola Group...Baily (1978) pointed out the similarity of the Quesnel volcanic units with both the Nicola Group rocks to the south and the Takla Group rocks to the north...The term Takla leads to ambiguity because in northern British Columbia it has been used for rocks in both Quesnel and Stikine terranes...The usage for the Triassic-Jurassic volcanic arc and related rocks in Quesnellia currently preferred is Nicola Group. The term Takla Group possibly should be discarded... (Panteleyev et al., (1996).

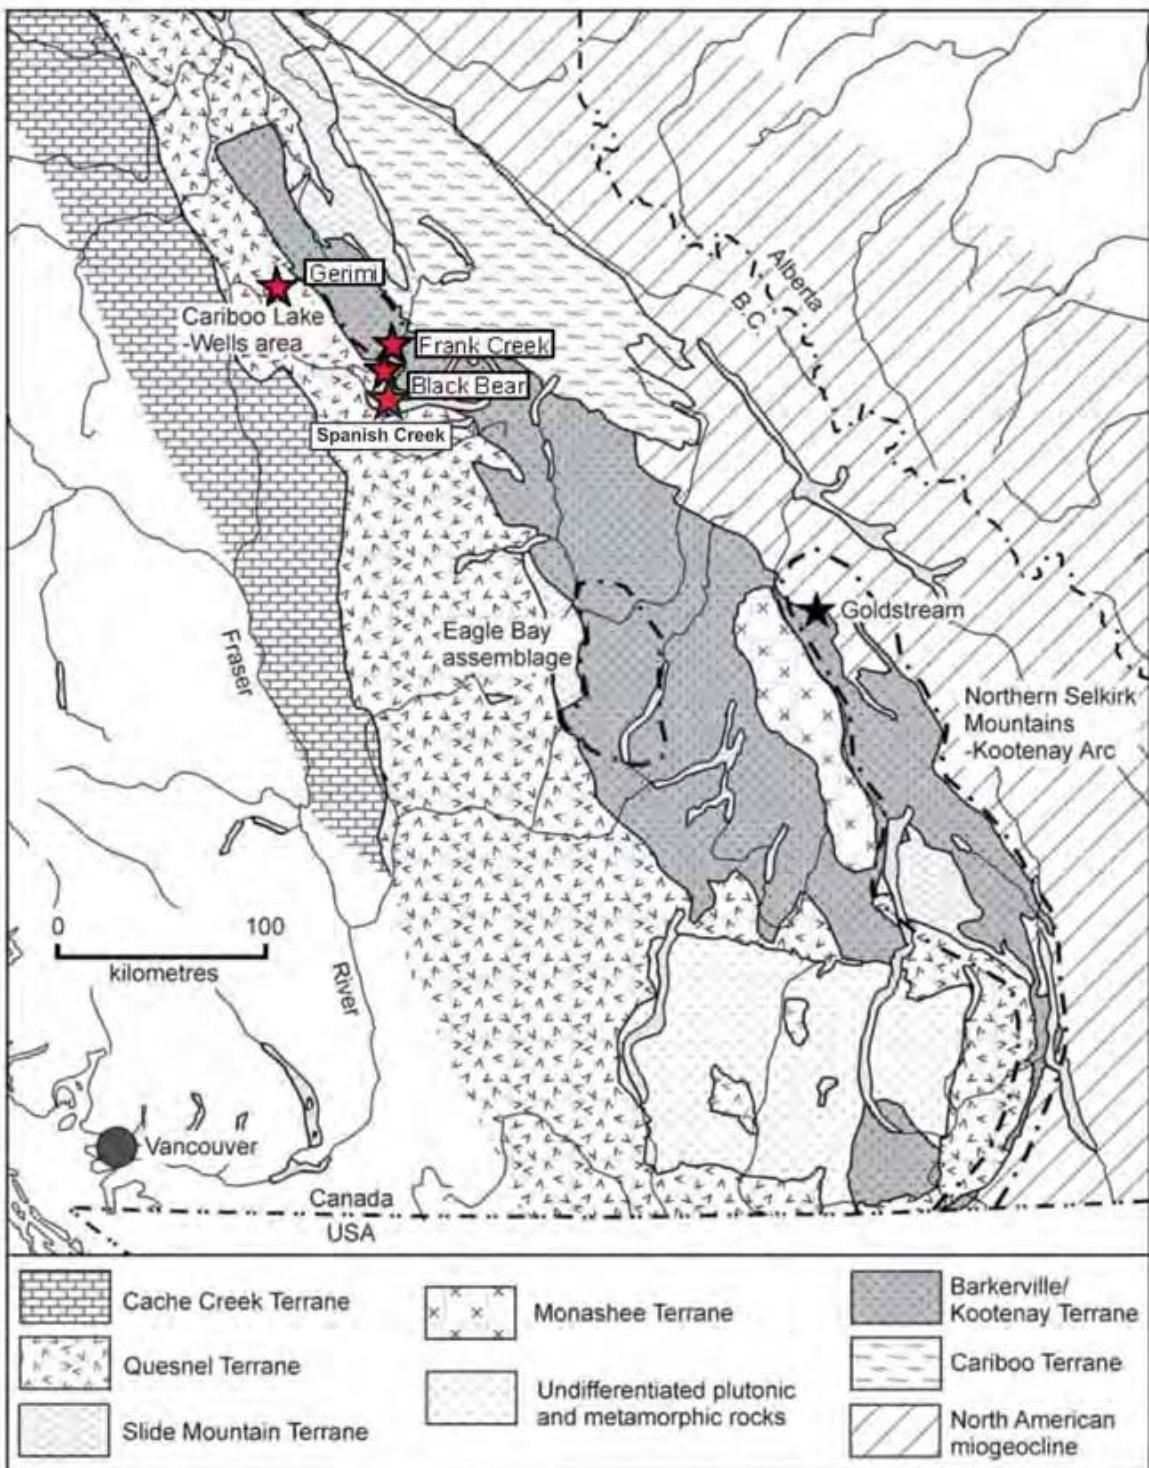

Figure No. 4 - Terrane Map of Southern British Columbia. Barker Minerals' properties are indicated by red stars.

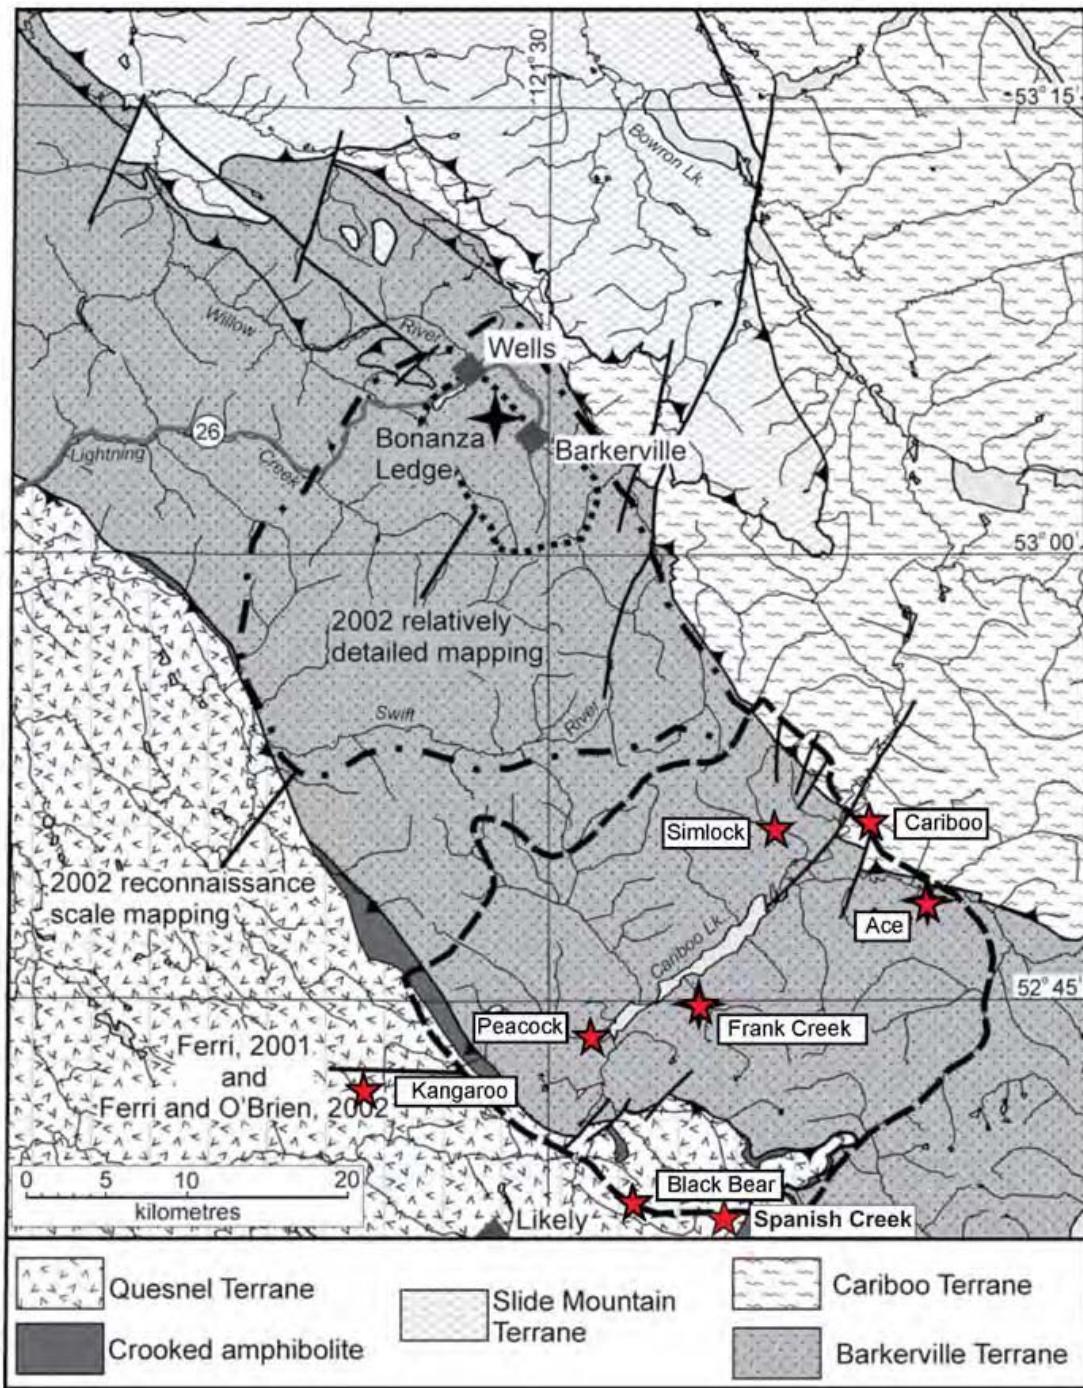

Figure No. 5 - Terrane Map of Cariboo Lake – Wells Area. Areas mapped by the BCGS in 2000 - 2002 are shown. Barker Minerals' properties are indicated by red stars.

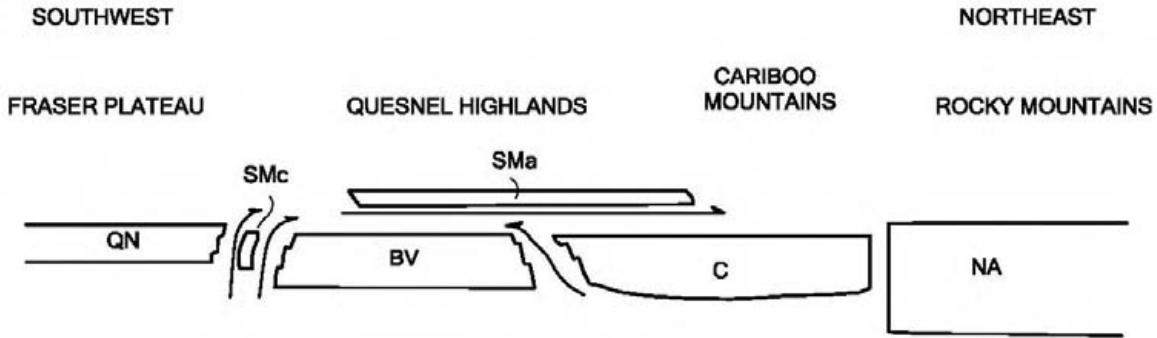

Figure No. 6 - Schematic Regional Structural Section from southwest to northeast across the four Terranes in Barker Minerals' claims area, showing the relative structural position of the Terranes. The Terrane symbols are BV-Barkerville, C-Cariboo, Sma-Slide Mountain (Antler Formation), SMc-Slide Mountain (Crooked amphibolite), QN-Quesnel and NA-North American. (after Struik, 1988).

The Quesnel Trough is a well-mineralized region typical of other Late Triassic to Early Jurassic volcano-plutonic island arcs in the Cordillera. It hosts a wide variety of mineral deposits. The principal recent exploration and economic development targets in the central Quesnel belt are alkalic intrusion-related porphyry copper-gold deposits and gold-bearing propylitic alteration zones formed in volcanic rocks peripheral to some of the intrusions. Other important targets are auriferous quartz veins in the black phyllite metasedimentary succession. The veins in some black phyllite members have potential to be mined as large tonnage, low-grade deposits. Tertiary rocks are mineralized with copper and gold. Antimony-arsenic and mercury mineralization in some apparently low temperature quartz-calcite veins indicated the potential for epithermal deposits. Placer mining for gold, said to occur together with platinum, has been of major historical and economic importance.

9.1.2 Slide Mountain Terrane

Rocks of the Devonian to Late Triassic Slide Mountain Terrane were partly obducted, partly subducted during collision of an oceanic plate with the continent. Small slices of mainly mafic volcanic rocks and ultramafic rocks of the Slide Mountain Terrane occur in and parallel to the Eureka thrust. Minor lithologies include chert, meta-siltstone and argillite.

The Crooked amphibolite, considered likely a part of the Slide Mountain Terrane, includes three major constituent rock types: greenstone, metagabbro and meta-ultramafite. North of Quesnel Lake, the map units consist of mafic metavolcanics, amphibolite, chlorite schist, serpentinite, ultramafic rocks and pillow lavas. Chemical analyses indicate subalkaline tholeiitic compositions of basalts formed on the ocean floor. If the Crooked amphibolite is a sheared and metamorphosed equivalent of the Antler Formation and is part of the Slide Mountain Terrane, it is separated from the underlying Barkerville Terrane by the Eureka thrust, a wide zone of mylonitization. The Crooked amphibolite and the overlying rocks of Quesnel Terrane are structurally coupled and emplaced tectonically onto Barkerville Terrane.

9.1.3 Barkerville Terrane

The Barkerville Terrane is made up of the Snowshoe Group and Quesnel Lake gneiss. The Snowshoe rocks are Upper Proterozoic to Upper Devonian metasediments, considered correlative in age with Eagle Bay rocks of the Kootenay Terrane to the south. The Snowshoe rocks are dominated by varieties of grit, quartzite, pelite, limestone and volcaniclastic rocks. The stratigraphic sequence is not well understood. The region was deformed by intense, complex, in part isoclinal folding and overturning. Locally, strong shear deformation produced mylonitic textures. The Quesnel Lake gneiss

is a Devonian to Mississippian intrusive unit varying in composition from diorite to granite to syenite. It is generally coarse grained, leucocratic, often with megacrysts of potassium feldspar. The main body of gneiss is 30 km long by 3 km wide and is elongated parallel to the eastern border of the Intermontane belt. Its contacts are in part concordant with, and in part perpendicular to, metamorphic layering.

The contact between the Barkerville Terrane and Cariboo Terrane to the east is the Pleasant Valley Thrust. The Barkerville and Cariboo Terranes were juxtaposed prior to emplacement of the Slide Mountain Terrane which was thrust over both of them. The northeastern third of the Barkerville Terrane is the main zone of economic interest in the Cariboo district. Struik described it as "gold-enriched", because it contains the historic Wells and Barkerville mines and the Cariboo Hudson deposit, approximately 40 km and 20 km northwest of the project area, respectively.

9.1.4 Cariboo Terrane

The northeastern part of Barker Minerals' 'Peripheral' claim group is underlain by Precambrian to Permo-Triassic marine peri-cratonic sedimentary strata of the Cariboo terrane. The Cariboo Terrane consists mainly of limestone and dolomite with lesser siliceous, clastic, sedimentary rocks and argillite. Some geologists believe that the Cariboo Terrane is a shallow, near-shore facies and the Barkerville is a deeper, offshore facies of the same erosion-deposition system. No rifting is suspected between the Cariboo Terrane and the North American continent, in contrast to that between the Barkerville Terrane and the North American continent. Lithologies within the Cariboo Terrane correlate well with parts of the Cassiar Platform and Selwyn Basin of Yukon and northern British Columbia.

The Cariboo and Barkerville Terranes are separated by the regional Pleasant Valley thrust fault, which dips moderately to steeply northeast. Struik (1988) states the Cariboo block was thrust from the east over the Barkerville block along a strike length of over 100 km. The Cariboo Terrane was cut by the Jurassic-Cretaceous Little River stock, a medium-grained granodiorite grading to quartz monzonite. Some of the carbonate layers in the lowest part of the Cariboo terrane (or upper part of the Barkerville Terrane) are enriched in zinc and lead. Since the 1970's, preliminary exploration on stratiform Zn-Pb targets has been conducted in this area.

9.1.5 Glaciation and glacial deposits

The last glacial stage that affected the Quesnel Highland, the Fraser glaciation, began 30,000 years ago. Much of this ice had melted by 10,000 years ago, but small remnants are preserved high in the alpine areas of the Cariboo Mountains. At lower elevations, glaciers of this age scoured the debris left by preceding ice advances, almost completely destroying them, leaving a chaotic assemblage of unsorted till, moraine and drift, with lenses of gravel and sand that had been roughly sorted by melt water and rivers, leaving behind beds of silt and clay that were stratified by settlement in ice-dammed lakes. In the Cariboo area, the debris covers bedrock in valleys below 1,700 m, leaving typical glacial features such as U-shaped valleys, ice-sculpted drumlins, moraine terraces and glacier and river benches. On the Barker Minerals properties, glacial deposits range from one to a few tens of metres thick. Some glacial till deposits are overlain by well-bedded glaciolacustrine clay and silt deposits up to a few tens of metres thick.

In much of the Cariboo district, a layer of distinctive, hard, compact, semi-rigid blue clay sits either on or slightly above bedrock and acts as "false" bedrock. It was formed from glacial drift left behind by the last ice advance prior to the Fraser glaciation and was compacted by the weight of the Fraser stage ice. In the placer-gold areas of the Cariboo, large amounts of gold were recovered from gravel resting on this clay. In places the clay layer was penetrated by the placer miners to reach richer "pay streaks" on true bedrock below.

9.2 Local Geology

9.2.1 Spanish Creek Property

The Wells & Barkerville areas just north from the Spanish Creek project boast Historic Mines in the greenschist facies, defined as mid-Jurassic deformation & metamorphism.

The Spanish Creek property is host to hundreds of meters of gold/base metal quartz veins in ultramafic assemblage rocks just 14km NE from "Spanish Mtn. Gold Ltd." on Spanish Mtn. & "Barker Minerals Ltd." on Black Bear Mountain. Little is known at this time on the local geology as up until recently access was limited and glacial overburden masked the bedrock in the lower portions of the valleys where most early access roads were located hindering exploration in the headwater areas of Black Bear, Sellers and Spanish Creeks.

It is believed that the Black Bear and Spanish Creek areas are part of a regional thrust equivalent to the Eureka Thrust in the Yukon which is host to many economic gold deposits. The area is located around an ancient continental margin setting with accreted exotic terranes which have been thrust over top of the older volcanic and intrusive rocks of the Goose Range.

The Likely/Spanish Creek district is host to old and new mines (Mt. Polley Mine, Barkerville Mines Ltd. - current producers), and is currently completely staked by Major companies, speculators and junior mining companies.

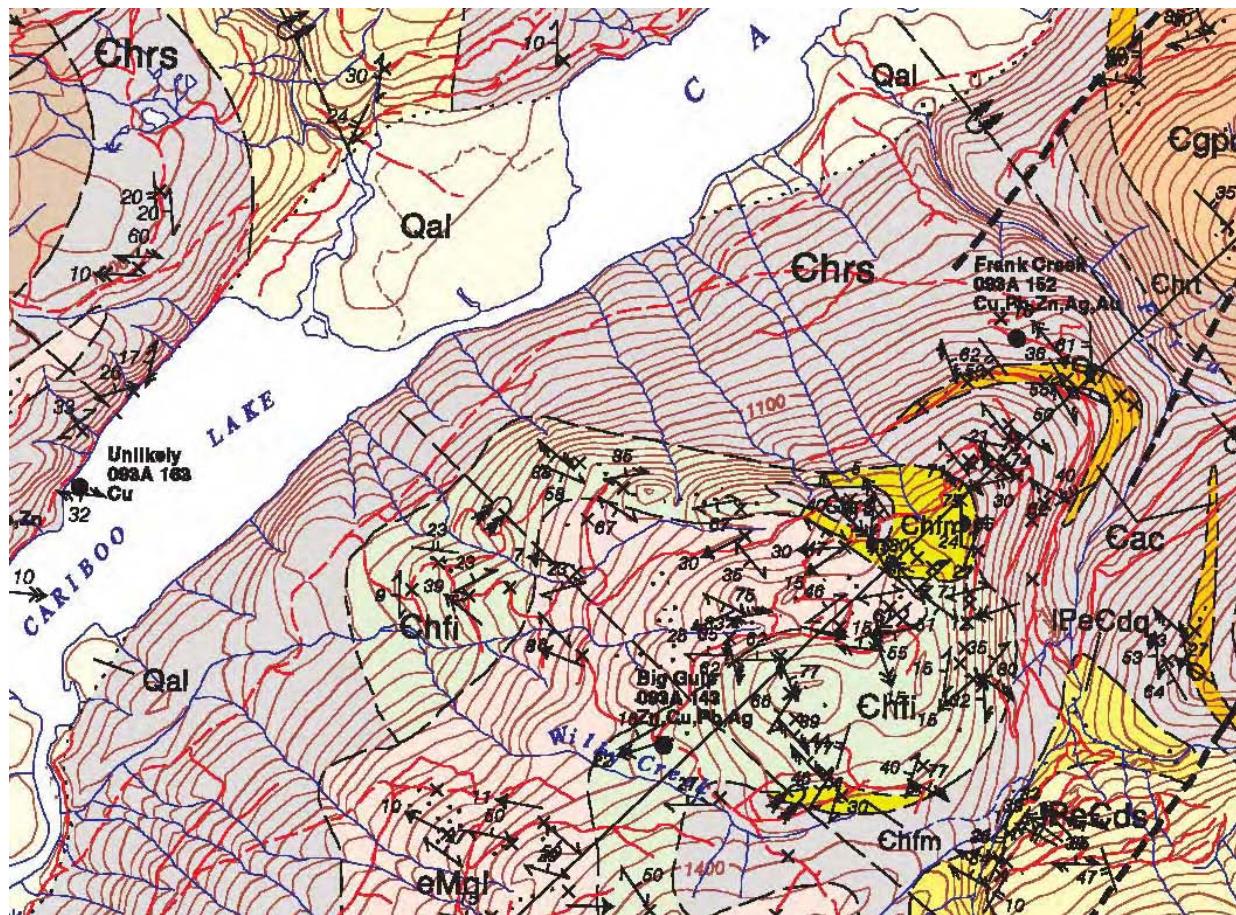

Figure No. 7 - Geology of Frank Creek area, after Ferri & O'Brien, 2003. Chrs = Harveys Ridge phyllite and sedimentary rocks, Cac = Agnes sedimentary rocks, Chfm and Chfi = Frank Creek metavolcanics, eMql = Quesnel Lake granite and granodiorite. The Minfile showings Frank Creek, Big Gulp and Unlikely are all owned by Barker Minerals Ltd. The black spot indicating the Frank Creek Minfile is at the location of the Discovery Trench. Cariboo Lake is approximately 1 km across

in a NW-SE direction. Overturned anticlines and synclines are indicated. Overturned lava pillows with tops toward the east are indicated in unit Chfm.

10.0 CONCLUSIONS

10.1 Spanish Creek Property

The 2013 soil study confirmed a precious and base metal environment near where high grade float has been discovered in past programs in shallow overburden. The rock sample XRF geochemistry reported elevated values in Fe, Cu, Zn, Sb, Hg, Se, Te and Sn. The soils were elevated in similar mineralogy of Fe, Cu, Zn, Sb, As, Hg, Se, Te and Sn. This mineralogical pattern is very similar to the mineralogy of the massive sulphide boulder found in 2011 suggesting that the boulder is from a nearby local source.

The 60cm x 50cm angular high grade massive sulphide float boulder was found near bedrock during 2011 prospecting. Two separate representative samples of the boulder assayed 15.3% and 17.6% copper respectively; 6.2% and 7.0% zinc respectively; .17% and .17% lead respectively; 158g/t and 183 g/t silver respectively; 11.7 ppm and 5.6 ppm gold respectively by ICP-MS; and 9.6 g/t gold and .14 g/t gold respectively by fire assay.

The high grade massive sulphide boulder at Spanish Creek was found near bedrock and is located 200 metres down slope from a strong multi-element copper/zinc/lead/silver and gold soil anomaly identified by the previous property owners while exploring for gold vein targets. The massive sulphide boulder was located near prominent discreet GSC airborne magnetic and conductor anomalies.

A property wide program of soil and rock sampling should be followed up by geological mapping and geophysical surveys to define targets for follow up exploration programs. IP surveys are recommended on the new soil grid in order to define targets for follow up drilling.

The results of the XRF study demonstrate that favorable mineralogy exists in the soils, which together with the fact overburden is of a minimal thickness, are indicative of a precious and base metal environment being present nearby. All roads and outcrops nearby should be sampled wherever possible in order to identify target areas for more detailed follow up programs.

Gold was semi-quantitatively identified in 15 soil samples by the XRF in the range of 6 ppm to 9 ppm. Gold was also semi-quantitatively identified by XRF in 4 of the 7 rock outcrop grab samples with readings between 6.0 ppm and 13.0 ppm Au.

Accurate gold values would need to be determined by accredited lab fire assay process taking into consideration the high iron and sulphur content. Roasting processes and proper fluxes should be determined in advance in order to produce reliable, repeatable fire assay gold results.

11.0 RECOMMENDATIONS

11.1 Spanish Creek Property

The project will be evaluated further in the spring of 2013 in order to determine the extent and grades of the copper stained bedrock areas and to determine the location of the high grade massive sulphide boulder discovered below the multi-element soil anomaly. A number of GSC airborne magnetic and EM anomalies will be evaluated in 2013 especially one which is upslope from the high grade boulder discovered in 2011. Grids will be planned for further soil sampling which is expected to identify drill targets for follow up. Historic work has identified veins which could immediately be drill tested along strike and to depth.

APPENDIX A

Glossary of Technical Terms and Abbreviations

Glossary of Technical Terms and Abbreviations

Anomalous	Chemical and mineralogical changes and higher than typical background values in elements in a rock resulting from reaction with hydrothermal fluids or increase in pressure or temperature.
Anomaly	The geographical area corresponding to anomalous geochemical or geophysical values.
Argentiferous	Containing silver.
Background	The typical concentration of an element or geophysical response in an area, generally referring to values below some threshold level, above which values are designated as anomalous.
BCGS	British Columbia Geological Survey.
B.C. MEMPR	British Columbia Ministry of Energy Mines and Petroleum Resources.
cm	Centimetre.
Cratonic	Pertaining to a craton, an old part of the continental crust, generally making up the interior portion of a continent such as North America.
DCIP	An electrical method which uses the injection of current and the measurement of voltage and its rate of decay to determine the subsurface resistivity and chargeability.
DDH	Diamond drill hole.
Diatreme	A breccia-filled volcanic pipe that was formed by a gaseous intrusion.
EM	Electromagnetic.
Float	Loose rocks or boulders; the location of the bedrock source is not known.
GBC	Geoscience BC.
GSC	Geological Survey of Canada
Grab sample	A sample of a single rock or selected rock chips collected from within a restricted area of interest.
g/t	Grams per tonne (metric tonne). 34.29 g/t (metric tonnes) = 1.00 oz/T (short tons)
Ha	Hectare - an area totalling 10,000 square metres, e.g., an area 100 metres by 100 metres.
HLEM	Horizontal loop electromagnetic.

ICP	Inductively coupled plasma.
IP	Induced polarization.
km	Kilometre.
lb.	Pound.
Leucocratic	Light-coloured.
m	Metre.
Max-min	An HLEM technique to test for resistivity and conductivity of rocks.
MT	Magnetotelluric. A electrical method that uses natural variations in the Earth's magnetic field to induce electric current in the ground to determine the subsurface resistivity.
NNW-SSE	North northwest – South southeast
NW-SE	Northwest - southeast.
N-S	North-South.
oz.	Ounce.
oz/T	ounces per ton (Imperial measurement). 34.29 g/t (metric tonnes) = 1.00 oz/T (short tons).
oz/st	ounces per short ton (Imperial measurement, same as oz/T). 34.29 g/t (metric tonnes) = 1.00 oz/st (short tons).
ppb	Parts per billion.
ppm	Parts per million (1 ppm = 1,000 ppb = 1 g/t).
Protolith	The original rock before it was metamorphosed.
QUEST	Quesnella Exploration Strategy.
TDEM	Time Domain EM.
Tholeiitic	A type of basalt. The most common volcanic rocks on Earth, produced by submarine volcanism at mid-ocean ridges and make up much of the ocean crust. Chemically, these basalts have been described as subalkaline, that is, they contain less (Na_2O plus K_2O) at similar SiO_2 than alkali basalt.
TRIM	Terrain Resource Information Management.
VLF	Very low frequency.

VLF-EM Very low frequency electromagnetic.

VMS Volcanic-related massive sulphide.

Wild, C.J., (2002b), Preliminary Report on Diamond Drilling and Trenching for the Frank Creek & Ace Projects, June 26, 2002. (as Appendix 3 in Assessment Report 27125 Doyle, L.E.).

Woodsworth, B., Report on the Geology and Proposal for Development of [the Big 2 and Big 3 Claims], Blackbear Creek Area, October 1983. (Assessment Report 12566).

Yorston, R., Assessment Report -Geology and Drilling Report on the MASS Claim, December 1996. (Assessment Report 24662).

Appendix G

Statement of Qualifications

Statement of Qualifications:

I Louis E. Doyle, President/CEO/Prospector have 18 years experience managing exploration programs in the Cariboo Mining District of British Columbia, Canada.

Appendix H

Spanish Creek Project – Statement of Expenditures

Barker Minerals Ltd.

Work was completed between August 31, 2012 to April 15, 2013

Geological - Rock Sampling & Prospecting on the Spanish Creek Property

Geological

Jack Logan - Rock & soil collection

3 days @ \$400.00/day wages	\$ 1,200.00
3 days @ \$125.00/day room & board	\$ 375.00
3 days @ \$126.00/day vehicle & gas	\$ 375.00

Brian Hall - Rock & soil collection

3 days @ \$250.00/day wages	\$ 750.00
3 days @ \$125.00/day room & board	\$ 375.00

Jack Logan - Sample preparation (drying, seiving & pulverizing)

4 days @ \$400.00/day wages	\$ 1,600.00
4 days @ \$125.00/day room & board	\$ 500.00

Aaron Doyle - Sample preparation (drying, seiving & pulverizing)

1 day @ \$400.00/day wages	\$ 400.00
1 day @ \$125.00/day room & board	\$ 125.00

\$ 5,700.00

Geochemical

Jack Logan - XRF analysis

2 days @ \$400.00/day wages	\$ 800.00
2 days @ \$125.00/day room & board	\$ 250.00

XRF Analysis

7 rock samples @ \$10.00 / reading x 4 readings	\$ 280.00
76 soil samples @ \$10.00 / reading x 4 readings	\$ 3,040.00

\$ 4,370.00

Miscellaneous Expenditures

Aaron Doyle - Camp Manager

3 days @ \$100.00/day wages	\$ 300.00
-----------------------------	-----------

Quad rental

3 days @ \$25.00/day	\$ 75.00
----------------------	----------

Hand held communications (Hand held radios)

3 days @ \$25.00/day x 2	\$ 150.00
--------------------------	-----------

Total Misc. Expenditures **\$ 525.00**

Barker Minerals Ltd.

Work was completed between August 31, 2012 to April 15, 2013

Geological - Rock Sampling & Prospecting on the Spanish Creek Property

Mobe & Demoboe

Brian Hall

1 day @ \$125.00/day wages	\$ 125.00
1 day @ \$125.00/day vehicle & gas	\$ 125.00

Jack Logan

2 days @ \$200.00/day wages	\$ 400.00
Total Mobe & Demoboe	\$ 650.00

Planning, Supervising & Report Preparation

Louis Doyle

3 days @ \$600.00/day wages	\$ 1,800.00
	\$ 1,800.00

Map Drafting

Aaron Doyle

2 days @ \$400.00/day wages	\$ 800.00
	\$ 800.00

Data Preparation

Jack Logan - XRF analysis

1 day @ \$400.00/day wages	\$ 400.00
1 day @ \$125.00/day room & board	\$ 125.00
	\$ 525.00

Total Geological Expenditures

\$ 5,700.00

Total Geochemical Expenditures

\$ 4,370.00

Total Misc. Expenditures - Supplies, etc.

\$ 525.00

Total Mobe & Demoboe

\$ 650.00

Total Planning, Supervising & Report Preparation

\$ 1,800.00

Total Map Drafting

\$ 800.00

Total Data Preparation

\$ 525.00

Total Expenditures

\$ 14,370.00
