REPORT KEYWORDS (lithology, age, stratigraphy, structure, alteration, mineralization, size and attitude. **Do not use abbreviations or codes**)Base and precious metal (vein and stratabound) mineralization is hosted by Mesoproterozoic Belt-Purcell Supergroup sediments, mainly the Creston and Kitchener Fm. Paleo-proterozoic faults appear to be major fluid pathways.

## INTRODUCTION

The Silver Fox is a sediment hosted base and precious metal target (Cu-Pb-Z-Ag). The property covers lithologies within the Middle Proterozoic Belt-Purcell basin that are favourable for Sedex/Red-Bed type mineralization. Recent work on the property has outlined specific geological features and related geochemical anomalies that are indicative of a large syn/diagenetic mineralizing system.

During the field season of 2012 soil and rock sampling was conducted in the Ward Creek area of the property where an area of anomalous copper and lead with some coincident silver values was partially defined. The area is underlain by favourable host rocks and is located near the hinge zone of a shallow north plunging open anticline.

## LOCATION AND ACCESS

The property is located 23 kilometres south of Cranbrook, BC. The property is dissected by a large network of logging roads and can be accessed from numerous points including the Gold Creek FSR, Sundown Creek FSR, and Teepee Creek FSR. A large network of forestry roads provides excellent access to much of the property.

## PROPERTY

The property is wholly owned by Darlene Lavoie, Sara Kennedy, and Sean Kennedy all of Kimberley, BC. Currently the property is funded under a first right of refusal to Kootenay Silver Inc.

## PHYSIOGRAPHY

The area is typified by forested, rounded glaciated mountains. Bedrock exposure is quite limited at less than 5%. Elevation on the property does not exceed 2200 metres with the highest point being at Yahk Mountain. Elevation lows on the property approach 1100 metres. The area is primarily forested with lodgepole pine and douglas fir at lower elevations with spruce and balsam fir at higher ones, small patches of cedar are found in wetter areas, and larch is ubiquitous. Underbrush is typically comprised of rhododendron, mountain alder, kinikinik and some small patches of dwarf huckleberry. The area has seen extensive clear-cut logging and is in various stages of regeneration. The field season can be expected to last from early April, at lower elevations, to late October/mid November with the entire property being snow free from early June to late October.

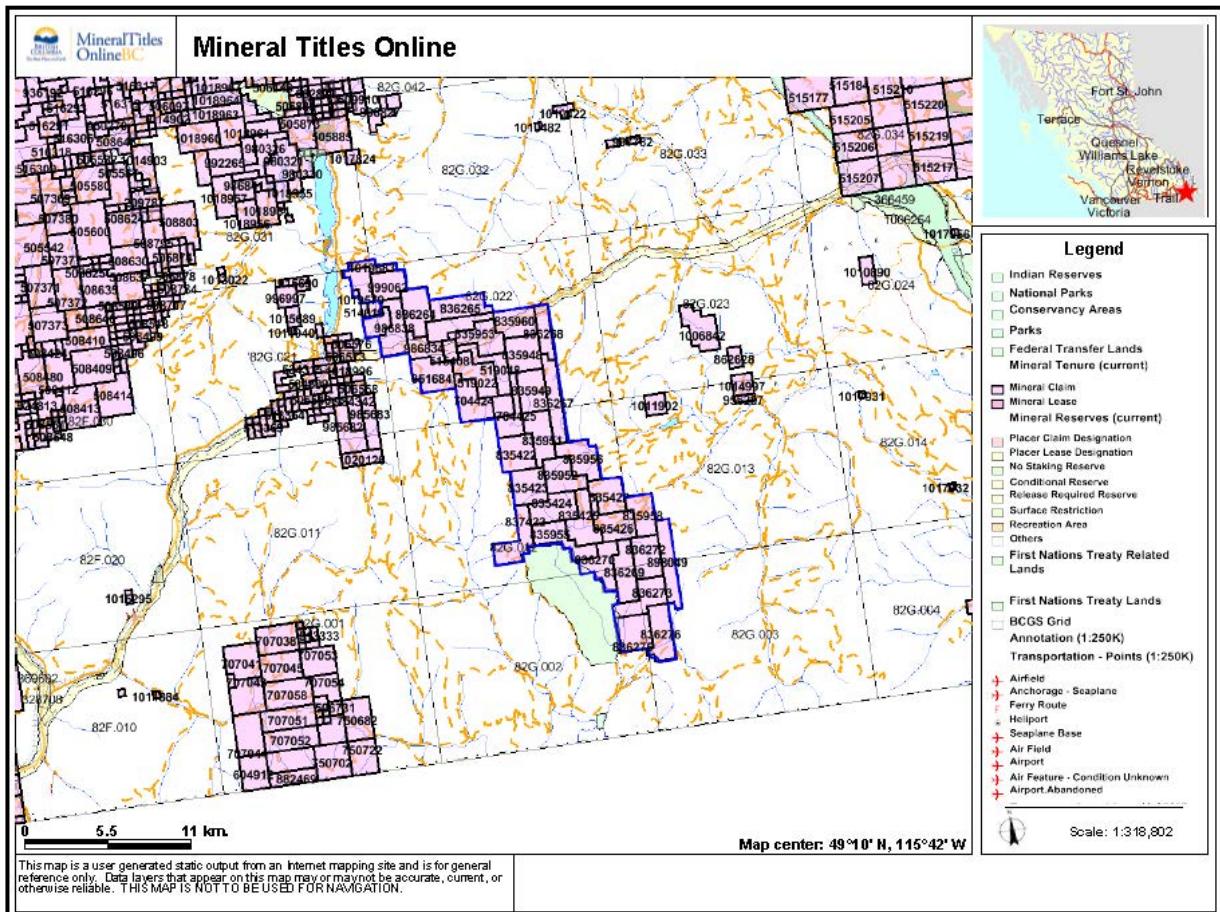

Figure 1. Property outlined in blue.

## HISTORY

The area has a very limited exploration history. The bulk of work conducted on the property was on the Silver Pipe and Sarah-Jean Veins (Jake/Tee/KRL) veins. These veins occur along trend (SE) from the past producing St. Eugene camp and are typified by quartz veins with breccia fills of goethite, magnetite, hematite, and manganese wad. At both locations veins are oriented east west within the trend of the mineralized corridor.

The Sarah-Jean Veins contain high grade Pb, Zn, Ag and multigram gold associated with iron wad material as well as strong pyromorphite and cerussite mineralization. The Sarah-Jean Veins are hosted within Middle Creston Formation stratigraphy. At the Sarah-Jean the Middle Creston is a sequence of blocky bleached, sericitized, carbonatized, and manganese stained siltstone and argillite with intervals of clean medium to coarse grained quartzites. Alteration roll fronts are quite intense adjacent to the mineralized veins within the quartzite units which develop bullseye patterns and flooding of brown, purple, pink, and green colouration that is associated with chlorite, silica, hematite, carbonate, sericite, magnetite, and goethite alteration. Mineralization is associated with two intrusive bodies, a strongly

altered gabbro-diorite and a syenite(?) dyke. The Sarah Jean Veins were discovered in 1989 by C. Kennedy (originally named the Jake) and trenched and drilled in the early 1990s. The area was staked by the Kennedy Group in the early part of the 2000s and since has undergone more intensive rock geochemistry and prospecting surveys as well as geological mapping.

The Silver Pipe was discovered in the 1960s by E. Pinchbeck and D. Pighin. Limonite wad veins and breccias at the Silver Pipe showing are very similar in character to those at the Sarah-Jean. However no primary sulphide or lead carbonates/phosphates have been discovered at the Silver Pipe, all vein and breccia occurrences are comprised of oxide material with highly altered sediment clasts. Numerous historic cat trenches cut the vein system along its east west trend.

Recent work in 2010 identified a number of stratabound disseminated Cu-Ag occurrences hosted in Creston Formation stratigraphy. Presently work from 2010 has included geological mapping, stream geochemistry, geophysical interpretation, rock geochemistry, biogeochemistry, ground based geophysics, and soil sampling.

#### PROPERTY GEOLOGY

The area is underlain by Mesoproterozoic Belt-Purcell Supergroup strata. Sediments were deposited in an intracontinental rift-fill sequence which hosts a number of world-class deposits including Butte, Sullivan, the Western Montana Copper Sulphide Belt, and the Coeur d'Alene Camp.

The lowest stratigraphic unit on the property is the Upper Aldridge Formation which is comprised dominantly of thin bedded black argillite with minor quartzite and siltstone. The Upper Aldridge is overlain by shallower water quartzite, siltstone and argillite of the Creston Formation. The Creston is overlain by limey siltstones, dolomite, and limestone of the Kitchener Formation which is in turn overlain by thinner bedded siltstones of the Van Creek Formation. Nicol Creek Formation which is comprised of amygdaloidal basalt, tuff, pyroclastics, and minor siltstone overlies the Van Creek and can be found along the eastern flanks of the property.

Intrusive rocks on the property are comprised of Moyie gabbro-diorite sills that are coeval with sedimentation and occur as both sills and dykes dominantly in the Aldridge Formations. Later diorite dykes and sills intrude the upper stratigraphy and are likely related to the Nicol Creek volcanics. These diorites commonly skarn the more carbonate rich upper stratigraphy on the property. A small body of microcline rich intrusive (syenite?) is located adjacent to the Sarah Jean Vein.

Structurally the area is located along the eastern limb of the Moyie Anticline, a regionally significant shallow north plunging open fold structure which cores the Purcell Supergroup. A series of open anti-synclinal features flank the Moyie Anticline within the property boundaries. A series of north-south trending block faults and thrust faults are mapped on the southern portion of the property near the international border. The property is located along an apparent paleo-Precambrian fault system (graben?) that extends southeast from the St. Eugene mine area. The structural environment is delineated by gabbro-diorite dykes, cross-cutting fragmentals within the Aldridge Formation, and Precambrian massive sulphide vein mineralization. Recent work utilizing historic seismic data by F. Cook

(2011) has outlined a structural corridor that underlies the property at depth. Within the property various thickness changes within the stratigraphy were noted through recon mapping and likely reflect growth faults that are hidden by overburden.

#### ROCK GEOCHEMISTRY

11 rock samples were collected and analyzed for a 36 element ICP by Acme Labs. Analysis, descriptions, locations, and maps with copper plotted in ppm are included in the Appendix.

All the samples were collected from the Ward Creek area in the southern portion of the property. Here favourable upper Middle Creston Fm geology, including thick sequences of clean quartzitic units are altered extensively with carbonate, chlorite, and sericite. Local areas of sulphide mineralization, including pyrite, chalcopyrite, and galena are hosted within the larger alteration zone. The area is located near the hinge of a shallow north plunging open anticline. The highest copper value returned was 4891 ppm, this sample also contained 5 ppm Ag. Elevated values for lead were also returned from some of the higher copper bearing samples. All the samples except for one were collected of disseminated sulphide mineralization in quartzitic beds. The samples that were collected in the northern portion of the map area were taken from sandy beds and lenses within the Upper Creston Fm.

#### SOIL GEOCHEMISTRY

96 soil samples were collected and analyzed for a 36 element ICP by Acme Labs. Analysis, descriptions, locations, and maps with copper and lead plotted in ppm are included in the Appendix.

The grid was completed in the Ward Creek area after prospecting identified a large zone of favourable lithologies and alteration/mineralization as discussed above. The grid outlined a core area approximately 800 meters x 200 meters which shows anomalous values for copper. Within the anomalous area for copper a few anomalous lead values were also returned. The soil geochemistry appears to delineate and expand the mineralization that was observed in rocks. Silver values were low within the grid area, possibly indicating that the area is distal to a stronger zone of mineralization. One sample containing elevated copper and lead was returned at the extreme southern end of the grid.

#### CONCLUSIONS AND RECOMMENDATIONS

A program of rock and soil geochemistry was conducted in the Ward Creek area of the Silver Fox property in 2012. The program was successful in delineating an area of anomalous alteration and mineralization hosted within lithologies that are considered favourable for hosting disseminated copper-silver mineralization, similar to the Revett deposits located in the Belt in Montana.

Additional field work is recommended. Prospecting and rock geochemistry should be expanded to the south. Geophysics should be employed to delineate structure that is masked by overburden. These structures may be conduits for the large alteration and low-grade Cu-Pb-Ag mineralization seen at surface.

**STATEMENT OF QUALIFICATIONS**

I, Sean Kennedy, certify that:

1. I am an independent prospector residing at 107 6<sup>th</sup> Ave, Kimberley, BC.
2. I have been actively prospecting in the throughout BC, Nevada, and Mexico for the past 15 years
3. I have been employed as a professional prospector by junior mineral exploration companies.
4. I own and maintain mineral claims in BC.

APPENDIX

| <b>Sample</b> | <b>UTM E</b> | <b>UTM N</b> | <b>Description</b>  |

## CERTIFICATE OF ANALYSIS

VAN12004448.1

### CLIENT JOB INFORMATION

Project: SILVER FOX  
Shipment ID:  
P.O. Number  
Number of Samples: 11

### SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

| Method Code | Number of Samples | Code Description                                  | Test Wgt (g) | Report Status | Lab |
|-------------|-------------------|---|--------------|---------------|-----|
| R200-250    | 11                | Crush, split and pulverize 250 g rock to 200 mesh |              |               | VAN |
| 1DX3        | 11                | 1:1:1 Aqua Regia digestion ICP-MS analysis        | 30           | Completed     | VAN |

### SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days  
DISP-RJT Dispose of Reject After 90 days

### ADDITIONAL COMMENTS

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Kootenay Silver Inc.  
Suite 920 - 1055 W. Hastings St.  
Vancouver BC V6E 2E9  
Canada

CC:

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only. All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.  
\*\* asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

## CERTIFICATE OF ANALYSIS

VAN13000382.1

### CLIENT JOB INFORMATION

Project: SILVER FOX  
Shipment ID:  
P.O. Number  
Number of Samples: 96

### SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

| Method Code | Number of Samples | Code Description                           | Test Wgt (g) | Report Status | Lab |
|-------------|-------------------|--|--------------|---------------|-----|
| Dry at 60C  | 96                | Dry at 60C                                 |              |               | VAN |
| SS80        | 96                | Dry at 60C sieve 100g to -80 mesh          |              |               | VAN |
| IDX3        | 96                | 1:1:1 Aqua Regia digestion ICP-MS analysis | 30           | Completed     | VAN |

### SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days  
DISP-RJT-SOIL Immediate Disposal of Soil Reject

### ADDITIONAL COMMENTS

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Kootenay Silver Inc.
