ASSESSMENT REPORT TITLE PAGE AND SUMMARY

TITLE OF REPORT: **Diamond Drilling, Geological Mapping, Trenching, Prospecting and Physical Work Assessment Report from the Providence Target on the Black Bear and Frank Creek Properties, Cariboo Mining Division, British Columbia**

TOTAL COST: **$873,721.00**

AUTHOR(S): **Jack Logan, Rein Turna and Louis Doyle**
SIGNATURE(S): **"SIGNED"**
NOTICE OF WORK PERMIT NUMBER(S)/DATE(S): **MX-10-155 & MX-10-228**
STATEMENT OF WORK EVENT NUMBER(S)/DATE(S): **5459587, 5459590, 5470599, 5470600, 5480890 & 5480892**
December 15, 2012 to December 15, 2013

YEAR OF WORK: **2012- 2013**
PROPERTY NAME: **Frank Creek and Black Bear**
CLAIM NAME(S) (on which work was done)
504419, 514,272 & 514364

COMMODITIES SOUGHT: **Copper, Lead, Zinc, Silver & Gold**
MINERAL INVENTORY MINFILE NUMBER(S),IF KNOWN: **N/K**
MINING DIVISION: **Cariboo**
BCGS: **93A/11 & 93A/14**
LATITUDE **52.75°**
LONGITUDE **121.36°**
UTM Zone **10** EASTING **610655** NORTHING **5833000**

OWNER(S): **Barker Minerals Ltd.**
MAILING ADDRESS: **8384 Toombs Drive, Prince George BC, V2K 5A3**

OPERATOR(S) [who paid for the work]: **Barker Minerals Ltd.**
MAILING ADDRESS: **8384 Toombs Drive, Prince George BC, V2K 5A3**

REPORT KEYWORDS (lithology, age, stratigraphy, structure, alteration, mineralization, size and attitude **do not use abbreviations or codes**)
Barkerville Terrane, Silver & Gold

Appendices

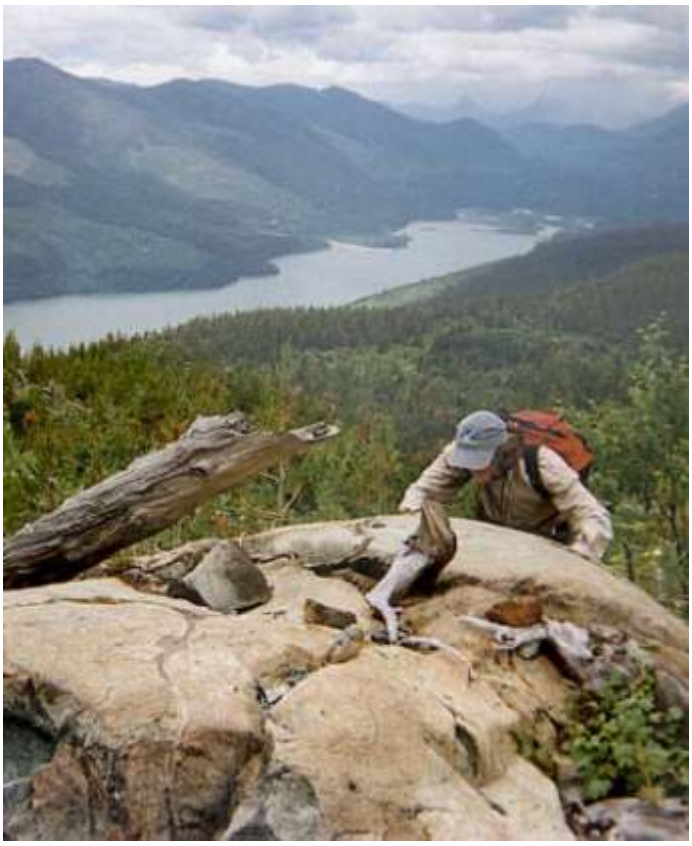

Plate 1: Pillowed mafic volcanic outcrop on mountain top approximately 1.0 km southwest of the Frank Creek Discovery Showing. View is toward northeast, with F1 and F9 target areas in the centre of the photograph. The north end of Cariboo Lake is visible. The rounded pillow tops are oriented roughly eastward.

Plate 2: Pillows.

1.0 Summary

Work performed in 2012 and 2013 on Barker Minerals Ltd.'s main contiguous group of mineral properties was concentrated in the Black Bear and Frank Creek project areas.

1.1 Black Bear

During 2012, at the Black Bear Project, the final diamond drill hole for 2012 (not included in the October 4th, 2012 Assessment Report 33309) was prepared and drilled between October 12th and December 1st, 2012 on the Providence target. Analytical results for drill hole BB-2012-07, also not included in the previous assessment report, are included in the appendix.

1.2 Frank Creek

At the Frank Creek Project, there were a total of six diamond drill holes prepared and drilled totalling 512.12m in depth between June 1st and November 7th 2013. Analytical results were attained for two holes. A total of 19 test pits were excavated in the month of October 2013.

2.0 Introduction

This report describes assessment work performed on Barker Minerals Ltd. Black Bear and Frank Creek mineral properties between October 2012 and December 2013.

Further diamond drilling, preparation, and analysis was completed at the Black Bear property between October and December of 2012.

Road clearing, diamond drilling, preparation, test pits, and analysis were completed at the Frank Creek property between June and December of 2013. Snowfall in November ceased the ability for further drilling and fieldwork for the remainder of the exploration season.

Technical abbreviations are used in this report and some of these abbreviations are defined in Table 1.

Table 1: Technical Abbreviations

Ag	Silver	DDH	Diamond Drill Hole	ICP-MS	Inductively Coupled Plasma Mass Spectrometry
As	Arsenic	TP	Test Pit	ICP-OES	Inductively Coupled Plasma Optical Emission Spectrometry
Au	Gold	TR	Trench	XRF	X-Ray Fluorescence
Ba	Barium	HLEM	Horizontal Loop Electromagnetic	BB	Black Bear
Co	Cobalt	IP	Induced Polarization	BBE	Black Bear East
Cu	Copper	VLF-EM	Very Low Frequency Electromagnetic	FC	Frank Creek
Cr	Chrome	Musc	Muscovite	ppm	Parts Per Million
Fe	Iron	Qtz	Quartz	ppb	Parts Per Billion
Mn	Manganese	Cpy	Chalcopyrite		
Pb	Lead	Gal	Galena		
Sb	Antimony	Py	Pyrite		
Zn	Zinc	Sph	Sphalerite		

3.0 PROPERTY DESCRIPTION and LOCATION

The Main Property's location in British Columbia is indicated in Figure 1**,** and the mineral claims are outlined in Figure 2.

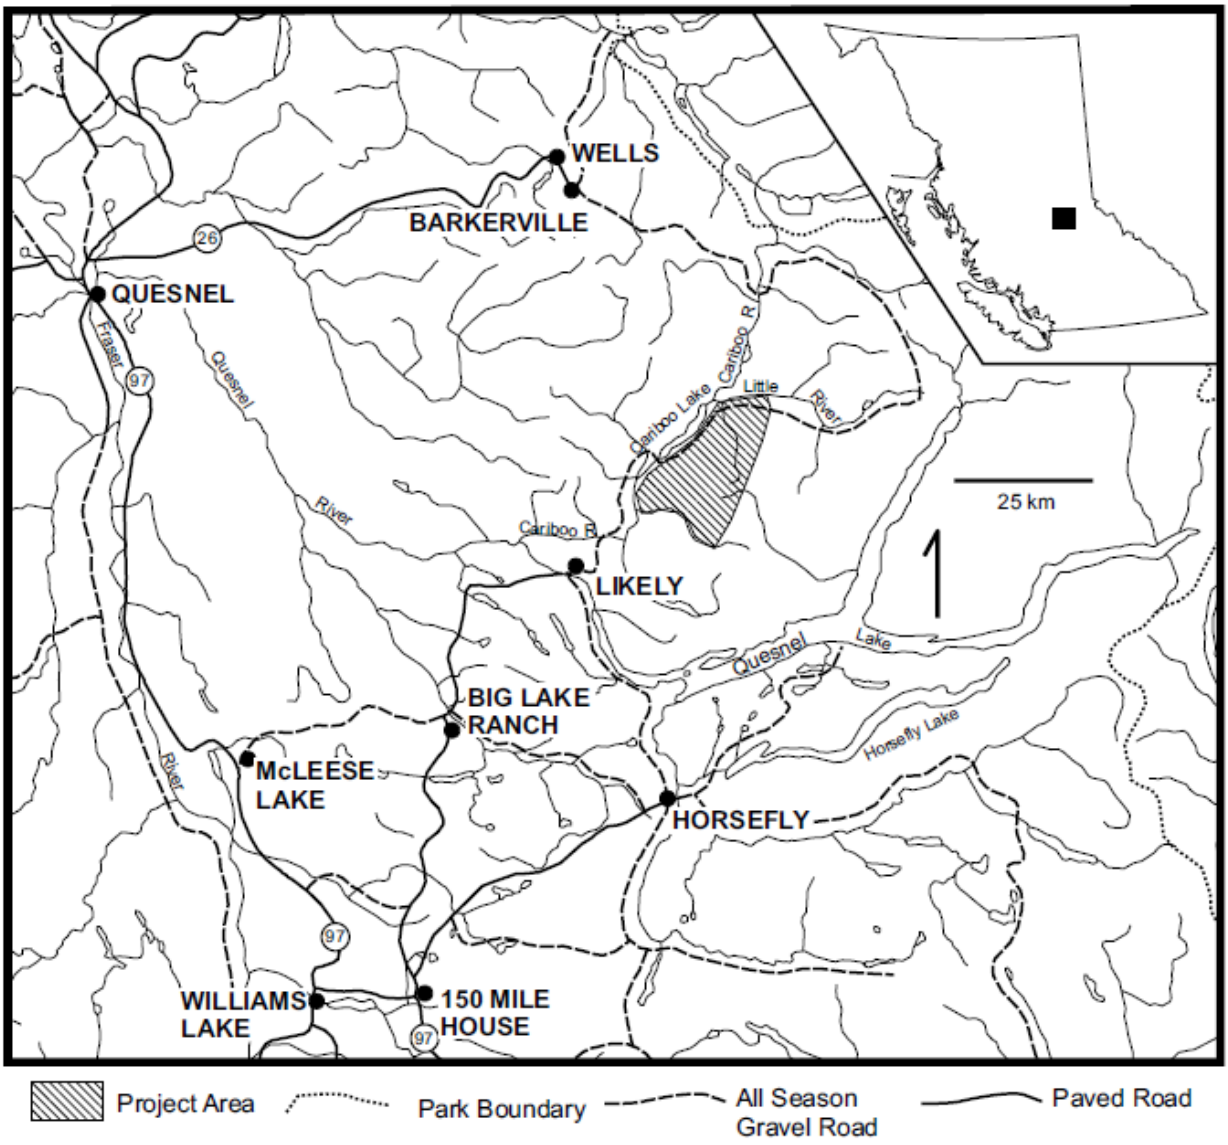

Figure 1: Main property Location in British Columbia, Canada; showing main access routes and drainages (from Ferri, 2001)

4.0 Barker Minerals Ltd. Mineral Claims

The mineral claims comprising the property are located generally in the area between Quesnel and Cariboo Lakes of the Cariboo Mining Division in British Columbia and are 100% owned by Barker Minerals Ltd. of Prince George, B.C. Barker Minerals Ltd. mineral claims are further detailed in Appendix 1.

The Property is approximately 10 km north of the settlement of Likely and 90 km northeast the City of Williams Lake. The City of Prince George is 155 km to the north.

The geographic coordinates to the Black Bear property are:
52.75° North Latitude and 121.36° West Longitude or
607000 E and 5833000 N UTM (Nad83 zone 10)
The relevant maps are:
N.T.S. Map No. 93A/11 and 93A/14.

The geographic coordinates of the Frank Creek property are:
52.75° North Latitude and 121.36° West Longitude or
610655 E and 5845640 N UTM (NAD83 zone 10)
The relevant maps are:
N.T.S. Map No. 93A/11 and 93A/14.

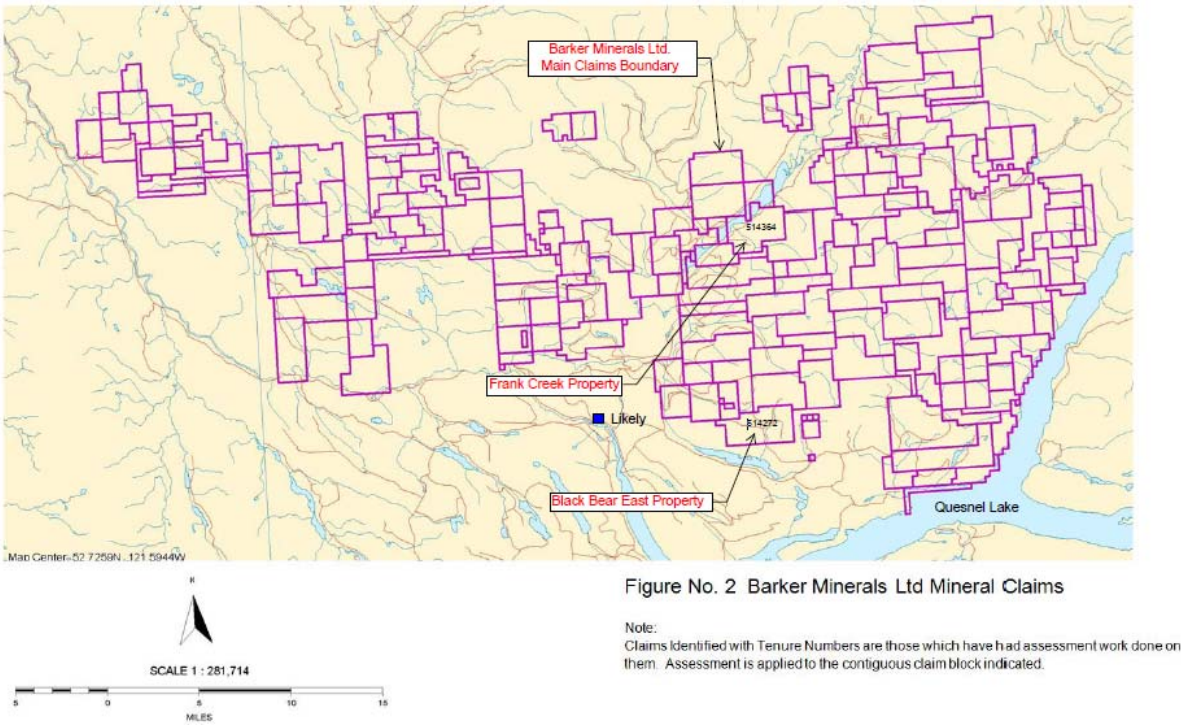

Figure 2: Barker Minerals Ltd. Mineral Claims with locations of Black Bear East and Frank Creek

5.0 PHYSIOGRAPHY and ACCESSIBILITY

The following description in *italics*, is after McKinley, 2004:

The property is situated in the central part of the Quesnel Highland between the eastern edge of the Interior Plateau and the western foothills of the Columbia Mountains. This area contains rounded mountains that are transitional between the rolling plateaus to the west and the rugged Cariboo Mountains to the east. Pleistocene and Recent ice sheets flowed away from the high mountains to the east over these plateaus and down to the southwest (Cariboo River), west (Little River) and northeast Quesnel Lake), carving U-shaped valleys. The elevation ranges from 700-1650 m.

Precipitation in the region is heavy, as rain in the summer and snow in the winter. Drainage is to the west via the Cariboo, Little and Quesnel Rivers to the Fraser River. Quesnel Lake, the main scenic and topographic feature in the region, is a deep, long, forked, glacier-carved lake with an outlet at 725 m elevation. Vegetation is old-growth spruce, fir, pine, hemlock and cedar forest in all but the alpine regions

of the higher mountains (mainly above 1400 m elevation). Weldwood has been actively logging fir, spruce and pine in the area.

Access to the Black Bear Project is via gravel logging roads bearing northeast from Likely. The way is: Keithley Creek road for 5 km to the 2400 logging road, go 10 km and take the right branch onto the Providence logging spur road. The drilling location is 2.4 km up the Providence spur.

Access to the Frank Creek Project is via gravel logging roads bearing northeast from Likely. The way is: Keithley Creek road for 19 km, take right branch onto Barkerville road and cross over Cariboo River. Continue north on Barkerville (8400) road for 6 km. Take right branch (sign indicates D Road) to Frank Creek work area.

6.0 History

6.1 Black Bear Project

The remainder of 2012 work completed at Black Bear (1 diamond drill hole) does not necessitate a comprehensive historical summary of the work completed at at Barker Minerals' Black Bear property. Please refer to the *Diamond Drilling and Physical Work Assessment Report* from the *Providence Target on the Black Bear Silver/Gold Property* (Assessment Report 33309) for historical work completed between 1926 and 2010.

The most recent and relevant work completed on the Black Bear (between 2010 and 2012) is found below.

6.1.01 Work Done in 2010

The relevant report is Assessment Report 3220 by L.E. Doyle.

On the Black Bear Property 2000 metres of trenching was completed in 12 trenches of which 700 metres was reclaimed.

Most trenches successfully exposed variable amounts of fresh high grade silver galena mineralization which was sampled along strike of the Providence and Hunt veins at various locations on the newly discovered veins and at highly altered zones adjacent to the veins. Grab samples reported up to 116 ounces per ton silver and 59% lead at the Providence target and a chip sample from the Hunt vein reported 34 oz/t silver and 37.1% lead over a 1metre width.

The trenching was also successful in identifying important intrusive rocks with elevated concentrations of silver, bismuth and lead located near the highest grade mineralization identified to date. This indicates that the mineralization may increase in grade as it gets closer to the intrusion. The high oz/t silver to the % lead ratio in the intrusive itself also supports this interpretation. It is apparent that on the Black Bear property the ratio of precious metals to the % of lead will be a very useful tool in determining the proximity of mineralization to its intrusive source.

A comprehensive exploration program (Turna, 2008) has been recommended which includes geological mapping, prospecting, soil sampling, geophysical surveys, trenching and drilling over the mineralized and airborne trends.

6.1.02 Work Done in 2011

The relevant report is Assessment Report 32696 by L.E. Doyle.

5 diamond drill holes totalling 80m depth were completed with poor recovery. All 5 drill holes were stopped prematurely due to a sudden loss of water in the holes. The difficulty in drilling was surmised to be due to unstable ground conditions possibly related to historical underground workings adjacent or

directly below the drill holes. This 2011 drill program on the Black Bear property did not yield any significant results but helped strengthen the understanding of surficial geology.

Mapping was completed in 2011 in the 2000 metre trenching location of 2010. Mineralized quartz veins were uncovered ranging from centimetres up to 8 metres of exposure and are comprised of persistent pockets of galena and pyrite mineralization along both the footwall and hanging wall (vein selvages) with lesser amounts of mineralization occurring within the quartz vein itself.

6.1.03 Work Done in 2012

The relevant report is Assessment Report 33309 by L.E. Doyle.

Between May and September of 2012, 3 vertical diamond drill holes were completed totaling 745m at the Providence target to test for shallow extensions of the high grade vein mineralization exposed in outcrop and to further the knowledge of subsurface geology.

The geological setting and environment of the Providence target were interpreted from the 2012 drill results to be an extensional basin; with drill core predominantly containing deep-sea basin sediments (thick argillite/shale succession) with evidence of local volcanism (tuffaceous input and volcanic sills and dikes). Further evidence below massive galena on surface for a hydrothermal environment was inferred from a strong alteration assemblage in drill core of chlorite, epidote, hematite, and magnetite with minor amounts of associated base-metal sulphides.

An internal handheld XRF study was conducted and announced initial gold and gold pathfinder element results for BB12-07. In comparison with fire assay results from the entirety of hole BB12-07, the XRF analyzer was found to be successful in its identification of gold pathfinder elements but unsuccessful in accurately reporting gold values. False elevated gold readings were consistently given by the instrument. Follow-up work, experiments, and multiple discussions with the Thermo-Niton staff has since aided in helping Barker Minerals to understand the technical limitations of the XRF.

Assay results yielded levels of gold in individual one metre samples analyzed by fire assay ranging from <1 ppb to a high of 120 ppb (.12 g/t or ppm) in BB12-06; and 798 ppb (.80 g/t or ppm) in BB12-07.

Barker compiled the radiometric and magnetic airborne survey data collected by the GSC and overlaid the data over the Black Bear project area, identifying large (approximately 7 km by 2 km) coincident potassium high and moderate magnetic high anomalies. The Providence target is located along the eastern edge of the anomaly. The GSC airborne anomalies cross Black Bear Creek below the Providence target and continue to the SE where porphyritic felsic intrusive rocks have also been recognized.

6.2 Frank Creek Project

A comprehensive historical summary of the work completed since 1980 on the Frank Creek property can be found below. Old placer workings on the lower portion of Frank Creek suggest placer mining was conducted perhaps since the turn of the 20th century and possibly earlier.

6.2.01 Work done in 1980

The relevant reports are Assessment Reports 9669 and 9677 by M.G. Larsen.

Work was done in 1980 by May G. Larsen on the Darcy claims and Alan claims, each consisting of 2 claim units. The Darcy claims straddled the Cariboo Lake Road, on the southeast side of Cariboo Lake approximately 2.5 km northeast of the south end of the lake. The Alan claims straddled Wilby (Pearson) Creek, 5.0 km east of the south end on Cariboo Lake. Prospecting and conventional panning for gold was done. A field chemical test kit and a fluorescent lamp were used to detect various elements and minerals. Nothing of interest was found.

6.2.02 Work done in 1981 (A)

The relevant report is Assessment Report 10252 by T.A. Jones.

Work was done in 1981 for Canadian Nickel Mining Limited on the BT claims, consisting of 103 claim units covering Browntop Mountain and the head waters of Frank Creek, north of Seller Creek and Badger Peak. Geological mapping was done and rock and stream sediment samples were collected. Samples of quartz veins had geochemical results of up to 250 ppb Au. The quartz veins occurred in a drainage area of a stream where a silt sample had 330 ppb Au. Quartz veins up to 1 metre thick were stated to be abundant near the common corner of the BT 5, 6, 7, 8 claims, this on a hill approximately 2.0 km southwest of Goose Peak. Follow up work was recommended.

6.2.03 Work done in 1981 (B)

The relevant report is Assessment Report 10264 by J.S. Christie et al.

Work was done in 1981 for E & B Explorations Inc. on the Boomerang Property consisting of 104 claim units in the head waters of Seller Creek and covering Badger Peak on the south side of Canadian Nickel's BT claims. Reconnaissance stream sediment and soil sampling was done to follow up government geochem data indicating a 750 ppm As anomaly in a stream. The stream and soil samples returned values up to 345 ppm As and up to 1,500 ppm Pb. Gold values obtained were low. Areas of very rusty soil and outcrop occurred in the anomalous drainage and quartz vein float containing galena, tetrahedrite and sphalerite were found. Follow up work was recommended.

6.2.04 Work done in 1983 (A)

The relevant report is Assessment Report 11620 by Beaton, R.H.

Work was done in 1983 for Silver Standard Mines Limited on the Thunder Property consisting of 36 claim units roughly along the southeast side of Cariboo Lake, extending from Frank Creek southwest toward Wilby Creek. Initial prospecting in early 1983 discovered pyrite-chalcopyrite mineralization on the 'D' logging road on the west side of Frank Creek. Subsequent follow up included 419 soil samples collected over a grid consisting of 22.4 km cut line over a 1.2 km x 2.0 km area. Soils anomalous in copper, zinc or silver were followed up by limited mechanical trenching at 3 locations along roads. Minor sulphide mineralization was found and was deemed to be probably related to lenses of intrusive rock and to a lesser degree quartz veining. No follow up work was recommended.

6.2.05 Work done in 1983 (B)

The relevant report is Assessment Report 13154 by Mar, J.

Work was done in 1983 for *Esso Minerals Canada* on the NB claims consisting of 40 claim units covering Wilby Creek drainage and southward toward Seller Creek. Work consisted of geological mapping over the claims area and stream sediment and soil sampling concentrated close to the banks of Wilby Creek. Stream sampling included heavy mineral concentrates and conventional stream sediments. 13 rock, 8 heavy mineral and 124 soil samples were collected. Rocks mapped were considered to be metamorphosed volcanic and sedimentary rocks belonging to the Harveys [Ridge] Succession and granitic gneiss, possibly a sill, belonging to the Quesnel Lake Gneiss. Rusty carbonate-sericite altered rock appeared to occur widespread on the north side of Wilby Creek. Minor pyrite, chalcopyrite, galena and sphalerite occurred with quartz and altered rock.

Several rock samples were anomalous in Au and in pathfinder elements; the highest Au value was 445 ppb. The Assessment Report text states that stream sediments indicated an enhanced background for As and Sb but modest Au values. Heavy mineral concentrate Sample No. H331 had 3,600 ppb Au however and a conventional stream sample at the same location on Wilby Creek had 130 ppb Au. The Assessment Report text states that the soils gave 'best responses' or anomalies in As, Co, Cu and Pb.

Ni, Co, Cu or Pb results in soils are provided in the report however. Though a suite of anomalous metals were acknowledged the soil results were considered sporadic with no well-defined trends. No follow up work was recommended.

6.2.06 Work done in 1984 to 1986

Work on [Frank Creek] *was done from 1984 to 1986 by the Rasmussen Brothers, who re-entered and re-explored the old Apostle placer drift on the west bank of the creek and dug a 48 foot (14.6 metre) shaft higher on the creek. When large massive sulphide boulders were found at the base of placer gravels on the east side of the creek, a hard rock claim, the Home Run (9 units) was staked, but little or no exploration was done and the claim lapsed in 1987.* (Guinet, 1988).

6.2.07 Work done in 1986

The relevant reports are Assessment Reports 15420 and 15804 by Schmidt, U.

Work was done in 1986 for Casmiro Resource Corp. on the C1, Conch1 and C3 claim groups totalling 56 claim units. The C1 and Conch1 claims were located approximately 2.0 km south of the south end of Cariboo Lake, on the west side of Esso's NB claims. The C3 claim was located on the east side of Esso's claims and in the headwaters area of Wilby Creek and south tributary of Frank Creek.

The purpose of the work was to locate areas of precious metals mineralization. Approximately 179 soil and 8 silt samples were collected and analysed. Geological mapping was also done in the C3 claim area. Metamorphosed sedimentary and intrusive rocks were observed. The report states no significant gold values occur on the C3 soil grid and that geochemical anomalies in other elements on the Conch 1 and C3 grids indicated off-property sources. An anomaly on C1 grid was considered to reflect lithological boundaries. It was recommended that the soil grids be extended.

6.2.08 Work done in 1987

The relevant report is Assessment Report 17696 by Guinet, G.

Work was done in 1987 for Golden Eye Minerals Ltd. on the MASS claim consisting of 9 claim units covering the lower portion of Goose (Frank) Creek just above the Cariboo Lake Road, on the southeast side of Cariboo Lake.

The occurrence of numerous boulders of massive sulphides, up to just over 1.0 m in size, in the lower portion of Goose (Frank) Creek prompted prospecting and stream sampling to be done on the MASS claim area. 20 stream sediment samples were collected along a 1,300 m length of Goose (Frank) Creek. The source of the massive sulphide boulders was not found and the stream sampling had no interesting results. Further work was recommended to be done on the north side of the property, to include geochemical and geophysical (EM) surveys.

6.2.09 Work done in 1988-1989

The relevant report is Assessment Report 19345 by Martin, L.S.

Work was done in 1988-1989 for Formosa Resources Corp. and Golden Eye Minerals Ltd. on the MASS Property totalling 100 claims covering the main parts of the drainages of Frank Creek and Wilby Creek.

Work consisted of geological mapping, soil sampling, VLF-EM and magnetic geophysical surveys and mechanical trenching. Approximately 1,400 soils and 166 rock samples were collected on a cut grid over approximately 2.0 km x 2.5 km in area. A suite of 30 elements was analysed. This work was concentrated on the west side of the lower part of Frank Creek.

Geological mapping outlined volcanic and sedimentary rock units of the Harveys Ridge Division and intrusive rocks of the Quesnel Lake Gneiss.

Three representative massive sulphide boulders from Frank Creek had assay results of:

Sample	Cu	Pb	Zn	Ag	Au	Ba
No.	%	%	%	oz/T	oz/T	%
Q5351	0.45	3.91	3.48	3.50	0.001	0.75
Q5352	0.07	3.81	5.44	4.24	0.001	3.08
Q5353	1.38	2.13	2.24	1.96	0.005	0.32

Soil sampling results indicated a coincident Cu, Pb, Zn soil anomaly occurring in the vicinity of D logging road where Barker Minerals would in 1999 uncover massive sulphide mineralization in bedrock in their 'Discovery' trench (later named Frank Creek showing). Barium was conspicuously not anomalous in this area. This anomalous area had weak coincident VLF-EM anomalies. A significant magnetic anomaly occurring approximately 500 m to the west could not be explained.

The southern part of the MASS Property grid had anomalies in Cu, Pb, Zn and Ba in an area of weak local magnetic anomalies and a fairly consistent VLF-EM anomaly oriented NW-SE. These geophysical anomalies were thought to be related to geological contacts between volcanic and sedimentary rocks and the Quesnel Lake Gneiss intrusive.

The trenching work did little more than indicate the presence of a thick blanket of till and that some of the soil anomalies may be transported. Further work was recommended to include soil sampling, trenching and eventually a drilling program.

6.2.10 Work done in 1991

The relevant report is Assessment Report 21930 by McClintock, J.A.

Work was done in 1991 for Formosa Resources Corp. and Annex Exploration Corp. on the MASS and ANNEX Options totalling 245 claim units. These claims covered almost all of the southeast side of Cariboo Lake and extended from Wilby Creek in the south to Little River in the north.

Work consisted of prospecting, geological mapping, stream silt and soil sampling and 388 line km of helicopter-borne EM, magnetometer and radiometric surveying. 56 stream silt, 21 soil and 5 rock samples were collected. The objective was to find the bedrock source of numerous massive sulphide boulders known to occur near the mouth of Frank Creek.

The helicopter-borne EM survey found 7 areas of conductors; all of the conductors were deemed possibly caused by sulphides. Most of the conductors occurred in rocks mapped as Harveys Ridge Group. Black argillaceous schists were noted; these varied from non-graphitic to graphitic.

Magnetic anomalies were interpreted as possibly associated with intermediate and mafic volcanic rocks. All conductive anomalies occurred on the southwest side of Frank Creek except for the minor Area H located northeast of Frank Creek. Most of the conductive responses occurred as parallel multiple horizons. Conductors at Anomaly E were considered a priority for follow-up.

Further southwest, toward Wilby Creek, a much larger conductive complex was evident. Graphitic schist known to occur in some parts of the survey area was assumed a probable cause of most of the conductor anomalies there. Notwithstanding the considered occurrence of graphitic schists, the geophysical interpreter determined seven areas of conductors worthy of follow up for base and precious metals mineralization.

The radiometric survey determined elevated potassium counts got were possibly associated with sediments having thin overburden cover at higher elevations on the property. The radiometric results did not appear to be mapping any specific lithology.

Further work was recommended to include prospecting, soil sampling and detailed mapping and a Max-Min EM geophysical survey. 610 m of diamond drilling was also recommended.

6.2.11 Work done in 1992

The relevant report is Assessment Report 22599 by Donaldson, W.S.

Work was done in 1992 for Formosa Resources Corp. and Annex Exploration Corp. on the MASS Property totalling 176 claim units covering the area between Frank Creek and Wilby Creek to the southwest.

Work consisted of prospecting, geological mapping, VLF-EM and HLEM ground electromagnetic surveys, rock, soil and stream silt sampling and mechanical trenching. The electromagnetic and soil sampling surveys were done over 7 small widely separated grids established over locations where the previous year's helicopter-borne EM survey defined conductors not explained by rock outcroppings. 308 soil samples were collected over these grids. The geophysical and geochemical surveys were successful in detecting conductors and numerous Pb and Zn soil anomalies in a 30-element suite analyzed. Six trenches were mapped and sampled over locations of HLEM and soil anomalies. Bedrock in the trenches consisted of metamorphosed sedimentary rocks, frequently graphitic.

It was deemed all the geophysical anomalies from the various EM surveys done in 1991 and 1992 were due to conductive graphitic argillite and schist. High Pb and Zn values in rocks, soils and streams were deemed due to high background values in the metasedimentary rocks and quartz veins and faults and shears resulting in remobilization of minerals. It was concluded the geological environment remained compatible with the massive sulphide mineralization observed in boulders in Frank Creek. It was considered the source for these boulders was not found because it may be located up ice (and off the property) or is too small to be detectable by the work done [over the 7 scattered grids]. Further work was not recommended.

6.2.12 Work done in 1992

The relevant report is Assessment Report 22642 by Donaldson, W.S.

Work was done in 1992 for Rio Algom Exploration Inc. on the CCH Property consisting of 38 claim units between the lower portions of Wilby Creek and Seller Creek. Rio Algom was also the operator of the work done for Formosa Resources and Annex Exploration on the MASS Property, adjacent to the northeast.

Work consisted of geological mapping and collection of 4 stream silt, 120 soil and 9 rock samples. A suite of 30 elements was analysed. The objective was to find the bedrock source of the numerous massive sulphide boulders known to occur near the mouth of Frank Creek on the MASS Property.

Some rock samples were anomalous in Au in quartz veins. Some soils were anomalous in Pb, Zn or Au, considered due to high background values in metasedimentary rocks. As on the MASS Property, the conclusion was that the source of the massive sulphide boulders in Frank Creek probably came from up ice, off the property, or was too small to be detectable by the work done. Further work was not recommended. [In this author’s opinion the work was too limited to find the massive sulphide source.]

6.2.13 Work done in 1996

The relevant report is Assessment Report 24662 by Yorston, R.

Work was done for in 1996 by R. Yorston on the MASS claims, a 20-unit property staked by himself over the lower portion of Frank Creek, a part of the area of Formosa Resources' and Annex Exploration's lapsed MASS Property.

Work consisted of 60.9 m of percussion drilling in 2 holes. These holes were done on the branch D logging road at a hairpin turn just below where Barker Minerals Ltd. would later discover massive sulphides in boulders and bedrock in their Discovery trench in 1999. Both Yorston's percussion drill holes returned highly anomalous Cu, Pb and Zn results (1,766 ppm, 746 ppm, 2,969 ppm respectively). Follow up work was recommended but not done, the MASS claims lapsed in 1999 and Barker Minerals Ltd. staked the Frank claim over this area the same year.

6.2.14 Work done in 1998

The relevant report is Assessment Report 25752 by Doyle, L.E.

Work was done in 1998 for Barker Minerals Ltd. on the Frank Creek Property (Jess 1-3 claims) in the middle part of Wilby Creek.

Work consisted of prospecting. Stream sediment and rock samples were collected and analysed for a suite of 32 elements. Several rock samples were highly anomalous, with Pb up to 9.06% and Ag up to 6.65 oz/T.

From 1998 onward all work on the Frank Creek Property was done for Barker Minerals Ltd. under the overall supervision and strategic guidance by Louis E. Doyle, President.

6.2.15 Work done in 1999

The relevant report is Assessment Report 26003 by Payne, J.G.

Work was done in 1999 for Barker Minerals Ltd. on the Frank Creek Property, at the time consisting of Jess 1-4 and Frank claims totalling 92 claim units covering the lower half of Frank Creek and extending west to include the Wilby Creek area. The Frank Creek Property was a portion of a 80 km x 30 km claim block including 2,590 claim units staked in 1996 by Barker Minerals. This large group of claims is henceforth termed the 'Peripheral' claim block.

The 1999 prospecting by L.E. Doyle on the Frank Creek Property discovered massive sulphide boulders containing pyrite, galena, sphalerite and chalcopyrite on the D logging road, approximately 2.5 km up from the main 8400 (Cariboo Lake) Road. Grab samples from the boulders returned high values in base metals and pathfinder elements. Sample No. 99-F1 for example had 0.62% Cu, 11.1% Pb, 3.13% Zn, 14.0 oz/T Ag. The (Discovery) trench subsequently excavated at this location exposed a stratiform, massive sulphide layer at least 1.2m thick over a strike length of 10 m (Wild, 2002a).

Mapping discovered pillow structures in mafic volcanic rocks on the Frank Creek Property indicating a seafloor environment. Mapping and lithogeochemical results by this time were indicating a bimodal (mafic-felsic) volcanic system favourable for hosting volcanogenic massive sulphide deposits. The orientation of the pillow structures indicated that, at least in the local area of Frank Creek, strata were overturned and younging of strata was toward the northeast, with mafic volcanics including pillow lavas stratigraphically overlain by felsic tuffs having a probable genetic relationship with the newly discovered massive sulphide zone.

Prospecting at Wilby Creek (Big Gulp showing) on the south side of the Frank Creek Property had encouraging results but no specific follow up was recommended. Soil and geophysical surveys were recommended at Seller Creek and other areas of the 'Peripheral' claim block.

Extensive follow up work recommended a detailed EM/magnetometer survey, grid soil sampling, a petrographic study, trenching and drilling to be done on the Frank Creek Property.

6.2.16 Work done in 2000

The relevant report is Assessment Report 26504 by Payne, J.G.

Work was done in 2000 for Barker Minerals Ltd. on the Frank Creek, Ace, SCR and other areas of the 'Peripheral' and 'Quesnel Platinum' claim blocks totalling 3,842 claim units.

A Max-Min HLEM and magnetometer geophysical survey was done at Frank Creek and SCR. The resulting magnetic patterns outlined bedrock geological boundaries. The HLEM survey defined 11 conductors on the Frank Creek Grid and 3 conductors on the Sellers Grid at SCR. The geophysical report (Walcott, 2001) describes the 'Sellers Grid' as having been done on the 'Sellers Creek Property'. This is actually at the SCR prospect (Minfile No. 093A 203) and not to be confused with the Sellers Creek showing (Minfile No. 093A 131), approximately 7 km to the southeast.

The conductors at Frank Creek were thought attributable to sulphide mineralization and/or graphitic horizons. Most of the conductors were shallow and dipped steeply. Conductor A at Frank Creek was considered possibly related to Cu-rich sulphide stringers in outcrops located east and stratigraphically above the Frank Creek Discovery massive sulphide showing. The presence of stacked massive sulphide bodies was suggested and Conductor A an excellent target for follow up. The conductors at SCR were associated with magnetic anomalies. The most prominent conductor was associated with higher magnetics and having good correlation with Pb, Zn and Cu in soils taken in a 1986 survey. Others conductors were associated with the Big Gulp showing at Wilby Creek or altered volcanic rocks or soil anomalies. (Payne, 2001, pp. 17-18).

A reconnaissance VLF-EM traverse was done along a road at Big Gulp. The data indicated a significant conductor ('Big Gulp' C-Road) but no interpretation was provided (see Payne, 2001).

Petrographic analysis was done on several rocks from the Frank Creek and other areas of the 'Peripheral' claim block.

Follow up work was recommended for the Frank Creek Property and at the Ace, SCR, Quesnel Platinum and other prospects within the 'Peripheral' claim block. The recommendation for Frank Creek included further geological mapping and Max-Min geophysics along with a gravity survey and trenching and drilling.

6.2.17 Work done in 2001

The relevant report is Assessment Report 26805 by Walcott, P.E.

Work was done in 2001 for Barker Minerals Ltd. on the Frank Creek, Ace and SCR Properties and other locations on the 'Peripheral' claim block.

Work done on Frank Creek Property consisted of Max-Min HLEM, magnetometer, dipole-pole induced polarization and gravity geophysical surveys and mechanical trenching. This work was concentrated at small areas near the F1 target (Discovery Trench-Frank Creek Showing) and up to 2.0 km away toward the west and southwest. HLEM and magnetometer work was also done at SCR and Big Gulp and gravity work was done at Big Gulp.

The HLEM survey extended previously known conductors on Frank Creek Property but the massive sulphide showing at the Discovery Trench was unresponsive to either the electromagnetic or induced polarization techniques. However anomalous chargeability values were observed just east of the showing. Gravity profiling over the showing area and previously located EM conductors failed to show any excess mass associated with them. The 1:20,000 scale TRIM maps used for terrain corrections in the gravity survey were deemed unsatisfactorily coarse for the purpose and the geophysical contractor recommended a new effort to be made with more accurate control for terrain corrections.

At SCR the prominent conductor and magnetic anomaly of the previous year was further defined. The geophysical report (Walcott, 2002a) describes the Sellers Grid at 'Sellers Creek' as having been extended

eastward. This is at the SCR prospect (Minfile No. 093A 203) and not to be confused with the Sellers Creek showing (Minfile No. 093A 131), approximately 7 km to the southeast.

A gravity anomaly at Big Gulp was somewhat coincident with a topographic high. Three moderate conductors were evident at Big Gulp. Additional geophysical work was recommended to detail the anomalies at Frank Creek, Big Gulp and SCR.

The trenching program, totalling 707 metres excavated in 9 trenches and 31 test pits in the areas of the Frank Creek Showing (Discovery Trench) and within several hundred metres to the northwest and northeast. Trenching near the beginning of the D Road did not reach bedrock. The source of massive and semi-massive mineralized boulders there remained unexplained. The Discovery Trench was also deepened. The several massive sulphide layers in the Trench were truncated by faults. The same metasedimentary and volcaniclastic rocks and mineralized horizon that host the massive sulphide mineralization of the Frank Creek Showing in the Discovery Trench were uncovered in Trench TR-BW-10, approximately 375 m northwest of the Discovery Trench, and in trench TR-BW-04, up to 50 m southeast of the Discovery Trench. The potentially mineralized NW-SE trend was considered to now be over 425 metres along and open in both strike directions and to depth (Wild, 2002a and Perry, 2002). Frank Creek's massive sulphide occurrence was considered to resemble the Besshi-type Goldstream Mine Cu-Zn massive sulphide deposit, 230 km to the southeast. Other trenches and test holes generally targeted geophysical conductors. Trench TR-BW-03, 50 m south of the Frank Creek Showing, uncovered pyritic rocks but did not locate the target mineralized horizon. Other trenches hit graphitic faults or did not encounter obviously conductive rock.

Further work was recommended to include soil sampling mechanical trenching and 7,500 feet (2,286 m) of diamond drilling.

6.2.18 Work done in 2002

The relevant report is Assessment Report 27125 Doyle, L.E.

Work was done in 2002 for Barker Minerals Ltd. on the Frank Creek, Ace, SCR Properties and other locations on the 'Peripheral' claim block totalling 4,092 claim units.

Work done on Frank Creek Property included 813 m of diamond drilling in 6 holes and 289 m of mechanical trenching in 5 trenches in and adjacent to the F1 Target area. Electromagnetic (Max-Min and VLF-EM), gravity, and induced polarization (IP) surveys were also done at Frank Creek.

Targets of this work were the northwest extension of the Frank Creek Showing toward the previous year's Trench TR-BW-10 and magnetic highs, conductors and chargeability anomalies from previous geophysical surveys. Drill holes FC02-05, 06 and 01 intersected disseminated, semi-massive and relatively narrow massive pyrite-rich mineralization along the mineralized trend between the Frank Creek Showing and Trench TR-BW-10. Besides pyrite, chalcopyrite, sphalerite and galena occurred in relatively minor amounts. The mineralized horizon was determined to be hosted by siliceous, sericitic, weakly chloritic phyllites and quartz-eye grits.

The geophysical surveys on the Frank Creek Property were done in the F1 Target area (Frank Creek Showing) and the F7 Target area (on the lower portion of D Road). Elevation control in the gravity survey was to 6 centimetre accuracy using a Sokkia total station and prism reflector. This was an improvement over the elevation control used in the 2001 gravity survey. As in a previous survey the Frank Creek Showing showed little response to IP or VLF-EM suggesting this showing does not have significant strike length or size. A new gravity traverse was not done over the Frank Creek Showing at the F1 Target. The conductor at F7 Target area was extended 100 m but the ensuing gravity traverse failed to detect an associated excess mass. The limited IP survey at Frank Creek confirmed the location of 2 previously located conductors but no further work was done on these.

Recommended follow up work included stratigraphic and lithogeochemical studies to define the paleotectonic setting of the mineralization, the most favourable host lithologies and the distribution of

hydrothermal alteration to provide an exploration model for the area. Other recommended work included HLEM, VLF-EM and gravity geophysical surveys to trace continuations of known anomalies. Further drilling, trenching and soil sampling toward the northwest and southeast to follow the mineralized strike was also recommended.

6.2.19 Work done in 2003-2004

The relevant reports are Assessment Reports 27655 and 28248 by Doyle, L.E.

Work was done in 2003-2004 for Barker Minerals Ltd. on the Frank Creek, Ace, SCR Properties and other locations on the 'Peripheral' claim block totalling 4,401 claim units.

A study (Barrett & MacLean, 2003) was done of the lithological and lithogeochemical features of approximately 503 rock and drill core samples from Frank Creek, Ace and the 'Peripheral' Properties, approximately 175 of these were from Frank Creek. Analyses were of rock-forming oxides and trace elements. The study included a petrographic examination of selected rock types. A review of possible analogs to Frank Creek and Ace was provided; these included places in Canada, Japan, Namibia and ocean ridges. The objective was to provide an interpretation of the host stratigraphy of the Frank Creek and Ace Properties and discussion of possible sea floor settings for the sulphide mineralization.

Conclusions by Barrett & MacLean relevant to Frank Creek were:

- The Frank Creek host rocks in the [Discovery] trench and nearby drill holes represent a sequence of distal continental shelf clastic sediments, with no evidence for felsic volcanic input.
- The lithological sequences at Frank Creek (and Ace) show features of both Besshi-type and Sullivan-type deposits. The Frank Creek setting suggested a continental marine shelf undergoing rifting.
- Evidence of graded bedding in the 2002 drill holes and outcrops of basaltic pillow lavas approximately 1.5 km southwest of the Discovery Trench indicated younging of strata toward the northeast and that the mafic extrusives would be the stratigraphic footwall of the sulphide beds in the Discovery Trench.
- The interpreted occurrence of mafic magmatism on a faulted continental shelf bodes well for the development of hydrothermal systems and the formation of massive sulphide beds, as does the generally reduced nature of bottom waters as indicated by the presence of graphitic argillites.
- Such a setting would be favourable for the development of hydrothermal systems, and the formation of sediment hosted massive sulphide deposits in sub-basins containing reduced bottom waters (now black shales and Mn-rich sediments).
- Much more drilling is required to explore the large tracts of favourable geology in the Cariboo Lake area that could host massive sulphide deposits (specific locations at Frank Creek and Ace Properties were recommended).

A Titan-24 geophysical survey included DC resistivity, induced polarization and deep-penetrating tensor-magnetotelluric surveys over 15.8 line km in a 1.5 x 2.4 km area on Frank Creek Property. The purpose was to identify drill targets characterized by high chargeability or low resistivity. 90 separate anomalies of varying significance were identified; 18 were considered major low resistivity features. Barker Minerals' F1, F3, F7 and F8 Target areas 'all hosted pronounced chargeability high and resistivity low anomalies consistent with massive sulphides or graphite' (Donohue et al., 2004, pp. i,ii).

The 90 anomalies of the Titan-24 survey were grouped into 3 major geophysical Trends A, B and C (Barker Minerals, Company News, August 26, 2004):

Trend A – a large broad conductive and variably polarizable zone, present on the western portions of survey lines 5100, 5300 and 5500. Locally, strong Cu, Pb and Zn soil anomalies from previous surveys correlated with the geophysical Trend on lines 5300 and 5500. Trend A remained open to the west and south.

Trend B – a flat lying conductive and polarizable zone extending from line 5100 in the south to line 6100 in the north, the trend becoming thicker and stronger toward the north and remaining open to the north. The high chargeability anomaly reached surface in narrow sections near the F1 Target area (Frank Creek Showing). Locally, strong Cu, Pb and Zn soil anomalies correlated with the geophysical Trend on line 5700.

Trend C – a steeply dipping conductive and polarizable zone on the eastern ends of lines 5100 to line 5900. Locally, Trend C is coincident with strong soil anomalies and a broad magnetic trend.

[Three geophysical Trends A, B & C were identified in 2004 and are shown in Figure No. 3.]

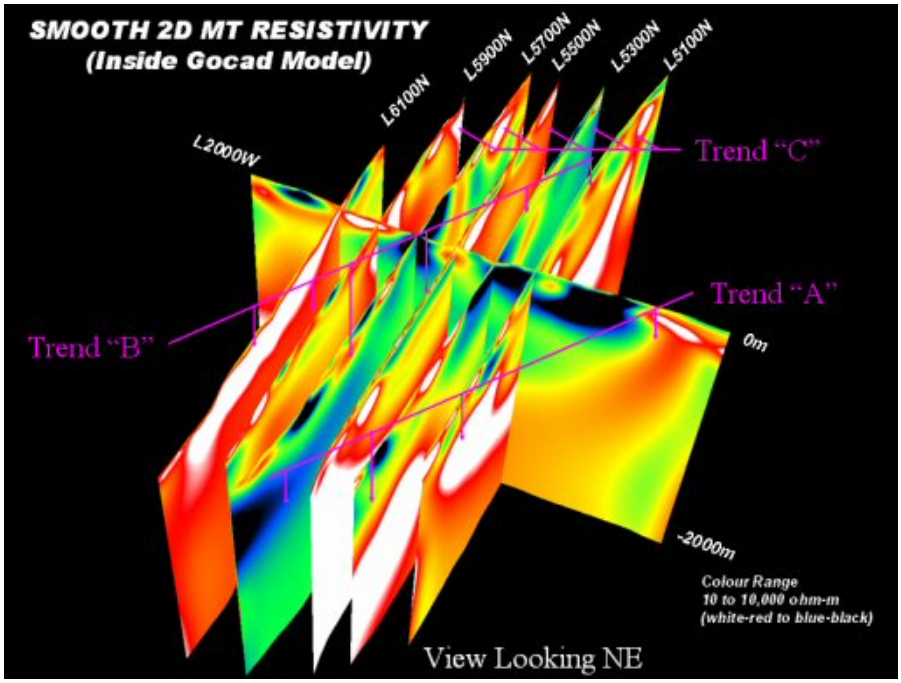

Figure 3: Frank Creek Property Geophysical Trends A, B, C resulting from the 2004, Quantec Geoscience Ltd. Titan 24 Distributed Array Survey. (See Doyle, 2005, Assessment Report 28248, Appendix II)

The Titan-24 geophysical survey is discussed in detail in Turna (2008, pg. 36).

In 2003 109 m of trenching in 2 trenches was completed at SCR. The targets were coincident geochemical soil and geophysical anomalies. Boulders with Cu, Pb and Zn mineralization were found in fairly deep till.

Trenching in 2004 focused on the Trend B anomaly of the Titan-24 geophysical survey. In the F7 Target area mineralized sub-outcrop contained stringer and semi massive mineralization containing pyrite, sphalerite and chalcopyrite. Usually the trenching was not able to reach bedrock due to thick glacial overburden.

Diamond drilling in 2004 included 7 holes (1,880 metres total). The holes were all located in the F7 Target area, low on the D Road, between approximately 400 m and 900 m west northwest of the Frank Creek Showing. The holes targeted geological features and geophysical anomalies. Zones up to 70 m wide of alteration (mainly sericite and chlorite) were reported and disseminated, stringer, semi-massive and narrow massive sulphides were described in the core logs for 6 of the 7 holes. One hole ended short at

41.8 m. Hole FC04-07 between 122.9 m and 307.9 m (185 m) had 4 (30 cm to 90 cm) zones of sulphides with aggregate Cu/Pb/Zn geochemical results of at least 10,000 ppm. Hole FC04-13 between 257.6 m and 433.0 m (175.4 m) had 12 (10 cm to 60 cm) zones of sulphides with aggregate Cu/Pb/Zn geochemical results of at least 10,000 ppm. These results were sub-economic but indicated an extensive mineralizing hydrothermal system.

Recommendations for further work included:

- Continue trenching geophysical and geochemical targets using a larger backhoe.
- The Titan-24 geophysical anomalies to be tested by systematic drilling, and geophysical surveying, particularly EM, to be made down the boreholes.
- Soil sampling over strike extensions of known mineralized trends and over specific target areas.
- A 3D geoscientific model to be built from the extensive existing data set in order to refine interpretations.

6.2.20 Work done in 2005-2006

The relevant report is Assessment Report 28978 by Doyle, L.E.

Work was done in 2005-2006 for Barker Minerals Ltd. on the Frank Creek Property.

The work done on Frank Creek Property included 1566 m of diamond drilling in 4 holes in 2005 and 2,037 m in 5 holes in 2006. The 9 holes mainly targeted geophysical anomalies from the 2004 Titan-24 geophysical survey. Zones of sericite, chlorite, silica, and iron carbonate alteration were encountered. Base metal sulphide mineralization occurred in stringers and narrow semi-massive and massive zones. The results were sub-economic but indicated the presence of an extensive mineralizing hydrothermal system consistent with a massive sulphide environment. Two further drill holes were completed in December 2006. These holes are described below together with work done in 2007.

Recommendations for further work included:

- Continued systematic testing of geophysical targets defined by the Titan-24 survey of 2004. The work to consist of soil sampling, trenching and drilling.
- A reconnaissance exploration program to examine the largely unexplored part of Barker Minerals' properties between the Frank Creek and Ace massive sulphide prospects, and other areas of the large 'Peripheral' claim block.

6.2.21 Work done in 2006-2007

The relevant report is Assessment Report 29740 by Turna, R. and Doyle, L.E.

Work was done in 2006-2007 for Barker Minerals Ltd. on the Frank Creek, Kangaroo and MAG Properties and other locations on the 'Peripheral' claim block. By this time the 'Peripheral' contiguous block of claims was 115,217 hectares in size under the Mineral Titles Online staking system and extended approximately 80 km x 30 km east-west and north-south.

On Frank Creek Property two drill holes (705.0 m) were done in December 2006 to test EM geophysical targets from the 2004 Titan-24 geophysical survey. Narrow zones of Zn and Pb-rich mineralization were encountered in zones of sericite, chlorite, silica or carbonate alteration.

889 soil samples were collected over the survey grid cut in 2004 for the Titan-24 geophysical survey. Seven anomalous multi-element patterns or Trends were recognized.

Trend 1, a NW-SE trending soil anomaly near the Frank Creek Showing included anomalous Cu, Pb, Zn and pathfinder elements. Trench FC07-3 and test pits were dug over this anomaly. This trench contained a stockwork of pyritic stringers containing chalcopyrite, sphalerite and galena. Trend 3, a NW-SE trending soil anomaly 750 m southwest from the trench dug over Trend 1, also included anomalous

Cu, Pb, Zn and pathfinder elements. Trenches FC07-1, 2, 4, 5 and test holes were dug over this anomaly. These trenches (F-9 Target area) all contained small lenses and pods of massive sulphide mineralization. Sulphides in these trenches contained mainly pyrite and galena with less chalcopyrite than the Trench FC07-3 over Trend 1. Trench FC07-5 contained a 2m x 5m pod of semi massive sulphide.

A petrographic study of representative rocks from the 2007 trenches indicated the mineral host rocks were rhyolitic volcaniclastics.

6.2.22 Work done in 2008

The relevant report is Assessment Report 30764 by Turna, R.

A diamond drilling program was done on the Frank Creek property to test the 2007 survey's Trend 3 Cu-Pb-Zn soil anomaly where significant Cu, Pb and Zn mineralization was discovered in trenches excavated that year, to test certain HLEM conductors from the 2000 geophysical survey and to improve understanding of the geology at certain locations. Most of the drilling at the Trend 3 anomaly was done in a grid pattern. 2,375 metres were drilled in 13 holes.

The results of DDH Holes FC08-25 to 28 were inconclusive. Holes FC08-25 and 26 did not reach the geophysical conductor targets due to squeezing in the holes caused by broken rock. Conductive zones targeted by Holes FC08-27 and 28 encountered graphitic argillite and sulphide bands. Hole FC08-29 affirmed the down-dip continuity of sulphide mineralization previously encountered in 2004 and 2005 in holes FC04-13 and FC05-17. A 4.65 metre intercept of semi-massive to massive sulphide with 50% - 90% total metal content occurred in Hole FC08-34 at a depth of 16.55m - 21.20m. Holes FC08-30 to 37 drilled in a grid pattern at F9 Target Area, affirmed the stockwork or footwall-type nature of the Cu-Pb-Zn sulphide mineralization in the area, notwithstanding occurrences of several syngenetic-appearing sulphide bands. A good example of overturned graded bedding in Hole FC08-29 added to similar proof of overturned strata from DDH holes from past years (see historic assessment reports regarding drilling at Frank Creek) and overturned pillows in lava (see Ferri, 2000, pg. 47 and Ferri, OF 2003-1, Map). The overturned geology implies, particularly at the F9 Target Area, the geology exposed at the surface is the footwall zone to possible massive sulphides, intact, at a deeper level. A semi-horizontal lie to shallow westward dip to geologic strata was indicated in the drilling sections in the assessment report, which accorded with Ferri (OF 2003-1, Section B-B') for the Frank Creek area.\

6.2.23 Work done in 2009

The relevant report is Assessment Report 31389 by Turna, R.

Work performed in 2009 was concentrated in the Frank Creek area where two diamond drill holes (900 m) were done and rock samples were collected from a recently excavated trench.

DDH FC09-38 targeted a strong HLEM conductor. The hole intersected a quartz vein stockwork in a very intense silica-sericite alteration zone which was sulphide-poor. An unmineralized gouge (fault) zone in locally graphitic sedimentary rocks may explain the conductor here. A gold-anomalous zone occurred between 39 to 60 m, associated with Pb and Zn in graphitic argillites. Though it was necessary to test the HLEM conductor, it is considered this drill hole was poor in sulphides due to it not being on geological strike with the stratabound massive sulphides in the nearby Discovery Trench.

DDH FC09-39 targeted a strong Titan-24 low resistivity (conductor) anomaly. The upper 90 m of this hole intersected locally graphitic sedimentary rocks which had generally elevated values in a number of elements, including gold. This can be partly explained by high background geochemical values to be expected in this type of rock or by mineralization remobilized from an older deposit, though the anomalous gold may be related to relatively late veins. Hole 39 had a mineralized zone between approximately 280 m and 410 m associated with a stockwork of sulphide veins in silicified and sericitized 'quartz eye' volcaniclastics. This mineralized zone appears to correlate with massive sulphide lenses discovered in trenching if the F9 area in 2007 and drilling in 2008.

6.2.24 Work Done in 2011

The relevant report is Assessment Report 32696 by Doyle, L.E.

8 drill holes were completed in 2011 totaling 422.02 metres as a follow up to high potential targets (geophysical anomalies near surface mineralization and exposed surface mineralization by trenching on strike with the Discovery showing). Up to 20% stringer mineralization, disseminated and semi-massive to massive sulphides, was intercepted in 7 of the 8 drill holes within the first 20 metres in volcaniclastic rock. The mineralized intercepts range from .5 metres to 8.7 metres which are within broader altered zones. Mineralization consists of pyrite, with variable amounts of chalcopyrite, sphalerite and galena.

Trench FC08-TR1 on line 53N and 22W was increased to approximately 200 m in length. The glacial till in the immediate area is around 30 feet deep (10 m). An excavator was used to clear out the overburden in this highly mineralized trench in preparation for follow-up mapping and drilling.

Three trenches (FC11-TR01-TR03) were excavated totalling 185 meters in total length. FC11-TR01 was 100 meters in length, located near line 58N and 25E and exposed copper and zinc massive sulphide mineralization in multiple lenses. FC11-TR02 was 50 meters in length, located below line 58, and three rock samples were sent for analysis. FC11-TR03 was 35 meters in length and below line 57N and 27E; excavation failed to reach bedrock.

Reclamation activities consisted of access roads with old trenches and a series of deep test holes from previous exploration programs were located mostly around the eastern ends of line 57N and line 59N. Five test pits and two trenches, from the 2007-2009 work programs, totalling approximately 400 m were filled.

7.0 GEOLOGY

7.1 Regional Geology

Much of the following geological descriptions are from Turna, 2008; these summaries derive mainly from Perry, 2002 (largely after Payne and Perry, 2001) and are quoted directly in *italics* below.

The regional geology was described by L.C. Struik (1988)…The Barkerville terrane is considered to be the northwest extension of the Kootenay terrane, which to the southeast overlies the Monashee metamorphic core complex, a large uplifted mass of high-grade paragneiss, quartzite, and marble. The properties are on the flank of the northern, unexposed portion of this core complex. Northwest from the North Arm of Quesnel Lake the characteristic metamorphic minerals change from sillimanite through staurolite-kyanite, almandine garnet and biotite to chlorite northwest of the Ace claims. The garnet isograd runs northerly across the east-central part of the Ace group, while that of biotite is 30 km further northwest. Historic mines near Wells and Barkerville are in rocks of the greenschist facies. The age of both deformation and metamorphism is regarded as Mid-Jurassic, which is interpreted as the time of collision of the North American plate to the east with a group of island arcs to the west. In the Little River area, four geological terranes are represented, most of which are dominated by marine sedimentary or metasedimentary rocks.

Figures 4 and 5 show the location and structural relationship between the four terranes found within Barker Minerals' mineral claims.

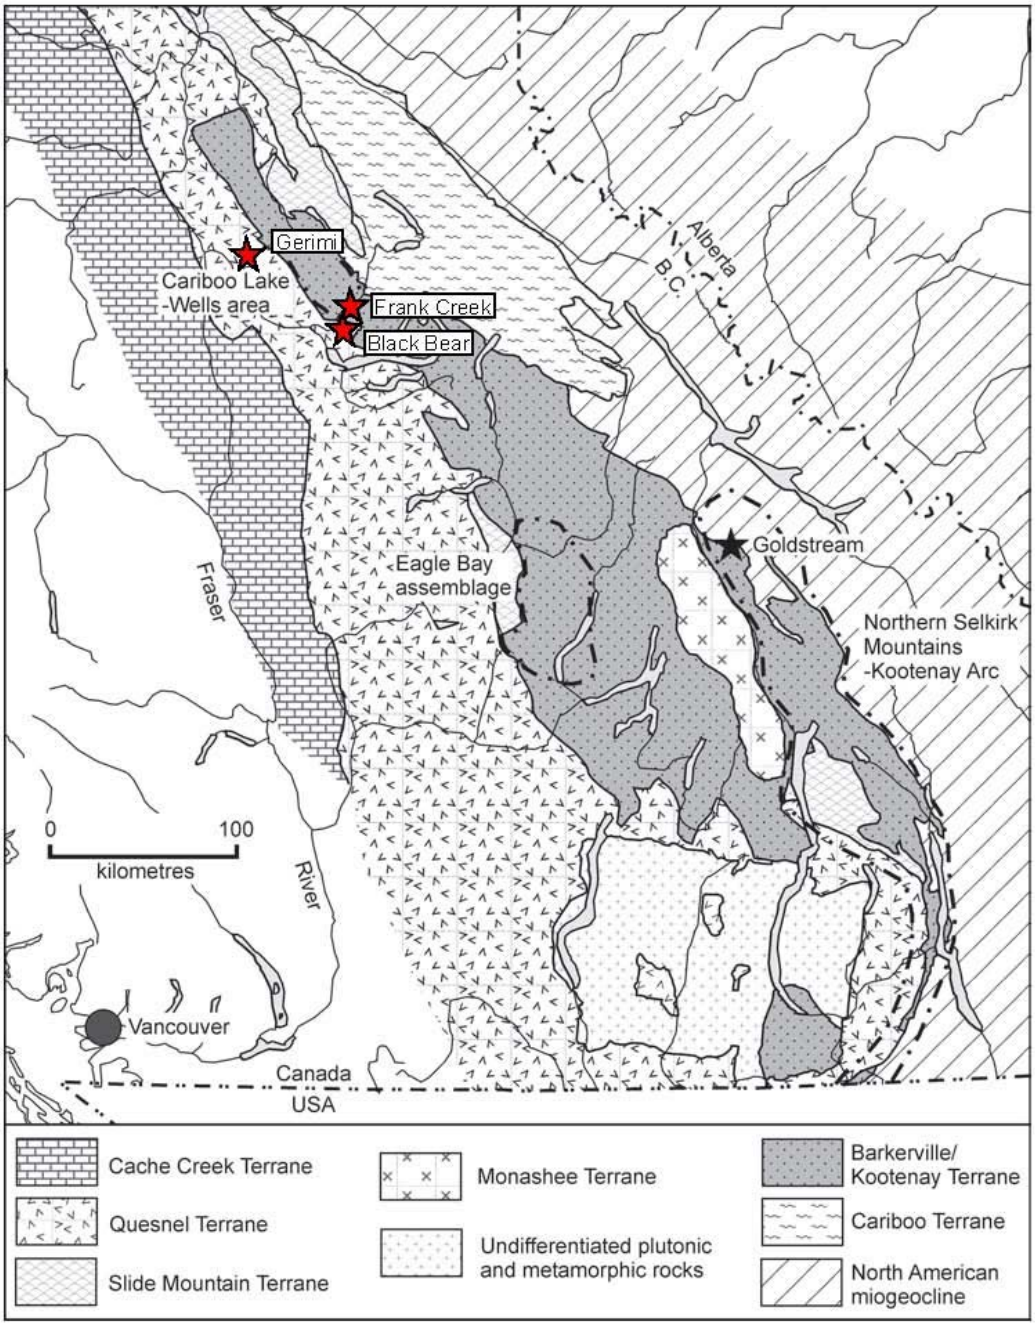

Figure 4: Terrane map of Southern British Columbia. Barker Minerals' properties are indicated by red stars

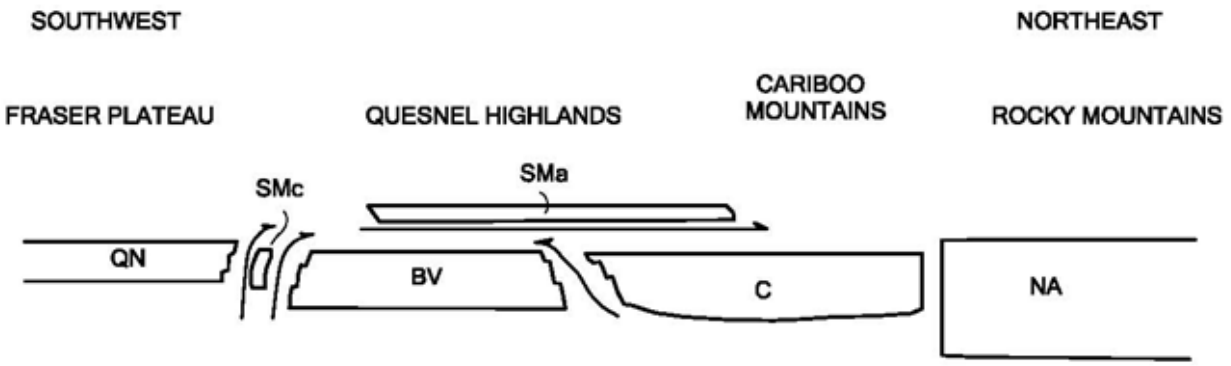

Figure 5: Regional structural section from SW-NE across the four terranes in Barker Mineral's claims area with their relative structural positions. ***BV-Barkerville, C-Cariboo, Sma-Slide Mountain (Antler Formation), SMc-Slide Mountain (Crooked Amphibolite), QN-Quesnel, NA-North American (after Struik, 1988)***

Barkerville Terrane

Most of the property area is underlain by marine strata [Snowshoe Group] *of the Barkerville terrane, whose age is classified broadly as Late Proterozoic to Mid-Paleozoic. It is categorized by the Geological Survey of Canada as a subdivision of the Kootenay terrane. The region was deformed by intense, complex, in part isoclinal folding and overturning that produced an intimate interlensing of impure quartzite, siltstone, ankeritic dolomite, pelite and amphibolite. These rocks are cut by dikes and sills of metamorphosed diorite. Locally, stronger shear deformation produced mylonitic textures.*

The northeastern third of this terrane is the main zone of economic interest in the Cariboo district. Struik described it as "gold-enriched", because it contains the historic Wells and Barkerville mines and the Cariboo Hudson deposit, 39 km and 18 km northwest of the Ace project area, respectively. This zone contains olive and grey micaceous quartzite and phyllite, amphibolite, marble, meta-tuff and meta-diorite sheets or sills. The Barkerville terrane is cut by the Mid-Devonian [Early Mississippian, Ferri and O'Brien, 2003] *Quesnel Lake gneiss (350 Ma), a coarse grained, leucocratic, biotite granitic gneiss with megacrysts of potassium feldspar. The main body of gneiss is 30 km long by 3 km wide and is elongated parallel to the eastern border of the Intermontane belt. Its contacts are in part concordant with, and in part perpendicular to, metamorphic layering. The Barkerville terrane hosts folded, sill-like masses up to 300 m thick of gneissic meta-diorite (400 Ma) and contains post-metamorphic anatectic pegmatite (86 Ma), particularly in a high-grade metamorphic aureole northwest of the North Arm of Quesnel Lake.*

12 km NE of Frank Creek an 8 km elongate diorite to gabbro sill-like intrusive has been dated at approximately 280 Ma - Early Permian (Ferri and O'Brien, Open File 2003-1). The mafic igneous rocks within the Snowshoe Group were considered to indicate alkaline to sub-alkaline compositions and be generally suggestive of an extensional tectonic setting (Ferri and O'Brien, Paper 2002-1). On the basis of geochemistry the Early Mississippian granitic rocks near Cariboo Lake are suggested to be the products of arc magmatism, and 'recognition of subvolcanic magmatism related to arc volcanism in the Barkerville Subterrane…enhances the potential for discovery of base and precious metal mineralization' (Ferri et al., 1999).

Cariboo Terrane

The northeastern part of the Little River area is underlain by marine peri-cratonic sedimentary strata of the Cariboo terrane. The Cariboo terrane consists mainly of limestone and dolomite with lesser siliceous, clastic, sedimentary rocks and argillite. Some geologists believe that the Cariboo terrane is a shallow, near-shore facies and the Barkerville is a deeper, offshore facies of the same erosion-deposition system. No rifting is suspected between the Cariboo terrane and the North American continent, in contrast to that between the Barkerville terrane and the North American continent.

The Cariboo and Barkerville terranes are separated by the regional Pleasant Valley thrust fault, which dips northeast moderately to steeply. It is reported by Struik (1988) to have moved the Cariboo block from the east over the Barkerville block along a strike length of over 100 km. In the map area, the fault cannot be found, suggesting that much of the movement attributed to it may have occurred by shearing in a broad zone along the "contact" between the two terranes. Some of the carbonate layers in the lowest part of the Cariboo terrane (or upper part of the Barkerville terrane) are enriched in zinc and lead. Since the 1970's, preliminary exploration on stratiform Zn-Pb targets has been conducted in this area over a strike length of 23 km from the vicinity of the head of the North Arm, via Maeford Lake to the Cariboo (Maybe) prospect.

The Cariboo terrane was cut by the Jurassic-Cretaceous Little River stock, a medium-grained granodiorite grading to quartz monzonite. A normal fault along its southwest side (Little River fault) dips east and extends southeasterly to Limestone Point, on the western side of the North Arm of Quesnel Lake. It intersects, and in some literature has been confused with, the Pleasant Valley thrust. It moved chlorite-biotite metamorphic grade strata of the Cariboo terrane eastward to rest against staurolite-kyanite metamorphic grade strata of the Barkerville terrane.

Quesnel Terrane

A small southwestern portion of the Little River area is underlain by the Late Triassic to Early Jurassic, allochthonous Quesnel terrane. It was accreted to the North American continent, in part by subduction and in part by obduction. The Eureka thrust fault marks the boundary between the Quesnel and Barkerville terranes as well as that between the Intermontane and Omineca physiographic belts. The terrane is partly submarine and partly subaerial, consisting of volcanic and volcaniclastic rocks and co-magmatic intrusions, with minor carbonate lenses and related sedimentary rocks. Regionally, it hosts many important mineral deposits, mainly of Cu and Cu-Au, such as Highland Valley, Craigmont, Copper Mountain, QR and Mt. Polley. The Bullion Pit, from which 175,700 oz. of placer gold were produced, is near Likely just on the west side of the boundary between the Barkerville and Quesnel terranes.

Slide Mountain Terrane

Rocks of the allochthonous, Devonian to Late Triassic, Slide Mountain terrane underlie a very small part of the Little River area. Portions of these rocks were obducted, while others were subducted during collision of an oceanic plate with the continent. It is exposed east of Wells and Barkerville as the upper plate overlying the generally low-angle Pundata thrust fault. This fault it is nearly vertical where it crosses the southwestern part of the Little River area. Small slices of mainly mafic volcanic rocks and alpine-type ultramafic rocks of the Slide Mountain terrane occur in and parallel to the Eureka thrust. Minor lithologies include chert, meta-siltstone and argillite.

Glaciation and glacial deposits

The last glacial stage that affected the Quesnel Highland, the Fraser glaciation, began 30,000 years ago. Much of this ice had melted by 10,000 years ago, but small remnants are preserved high in the alpine areas of the Cariboo Mountains. At lower elevations, glaciers of this age scoured the debris left by preceding ice advances, almost completely destroying them, leaving a chaotic assemblage of unsorted till, moraine and drift, with lenses of gravel and sand that had been roughly sorted by meltwater and rivers, leaving behind beds of silt and clay that were stratified by settlement in ice-dammed lakes. In the Cariboo area, the debris covers bedrock in valleys below 1700 m, leaving typical glacial features such as U-shaped valleys, ice-sculpted drumlins, moraine terraces and glacier and river benches. On the Barker Minerals properties, glacial deposits range from one to a few tens of metres thick. Some glacial till deposits are overlain by well-bedded glaciolacustrine clay and silt deposits up to a few tens of metres thick. In much of the Cariboo district, a layer of distinctive, hard, compact, semi-rigid blue clay sits either on or slightly above bedrock and acts as "false" bedrock. It was formed from glacial drift left behind by the last ice advance prior to the Fraser glaciation and was compacted by the weight of the Fraser stage ice. In the placer-gold areas of the Cariboo, large amounts of gold were recovered from gravel resting on this

clay. In places the clay layer was penetrated by the placer miners to reach richer "pay streaks" on true bedrock below.

7.2 Local Geology

7.2.01 Frank Creek Geology

Refer to Figure 6A and 6B for the broad-scale geology, stratigraphy, and geologic section of the Frank Creek project area. Refer to Figure 7 for more detailed geologic mapping of the Frank Creek project area.

Work by Struik (1983), Ferri (2001) and Ferri and O'Brien (2002) placed the rocks of these project areas in the Snowshoe Group of the Barkerville terrane. These rocks include, from oldest to youngest, the Keithley succession, Harvey's Ridge succession and Goose Peak quartzite.

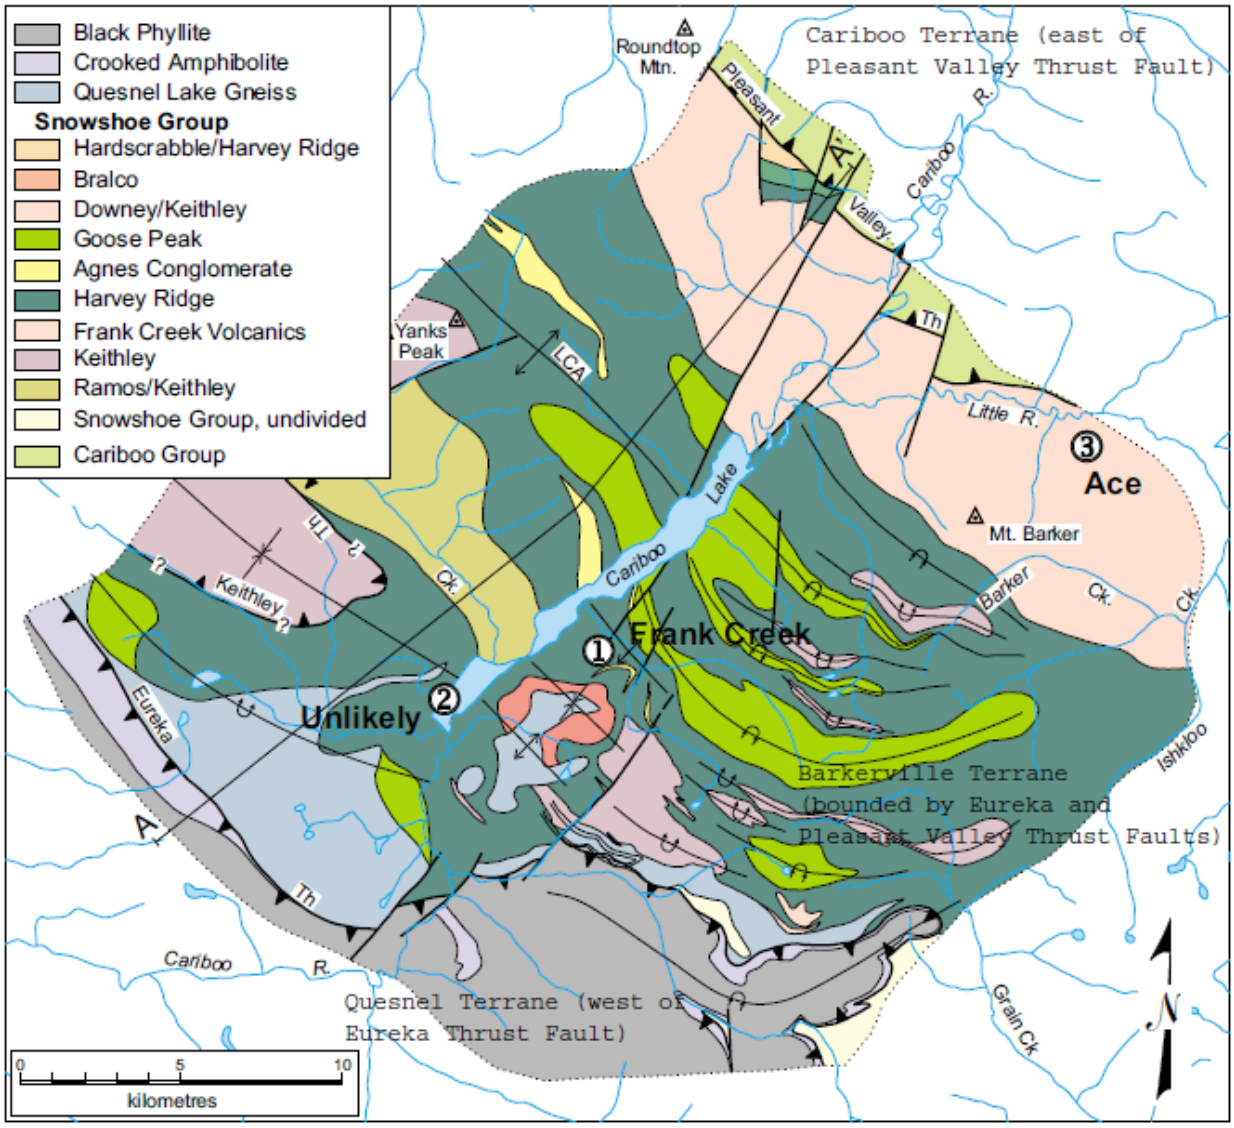

Figure 6A: Geology and stratigraphy of the Snowshoe Group at the Frank Creek project area (after Ferri, 2002)

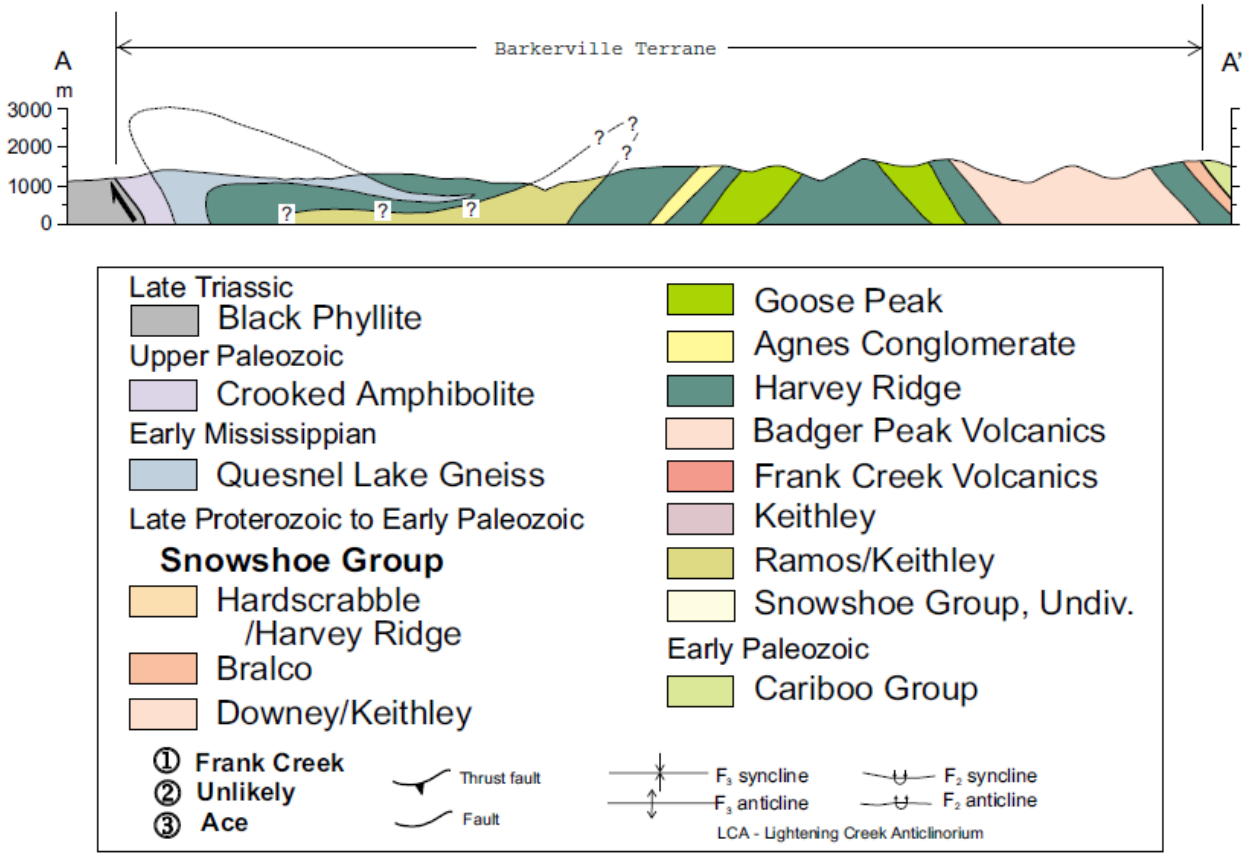

Figure 6B: Geological section and legend (after Ferri, 2002)

The Keithley succession consists of micaceous quartz sandstone to siltstone, phyllite and quartz-muscovite schist, in which common pyrite and ankerite porphyroblasts give a brown to rusty brown weathering surface. At the top of the Keithley succession is a distinctive quartzite. Southwest of Browntop Mountain, a section of rusty-weathering quartz- chlorite- muscovite- schist of the Keithley succession contains two stratabound intervals of marble 50-75m thick. This area also contains a quartzite unit that is less than a few metres thick and contains minor disseminated chalcopyrite, sphalerite and galena. The upper contact of the Keithley orthoquartzite is sharp with the dark grey to black siliceous siltstone and phyllite of the Harvey's Ridge succession.

The lower part of the Harvey's Ridge succession is characterized by dark grey to black phyllite, schist, siltstone, siliceous siltstone and sandstone. An important wedge of mafic volcanic rocks occurs west of the Frank Creek fault. The upper contact of the Harvey's Ridge succession is gradational with the overlying Goose Peak quartzite. The contact is placed at the base of the lowermost, thick section of clean, feldspathic sandstone to quartzite. The Harvey's Ridge succession contains abundant interlayers of coarse grained, feldspathic sandstone and wacke, similar to but darker in colour than those of the Goose Peak quartzite.

The Goose Peak quartzite contains micaceous and feldspathic sandstone to quartzite, with minor interlayers of grey to dark grey phyllite/schist, siltstone, wacke and quartz-chlorite-muscovite schist

(possibly of volcanic origin). This unit caps many of the higher ridges situated to the east of the Frank Creek fault, including Goose Peak, Badger Peak and Borland Mountain.

The Agnes conglomerate occurs in the upper transitional portion of the Harvey's Ridge section and may be a lateral equivalent of the Goose Peak quartzite. The Quesnel Lake gneiss, which intruded the older rocks in the Frank Creek area, was dated at 357.21.0 Ma by the U-Pb zircon method by the BC Geological Survey (Ferri, Hőy and Friedman, 1998).

The stratigraphic section is overturned and warped by a series of broad late-stage (F3) folds. Most rocks are variably slaty, foliated, laminated or schistose. In much of the Frank Creek area, the main foliation (S2) dips moderately to the west or southwest, in contrast to the regional trend of moderate dips to the northeast, such as at the Ace project area. The Frank Creek area is in the nose of a series of broad F3 folds that warp S2 gently to steeply, locally, and plunge gently to the northwest.

Most rocks of the Frank Creek project area are of the Harvey's Ridge succession. At the stratigraphic base of the section (top of Frank Ridge) is a finely banded, tuffaceous, basaltic andesite. Much less abundant are massive, coarser grained flows, one of which contains a few pillow flows, whose orientation supports the overturned model. A transition zone contains intercalations of volcanic and sedimentary rocks and mixed rocks described as tuffaceous phyllite. Stratigraphically overlying this unit (downslope to the north) is a zone of mixed quartz pebble and sugary quartz sandstone, dark grey to black quartz siltstone and black argillite.

Further downslope is a unit at least several tens of metres thick containing abundant angular fragments of quartz and lesser plagioclase ranging 0.5 - 3 mm in size. This unit has been interpreted previously either as pebbly sandstone to conglomerate or medium to coarse felsic tuff. The unit contains intervals up to a few metres thick of black, argillaceous schist that is mainly non-graphitic, but contains local zones of significant graphite content.

A broad interval represented by little to no outcrop separates the main zone of quartz-pebble rocks from the stratigraphic level of the massive sulphide. Stratigraphically above the massive sulphide showing is a small outcrop containing abundant zones of pyrite and chalcopyrite replacement and stringer mineralization. The discovery of the massive sulphide zone and its probable genetic relationship to these rocks, which have been interpreted by Payne and some others to be felsic volcanic rocks, indicate that this area has potential for an economic VMS mineral deposit. [Mckinley (2004, pg. 14) disagrees about the type of host rock. '… there are no felsic volcanic rocks present in the area'].

[The hosting volcanic rocks need not be thick. Evans and Moon (1995, pg. 292) state '[The deposits of Kuroko-types] often occur within a limited stratigraphic interval…This is usually at the top of the felsic stage of cyclical, bimodal, calc-alkaline volcanism… Sometimes this favourable horizon is hosted by quite relatively thin developments of volcanic rocks, as in the Iberian Pyrite Belt where the volcanic-sedimentary complex underlying the many enormous ore bodies of this region is only 50-800 m thick. The Japanese Kuroko mineralization and associated volcanism occurred during a limited period of the Middle Miocene in the Green Tuff volcanic region. By contrast the deposits of the Noranda area, lie in a narrow stratigraphic interval within a vast volcanic edifice at least 6,000 m thick'].

Further to the east and northeast is a resistant marker unit of quartzite and locally finely laminated limestone. The interpretation of this unit is not resolved. If the section is overturned, as detailed data suggest, this could be part of the Goose Peak quartzite. Alternately, it might be an interval of the Agnes conglomerate. In some outcrops, a pseudo-conglomeratic texture was produced by deformation. Some of these outcrops contain scattered, rounded boulders up to 25cm across of quartzite of the same composition as the matrix. If they are actual boulders, the rock would be a true conglomerate. However, the absence of exotic boulder types argues that they are pseudo-boulders and are the products of the regional metamorphism. The limestone is exposed only in the canyon of Frank Creek. The quartzite continues as a significant stratigraphic marker unit to the southwest, where it does not contain any pseudoconglomeratic textures.

To the east, a major fault (Frank Creek fault) identified in this study, drops the Frank Creek block down with respect to the Goose Peak block to the east, in which surface rocks are dominantly Goose Peak quartzite. Although regionally, F3 folds and L12/L23 lineations in the Goose Peak block also plunge gently to moderately to the northwest, within about 1 km of the Frank Creek fault, the plunge is reversed to gently to the southeast. Further work on the regional folding should be done in order to resolve the facing direction of the stratigraphic section and the direction of movement on the Frank Creek fault. Preliminary work in this study suggests that the stratigraphic section is overturned and the fault is normal.

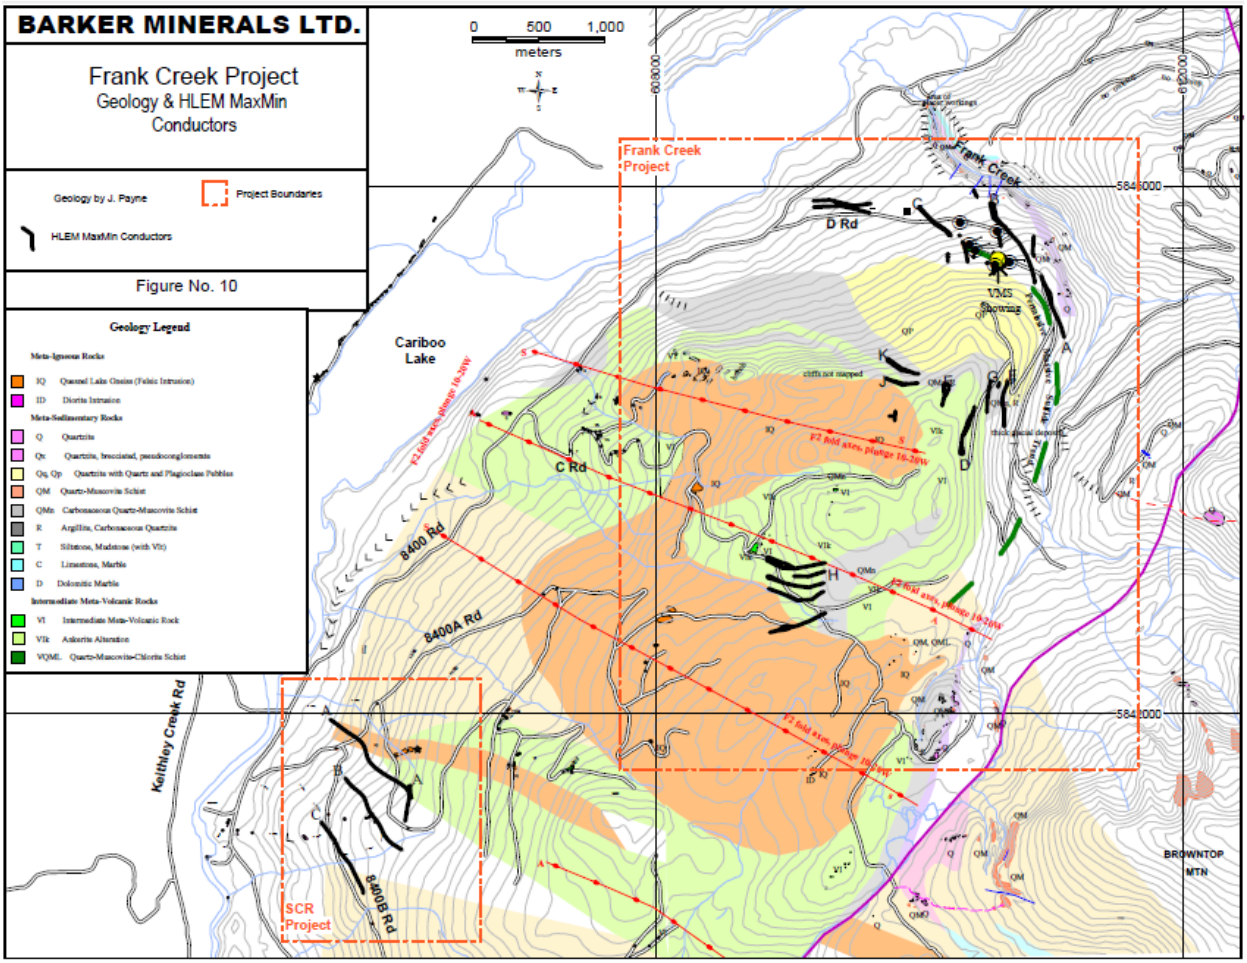

Figure 7: Frank Creek geology map with HLEM conductors (From Payne, 2001)

7.2.02 Black Bear Geology

The geology of the Black Bear property consists of locally graphitic and tuffaceous dark grey shales with minor interbedded limestone and minor calcareous siltstone (refer to 'Black Phyllite' unit in Figure 6 and Unit 1 in Figure 8). The assemblage belongs to the basal unit of the Nicola Group in the Quesnel Terrane, a composite volcanic-arc sequence dominated by Mesozoic mafic to intermediate volcanic rocks. Horizons of bleached light grey to greenish phyllite are commonly associated with mineralized quartz veins. Several occurrences of a dark green ultramafic or gabbroic rock occur in small outcrops and large rounded boulders. This rock commonly contains fuchsite. Andesitic volcaniclastics and pillow breccia have been described in the north side of Collins Creek (Cooper, 1984).

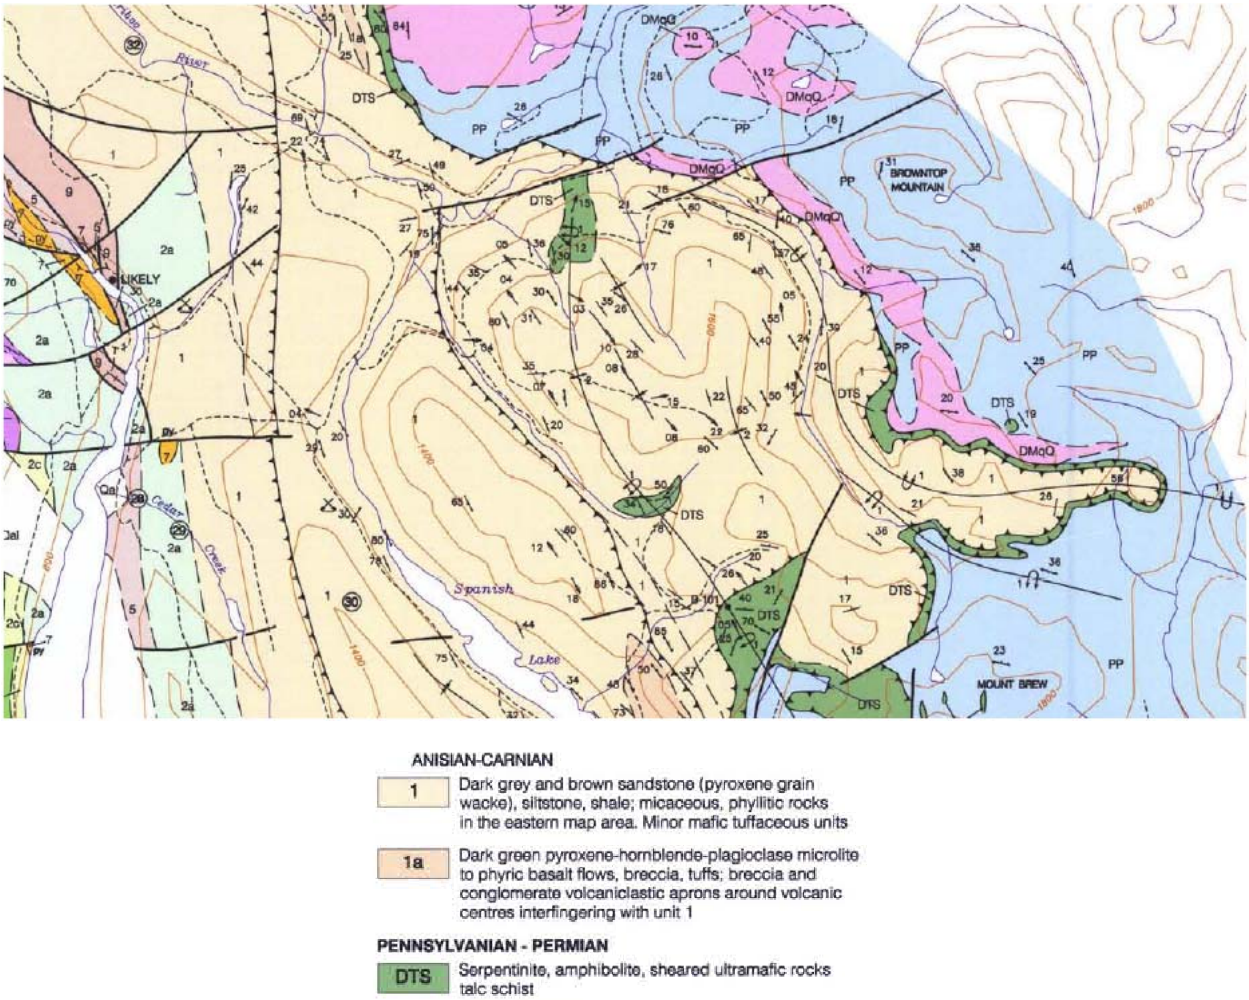

Figure 8: Geology of the Black Bear project area (Bulletin 97, Ministry of Energy and Mines - A. Panteleyev, D.G. Bailey, M.A. Bloodgood and K.D. Hancock, 1996)

Bedding and foliation parallel to bedding strike NW-SE and dip shallow to moderately NE. Panteleyev et. al. (1996) mapped the fold axis of an antiform in the Collins Creek area of the Black Bear property and a splay of the Eureka Thrust Fault along Black Bear Creek.

Quartz and quartz-iron carbonate (siderite) veins range in size from centimeters up to 8m of exposure with persistent pockets of partly leached galena, pyrite and trace argentite mineralization along a NW/SE strike. Multiple parallel veins with consistent lateral mineralization of up to 150m are common to both Providence and Hunt targets. The quartz and quartz-iron carbonate veins are locally intensely oxidized and leached leaving them with rusty red stains and vugs of partly leached sulphide (pyrite + galena). Fuschite (chrome mica) is a common mineral along vein selvages in association with galena mineralization and in the host rocks as possible late alteration overprint.

Dark grey argillite and laminated felsic rock are the host rock of the quartz and quartz iron carbonate veins on the Black Bear property. The vein mineralization branches out from the felsic centers into the argillite before pinching out. As observed in most of the trenches, the mineralized veins have a general NW/SE strike and a N/NE dip and extend over a 2km trend from TR-07 (LCTR3) in the NW to TR-01 (Providence Adit) in the SE.

8.0 Economic Targets

8.1 Black Bear

Barker Minerals is exploring the Black Bear Property for Au-quartz veins (BCGS Deposit Type I01) and polymetallic veins: Ag-Pb-Zn+/-Au (BCGS Deposit Type I05). The possibility of stratigraphically controlled disseminated gold mineralization (similar to the *Spanish Mountain Gold Ltd.* project 5.0 km to the southwest) is also being considered. The economic target at Black Bear is high grade Ag ± Au in quartz-galena veins hosted in the sedimentary rocks of an extensional basin.

Mineralization on Black Bear property consists of discontinuous blebs of galena and pyrite in quartz and quartz-iron carbonate veins. These mineralized veins occur as float and outcrop over approximately a 2 km NW-SE trend from the Providence adit at the SE end.

8.2 Frank Creek

Barker Minerals is exploring the Frank Creek Property for volcanogenic massive sulphides deposits. The rock hosting the known massive sulphide mineralization on the Property is quartz-muscovite schist. Regional metamorphism has disguised the protolith such that identification of the host rock has been difficult. The host rock has been interpreted as quartzite, quartz-eye tuff, felsites, or rhyolitic volcaniclastics by various geologists in past and present work. Controversy is likely to continue.

Past opinions of some have favoured the massive sulphide prospect at Frank Creek to be Besshi-type or sedex due to the apparent lack of felsic volcanism at Frank Creek; the host rocks at the Frank Creek Showing were considered metamorphosed shales, argillites and quartz-eye grits or quartzites. Christopher Wild, former Chief Geologist of Goldstream Mine, near Revelstoke, B. C., stated the geological setting, mineralization and host rocks here are all remarkably similar to the Goldstream Mine mineral deposit, which produced more than 2 million tonnes of ore at a grade in excess of 4.0% copper and 2.2% zinc. (Doyle, L.E., in Assessment Report 27125 pg. 16). The Goldstream deposit is considered a Besshi-type massive sulphide. Barker Minerals' L.E. Doyle, President, and R. Turna, Vice President of Exploration consider the Frank Creek prospect to likely be Kuroko-type. The hosting 'quartzites' are considered to be rhyolitic volcaniclastics. The prospect has important components of galena mineralization, barite (suggested in the 2007 soil survey and exposures in Trench TR07-4) and extensively occurring stockwork or stringer mineralization. The above characteristics are more indicative of Kuroko rather than Besshi deposits. Carbonaceous black shales, the common host of sedex deposits, appear to mainly overlie rather than host the Frank Creek massive sulphides.

9.0 QA/QC of Sampling and Sample Collection

9.1 Sampling Method and Approach

The drill core was split in half with a table-mounted diamond saw in the cutting trailer in camp. Half of the core was returned to the core box and the other half was placed in a marked plastic bag, zip-tied, and stored prior to shipment to the analytical lab. Care was taken to minimize cross-sample contamination and to ensure representative samples were being collected. Core recovery factors during drilling which could materially affect the accuracy of the results are described as core recovery percentages in the drill logs.

Soils were sampled and/or collected from the flanks of logging roadside and placed into either plastic sample bags or paper bags. A shovel was used to recover soil from a depth of 15-25cm with intent to collect from the B soil horizon where possible. Where a B-horizon was not attainable, sample mediums did include A and C horizons and regolith. At each sample location, a GPS waypoint was taken and marked in a notebook, the area was flagged with tape, and any pertinent observations (soil horizon, moisture content, colour, etc.) were noted.

Core samples were shipped in plastic rice bags to the analytical lab. Samples were stored in the garage or cabin at the camp prior to shipment. After sampling the core boxes were returned to their storage locations in camp.

9.2 Laboratory Methods

9.2.01 Sample Preparation and Analysis

Samples from DDH BB-2012-07 were sent to *AGAT Laboratories Ltd*. of Burnaby B.C. for base and precious metal analysis. Samples from the BB-East soils program and the Frank Creek property drill-program of 2013 were sent to *Activation Laboratories Ltd*. of Kamloops B.C. for base and precious metal analysis.

Samples from DDH BB-2012-07 were subject to three types of analyses by *AGAT Laboratories Ltd*. of Burnaby, BC; an aqua-regia digest with an ICP/ICP-MS finish (AGAT code 20174), a fire-assay with an ICP-OES finish (AGAT code 202055), and a lithium borate fusion with an ICP-OES finish (AGAT code 201076). Samples from the BB-East soils program and the Frank Creek property drill-program of 2013 were subject to two types of analyses by Activation Laboratories Ltd. of Kamloops, BC; an aqua-regia digest with an ICP-MS finish (ACTLABS code UT-1) and a fire-assay with an ICP-OES finish (ACTLABS code 1C-OES).

All lab results are accompanied by the laboratory sample preparation, analyses methods, and quality assurance and can be found in Appendix 2 (Black Bear) and Appendix 5 (Frank Creek).

All pulp and reject samples were shipped back and stored in camp for future QA/QC and further analyses.

9.2.02 Verification of Accuracy

Check samples (standards) from *WCM Minerals* of Burnaby, BC with certified metal concentrations were included at specific intervals when samples were sent to the labs for analysis. The Labs, as well, performed their own accuracy checks with certified samples, blanks, and duplicate analyses of Barker's samples.

10.0 Current (2012/2013) Work Performed

10.1 Black Bear Property

10.1.01 Black Bear Work Performed in 2012

The previous assessment report (AR 33309) pertaining to the Black Bear property did not include the final drill hole of 2012 (BB-2012-09) nor the analytical data for drill hole BB-2012-07 as both sets of information were not available at the time of submittal. Please refer to AR 33309 for a general map of the Black Bear 2012 drill holes and work locations.

Table 2: 2012 Black Bear Drill Hole Parameters

2012 Drill Hole	Easting	Northing	Elevation (m)
BB-2012-06	0607037	5832834	1378
BB-2012-07	0606956	5832840	1382
BB-2012-08	0606991	5832877	1402
BB-2012-09	0606924	5832825	1366

The aim of the 2012 drill program at the Black Bear property was to test for shallow extensions for the high grade Ag-Pb-Au vein mineralization exposed in outcrop and by trenching at surface.

Similar to the previous holes on the Black Bear property in 2012, drill hole BB-2012-09 was collared vertically (90^{o} dip) and drilled to a total depth of 107.29m between October 12th and December 1st, 2012. An NQ bit size was used until 28.04m and subsequently reduced to BQ for the remainder of the hole.

BB-2012-09 intersected alternating horizons of black carbonaceous and grey fissile shale (phyllitic siltstone). Input from local volcanism could be seen as pyroclastic clasts, tuffaceous sediments, or tephra. The alteration mineral assemblage consists of muscovite, carbonate, quartz, calcite, fuschite (a green chrome-bearing mica), pyrite, sphalerite, and pyrrhotite. No significant visual mineralization was intercepted. Refer to Appendices 3 and 4 for detailed drill logs and drill sections).

Analytical results for gold presence in BB-2012-07 were discussed but not included in the previous assessment report (AR 33309). See Appendix 2 for the base and precious metal analyses conducted by *AGAT Laboratories Ltd* from Burnaby, BC. The results are briefly summarized in Section 6.1.03 of this document.

10.2 Frank Creek Property

Work Performed in 2013

Six drill holes were completed on the Frank Creek property to a combined depth of 512.12m between June and November of 2013.

Table 3: 2013 Frank Creek Drill Hole Parameters

2013 Drill Hole	Easting	Northing	Elevation (m)
FC-2013-09	0610486	5845537	1118
FC-2013-10	0610630	5845889	1048
FC-2013-11	0610630	5845889	1048
FC-2013-12	0610525	5845882	1029
FC-2013-13	0610540	5845749	1072
FC-2013-14	0609798	5845044	1185

All pertinent information to each drill hole can be found in detail in the attached drill-logs and sections in Appendices 5 and 6. Refer to Figures 10, 11, and 12 for location of drill holes and test pits completed at the Frank Creek property in 2013.

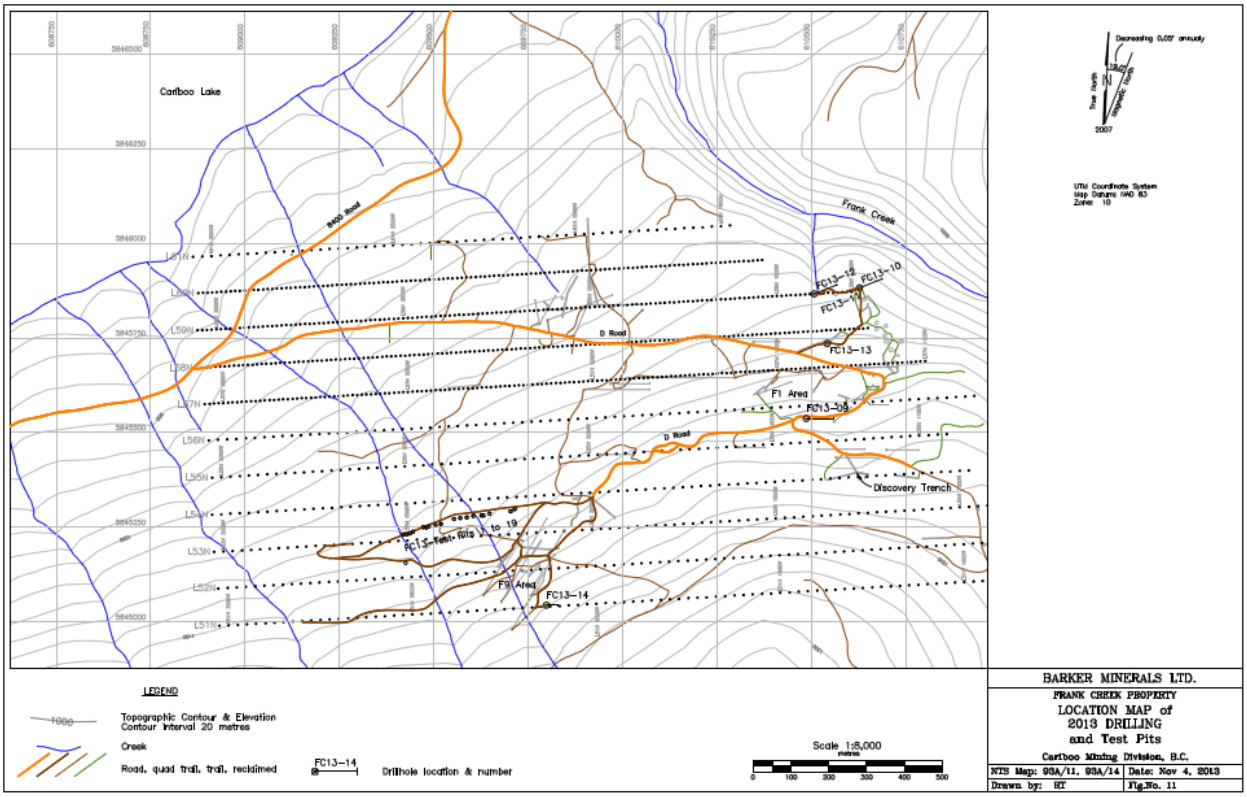

Figure 10: Location map of 2013 work completed at Frank Creek

FC-2013-09 – The objective of this hole was to follow up and confirm elevated gold results from FC-2011-03, on Line 55N, by twinning the hole (same location/azimuth/dip) due east with a 60º dip. FC-2013-09 was drilled to a depth of 147.5m but did not yield any significant gold results when compared with FC-2011-03 (refer to lab results in Appendix 5). The hole intersected small replacement lenses of massive sulphide, thought to represent the Discovery mineralization trend (refer to *Quantec Geosciences Inc. Titan Survey Pages F22-F28 in* Appendix 8), of 40cm at 62.65m and 47cm at 67.43m depth. A stockwork of pyrite stringers surrounds the mineralized lenses that were bound by a light-medium grey greywacke (protolith is interpreted to be felsic volcanic but is still openly contested).

FC-2013-10 – Purpose of hole was to follow up on a low resistivity (inferred conductor) anomaly (refer to *Quantec Geosciences Inc. Titan Survey Pages F36-42 in* Appendix 8*)* at 30-250m depth at the northeastern side of the Frank Creek property between lines 58-59N and to further seek the source of placer gold found in Frank Creek. The intersection of the core of this anomaly was expected at 100m depth. FC-2013-10 was drilled at a 70º azimuth and 60º dip to 128.63m and intersected repeated alternating horizons of black graphitic argillite with sharp contacts between a highly altered (locally intense sericite, muscovite, qtz-carbonate veins, and cr-mica) soft and aphanitic green unit. No significant mineralization or elevated precious metals were intersected (refer to lab results in Appendix 5) and the low resistivity anomaly was attributed to the presence of black graphitic argillite.

FC-2013-11 - Purpose of hole was to verify the dip orientation of the stratigraphy encountered in hole FC-2013-10 by drilling in the same location and opposite direction (azimuth 250º, dip of 60º). The hole was drilled to 26.85m and laminations and foliation were mainly determined to be an acute angle to the core-axis at 20-30º. A 90 degree angle of bedding and foliation to the core-axis generally denotes drilling perpendicular to bedding; an acute angle to the core-axis denotes drilling closer to bedding parallel. Only an intensely fractured black graphitic argillite unit was intersected.

FC-2013-12 - Purpose of hole was to create a drill fence westward from the low resistivity, inferred conductor, anomaly drilled at FC-2013-10 on the eastern portion of Line 59. FC-2012-12, drilled to

128.73m with a 68^{o} azimuth and 60^{o} dip, intersected similar alternating horizons to that of FC-2013-10. The hole exhibited repeating units of black graphitic argillite with sharp contacts between a soft and altered light green-grey unit with an identical alteration mineral suite. No significant mineralization was intersected. The black graphitic argillite was interpreted to be the source of the low resistivity anomaly.

FC-2013-13 - Purpose of hole was to drill a Pb anomaly from the Enzyme Leach survey (refer to Appendix 9) in an attempt to intersect the Discovery mineralization trend. Pb is a relatively immobile element and elevated values in soils should reflect mineralization in local basement rock, thus drilling the anomaly is a viable option. The hole was meant to be shallow and quick whilst waiting for permitting for further drilling in the FC13-09 area on Line 57 (refer to *Quantec Geosciences Inc. Titan Survey Pages F29-F35 in* Appendix 8). Initially, the hole encountered difficulty due to lack of casing. Hole was ceased after a drill rod broke down hole and rods were not recoverable. 18.90m (2 boxes) were produced only containing overburden of quartz-muscovite and carbonaceous schist.

A first-pass XRF study was conducted to on FC-2013-09, 10, 11, and 12 to gain semi-quantitative geochemical results (refer to results in Appendix 10) to help discern if a hole warranted lab analysis. The XRF analysis was repeatedly giving elevated gold values (up to 34.82ppm) for the light grey-green muscovite and sericite altered unit in FC-2013-10 and 12; it was decided that FC-2013-10 was to be sent for lab analysis to follow up on these XRF gold readings. Lab results returned with insignificant gold values and the gold values determined by the XRF were deemed to be false readings. False readings from a handheld XRF instrument can be attributed to matrix effects of the sample medium or overlapping peaks from elements with similar wavelengths. From the lab results, the grey-green altered unit is elevated in arsenic compared to the intercalating black argillite. Arsenic is well-known to interfere by overlapping gold peaks and giving false readings; this is the likely source of the false gold readings given for FC-2013-10 and 12.

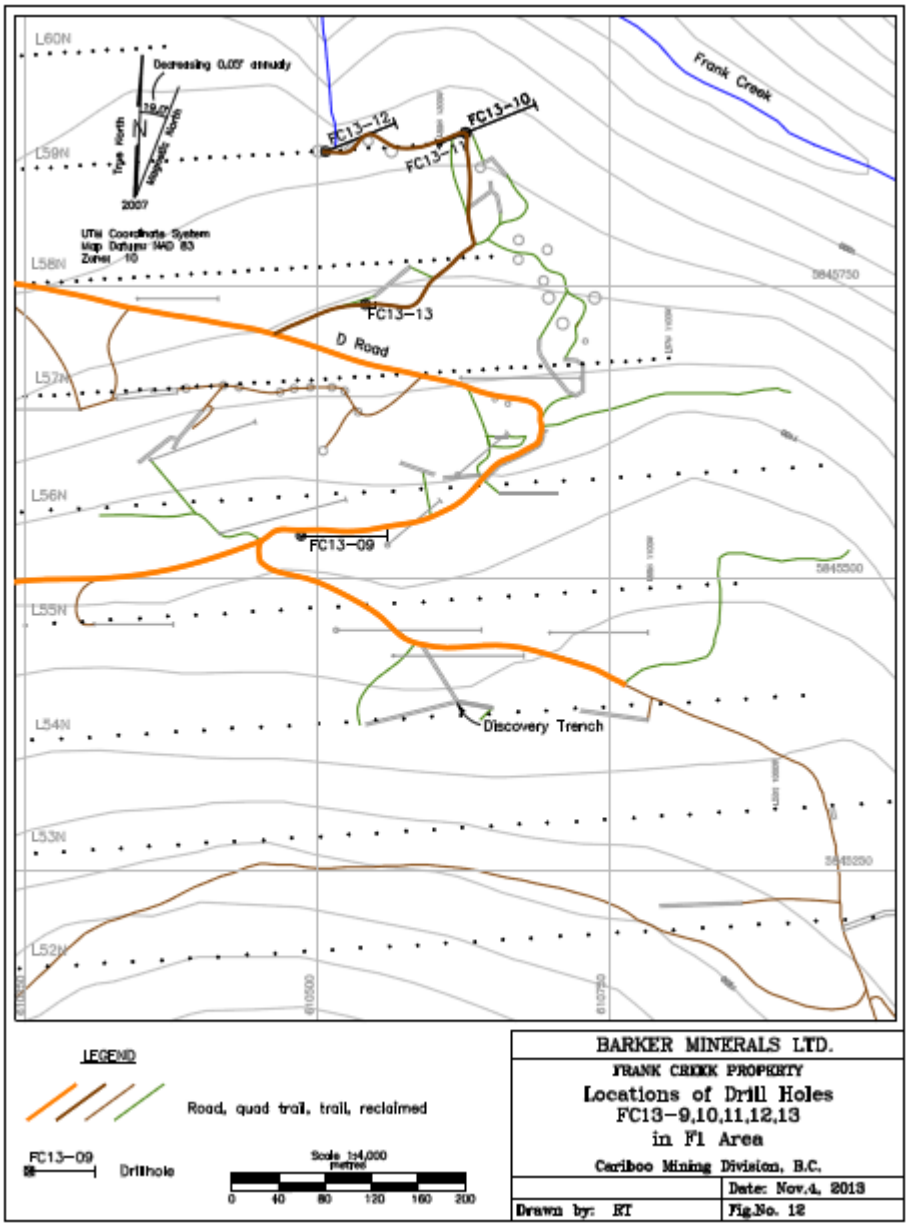

Figure 11: Locations of DDH FC-2013-09, 10, 12, and 13 on the Eastern side of the FC property

FC-2013-14 - Purpose of hole was to test chargeability high on L51N (refer to *Quantec Geosciences Inc. Titan Survey Page F8-F14 in* Appendix 8*)* with a target depth greater than 100m. Hole was drilled to 67.56m due east with a dip angle of 70º. The hole intersected a 24cm rotted lens of massive sulphide rich in cr-mica at 3m and three semi-massive sulphide lenses in the upper 17m of the hole (55cm, 34cm, and 22cm in length respectively). A small 3cm band of massive chalcopyrite was intercepted at 65.23m shortly before the termination of the hole. The hole was sampled and shipped to *Activation Laboratories Ltd.* of Kamloops, BC but analytical results were not available before the deadline of submittal of this assessment report.

A series of 19 test pits were completed by an excavator in an attempt to follow the continuation of the mineralization intersected in the northern section of trench FC08-TR1 (see AR 32696) and were

completed between proposed trenches T2 and T3 (2009 Proposed Drilling, Trenching, and Access Trails, Turna 2009) along an existing logging road (See Figure 12). The test pits yielded minimal outcrop as glacial overburden is meters thick in the locality. The outcrop exposed in the test pits was predominantly oxidized blue quartz-muscovite schist with no mineralized horizons.

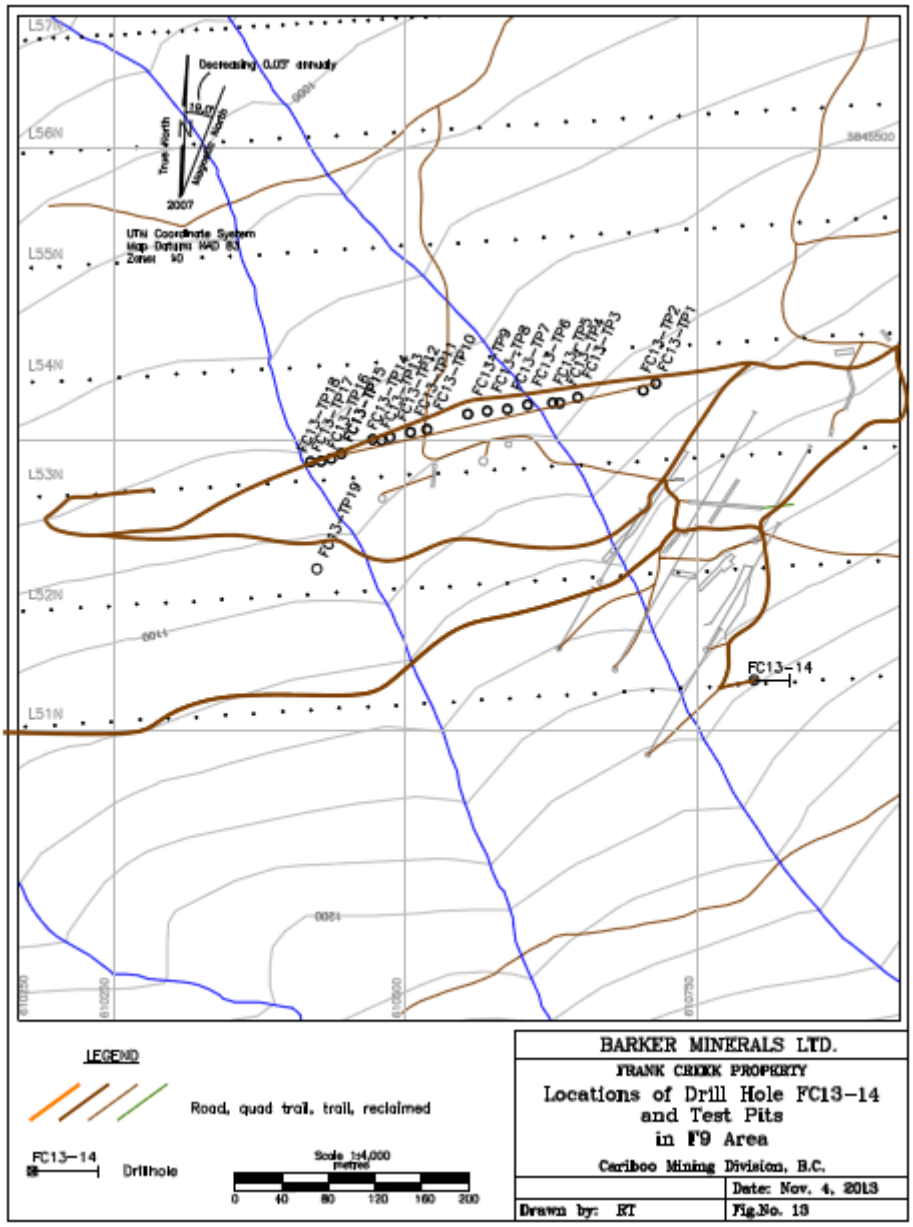

Figure 12: Locations of DDH FC-2013-14 and 19 test pits in F9 area on western side of FC Property

.A small prospecting exercise was conducted in both work areas of 2013 at the Frank Creek property in an attempt to discern the orientations of strata and the strata-bound mineralization. The field notes can be found in Appendix 10. The findings revealed a repeating orientation of strata and foliation generally striking NW-SE dipping to the SW, reaffirming previous structural measurements taken in the area.

11.0 CONCLUSIONS

11.1 Black Bear Property

11.1.01 Work Performed in 2012

The aim of the 2012 drill program at the Black Bear property was to test for shallow extensions for the high grade Ag-Pb-Au vein mineralization found at the selvages of extensive quartz veining exposed in outcrop and by trenching at surface. These Quartz veins containing Ag-Pb-Au bearing galena mineralization occur extensively over a 2.0 km trend northwestward from the Providence adit. Many new mineralized quartz occurrences were discovered by prospecting in 2008.

BB-2012-09 intersected alternating horizons of black carbonaceous and grey fissile shale. Input from local volcanism could be seen as pyroclastic clasts, tuffaceous sediments, or tephra. This geology supports the interpretation of an extensional basin with volcanic input; a favourable location for hydrothermal activity and related mineralization processes. The alteration mineral assemblage found in BB-2012-09 consists of muscovite, carbonate, quartz, calcite, fuschite (green chrome-bearing mica), pyrite, sphalerite, and pyrrhotite. No significant amount of mineralization was intercepted.

Rock samples highly anomalous in gold and placer gold have been sporadically discovered in Black Bear Creek. Though silver has been the focus of exploration in the past, gold should also be explored for on the Black Bear property. The Spanish Mountain gold deposit is approximately 5.0 km SW of Black Bear.

Although economic gold has not yet been found in the 2012 drilling at the Providence target, the results thus far indicate the drilling is within a large hydrothermal system with a favourable alteration assemblage to warrant further exploration endeavours.

11.2 Frank Creek Property

FC-2013-09 did not mimic the gold results as expected from its twin hole FC-2011-03. This can perhaps be attributed to small-scale variability in the geology and structure experienced at depth or errors in the sampling, cutting, and/or analytical procedures. Sample 04559, the highest gold-bearing sample from FC-2011-03, is a 15cm white quartz vein with up to 50% massive sulphide (pyrite and chalcopyrite). The same quartz vein is thought to have been intercepted and subsequently sampled in FC-2013-09 as Sample 17774, a 40cm white quartz vein, which did not contain any massive sulphide. It can be interpreted that the gold is found in association discontinuous sulphide mineralization. To further substantiate this interpretation, elevated gold values in FC-2013-09 and FC-2011-03 are closely associated with the presence of arsenic and sulphide mineralization. The highest gold value in FC-2013-09, 508ppb, is associated with a massive sulphide lens and immediately flanked by anomalous arsenic concentrations (202-5210ppm). Although FC-2013-09 did not yield the concentrations of gold as expected, the deeper hole intersected two lenses of massive sulphides, totalling 1.24m, thought to be the extension of the Discovery showing constrained between greywacke (interpreted felsic volcanic).

Drill holes FC-2013-10, 11, and 12 were conducted to test a low-resistivity anomaly, interpreted as a conductor, from the Quantec Survey. The holes were drilled to test for the presence or indication of mineralization as massive sulphides (conductors) at depth, to test for the source of the placer gold found in Frank Creek below, and to further develop the structural understanding of the area. No significant mineralization was observed in the core. First-pass XRF analysis was giving elevated gold values for the green sericite-altered unit in FC-2013-10, 11, and 12; it was decided that FC-2013-10 was to be sent for lab analysis to follow up on these XRF gold readings. Lab results returned with insignificant gold values and the XRF was deemed to be displaying false readings due to a matrix effect or overlapping peaks from elements with similar wavelengths. From the lab results, the sericite-altered green unit is elevated in arsenic compared to the intercalating black argillite. Arsenic is well-known to interfere by overlapping gold peaks to give false readings and this is likely to be the source of the false gold readings given for FC-2013-10 and 12.

Drill hole FC-2013-14 was to test a chargeability high at greater than 100m depth. The hole did not reach target depth and subsequently did not test this geophysical anomaly. However, the hole intersected small lenses of massive and semi-massive sulphides; a 24cm rotted lens of massive sulphide rich in cr-mica and three semi-massive sulphide lenses in the upper 17m of the hole (55cm, 34cm, and 22cm in length respectively). A small 3cm band of massive chalcopyrite was intercepted at 65.23m shortly before the termination of the hole. The hole was sampled and shipped to *Activation Laboratories Ltd.* of Kamloops, BC but analytical results were not available before the deadline of submittal of this assessment report.

19 test-pits were excavated to expose bedrock in hopes of revealing the extension of the mineralized horizon found in trench FC08-TR1. The majority of test-pits did not expose bedrock as in most cases the overburden was deeper than the boom of the excavator. Of the geology that was exposed, it was mostly a blue quartz-muscovite schist unit, locally oxidized due to disseminated coarse grained pyrite cubes.

13.0 Recommendations

Structural measurements should be mapped in detail to project mineralized horizons outcropping on surface. Follow up should include test-pits and drill holes. Fences of holes should be drilled in the area of FC-2013-09 to /FC-2011-03 to further constrain the massive sulphide horizons and determine whether significant gold is present. Further mapping of mineralization and projections of mineralization is necessary to further constrain the extensive array of geochemical and geophysical targets outlined in previous work on the Frank Creek property.

Bedding/structural measurements should be mapped in detail to project mineralized horizons outcropping on surface. Follow up test-pits, drill holes, etc.

Black Bear – Drill Logs for DDH BB-2012-07 and BB-2012-09

BARKER MINERALS LTD.

DRILL HOLE NO. BB-2012 - 07

Dip & Azimuth Tests			BB-2012-07	Easting (NAD 83): 0606956	Core Size: NQ, BTW at 82.04m	Started: June 18, 2012
Depth	Dip	Azmth	Other tests	Northing (NAD 83): 5832840	Hole Azimuth: 0°	Finished: August 6, 2012
				Grid Location: 10 U	Hole Angle: 90°	Logged by: Bethany Duff
				Elevation: 1382m	Total Depth: 309.14m	Analysis by: AGAT LABS
						Drilling by: C. Best

Note: Azmths above are
Tests done using Reflex EZ-Shot.

Depth (m)										Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong)						
From	To		Description	% Py	% Cpy	% Sph	% Gal	% Mo	Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl	Ep	Reactions to Magnet and Acid.
			Purpose of hole is to better understand the model, the deeper hole wil provide more information.												
3.65	5.00		Overburden												
5.00	18.90		**Argillite/Mudstone**. Dk grey, graphitic on fracs @12 (30cm) lt grey oxidized rock. Very few veins, Qtz/Carb veins @14.89 (2cm), 15.58 (2cm), 16.30 (15cm, 4 veins), 17,.20 (1cm)	0.5											Fizz on veins, non magnetic
18.90	28.94		**Felsic Rock**. Med to lt grey/brown oxidized. Minor diss Py, Py more abdt near veins.	1			0.4				1	2			Strong fizz on alt and veins, non magnetic
			`@20.42 (23cm) rubbly Qtz vein, oxidized												
			`@22 (12cm) Qtz vein Py and Gal around edges												
			`@23..31 (29cm) thick Qtz vein, right edge oxidized, vuggy, massive Gal, at left edge a few Gal stringers. Mn staining on heavily oxidized sections.				4					5			
			`@24.75 (45cm) Qtz/Carb vein, Gal stringers, Py blebs, tr Chl	1			0.5				3	5	tr		Strong fizz, non magnetic
			`@26.02 (55cm) silicified section, minor Py and Gal												
			26.52 to 28.94 rubbly												
28.94	37.18		**Argillite/Mudstone**. Dk grey w/ med grey banding, diss Py	0.5											no fizz, non magnetic
			`@34.80 (37cm) lt grey rubble, lots of mica, soapy feel												
37.18	39.32		**Felsic Rock**. Lt grey to brown, silicified, diss Py												non magnetic, some fizz
			`@38.50 large Py blebs and Gal stringers												lots of fizz
			`@39 (7cm) Qtz vein tr Py otherwise barren												

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	% Mo	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl	Ep	Reactions to Magnet and Acid.
39.32	39.74		**Fault Gouge**												
39.74	42.27		**Argillite/Mudstone**. Dk to med grey, diss Py, minerals leached out (Py replaced by clay alt).	1											
			`@40.87 (20cm) more intense alt, Py stringers												
			`@41.28 (17cm) brecciated Qtz vein vein w/ minor Py and Gal												
42.27	46.56		**Felsic Rock**. Lt grey to white, highly silicified, intense alt, diss Py	4								4			
			`@42.64 (30cm) more mineralized, Py blebs, Gal stringers, poss tr Mo, Sph bleb w/ Gal, small vugs in Qtz, Bedding tilted; Fault?	0.4		0.3		tr							
			`@41.21 (16cm) intense alt, larger Py blebs												
			`@43.43 (10cm) Py and Sph stringers	3		1									
			`@43.58 (14cm) Massive Py	10											
			`@44.88 stringer of Cr mica						2						
46.56	52.30		**Argillite/Mudstone**. Gradational change from felsic to dk grey. Dk grey w/ carb veins, intense fizzing; Argilliceous limestone? Bedding tilted up to 47.85, Fault?	0.1							4				Intense fizzing in dk grey carb banded rock, non magnetic
			`@47.80 (7cm) barren Qtz vein												
			diss Py in non carbonate rock, oxidized, Py replaced by clay alt												
52.30	55.61		**Felsic Rock**. Gradational change into lt grey silicified rock. Diss Py, more abdt w/ alt	2								4			no fizz, non magnetic
			`@54.80 Py stringers w/ tr Gal												
			`@55 Py on fracs, tr Gal, @55.20 (6cm) barren looking Qtz vein w/ tr Cr mica						tr						
55.61	65.90		**Argillite/Mudstone**. Dk grey w/ minor Qtz veins, Diss Py, slatey cleavage	0.5								2			No fizz, non magnetic
			`@65 (16cm) Gouge, silty.												
65.90	85.76		**Argillite/Phyllite**. Dk grey Qtz/Carb banded, slatey cleavage, appearance of more Musc. Qtz has small vugs.	1							3	2			Fizzing on Qtz/Carb banding, Non magnetic

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	% Mo	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl	Ep	Reactions to Magnet and Acid.
			`@68.70 to 69.90 lighter grey/more alt, diss Py in highly alt zones.												
			70.71 to 73.76, wash out												
			`@80.76 (57cm) and 84.09 to 85.20 intensely alt, larger Py blebs and stringers	2											
85.76	86.26		Argillite/Phyllite. Rubble, graphitic												
86.26	90.90		**Felsic Rock**. Lt grey/brown, silicified, some distince veins other areas of high Qtz alt. Diss Py more in silicified zones.	1											
			`@86.54 (20cm) Qtz vein, tr Py, lots of mica of fracs, Musc w/ tr Cr mica, vuggy Qtz						tr						
			`@88.06 to 89.28 highly silicified alt, larger Py blebs and stringers, tr Gal, tr Chl, slightly brecciated	2											
			`@89.50 (5cm) slightly brecciated Qtz vein, Py stringers												
			Starts to grade into dk grey near end of section												
90.90	103.81		**Argillite/Mudstone**. Dk grey, alt Qtz/Carb banding, Py blebs and stringers, graphitic on fracs	2							3	2			Moderate fizz, non magnetic
			`@95.18 (2.5 cm) barren Qtz vein												
			`@103.68 (6cm) Qtz vein w/ Py stringers at edge								4	3			
103.81	122.50		Dk grey, Qtz/Carb banding, diss Py	3											Strong fizzing (lots of Carb veins), non magnetic
			`@118.31 (8cm) barren Qtz/Carb vein												
			`@120 to end of section, high silicified, high alt zone. Larger Py blebs @ 122.05 (11cm) Qtz vein.												
122.50	129.00		**Felsic Rock**. Grey w/ silicified zones, alternates a bit w/ dk grey argillite @124.97 (65cm), 126.35 (6cm), 126.60 (60cm) gradational change between 2 rock types. Diss Py mostly in dk grey	0.3							2	3			weak fizz, non magnetic
			`@122.73 (20cm) Cr mica alt as banding, flecks of Musc visible, and poss some Chl							3					
			`@123.23 (7cm) some Cr mica alt as well as on fracs												

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	% Mo	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl	Ep	Reactions to Magnet and Acid.
			`@128.8 (15cm) brecciated Qtz vein w/ Cr Mica stringers and on fracs, bleb of Sph	0.5		tr			3						
129.00	137.58		Felsic Rock. Grey, laminated, not as alt, diss Cr mica and Musc	tr					2		3	2			Moderate fizz, non magnetic
			`@129.90 (25cm) Py stringers w/ Cr mica												
137.58	139.15		Felsic Rock. Lt Grey, laminated, diss Cr mica and on fracs						2						fizz in only a few small Carb veins. Non magnetic
139.15	139.55		**Argillite/Mudstone**. Weak Chl, Musc on fracs, diss Py	1									1		
139.55	140.82		**Felsic Rock**. Lt grey, diss Py following fabric.	3								1			no fizz, non magnetic
			`@139.55 (6cm) Qtz/Carb vein w/ massive Py												
			`@140.35 soft grey mineral w/ grey streak?												
140.82	145.76		**Argillite/Mudstone**. Dk grey, laminated, diss Py, minor Qtz veins												
			`@145.08 (11cm) Felsic rock w/ Qtz veining												
145.76	158.51		**Felsic Rock**. Lt grey/green, laminated, porphyritic (Plag phenos), Chl alt, finely diss Py, minor Qtz veins and infill, diss Musc	0.5								2	4		Non magnetic, fizzes on a few Carb veins
			`@147.11 (4cm) Qtz vein w/ Chl and Musc/Plag phenos on either side												
			`@148.37 to 148.78 Chl alt Qtz vein, Py blebs	1											
			`@150.26 loses some of the porphyritic texture, Chl alt and brown clay alt Ser?							2			3		
			`@151.07 (5cm) Qtz/Carb vein barren w/ tr Py	tr											
			`@152.85 (15cm) Qtz vein w/ Clay alt, Py blebs, Chl alt, tr Cr Mica						1	3			2		
			`@153.20 (20cm) silicified zone, diss Py, clay (Ser?) alt, minor Chl w/ Musc												
158.51	163.68		Felsic Rock. Med grey, porhpyritic texture, magnetic, Chl alt.												
			`@159.52 marked magnetic on fracs, other areas also magnetic on fracs and rockmass, Magnetite.	tr							2		2		Minor fizz on carb veins, Magnetic on rockmass and fracs

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	% Mo	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl	Ep	Reactions to Magnet and Acid.
			`@162 (44cm) intense Carb and Chl alt, loses magnetism												
163.68	172.52		**Grey/ Green Volcanic.** Porhpyritic, dk grey, Chl alt volcanic.	1									2		Non magnetic
			`@164.83 (3cm) vuggy Qtz vein w/ soft grey/blk mineral w/ grey streak												
			`@166.32 (10cm) Qtz/Carb vein looks barren, tr Chl, slight rosey colour to Qtz												
			`@166.60 Plag phenos become abdt again												
			`@168.75 to 169.90 pyritic zone	5											
			`@171.18 biotite w/ Chl, micaceous on fracs												
			`@172.25 Ep alt											1	
172.52	193.83		Grey/Green Volcanic. Chl alt, a few silicified zones, Ep al appears more freq, magnetic, phenos are Ep altered	tr						1	3		3	1	Magnetic in less alt sections, some visible magnetite
			`@173.67 (30cm) more intense Ep alt, silicified w/ some Carb, Hem rim around a Carb vein											1	
			`@174.77 (40cm) silicified Chl alt zone, tr Py, slight pinkish colour to Qtz @175												
			`@178.69 (20cm) intense alt, Chl and Clay, tr Py												
			`@187.87 intense Ep alt w/ Carb and Hem staining in rockmass and on fracs											3	
			`@188.75 (23cm) silicified zone w/ Mag												
			`@189.40 (1cm) clay alt edged Qtz vein w/ Hem alt												
			`@190.20 (35cm) clay alt zone							3					
			`@190.70 to 191.87 Hem alt in bands and around Carb veins												
			`@193.03 (62cm) partially silicified/partially Chl alt, massive Ep alt, minor Hem alt on fracs												
193.83	197.67		Grey/Green Volcanic. Very little alt, not porphyritc.										3		Weakly magnetic in some areas, strong in others
			`@195.39 (25cm) Carb stringers red w/ Hem alt												
			`@196.50 (27cm) more grey colour, Carb alt, magnetic												
			`@197.14 (0.5) concentrated diss Mag												

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	% Mo	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl	Ep	Reactions to Magnet and Acid.
197.67	206.35		Grey/Green Volcanic. Carb alt, diss Mag, Chl alt	tr							2		3		very slight fizz, magnetic
			`@204.70 reappearance of plag phenos												
			`@204.32 to 206.35 more altered qtz & clay banding. No longer magnetic, does not fizz.												not magnetic, no fizz
206.35	216.12		**Felsic Rock**. Light to medium greay. Silicified and clay altered sections, some diss Mag, and micaceous on fracs	tr	tr					3		2			weakly magnetic, no fizz
			`@207 (42cm) silicified zone tr Py and poss tr Cpy, diss Mag, vuggy Qtz												
			`@207.87 (93cm), silicified w/ chl & clay alt, tr diss Py, diss Mag, micaceous on fracs												
			`@209.30 and 211.40 clay altered areas w/ more Py												
			`@211.90 (30cm) clay altered, leached, conglomerate, diss Py, clasts range from mm's to 1-2cm												
			`@212.55 (45cm) altered w/ white clay - Kaolinite? Diss Py, clay is chalky & greasy feeling, does not fizz, turns pasty when wet.												
			`@212.42 band of blebby Py & small Qtz vug												
216.12	219.00		**Dark grey/blk Rock**. w/ clay feldspar alteration, diss Py, Chl alteration	0.2						2		2	2		very weak fizz, non magnetic
			`@216.84 (5cm) silicified zone, slight carbonate alt, Py blebs w/ Chl and Biotite?												
			`@217.77 (23cm) grades back into felsic silicified rock, diss Py												
			`@218.37 (9cm) tr Py, barren Qtz vein												
219.00	225.00		**Felsic Rock**. Clay altered, light grey to brown w/ silicified zones, diss Py and on fractures	0.2											no fizz, non magnetic
			`@219.08 (30cm) silicified w/ Py and Chl alteration	0.5											
225.00	228.13		Felsic Rock. Grey to brown, zone of high silicification & mineralization, blebby/diss Py	2								4	2		no fizz, non magnetic
			`@225.60 grey metallic mineral, possibly from PGE's?												

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	% Mo	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl	Ep	Reactions to Magnet and Acid.
			`@225.77 (20cm) Qtz vein w/ few Py blebs up to 1cm, on both edges of vein very micaceous, Mus w/ some Chl alteration												
			`@126.60 (19cm) stringers of mica/Chl as well as Py stringers												
228.13	229.21		**Dark grey/blk Rock**. Banded, silicified zones, diss Py, Chl & clay alteration	0.5								2	3		no fizz, non magnetic
229.21	232.48		Felsic Rock. Grey/green, clay and Chl alteration, minor Qtz veins throughout.	tr								2	3		no fizz, weakly magnetic in less altered zones
			`@229.34 (17cm) silicified zone w/ Py stringers												
			`@231.83 (65cm) grey, siliceous, yellowish/brown alt on Qtz, grey mineral possibly ArsPy (232.32)												
232.48	235.30		**Grey/Green Volcanic**. Porphyritic, @233 to 235.30 less alteration, although still serecite and Chl rich. No visible Py.												
235.30	239.66		**Felsic Rock**. Grey/green, clay and Chl alteration												
			`@236.04 possible Tourmaline on fracture surface, small thin, hard, needle like mineral.												
			`@236.37 (15cm) silicified zone, Py on fracs												
239.66	243.94		Felsic Rock. Pale grey/brown, silicified, diss Py	0.3								2			no fizz, non magnetic
			`@240.80 to 243.94 grey/green colour, minor clay alteration, magnetic @241.95, no visible Mag	tr									2		no fizz, weakly magnetic
243.94	249.74		Felsic Rock. Light brown/grey, greenish in some areas from Chl alteration, tr diss Py, clay alteration	tr						1		2	1		weakly magnetic, no fizz
			`@244.56 (7cm) silicified zone, diss Py												
			`@246.40 (25cm) clay & Chl altered silicified zone												
249.74	256.45		**Dark grey/blk rock**. Banded, diss Py												
			`@250.88 (5cm) & 251.35 (60cm) silicified zone, larger Py blebs												
			`@253.28 (35cm) Qtz vein, large blebs Py, tr possible Tourmaline												
256.45	263.94		**Grey/ Green Volcanic**. Alternates btwn porphyrytic texture & clay alteration, tr diss Py	tr									2		Magnetic in less alt zones, fizzes on carb banding
			`@259 (20cm) silica & clay alteration, more Py												

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	% Mo	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl	Ep	Reactions to Magnet and Acid.
			weakly magnetic in less altered zones												
263.94	269.93		**Felsic Rock**. Medium grey, Chl altered, contains phenocrysts												
			`@264.30 (10cm) silicified w/ Py & mica (Cr? & Mus)						tr			2	2		
			fuzzy contact back to grey/green volcanic												
269.93	282.72		**Grey/Green Volcanic.**												
			`@276.76 to 277, Py rich, silcified Chl/Ser altered, Mag oxidizing to Hem, Epidote alt, carbonate alt.	0.3						3	2	3	2	2	weakly magnetic, carbonate zones fizz
282.72	283.05		**Felsic Silty Sandstone**. Light grey, small Py blebs, silicified.	0.3								3			No fizz, non magnetic
283.05	285.44		**Grey/Green Volcanic**. Fuzzy contact between Felsic rock. Thinly bedded carbonates Chl/Ser alt phenocrysts.												
			`@284.07 (29cm) Qtz alt zone w/ Chl and Carb alteration, Epidote **(can see crystals)**											2	
285.44	288.07		Grey/Green Volcanic. w/ blk Chl banding, some carbonate alt & more diss Py. Can still see phenos but they have been stretched, Chl & Ser alt give rock green colour.	0.3						2	2	1	3		Slight fizz on minor Carb, very weakly magnetic
288.07	308.40		**Quartzite**. Light to medium grey, banded w/ Chl & Ser alt. Brown bands possibly ankorite, Py diss & on fracs	0.3			tr		1	1		4	3		No Fizz, non magnetic except minor Pyrrotite
			`@288.28 (4cm) Qtz vein w/ metallic, needle like magnetic mineral												
			`@289.60 1cm Py blebs w/ Gal												
			`@292.47 (9cm) Qtz vein, tr Py, Gal & Mo					tr							
			`@296.60 (12cm) very fractured, clay/Ser? Altered, very micaceous on fracs, Cr mica												
			`@298.90 to 299.90, intense clay alteration leached from hydrothermal fluids, a few Qtz clasts up to 1cm, very crumbly												
			`@300.20 (27cm) large stringer of Py, Gal & Mo w/ smaller Py blebs & Gal stringers, tr Cr mica					tr							

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	% Mo	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl	Ep	Reactions to Magnet and Acid.
			`@301 Pyrrotite bleb												
			`@302.80 (79cm) intense blk Chl alteration												
			`@303.23 tr Cpy												
			`@306.25 (3cm) vuggy Qtz vein w/ Py												
308.40	309.14		**Quartz Vein**			0.2			1			5			no fizz, non magnetic
	EOH		Pure white, Cr Mica and Mus?, 3cm long bleb Sph w/ Gal

DRILL HOLE NO. BB-2012-09

Dip & Azimuth Tests			BB-2012-09	Easting (NAD 83): 606924							Core Size: NQ				Started: Octob
Depth	Dip	Azmth	Other tests	Northing (NAD 83): 5832825							Hole Azimuth: 0°				Finished: 2012
				Grid Location: 10 U							Hole Angle: 90°				Logged by: J. L
				Elevation: 1366m							Total Depth: 107.29m				Analysis by: AC
															Drilling by: C. Be
Note: Azmths above are															
Tests done using Reflex EZ-Shot.															
			biotite, titanium, , muscovite,						Alteration Scale: 1 - 5						
									v. weak/weak/moderate/						

Depth (m)				%	%	%	%	%	2nd	2nd	Cr-	Ser-				
From	To		Description	Py	Cpy	Sph	Gal	Mo	Carb	Qtz	Mica	icite	Kao	Hem	Chl	Ep
			Purpose of hole is to better understand the model, the deeper hole will provide more information.													
0	9.75		**Overburden**	tr						4						
			Angular clasts of quartz, pyritiferous milky qtz, and oxidized phyllites													
			@6.70 (13cm) fault conduit? Fabric is perpendicular to general bedding, weakly pyritiferous													
9.75	15.85		**Black phyllitic siltstone**	tr						1						
			Fissile, slaty partng with mica sheen on fracture face													
			trace pyrite, unit is weakly vugy													
			unit is highly fractured and moderately oxidized.													
15.85	22.39		**Light-pale grey, highly altered phyllitic siltstone**	2			tr			3						
			Highly altered - bleached, oxidized, very silicified, and fractured. Protolith interpreted to be phyllitic siltstone unit above													
			Remanent lamination structure is present and fissile as well as locally massive													
			Unit directly overlies extensive quartz ein													
			Unit is pyritiferous (approx 2%), white clay mineral (v. Soft) is present locally on frac. Faces, and rusty minerals are disseminated throughout unit (py?)													
			Mica-sheen is on slaty-parting fracture faces, sugary texture on fresh fracture face													
			Trace galena as minor blebs													

			biotite, titanium, , muscovite,						**Alteration Scale: 1 - 5**								
																	v. weak/weak/moderate/
Depth (m)				%	%	%	%	%	2nd	2nd	Cr-	Ser-					
From	**To**		**Description**	**Py**	**Cpy**	**Sph**	**Gal**	**Mo**	**Carb**	**Qtz**	**Mica**	**icite**	**Kao**	**Hem**	**Chl**	**Ep**	
			at 20.47m, unit is severly oxidized and highly fractured.														
22.39	24.99		**Quartz Vein**	tr		tr	tr										
			Contact with above unit is mixed and oxidized.														
			Pyrite bleb @22.45m														
			Qtz vein is milky, fractured, and mildly oxidized.														
			1.5cm blebs of sphalerite present @23.42m														
24.99	31.46		**Grey, Altered Phyllitic Siltstone**	1.5						3							
			Similar to unit at 15.85m														
			Unit is a grey silicified and altered phyllitic siltstone in contact with above quartz vein (contact is highly fractured and moderately oxidized), more felsic than black phyllites but locally exhibits lamination and slaty parting with local mica-sheen.														
			There is a milky quartz vein @28.04 (just after bit change, very fractured with poor recovery, approx. 10cm in length?)														
			Unit is mildly pyritiferous (1.5%) found as blebs and elongate to lamination/fabric														
			Gougen texture @29.48 (10cm)														
			Vitreous quartz veining and vein breccia texture @26.47 (5cm), 29.62 (6cm), and 30.85 (2cm w/pyrrhotite and pyrite @ vein edges)														
			White euhedral alteration/tuff/f.g specks? Abundant throughout unit														
31.46	42.13		**Black tuffaceous phyllitic siltstone**	.1						1							
			Unit has lapilli-tuff/pyroclasts, fine-grained mineral shards (see @37.85m), and whte euhedral specks (see 42.00) throughout unit.														
			Unit is predominantly fissile approx 90deg to core and exhibits minor waviness amongst laminations														

			biotite, titanium, , muscovite,						**Alteration Scale: 1 - 5**							
																v. weak/weak/moderate/
Depth (m)				**%**	**%**	**%**	**%**	**%**	**2nd**	**2nd**	**Cr-**	**Ser-**				
From	**To**		**Description**	**Py**	**Cpy**	**Sph**	**Gal**	**Mo**	**Carb**	**Qtz**	**Mica**	**icite**	**Kao**	**Hem**	**Chl**	**Ep**
			Locally exhibits white-clay alteration													
			Phyllitic mica-sheen on slaty-parting faces, unit has minor pyrite, local muscovite on core face													
			minor quartz veinlets are present													
			Recemented fault breccia and quartz? @38.71m													
			Gougen texture @33.92 (13cm), 35.52 (2cm), and 35.76 (2cm)													
42.13	47.43		**Light-pale grey, highly altered phyllitic siltstone**	4		tr	tr			5	2					
			near-identical repeat of unit @15.85m													
			Laminations are still present, locally wavy. Where laminations are locally wavy - could be crustiform quartz banding @42.51-43.28m													
			Unit is locally phyllitic wih mica-sheen on parting face. Unit is very strongly silicified with cr-mica prent on occasional frature face.													
			Unit is moderately oxidized and weakly fractured.													
			White alteration clay present													
			unit is pyritiferoous with blebs elongate to lamination and crystals													
			gal/sphl present wth qtz veining													
47.43	52.43		**Black tuffaceous phyllitic siltstone**	.5						1						
			Lapilli/pyroclasts elongate with lam/fabric, fg shards, and white euhedral specks present throughout unit													
			unit exhiits weak qtz veining and pyrite blebs elongate with fabric (90deg to core)													
			Unit is locally wavy (sedimentary depositional processes? Flow events?) and fissile with mica-sheen on parting face.													
52.43	56.88		**Light-pale grey, highly altered phyllitic siltstone**	1.5						5						

			biotite, titanium, , muscovite,						**Alteration Scale: 1 - 5**							
																v. weak/weak/moderate/
Depth (m)				%	%	%	%	%	2nd	2nd	Cr-	Ser-				
From	**To**		**Description**	**Py**	**Cpy**	**Sph**	**Gal**	**Mo**	**Carb**	**Qtz**	**Mica**	**icite**	**Kao**	**Hem**	**Chl**	**Ep**
			Remanent laminations, pyritiferous, strongly silicified with white clay minerals locally present on frac. Faces													
			sugary texture on fresh face													
			unit gradually darkens to grey @53.80 but remains pyritiferous and silicified													
56.88	64.05		**Black tuffaceous phyllitic siltstone**	.5						3						
			Sharp contact of above unit with black fault gouge. Fault													
			Unit is fissile and moderately quartz veined, laminations are locally wavy (sedimentary/depositional processes?)													
			Very poor recovery throughout unit with gougen texture @ 56.88 (12cm) and 61.57 (6cm).													
			White clay mineral locally present along with euhedral specks													
			Unit begins to lighten toward grey and becomes more silicified at 63.09m													
64.05	66.37		**Grey Fault conduit/Shear Zone?**	1.5						4						
			Marked predominantly by pyritization, abundant and large vitreous and locally minor vuggy quartz veining, muscovite alteration, and local vein breccia texture													
66.37	75.37		**Black Phyllitic Siltstone**	.5					2	2		?				
			Grades into phyllites from above unit gradually by colour change (grey->black) and laminations													
			Laminations present are locally wavy and crenulated (could be local sedimentary/depositional structures and/or regional folding). Deformed layering iss localized and not uniform and found parallel and at high angles to lamination													

			biotite, titanium, , muscovite,						Alteration Scale: 1 - 5							
									v. weak/weak/moderate/							
Depth (m)				%	%	%	%	%	2nd	2nd	Cr-	Ser-				
From	To		Description	Py	Cpy	Sph	Gal	Mo	Carb	Qtz	Mica	icite	Kao	Hem	Chl	Ep
			Unit is fissile along lamination and core fracture face has mica-sheen													
			Core outer surface has fg mica-sheen and larger areas of muscovite (?)													
			Qtz, qtz-carbonate, and carbonate Veins, veinlets, stringers exist in unit both along lamination plane and eratically cross cutting laminations													
			Small laminations of limestone exist but in very minor amounts (<5%)													
			Unit has fg white-rimmed shards @ 73.00m (tuff??)													
			Unit is weakly pyritiferous with 5% pyrite. Pyrite is present as disseminated blebs, blebs elongate with lamination, and stringers (with qtz).													
			Py-Qtz stringer @73.60													
			Fault gouge found @71.84 (23cm) and 73.35 (2cm)													
			White euhedral specks exist throughout													
75.37	79.96		**Light Grey-Grey Altered Phyllitic Siltstone**	3						4	1					
			Acid-leached phyllite? Vugs, kaoliite, lighter colour, softer													
			Rock is grey, Lgrey, and how patches and bands of brown													
			Contact with above unit is gradual													
			Unit is silicified and has pervasive quartz alteration in the form of milky, vitreous, and vein breccia													
			Quartz vein @ 77.73 (20cm) is crustiform with pyrite rimming the vein (CHECK FOR AU) - typical low sulfidation epithermal vein texture													
			Unit is pyritiferous with abundant pyrite present as blebs, small euhedral crystals, or as stringers; pyrite is found within weakly vuggy veins, rimming veins, and apparently randomly disseminated throughout unit.													
			Trace Arsenopyrite present @													

			biotite, titanium, , muscovite,						**Alteration Scale: 1 - 5**								
																	v. weak/weak/moderate/
Depth (m)				%	%	%	%	%	2nd	2nd	Cr-	Ser-					
From	**To**		**Description**	**Py**	**Cpy**	**Sph**	**Gal**	**Mo**	**Carb**	**Qtz**	**Mica**	**icite**	**Kao**	**Hem**	**Chl**	**Ep**	
			Pyrrhotite is disseminated throughout unit giving strong local (but pervasive) magnetism														
			Very soft and white clay mineral (kaolinite?) exists as discontinuous stringers or associated with quartz veins														
			Cr-mica is preent in minor amounts (small blebs)														
			Muscovite present on fracture face and moderately present														
79.96	83.40		**Black Tuffaceous Phyllitic Siltstone**	.2						3							
			Tuff manifests as discontinuous laminations, elongate grains (e.g. 83.20m)														
			Laminations present and quartz veining is common														
			Small and minor blebs/fabric-elongate blebs of pyrite														
			Highly fractured @80.24 (6cm)														
			Wavy lamination perpendicular to general lamination/foliation @81.04 (18cm) and 83.00 (15cm)														
			Unit is weakly graphitic, micaceous on slaty-fracture face. Slaty parting along laminations														
83.40	86.83		**Fault Conduit/Shear Zone (?)**	.5						2							
			Can see perpendicular structures to general foliation/lamination orientation. Unit is variable in colour Grey-Lgrey. Unit has dissem py and pyrrho														
			From 83.40-84.69 - Lgrey with moderate alteration; vbx quartz, pyrite and pyrrhotite present. Muscovite on core face and fracture face. Locally wavy laminations/structures	1						4							
			White alteration clay @83.67 (15cm) present (strong kaolinite alteration?) on quartz vein/fracture surface.														

			biotite, titanium, , muscovite,						**Alteration Scale: 1 - 5**							
									v. weak/weak/moderate/							
Depth (m)				**%**	**%**	**%**	**%**	**%**	**2nd**	**2nd**	**Cr-**	**Ser-**

			From 85.72-86.45 - very strong brecciated/shear texture and alteration. Very strong muscovite alteration (5 on scale), moderate cr-mica present, 3% py w/pyrrho	3						4	3					
86.83	96.94		**Black Tuffaceous phyllitic siltstone**	.5					2	3						
			Laminated, phyllitic, mica-sheen on slaty parting face													
			Unit is weakly calcareous with abundance of qtz-carbonate veins/veinlets													
			Unit is weakly pyritiferous with .5% but varies in abundance throughout unit (tr-2%) as elongate blebs with laminations or as dissem blebs													
			Unit is locally way with laminations exhibiting flow textures (? E.g. X-bedding) - found at 98.10m													
			White euhedral specks found until 89.00													
96.94	99.53		**Light Grey Altered Phyllitic Siltstone**	3.5		tr			2	2	1					
			Gradual contact. Laminations still present and unit is pyritiferous at 3.5%. Pyrrhotite is trace and disseminated throughout. Both Pyrrho/Py present as Vfg thin blebs elongate with lamination													
			Unit is weakly fissile with slaty parting, micaceous on parting face.													
			Vweak Cr-Mica presence.													
			Unit is weakly calcareous with minor qtz-carb veining													
			Cr-mica gives slight green colouration @98.18m													
			Reddish-brown trace sphalerite in elongate thin blebs @98.25m													
			Pyrite decreases in grain size with depth in unit													
99.53	101.74		**Black Tuffaceous Phyllitic Siltstone**	2					1	2						
			Contact is gradational with above unit													
			Unit has fg pyrite elongate to laminations (max 2%)													

			biotite, titanium, , muscovite,						**Alteration Scale: 1 - 5**

			qtz-carb veining present but weak													
			Weak fizz on core and on qtz-carb locally													
			Muscovite is found on core-surface													
			interbed of above altered unit @100.33 (13cm)													
			At 101.41m unit gains white euhedral specks													
101.74	105.34		**Grey Tuffaceous Pyroclastics with interbedded tephra**	1			tr		2	3	2	?				
			Gradational contact with above unit													
			Unit is soft (easily scratched) where not silicified or veined													
			Unit has pyroclasts and tuff perhaps within a predominant tephra (vfg) matrix													
			Muscovite alteration is present and adds to increased softness of core-surface													
			Mica-sheen on fracture face													
			Dissem py throughout unit (1%) and weak local magnetism from small dissem blebs of pyrrhotite													
			weak fizzing exhibited locally throughout unit (carbonate cementing fluids?)													
			large vitreous qtz-carb vein from 105.34-105.77m, w/ cr-mica in noticable abundance (small specks)													
			Galena bleb @													
105.34	107.29	EOH	**Qtz Vein**													
			Only 3cm recovered of quartz vein (cr-mica and pyrite present)

CERTIFICATE OF ANALYSIS

230 Core samples, 7 Pulp samples and 41 Soil samples were submitted for analysis.

The following analytical packages were requested: Code 1C-OES-Kamloops Fire Assay ICPOES
Code UT-1-Kamloops Aqua Regia ICP/MS

REPORT **A13-11486**

Notes:
Assays are recommended for values >10,000 for Cu and Au. Due to matrix change used in AR-MS analysis, the detection limts for Au has been modified to 5ppb. The AU from AR-MS is only semi-quantitative. For accurate Au data,fire assay is recommended.

Frank Creek Drill Logs

PROPERTY: FRANK CREEK

BARKER MINERALS LTD.

DRILL HOLE NO. FC2013 - 09

Dip & Azimuth Tests			DDH FC2013-09	Easting (NAD 83): 610486	Core Size: NQ, BQ	Started: , 2013
Depth	Dip	Azmth	Other tests	Northing (NAD 83): 5845537	Hole Azimuth: 90°	Finished: June 27, 2013
				Grid Location: 10U	Hole Angle: -60°	Logged by: R.Turna
				Elevation: 1118m	Total Depth: 147.5 m	Analysis by: Actlabs
						Drilling by: Barker Minerals

Depth (m)								Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong)						
From	To		Description	% Py	% Cpy	% Sph	% Gal	Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
			Purpose of hole is to follow up results in DDH FC-11-03											
0.00	2.05		Rubble consisting of black siltstone, quartz, silicified phylite and pyritic sand. Much of this is rounded and appears to be related to o**verburden**.											None.
2.05	3.50		**Black sheared siltstone.** Intensely sheared perpendicular to the core axis. Weak highly fractured rock. The upper half of this interval is mostly pyritic sand, suggesting an incompetent pyritic interval may have been washed away. 5% pyrite is an average for the interval, though concentrated in the upper portion. The black siltstone is about 3% pyritic, py is disseminated, cubic. Not very graphitic. Mainly not altered, the black siltstone here may be considered a protolith of the extensive grey silicified rock below. The lower contact appears to be gradational, related to increasing silicification downward.	5										None.

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
3.50	22.63		**Grey sheared siltstone and greywacke**. Local 1 mm angular clasts resemble phenocrysts which suggest some tuffaceous intermixture. Fairly intense shearing generally, though intensity diminishes downward. Fracture intensity is fairly high. Locally wavy shearing. Stretched clasts may be breccia clasts or coarser grains from the protolith sediment. Patchy weak to moderate pervasive silicification, masking possible sericite. Above 16 m quartz veinlets are unimportant. Some qtz veinlets from 16.0 - 20.90 m. At 20.90 m - 21.75 m is 30% disorganized mass of greyish quartz. Pyrite is blebby and cubic, disseminated and commonly in discontinuous in fine bands, deformed by and parallel with shear planes. 80% pyrite band at 3.30 m - 3.39 m, parallel with shear planes. Py is 5% to 16.0 m, diminishing below that to 2%. Minor chalcopyrite with pyrite in blebs at 10.43 m, 10.61 m, 11.40 m and 17.50 m.. Weak to moderate pervasive silicification throughout.	3	0.01						3			Magnetic sulphide (pyrrhotite) at 10.61 m, and 22.23 - 22.63 m.

Depth (m) From	Depth (m) To		Description	% Py	% Cpy	% Sph	% Gal	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
22.63	44.15		**Altered zone with faults.** Coarser grained. Light grey greywacke with some volcaniclastic. Grains are poorly sorted, in size and roundedness. Local 1 mm clasts are rectangular, suggesting tuffaceous input. Blocky massive rock with a little local weak shearing evident. Local fractured crumbly rock and gouge at 23.8 - 23.9 m, 38.25 - 38.35 m, **38.7 - 40.4 m (much gouge)** and 43.5 - 43.85 m suggest acid leaching in fault zones. Pervasive moderate to strong sericite and patchy moderate silicification. Patchy very weak greenish colour appears related to sericite. No important veins but for vuggy white quartz at 34.80 - 35.0 m, 45 dgrees to core axis (tca). Pyrite is extensive but patchy, cubic, fairly coarse. Lower contact is abrupt, apparently related to a fault contact and an alteration front.	0.5				0.1	3		2			None.
44.15	60.40		Finer grained than above, **medium grey greywacke**, locally weakly sheared breccia. Local 1 mm clasts are rectangular, suggesting tuffaceous input. Mainly massive as above, more silicified and pyritic, less sericitic and much less acid leached. Local weak wavy shearing and weakly sheared incipient breccia, clasts not rotated much from eachother. Rare sericitic green colour. Patchy, blebby, cubic pyrite is more abundant than above. No important veins but for some small ragged grey quartz patches.	2					1		2			None.

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
60.40	66.85		**Pyritic hydrothermal breccia and quartz zone.** Extensive incipient breccia and and shapeless dark grey quartz floods. Much pyrite in blebs, stringers, cubes and irregular masses. **Massive pyrite at 62.65 - 63.05** may be a replacement body similar to the stringers and masses. Scattered traces of chalcopyrite. 1-2 mm angular and rectangular tuffaceous clasts in the bottom metre. At 66.85 m core size is reduced to BQ due to squeezing.	10	0.1						4			
66.85	67.00		50 cm of sand and grey silt, likely fallen from above during the change in core size from NQ to BQ. Also here are some pyrite cubes to 1 cm and fragments of sheared rock.											None.
67.00	71.97		**Pyritic breccia zone.** Greywacke protolith. Little quartz. Pyrite is commonly in stringers parallel with weak wavy shearing. At **67.43 - 68.1 m is massive pyrite, similar to that at 63 m,** with chalcopyrite. Extensive incipient breccia. More sericitic, less silicified than the hydrothermal breccia above.	10	1				3		2			None.
71.97	74.75		**Light grey greywacke.** Blocky, massive. Moderately sericitic as above. Diminished pyrite is disseminated, blebby and cubic.	1					3		1			None.
74.75	81.63		**Altered fault zone. Acid leached rubble and gouge**. Light grey leached breccia and some pyrite cubes. Protolith is rarely clear. Pyrite appears not much. Sericitic. Shattered soft rock all the way. Sericitic breccia protolith is clearer in the more blocky bottom 85 cm.	0.1					4					None.
81.63	82.95		**White vuggy quartz vein.** Has sphalerite blebs and minor chalcopyrite near 82 m but sulphides are spotty.	0.1	0.01	0.1								None.
82.95	84.43		**Lost core**. 15 cm of white vuggy quartz vein. Nothing else but some drill mud.											None.

Depth (m) From	Depth (m) To		Description	% Py	% Cpy	% Sph	% Gal	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
84.43	85.95		**Lost core.** 2 cm of drill mud. Nothing else. The upper and lower blocks are 2 cm apart. It is possible this zone represents a fault zone with extremely fractured soft rubble that got washed away. Alternatively, the above vuggy vein may have had a tendency to shatter and be washed away.											None.
85.95	92.25		**Light grey greywacke**. Blocky, massive. Moderately sericitic, locally green, as at 88 m.. Pyrite is mainly fine, disseminated. A 2 cm piece of white quartz may suggest the above large white quartz vein may extend to here but such evidence is scant indeed.	0.5					3					None.
92.25	111.55		**Locally weakly sheared greywacke breccia**. Medium grey. Light coloured angular lithic fragments and 1 mm sericitized plagioclase phenocrysts are common and may suggest a tuffaceous content. At 94 - 96.7 m is locally abundant rubble and sandy gouge, suggestive of minor faults. Minor scattered irregular grey quartz. Scattered blebby pyrite. At 104.5 - 108.2 m the rock is soft, acid leached, locally intensely fractured though no fault is definitely inticated.	0.5					1					None.
111.55	123.20		**Greywacke with high volcanic component.** Light greenish grey. Homogenous, massive blocky texture. Sericitic. Spotty alteration texture is exibited at 117.1 m, where several small radial growths (flowers) are evident.	0.2				1	4					None.

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
123.20	147.50		**Dark grey greywacke**. Elevated quartz and pyrite. Local fine bedding. Local lighter, greener sections are porphyritic with a relatively minor volcaniclastic component. Weak local foliation 30d tca, parallel with bedding. Local shapeless grey quartz flooding similar to that at 60-66.85 m. Quartz flooding is concentrated somewhat at 126.9 - 129.6 m. Pyrite occurs erratically disseminated, blebby, cubic. Trace galena in a white quartz vein at 136 m. Alteration is erratic and localized. Generally high fracture intensity which is normal in this hole. At 142.65 - 144.8 m is intensely fractured gougy rubble with some quartz. At 146.5 m is a 40 cm white quartz vein with a few pyrite cubes.	1			0.1		1		2			None.
			EOH at 147.50 m.

DRILL HOLE NO. FC-2013-10

Dip & Azimuth Tests			DDH FC-2013-10	Easting (NAD 83): 0610630	Core Size: NQ, BQ	Started: July 2 , 2013
Depth	Dip	Azmth	Other tests	Northing (NAD 83): 5845889	Hole Azimuth: 70°	Finished: July 16, 2013
				Grid Location: 10U	Hole Angle: -60°	Logged by: J. Logan; R.Turna
				Elevation: 1048m	Total Depth: 128.63 m	Analysis by: ACTLABS
						Drilling by: Barker Minerals

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
			Purpose of hole is to: follow up on low resistivity anomaly @ 30-250m depth at the eastern side between lines 58-59N. Expected to hit core of deposit @ 100m depth											
0.00	2.00		**Overburden**								2			NO/NO
			light grey boulder and argillite fragments. Fractured.											
2.13	27.11		**Black graphitic argillite**	tr	tr						2			NO reaction to acid.
			locally and weakly oxidized.											NO magnetism.
			graphite and muscovite on fracture surfaces. Highly fractured to to approx. 9.75 but more blocky/massive. From 9.75-27.11 - fissile along foliation/consistent plane (likely primary structure - i.e. Bedding).											
			Foliation and fracturing is reoccuring parallel at approximately 50-60 degrees to core axis. Foliation can be locally wavy and crenulated											
			Minor and local quartz stringers/veinlet. One quartz vein had very small (1mm) bleb w/bornite											
			Presence of pyrte is local and spotted; trace.											
			Presence of clasts are minor - little/trace evidence of tuffaceous input.											
			No reaction with acid and no magnetism.											
27.11	57.94		**Light grey-green Qtz-Musc-Sericite altered felsic Volcaniclastic**	tr		tr	tr	2	3	2	3			Magnetism strong on trace pyrrhotite blebs ONLY

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
			Possibly siltstone or greywacke/volcaniclastic. Unit is predominantly competent and fine-grained. Existence of angular clasts or phenocrysts is minimal; some rounded and elongate clasts are present but minimal and local											Acid reaction only with qtz-carbonate/calcite breccia veins - NOT with host rock matrix.
			Unit is light grey when dry; light green when wet. Minor oxidation on fracture surfaces common throughout unit.											
			Contact with above unit until 30.30m is highly oxidized, silicified, fractured, and contains qtz vein breccia											
			Entire unit is light-green when wetted, shows muscovite sheen on surface, and is hard to scratch = qtz-muscovite-sericite alteration											
			Unit is competent and fractures along structure consistent with foliation in above unit at an average of 50 degrees to the core-axis (but foliation is locally wavy/crenulated to 90 degrees to core-axis). Unit is silicified and contains multiple breciated quartz and qtz-carb veins and veinlets along bedding plane.											
			Brecciated quartz, quartz-carb veins/veinlets are host to pyrrhotite (magnetic)											
			Zones of intense sericitization @ 41.76-43.51m ad 44.50-46.33m - fuschite is common in elongate blebs strung along foliation. Appearance of faded feldspar phenocrysts (?) upon close inspection of this zone.											
			Blebs of galena and sphalerite found with each other between 47.00-49.10; galena blebs are mm's in size but up to 1.5cm; sphalerite blebs are mm's in size. Blebs found in association with vein breccia only.											

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
			There are what seem to be black or dark-grey laminations/beds intercalated throughout unit (argillite?)											
			JUSTIFICATION - sericite/muscovite in core scratch white and not green (so not chlorite therefore rock does not have a predominant mafic constituent). Sericite is an alteration mineral of orthoclase (k-feldspar) of plag-feldspar (constituent of felsic igneous rock). Can see phenocrysts in intensely sericitized zone. Intercalations of black laminations suggest a syndeposition with argillite and perhaps local wavy structure and brecciation represent slumping and sediment movement.											
57.94	73.96		**Black - weakly pyritiferous - argillite**	0.1				tr			3			NO magnetism
			Contact with above unit is fractured, interacalated, quartz veined, brecciated, and contains pyrite blebs											Only intercalations of sericitic volcaniclastic with qtz-carb vein breccia exhibit fizzing.
			Intercalations of sericitic volcaniclastic (above unit) exist until 63.46m: 58.85-59.03, 61.98-62.10, 62.58-63.46 (contains vein breccia, large clasts, one is vuggy). Contacts are sharp/well defined. Intercalations are softer/less siliceous than above qtz-musc-ser unit											
			This unit is notably more pyritiferous than previous units. Pyrite stringers and blebs often coexist with white quartz stringers. Quartz stringers are common, but vein-sized quartz is minor.											
			Fracture surfaces are very graphitic, but unit is predominantly silicified (difficult to scratch).											

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
			Argillite at 63.66-63.99 is incompetent (almost gouge), very black and crumbly texure but still maintains original structure.											
			Quartz veining, brecciation with visible clasts, and variable/crenulated wavy laminations exist between 71.60-73.45m											
			57.83-60m - large blebby patch of pyrite and white milky quartz. Not bound by structure.											
			64.95-65.35 - pyritiferous argillite where fg pyrite follows the varying wavy/perpendicular lamination structure											
			Reoccuring foliation @62.00-63.48m at 40-50 degrees to core axis											
			SWITCH TO BQ @ 60.48											
73.96	75.39		**Altered light grey-green sericite-muscovite altered volcanic/clastic**	0.05					3	2	2			No magnetism
			Sharp contact with above argillite unit. Unit does have spotty grains; could be remnant of porphyritic texture, volcanclastic clasts, or alteration spots?											Acid reacts on qtz-carb vein breccia and stringers
			Unit is weakly pyritiferous (finely dissemeninated) and has quartz-carb vein breccia and stringers											
			Small interbed of argillite @ 75.13-75.20 with well defined/sharp contacts											
75.39	78.49		**Black graphitic argillite**	tr							3			
			Contact with unit above is fractured with gouge/incompetent core @ 75.40-74.50.											No magnetism
			Argillite unit is hard (siliceous) and has no definitive foliation direction. Very graphitic on fracture face. Locally wavy and brecciated.											No reaction to acid
			Interbed of above ser-musc unit with a sharp contact @ 77.50-77.80.											

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
78.49	79.79		**Altered light grey-green sericite-muscovite altered volcanic(clastic)**	1					3	2	2			No magnetism
			Contacts at start and end are bound by quartz-carb vein.											Reaction w/qtz-carb veins and local calcite stringers
			Unit is weakly pyritiferous (finely disseminated and as blebs) with minor qtz-carb veining and unit does have spotty grains; could be remnant of porphyritic texture, volcanclastic clasts, or alteration spots?											
79.79	89.21		**Black graphitic argillite**	0.01							4			No reaction
			locally fractured, locally very siliceous where unit is very difficult to scratch											No reaction
			Zones of intensive fracture - 81.60-82.00m, 83.05-85.09m											
			87.00-87.38 and @ 88.25m - very fg white angular shards; tuffaceous input? Fossils?											
89.21	95.55		**Light grey-green muscovite-sericite volcanic(lastic)**	tr				tr	2	2	2			
			Contact with unit above and unit below is veined with fizzing qtz-carb											Rock matrix has predominantly weak-very weak fizzing
			Unit very weakly fizzes in matrix throughout. Unit has common qtz-carb veins											Qtz-carb veins and calcite stringers fizz strongly
			Sericite not as prevalent as prior unit and wanes at approx. 93.35m. Unit is fairly competent with only minor fracturing											Local and very weak magnetism with rare and v.fg disseminated pyrrhotite
			Trace cr-mica and trace pyrite.											
			Unit exhibits a general lamination/foliation direction at approximately 93.80m - 45 degrees to core axis											

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
95.55	106.71		**Black graphitic argillite (highly fractured)**	tr							3			
			Highly fractured, very graphitic, graphitic on fracture face. Writes on paper.											local on interbedded lgrey-green unit; both minor fizzing qtz-carb veins and trace pyrrhotite
			unit has localized gougen texture. Unit has weak qtz stringers and veining, local.											
			Band of cg pyrite with qtz 2cm thick @99.77m, stringers of py following local wavy lamination/foliation @ 100.15m. Reoccuring foliation angle between 40-50degrees to core axis											
			Unit has an interbed of foliated/laminated soft (easily scratched) light grey-green unit from 100.10-101.03m. Small local tr belbs of py and pyrrhotite and qtz carb breccia veins; white speckles.											
			Argillite unit is highly fractured from 96.92-98.20m(approx), 98.80-99.53(approx), 101.19-103.79m. Rock is fissile from 103.79-105.00m with fissility along plane @ 45degrees approx to core axis. Fractured until lower contact at 106.71.											
			Gougen texture @ 99.48-99.53, 101.80-101.90, 104.78-104.82, 105.22-102.26											
			Trace pyrite as blebs or as stringers along foliation plane.											
			silicification is moderate throughout and very strong from 105.35-105.88 (can see as water will bead on this area when wet); is weakly magnetic (pyrrhotite is finely dissem) has blebs of py, qtz vein breccia shards, bands of sericite.											
106.71	121.00		**Light-grey green qtz-ser-muscovite volcanic(lastic)**	tr					3	2	3			

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
			contact with above unit is fractured											Weak, rare, local magnetism from finely disseminated pyrrhotite
			Unit has foliation, appearing as laminations locally											fizzing found locally and on qtz-carb brecciated veins
			unit is locally fractured, 109-110.34 being the most fractured length											
			alteration within unit is not consistent/pervasive with areas of intense sericitization and silification. Areas of intense silification are noticeable as they bead water when wet.											
			Approximately 113.05-113.14, 113-end of box the matrix fizzes (abundant calcite stringers)											
			qtz-carb breccia veining prevalent throughout unit.											
			Pyrite is found as trace as blebs											
			At 108.29-108.66, unit appears to be cg, with sub-angular clasts up to a few mm's in size. Both white and dark grain. Perhaps these white 'grains' are alteration spots? Feldspar? Tuff? Also found elsewhere locally in unit (e.g. 111.53 and 113.36m)											
			Unit is interbedded with argillite (as above) at 112.34-112.89m and at 113.14-113.32m											
			Very large intensely silificed qtz-carb breccia w/sericite clasts(?) from 113.95-114.33m, fizzes											
			From 113 m - 121 m the greenish volcaniclastic component is more dominant, with little dark grey argillite. Minor local breccia is evident at 121.00 m.											
121.00	128.63		**Dark-grey and greenish rubble and gouge. Fault?**	tr					3	2				

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
			Very poor core recovery in very poor quality rock. Local intense shearing, as throughout the hole. This interval has more rubble and gouge than rock. Fractures, rubble and gouge become more intense below 122 m. From 128.0 m to EOH is whitish bleached gouge, sticky when damp. This bottom gouge likely represents a fault.											No reactions to magnets. Minor local fizzing at dirmembered carbonate veinlets and blebs.
			Lithologies here are as above, interbedded sericitized green volcaniclastic and dark grey graphitic argillite.											
			Patchy irreggular pervasive sericitic alteration occurs extensively though gouge here masks much. Minor irregularly disseminated fine pyrite.											
			End of Hole at 128.63 m.											

Lithology: DDH FC2013 - 10

				Elevation: 1048m	Total Depth: 26.85 m	Analysis by:
						Drilling by: Barker Minerals

Depth (m)								Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong)						
From	To		Description	% Py	% Cpy	% Sph	% Gal	Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
			Purpose of hole is to: verify the dip orientation of the stratigraphy.											
0.00	1.22		**Casing. No core recovered.**											
1.22	26.85		**Dark grey graphitic argillite.** Fairly intensely fractured. Foliation intensity varies and orientation is irregular, mainly at an acute angle to the core azis, is generally 20d-30d to core axis, locally less or almost parallel. Weak local compositional layering follows the foliation. Many small vugs throughout parallel the foliation, these may be rotted out calcite, though the rock is not calcareous. Graphitic throughout, writes poorly on paper. Very weak pervasive silicification, otherwise not altered. Rare quartz veinlets up to 1 cm. 1.22 m - 2.3 m is rubble. Trace, very fine irregularly disseminated pyrite. At 26.2 - 26.85 m is rubble, a 1 cm quartz vein and local black sticky gouge (possible fault).	tr							1			NO reaction to acid. NO magnetism.
			End of Hole.

DRILL HOLE NO. FC-2013 - 12

Dip & Azimuth Tests			DDH FC2013-12	Easting (NAD 83): 0610525	Core Size: NQ, BQ	Started: July 22 , 2013
Depth	Dip	Azmth	Other tests	Northing (NAD 83): 5845882	Hole Azimuth: 68°	Finished: August, 2013
				Grid Location: 10 U	Hole Angle: -60°	Logged by: R.Turna/J.Logan
				Elevation: 1029m	Total Depth: 128.73 m	Analysis by:
						Drilling by: Barker Minerals

Depth (m)								Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong)						
From	To		Description	% Py	% Cpy	% Sph	% Gal	Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
			Purpose of hole is to extend the drill fence westward from original target (FC-11-10); a low resistivity anomaly (conductor) to the east on Line 59											
0.00	2.13		Casing. No core or rock recovered.											
2.13	5.25		**Overburden**. 1.6 m of rounded stones - silicified quartz-muscovite schist, gabbro, rusty soil.											
5.25	6.70		**Silicified quartz- muscovite schist**. Strongly foliated perpendicular to core axis. Strong competent rock. 4 cm quartz vein at 6.60 m.								4			
6.70	25.20		**Dark grey argillite rubble**. Foliated approximately 20 d to core axix but not sheared. Weakly silicified dark siltstone and argillite. Pyrite occurs erratically with numerous small irregular quartz veinlets.	0.2							1			No reaction to magnet or acid.
25.20	43.28		Extremely poor core recovery. Possible fault. Approximately 70% well sorted dark grey sand. The sand , evidently intensively worked by the drill, derives from pulverized argillie, some probably fallen from above. The sand sparkles with pyrite. The upper and lower portion of the overall interval is black, somewhat graphitic argillite, very fragile, brecciated, sheared with many irregular quartz stringers. The middle portion, 33.8 - 36 m, is silicified siltstone. Overall, pyrite is very irregular, blebby, cubic and irregularly disseminated.	1							1			No reaction to magnet or acid, though the sand is locally weakly magnetic.

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
43.28	51.00		Similar to above. 20% well sorted sand, Last sand interval, 40 cm, ends at 51.0 m. Remainder is rubble with minor scattered gouge. Rock consists of very weak dark grey silicified siltstone and black graphitic argillite, all brecciated. Rock quality and core recovery are extremely poor.	0.2							1			No reaction to magnet or acid, though the sand is locally weakly magnetic.
51.00	52.60		**Black graphitic argillite**. A sheared breccia, typical of the hole. Shearing and compositional layering are 85d to core axis (tca) at 52.0 m, typical. Pyrite is irregularly blebby, cubic and irregularly disseminated. Lower contact, against silicified rock, is abrupt, 10d tca. Some Fe carbonate breccia fragments.	1										No reaction to magnet or acid.
52.60	58.00		**Grey silicified zone**. Core is more intact. Protolith appears to be the same brecciated sheared argillite as above. Compositional layering is less clear. Not graphitic here. There are several grey irregular quartz veins here, likely associated with the silicification. Scattered Fe carbonate vein fragments. Pyrite is the same as above. Lower contact, related to diminishing silicification, is gradational.	1							3			No reaction to magnet or acid.
58.00	79.33		**Black graphitic argillite**. Sheared breccia, typical. Same as at 52 m. Pyritic. A few qtz and carbonate vein fragments.	0.5							2			No reaction to magnet or acid.
			Unit is very graphitic, quite fractured and broken (predominantly along foliation planes).											
			Milky quartz veins of up to approx. 5cm in length are scattered throughout unit in weak-moderate abundance. These veins are occasionally associated with pyrite blebs.											
			Strong gouge texture (zero competency - black sludge) at 63.54-64.62m											

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
79.33	86.55		**L.Grey-Green unit (Volcaniclastic?)**	0.1				1	2		2			Fizzes locally on qtz-carb stringers, veins, and clasts
			This unit is similar in appearance to the 'silicified zone' and exhibits a sheared breccia texture typical to the hole											No magnetism
			Contact with above argillite unit is sharp; unit is moderately fractured.											
			Rock has a green-tinge (evident when wet) and rock is easily scratched (not overly silicified). Alteration spots are local as are elongate sheared clasts. has sericite (an alteration from feldspar), cr-mica, laminations of arg, carbonate that fizzes exists in this unit, unit is softer than argillite.											
			Interbed of black gougen-textured and fractured argillite @ 80.48-81.02m. Argillite also seems to appear as fine laminations intermittently.											
			Unit is weakly pyritiferous from 79.33-80.48m; pyrite is very fine and disseminated (.5%?)											
			Trace cr-mica and little pyrite in remainder of unit. Pyrite found is recrystallized in larger grains											
			Gougen texture @ 85.47-85.54m											
			Qtz-carbonate veins, stringers, and brecciated clasts exist in unit and fizz when exposed to acid.											
86.55	92.47		**Black graphitic argillite**	0.5							2			No fizz
			weakly pyritiferous, sheared and brecciated, and locally fractured/gouged											No magnetism
			Pyrite exists as disseminated mineralization and as larger elongate blebs parallel to shear stress. Pyrite found with blebs of qtz											
			fracture planes/shear planes @ 65-75 degrees to core axis. Laminations are locally wavey											
			Contact with above unit is gougen and contact below is gougen and fractured.											

								Alteration Scale: 1 - 5 v. weak/weak/moderate/strong/v.strong

Depth (m)								Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong)						
From	**To**		**Description**	**% Py**	**% Cpy**	**% Sph**	**% Gal**	**Cr Mica**	**Seri-cite**	**2nd Carb**	**2nd Sil**	**2nd Chl**		**Reactions to Magnet and Acid.**
			Purpose of hole was to drill Pb anomaly from Enzyme Leach survey (Pb is immobile), perhaps intersecting Discovery mineralization. Hole was meant to be shallow and quick while waiting for permission to drill in FC13-09 area.											
			Initially, hole encountered difficulty due to lack of casing. Hole was ceased after a drill-rod broke down hole and rods were not recoverable. 18.90m, 2 boxes, were produced that contained only overburden.											
0.00	18.90		**Overburden**											
			Entire hole consists of overburden and till. Oxdized clasts, boulders, sand, and rounded cobbles. Lithologies encountered were qtz-muscovite schist (pyritiferous and non-pyriteferous), carbonaceous schist, and milky quartz.											
			Very poor recovery (<30%)											
			EOH

DRILL HOLE NO. FC-2013 - 14

Dip & Azimuth Tests			DDH FC-2013-14	Easting (NAD 83): 0609798	Core Size: NQ, BQ	Started: Oct.13, 2013
Depth	Dip	Azmth	Other tests	Northing (NAD 83): 5845044	Hole Azimuth: 90°	Finished: Nov. 6th, 2013
				Grid Location: 10U	Hole Angle: 70°	Logged by: R.Turna, J.Logan
				Elevation: 1185 m	Total Depth: 67.56m	Analysis by:
						Drilling by: Barker Minerals

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
			Purpose of hole is to test chargeability high on L51N, as suggested by the Quantec/Titan Report in Appendix F8.											
0.00	2.13		**Overburden**. Rounded stones ofgrey silicified schist and quartz. Minor rubble and mud.											
2.13	19.85		Light grey silicified qtz-muscovite schist with angular clasts, and quartz-eyes. Protolith is volcaniclastic greywacke. Irregular weak to moderate foliation averages 60d tca (degrees to core axis). Fairly strong pervasive silicification. Some irregular quartz veins at 7.35 - 8.3 m. Disseminated fine and cubic pyrite occurs irregularly. **At 3.10-3.24 m is vuggy, somewhat rotted 100% massive pyrite with some chalcopyrite (95% py, 5% cpy). At 6.33-6.88 m is 50% massive pyrite with some chalcopyrite (50% py, 2% cpy).** Both massive sulphides appear to be replacements, the upper one is adjacent to a 4 cm quartz vein.	5	0.1				2		4			No fizzing. The lower massive sulphide has local very weak magnetism apparently due to magnetite.

Depth (m) From	To		Description	% Py	% Cpy	% Sph	% Gal	Alteration Scale: 1 - 5 (v. weak/weak/moderate/strong/v.strong) Cr Mica	Seri-cite	2nd Carb	2nd Sil	2nd Chl		Reactions to Magnet and Acid.
19.85	44.45		Darker grey greywacke. Irregular weak to moderate foliation averages 60d tca. Less altered and pyritic. Silicification is less and patchy. Sericite alteration isincreasing, occurs patchily. Coarser. Local plagioclase alteration spots and "flowers". These are somewhat sericitized. Disseminated pyrite is irregular, patchy. Minor veining, is more abundant below 40.25 m. Minor scattered ankerite veinlets. A 20 cm white quartz vein occurs at 27.5 m. At 41.05 m a 8 cm grey quartz vein.	0.5					2		2			No fizzing or magnetism.
44.45	59.48		Light grey uniformly sandy textured greywacke. Irregular weak to moderate foliation averages 60d tca. Pervasive sericite. Very minor quartz veinlets. Irregular weak to moderate foliation averages 60d tca. Gets gradually finer grained from 56 m to 59.48 m. The contact, 70d tca at 59.48 m, is abrupt against coarser grained rock below.	2					4					No fizzing or magnetism.
59.48	67.56		Light grey coarse grained quartz eye greywacke. Abundant rounded quartz eyes, up to 4 mm. Fairly strong pervasive sericite. Minor white quartz veins. The upper contact is evidently between overturned graded sequences. Above 59.48 m fining downward terminates at the contact. Below 59.48 m is coarse, a new sequence fining imperceptibly downward. **At 65.29 m is a 3 cm band of chalcopyrite** 65d tca parallel with weak to moderate foliation. appears to be a replacement.	0.2	0.1				4					No fizzing or magnetism.

XRF Test on Host-Rock Zonation

FC13-11

All Readings: 120sec, in ppm

Soils Mode

Reading No	Depth	Description	Photo #	Duration
1242	3.05	Entire host rock is dark-grey/black weakly siliceous argillite	1549	120
1243	3.95		1550	120
1244	4.75	rusty bleb targeted (weathered py cube)	1551	120
1245	4.75	same location as above, not on py cube	1551	120
1246	5.50		1552	120
1248	6.15		1553	120
1249	6.80		1554	120
1250	7.50		1555	120
1251	8.20		1556	120
1252	9.40		1557	120
1253	10.10	w/qtz stringers and trace rusty py cubes	1558	120
1254	11.10		1559	120
1255	11.38		1560	120
1256	11.54	qtz vein in hostrock, XRF on selvege of vein	1561	120
1257	12.10		1562	120
1258	12.90		1563	120
1259	13.40		1564	120
1260	13.80		1565	120
1261	14.35		1566	120
1262	15.15		1567	120
1269	15.70		1570	120
1270	16.10		1571	120
1271	16.50		1572	120
1272	17.15		1573	120
1273	17.67		1574	120
1274	18.40	pyrite bleb in qtz in hostrock	1575	120
1275	19.05		1576	120
1276	19.57		1577	120
1277	20.15		1578	120
1278	20.60		1579	120
1279	21.35		1580	120
1280	21.90		1581	120
1281	22.45		1582	120
1282	22.90		1583	120
1283	23.80		1584	120
1284	24.30		1585	120
1285	25.10	pyrite content increases - small blebs and weakly pyritiferous	1586	120
1286	25.50	pyrite content increases - small blebs and weakly pyritiferous	1587	120
1287	26.00	weakly pyritiferous and brecciated/foliated with qtz	1588	120

XRF Test on Host-Rock Zonation

FC13-12

All Readings: 120sec, in ppm

Soils Mode

Note: Rock is VERY incompetent and fractured and depths are subsequently not precise

Reading No	Depth (m)	Description	Photo #	Duration
1292	3.63	silicified oxidized rock at top of hole	1598	120
1293	5.13	weakly pyritiferous phyllite rusty, qtz stringers, silicified	1599	120
1294	5.79	bleached phyllites? Silicifed, oxidized	1600	120
1295	6.60	quartz vein with oxidation	1601	120
1296	7.00	brecciated/foliated hostrock, oxidized, with muscovite and elongate clasts	1602	120
1297	7.00	brecciated/foliated hostrock, oxidized, with muscovite and elongate clasts	1602	120
1298	8.00	brecciated/foliated hostrock, oxidized, with muscovite and elongate clasts	1603	120
1299	8.00	brecciated/foliated hostrock, oxidized, with muscovite and elongate clasts	1603	120
1300	11.60	black argillite	1605	120
1301	14.00	brecciated argillite with clasts	1604	120
1302	15.00	brecciated argillite with clasts	1606	120
1303	15.00	brecciated argillite with clasts	1606	120
1304	16.50	brecciated and silicified argillite	1607	120
1305	17.00	brecciated and silicified argillite	1611	120
1306	19.50	brecciated and silicified argillite	1609	120
1307	20.00	brecciated and silicified argillite	1610	120
1310	23.32	brecciated and silicified argillite w/ small py blebs	1617	120
1311	23.32	brecciated and silicified argillite w/ small py blebs to repeat Au hit	1617	120
1312	24.05	qtz stringer zone with py in FOV	1618	120
1313	24.20	qtz stringer zone with py in FOV	1619	120
1314	24.25	pyrite vein in stringer zone	1620	120
1315	24.45	pyrite vein in stringer zone	1621	120
1317	29.39	dark pyritic sand	1622	120
1329	26.00	dark pyritic sand	1623	120
1330	26.55	gouge - grey	1624	120
1331	27.10	gouge - grey	1625	120
1332	27.50	dark pyritic sand	1626	120
1333	28.00	dark pyritic sand	1627	120
1334	28.50	dark pyritic sand	1628	120
1335	29.50	dark pyritic sand	1629	120
1336	30.00	schistose light grey brecciated rock	1630	120
1337	31.00	dark pyritic sand	1631	120
1338	31.50	schistose light grey brecciated rock	1632	120
1339	32.00	dark pyritic sand	1634	120
1340	32.70	schistose light grey brecciated rock	1635	120
1341	33.00	schistose light grey brecciated rock with green mineral (ni? Cr-mica?)	1637	120
1342	33.00	schistose light grey brecciated rock with green mineral (ni? Cr-mica?)	1637	120
1343	33.50	dark pyritic sand	1636	120
1344	34.00	schistose light grey brecciated rock	1641	120
1345	35.00	schistose light grey brecciated rock; has stringers and veins of qtz	1638	120
1346	35.15	schistose light grey brecciated rock; has stringers and veins of qtz	1639	120
1349	36.00	schistose light grey brecciated rock; has stringers and veins of qtz	1641	120
1350	37.00	dark pyritic sand	1642	120
1351	38.00	dark pyritic sand	1643	120
1352	38.50	grey gouge	1644	120
1353	39.25	brecciated gouged rock	1645	120
1354	40.00	dark pyritic sand	1646	120
1355	41.00	unsorted breccia, host rock - FOV on v.small stringer	1647	120
1356	41.35	unsorted breccia, host rock	1648	120
1357	42.00	unsorted breccia, host rock	1650	120
1358	43.00	black argillite	1651	120
1361	44.00	dark pyritic sand	1652	120
1362	45.00	brecciated gouged rock	1653	120
1363	45.90	brecciated hostrock	1654	120
1364	46.50	dark pyritic sand	1655	120
1365	47.35	brecciated hostrock	1656	120
1366	48.00	bleached brecciated gougen rock	1657	120
1367	49.00	dark pyritic sand	1658	120
1368	49.50	black gouge, graphitic/carbonaceous	1659	120
1369	50.00	black argillite	1660	120
1370	50.80	dark pyritic sand	1661	120
1371	51.50	black argillite	1662	120
1372	52.00	black argillite	1663	120
1373	52.10	black argillite; with py & qtz bleb	1664	120
1374	52.50	black argillite	1665	120
1375	53.00	light grey bleached rock; w/crystalline py	1666	120
1376	53.50	light grey bleached rock; w/crystalline py	1667	120
1377	54.00	light grey bleached rock; w/crystalline py	1668	120
1378	54.50	light grey bleached rock; w/crystalline py	1669	120
1379	55.00	light grey bleached rock; w/crystalline py	1670	120
1380	55.00	light grey bleached rock; w/crystalline py	1671	120
1381	56.00	light grey bleached rock; w/crystalline py	1672	120
1388	56.50	light grey bleached rock; w/crystalline py	1685	120
1389	56.95	light grey bleached rock; w/crystalline py	1686	120
1390	57.50	light grey bleached rock; w/crystalline py	1687	120
1391	58.00	black argillite	1688	120
1392	58.50	black argillite	1689	120
1393	59.00	black argillite	1690	120
1394	59.40	black argillite	1691	120
1395	60.00	black argillite	1692	120
1396	61.00	black argillite	1693	120
1397	61.50	qtz vein in black argillite	1694	120
1398	62.00	small qtz bleb with py	1700	120
1399	63.05	black argillite	1695	120
1400	63.50	black argillite	1696	120
1401	64.00	black sludge	1697	120
1402	65.00	black argillite	1698	120
1403	65.50	black argillite	1699	120
1404	66.50	black argillite	1701	120
1405	67.00	black argillite	1702	120
1406	67.50	qtz vein in black argillite	1703	120
1407	68.00	qtz vein in black argillite	1704	120
1408	68.50	black argillite	1705	120
1411	69.00	black argillite	1706	120
1412	69.95	brecciated qtz and argillite	1707	120
1413	70.50	black argillite	1708	120
1414	71.00	black argillite	1709	120
1415	71.50	black argillite	1710	120
1416	72.00	black argillite	1711	120
1417	72.50	black argillite w/slightly more py, foliated	1712	120
1418	73.00	black argillite w/slightly more py, foliated	1713	120
1419	73.50	black argillite	1714	120
1420	74.00	black argillite	1715	120
1421	74.50	black argillite	1716	120
1422	75.00	black argillite	1717	120
1423	75.05	py bleb in qtz in argillite	1718	120
1426	75.50	black argillite	1724	120
1427	76.50	black argillite	1725	120
1428	77.00	black argillite	1726	120
1429	77.50	black argillite	1728	120
1430	78.00	black argillite	1729	120
1431	78.50	black argillite; locally wavy with qtz blebs	1730	120
1432	79.00	black argillite	1731	120
1433	79.50	light -grey green altered rock	1732	120
1434	80.00	light -grey green altered rock	1733	120
1435	80.25	light -grey green altered rock	1734	120
1436	80.80	interbed of black argillite	1736	120
1437	81.50	light -grey green altered rock	1735	120
1438	82.00	light -grey green altered rock	1737	120
1440	82.50	light -grey green altered rock	1738	120
1441	83.00	light -grey green altered rock	1739	120
1442	83.35	light -grey green altered rock with alteration spots	1740	120
1443	84.00	light -grey green altered rock	1741	120
1444	84.50	light -grey green altered rock	1742	120
1445	85.00	light -grey green altered rock	1743	120
1446	85.00	light -grey green altered rock gouge	1744	120
1447	86.00	light -grey green altered rock	1745	120
1448	86.50	light -grey green altered rock	1746	120
1449	87.00	black gougen argillite with small py grains	1747	120
1452	87.50	black argillite w/brecciated elongate clasts	1754	120
1453	88.15	black argillite	1755	120
1454	88.50	black argillite	1757	120
1455	89.00	black argillite	1758	120
1456	89.50	black argillite	1759	120
1457	90.10	pyrite bleb on black argillite	1760	120
1458	90.50	black argillite	1761	120
1459	91.00	black argillite	1763	120
1462	91.50	black argillite	1764	120
1461	92.00	black argillite	1765	120
1463	92.50	altered l grey rock	1766	120
1464	93.00	altered l grey rock	1767	120
1465	93.50	altered l grey rock	1768	120
1466	94.00	altered l grey rock	1769	120
1467	94.50	altered l grey rock	1770	120
1468	95.00	altered l grey rock	1771	120
1469	95.45	qtz vein in fractured argilite w/galena blebs	1772	120
1470	96.00	black argillite interbed	1773	120
1471	96.50	altered l grey rock	1774	120
1472	97.00	altered l grey rock	1775	120
1473	97.50	altered l grey rock	1776	120
1474	98.50	altered l grey rock	1777	120
1475	98.50	qtz vuggy vein - qtz carb? Oxidized colour; ankerite? (see core photo)	1783	120
1482	99.00	altered l grey rock	1787	120
1483	99.50	black argillite	1789	120
1484	100.00	black argillite	1794	120
1485	101.00	altered l grey rock	1790	120
1486	101.50	altered l grey rock	1791	120
1487	102.05	pyrite in qtz vein; very fine grained (see core photo)	1792	120
1488	102.50	altered l grey rock	1793	120
1489	103.00	altered l grey rock	1795	120
1490	103.35	altered l grey rock w/gougen texture	1796	120
1491	104.00	altered l grey rock	1797	120
1492	104.50	black argillite interbed	1798	120
1493	105.00	altered l grey rock	1799	120
1494	105.50	altered l grey rock	1800	120
1495	106.00	altered l grey rock	1801	120

Appendix 11

Frank Creek 2013 Field Notes

Frank Creek Field Notes; Orientations for October 2013

Jack Logan

Goals: to get an idea of structure on the eastern and western side of the soils/quantec grid; to constrain a general location of the mineralized horizons at the Frank Creek property.

Discovery Trench

A very siliceous unit with cr-mica bound by black argillite is found exposed in the discovery trench. It weathers a different colour than the unit it is hosted within (an orange-brown). The contact with the adjacent black argillite unit is strong and sharp. It has a thickness of approximate 60cm and trends 116^{o} - 296^{o}. Adjacent quartz stringers trend in the same direction. See photo#'s 2035-2039.

Two massive sulphide lenses are outcropping higher in the discovery trench. They appear to trend 320^{o}-140^{o} dipping SW.

Flanking a massive sulphide lens in outcrop appeared to be carbonaceous qtz-muscovite schist.

Foliation/bedding measurements taken in the discovery trench were 134^{o}/64^{o}, 140^{o}/32^{o}, and 128-130^{o} strike dipping to the SW.

Location of mineralized outcrop: 610630E, 5845390N +/- 4m; Elevation 1154m.

DDH FC13-13 Area

Location of DDH FC13-13 collar is 610540E. 5845749N +/- 6m; 1072m elevation. Dip is 60^{o}, azimuth is 90^{o}.

Bedrock proximal to DDH FC13-13 at 0610647E, 5845833N +/- 3m; elevation 1060m appears to be a qtz-muscovite schist. Outcrop is locally oxidizing bn-orange, grains not visible (aphanitic), easily scratched with hammer. Surface has muscovite sheen and is hard and difficult to break. Foliation appears to strike approximately 130^{o}. Foliation measurement of 129^{o}/67^{o}. See photo# 2040-2043.

Further N-NW from qtz-muscovite outcrop is a foliated argillite/carbonaceous schist at 610644E, 5845851N +/- 4m; elevation 1055m. Foliation or bedding measurements measured at 162^{o}/70^{o}. See photo# 2044, 2045. Average strike is 140^{o} but outcrop-scale/local folding ranges from 122-164^{o}.

DDH FC13-09/FC11-03 Area (before second switchback)

Outcrop proximal to DDH FC13-09, further west down road. Unit is oxidized and contains stringers and semi-massive lenses of sulphides. Unit is schistose with foliation/bedding measurements of 162^{o}/52^{o} and 162^{o} /62^{o}. Oxidized qtz-muscovite schist? Location is 610511E, 5845538N +/- 5m; elevation is 1120m. Photo# 2046.

Outcrop adjacent to DDH FC13-09; similar to above unit – schistose and oxidized with evidence of outcrop-scale localized folding. See photo# 2047. More shallow-dipping; measurements are 220/12, 210/17, 226/20, 200/19. Location is 610494E, 5845538N +/- 5m; elevation is 119m.

Drill collar location of FC13-09/FC11-03 is 610488E, 5845541N +/- 5m

Determined coordinates of furthest points on L55-57:

L59: 6610700E, 5845870N

L57: 610920E, 5845670N

L55: 610960E, 5845510N

Eastern end of L59

Traverse from L59 and down steeply dipping slope into Frank Creek, outcrop was extremely limited. Of rock encountered, was difficult to surmise as outcrop or large colluvial boulders. Traverse was extremely slippery, would recommend doing traverse in drier conditions. Large patches of devils club and the steep slope angle also make the traverse difficult.

Soil/till sample from 75cm test pit was collected on the slope at 610737E, 5845881N +/-6m; elevation 1013m. (labelled L59 Soil 1).

Made it down into Frank Creek but did not cross outcrop on traverse downwards. Location at Frank Creek was 610804E, 5845950N +/- 8m; elevation 970m. Again, tried digging a pit to find bedrock but till cover is thick in this area.

Sample of grey clay and two different rock types were collected (green quartzite? And muscovite schist) at 610828E, 5845938N +/- 20m; elevation 1004m.

Came across a very large boulder, could not get a GPS location due to valley wall height and location of satellites. Schist had a foliation of 148^{o}/38-48^{o}. Photo #'s 2053-2054

Eastern end of L57 (traverse down spur road w/limestone outcrop)

Lots of exposure but is discontinuous over span of spur road.

The first encountered outcrop on the spur road is 1.5x1.5m wide, rounded carbonaceous limestone (fizzes with exposure to acid). It exhibits a foliation or bedding structure striking 150^{o}. It's location is at 610768E, 5845650N +/-8m; elevation 1096m. Bedding measurements of 148/75, 138/69, 149/72, 149/69 all steeply dipping SW-W.

See photo# 2055-2057; 2058 – fresh face.

2m further along spur road from previous outcrop is another outcrop with quartz veins, limestone, oxidized quartz-muscovite schist, and a similar siliceous cr-mica bearing unit as seen at the discovery

trench. This outcrop also steeply dips to the SW but outcrop-scale localized folding gives a dip in the opposite direction as well. See photo# 2060-2062. Limestone bedding measurements collected are 144/72, 152/70, 142/66Photo# 2064: left orange tape = cr-mica siliceous unit; middle orange tape = muscovite schist; right orange tape = limestone.

Photo# 2065 shows a synclinal fold(?) where the dip direction changes. Oxidized quartz-muscovite schist measurements are 146/79, 294/68, 328/80, 340/84, 125/74, 120/76.

Photo# 2067 and 2068 show the resistant siliceous cr-mica bearing unit.

Further along spur road heading easterly, there are vertically dipping dark grey units (dip direction SW); perhaps a carbonaceous qtz-muscovite schist? Photo# 2069. Measurements are 152/72, 160/62, 143/84, 139/77.

Again, further east on spur road brings another outcrop of limestone with measurements of 138/63, 148/72, 140/80. Contact on right of limestone is a weak and very fissile muscovite schist.

Vertically dipping limestone outcrops again at 610789E, 5845657N +/- 6m, elevation 1097m, 610810E, 5845657N +/- 6m, elevation 1097, and at 610819E, 5845650N +/-7m, elevation 1097m with bedding measurements at 156/72 and 154/70.

Past the end of L57 there is an undetermined contact between limestone and quartz muscovite schist. Beyond the spur road there is abundant outcrop of a light-grey quartz muscovite schist. It is weakly oxidized with milky and mildly oxidized quartz veins that are parallel and cross cutting the foliation.

Coordinates of some outcrops are 610955E, 5845592N +/-5m, elevation 1116m. See photo# 2070.

Foliation and bedding measurements are 180/50.

Another outcrop at 610970E, 5845576N +/-5m; elevation 1119m - See photo# 2071 – unit has conglomerate looking texture.

Another outcrop at 610962E, 5845629N +/-6m, elevation 1097m. Foliation measurements are 170/68, 196/80, 162/64, 150/66, 170/63 – local steepening and shallowing (localized outcrop-scale folding) in folation.

Cross cutting quartz vein orientation of 060/63.

Samples collected of quartz veins and qtz-muscovite schist.

Western Side of L53; D2 Area

In trench at 0609767E, 5845085N; elevation 1169m. Foliation/schistosity measurements of 156/58 and 144/51. Quartz veined muscovite schist and quartz muscovite schist with disseminated oxidized sulphides present in vicinity.

609772E, 5845098N green-grey quartz muscovite (chlorite?) schist with stringers and veinlets of pyrite and quartz. foliation strikes 136 degrees but is difficult to find a good dip surface.

Location 609774E, 5845100N; elevation 1162m. Measurements of foliation at 160/40, 132/39, 151/48, 164/48, 176/50, 166/49, 164/50; 1m below 166/46.

Location 609783E, 5845111N; elevation 1157m foliation measurement at 154/37. Massive sulphide lenses 40cm above, same orientation. 2m below = 160/32, 133/42, 120/57.

Lower trench

609770E, 5845210N; elevation 1136m. Foliation measurements of 132/35, 115/54, 136/34, 166/32, 132/34. Photo# 2075 is a 1.18m massive sulphide horizon that trends 118 <-> 298.

Down in lowest (bottom) trench; general location is 609738E, 5845255N +/-6m; elevation 1116m. Foliation readings are 178/40, 148/58, 145/62, 154/62.

Rusty massive sulphide lens or horizon at 609726, 5845247 elevation 1121m, strike between 154-180. Dip of 32-48.

Appendix 12

Appendix 13

Statement of Qualifications

Jack Logan, of the City of Victoria, British Columbia:

1. Is an employee of Barker Minerals Ltd.

2. Is a graduate of the University of Victoria with a B.Sc. in Earth Sciences granted in 2012.

3. Is a registered member of the Professional Engineers and Geoscientists of British Columbia (APEGBC) as a Geoscientist-in-Training (GIT).

4. Has worked as a geologist in British Columbia, Ontario, and the Yukon since 2011.

5. Is the primary author of this report and has carried out or supervised work described in this report.

Rein Turna, of the City of West Vancouver, British Columbia:

1. Is an employee of Barker Minerals Ltd.

2. Is a graduate of the University of British Columbia with a B.Sc. in Geological Sciences granted in 1975.

3. Is a registered member of the Professional Engineers and Geoscientists of British Columbia (APEGBC) as a Professional Geologist (P.Geo).

4. Has worked as a geologist in British Columbia, Saskatchewan, Ontario, Yukon and Northwest Territories in Canada since 1975.

5. Is a contributing author of this report and has carried out or supervised work described in this report.

Louis E. Doyle, of the City of Prince George, British Columbia:

1. Is the President and CEO of Barker Minerals Ltd.

2. Has over 19 years of experience prospecting and managing exploration programs in the Cariboo Mining District of British Columbia, Canada.

3. Is a contributing author of this report and has supervised work described in this report.

Appendix 14

Statement of Expenditures

Barker Minerals Ltd.

Work was completed between December 15, 2012 to December 15, 2013

Diamond Drilling & Physical Work
on the Frank Creek, BB East and Black Bear Projects

Geological

Planning, managing all exploration related work in 2013 including XRF analysis and report writing

Louis Doyle -

165 days @ $500.00/day wages	$	82,500.00
165 days @ $125.00/day room & board	$	20,625.00
107 days @ $125.00/day vehicle	$	13,375.00
	$	**116,500.00**

Sampling, mapping, drilling, XRF analysis, core teching, core splitting, interpretation & report writing

Rein Turna - Geologist

80 days @ $400.00/day wages	$	32,000.00
80 days @ $125.00/day room & board	$	10,000.00
40 days @ $125.00/day vehicle	$	5,000.00

Jack Logan - Geologist

144 days @ $400.00/day wages	$	57,600.00
144 days @ $125.00/day room & board	$	18,000.00
100 days @ $125.00/day vehicle	$	12,500.00
	$	**135,100.00**

Drilling

Curtis Best - Head Driller

88.5 days @ $125.00/day room & board	$	11,062.50
88.5 days @ $125.00/day vehicle	$	11,062.50

Dean Best - Drill helper

88.5 days @ $125.00/day room & board	$	11,062.50
