1:00 SUMMARY

During the summer of 2013 seventy seven rock samples were collected on the FOX property. Significant values of gold and silver were obtained from a network of quartz veinlets within argillic and pyrite altered felsic rocks.

2.00 INTRODUCTION

This report describes the results of a Rock geochemistry program conducted on the FOX group of mineral claims during the summer of 2013.

2.10 Location and Access

The FOX GROUP of claims is located in the Omineca Mining division of central BC (NTS 093F083, F093) and is centered roughly at UTM Co-ordinates 338000E and 5976000N (Fig.1), approximately 45 km Southeast of Burns Lake. Access to the property is provided by a series of haul roads branching off of the Binta main or 200 Haul road which can be accessed via small community Southbank in the west or from the east via the Francois Lake haul road.

2.20 Property

The FOX Claim group consists of 4 mineral tenures 750982, 751002, 843278, and 843280(Figun: 2) owned by Kootenay Silver Inc of Vancouver BC.

2.30 Physiography

The FOX Claim group covers an area of rolling to gentle topography at elevations between 840m and 1060m. Roughly half of the property is covered by recent and older patches of clear-cut logging. The remainder of the property is covered by stands of pine beetle killed lodgepole pine and spruce balsam growths in swampy boggy lowlands. Windfall in these stands is common and in areas of older logging thick regeneration and alder growth makes traversing very difficult. Outcrop on the property is extremely poor with maybe five percent of the property containing rock outcrops, dominantly located on topographic highs or found along logging access. The remainder of the property is covered by variable amounts of till and outwash gravels.

2.40 History of Previous Exploration

The FOX Group of claims covers an area that has received little focussed oxploration in the past. Several work programs were conducted in the area for molybdenum by various junior companies with limited soil sampling and geology. Two programs of previous rock geochemistry and prospecting were conducted on the claim group by Kootenay Silver Inc. (reports 32331, and 32952) with significant mineralization of silver and gold discovered in felsic volcanic rocks.

Figure 4. Location of Figures 5A,B,C

2.50 Purpose of work

The purpose of the 2013 rock geochemistry program on the FOX Group of claims was to try and extend an area of previously identified alteration and mineralization within the Eocene aged Ootsa Lake formation. This mineralization is associated with variable amounts of pyrite flooding and silicification of the host with thin quartz veining and brecciation and this style of material were targeted.

3.00 GEOLOGY

The FOX Group of claims covers an area underlain by felsic Eocene age Ootsa Lake formation bounded to the east and west by Cretaceous sedimentary and mafic volcanic rocks assigned to the Kasalka group (Figure 3 taken from MapPlace geology). Local outcrops of chert pebble conglomerate and andesite volcanics possibly of the Jurassic Hazelton Group as well as sedimentary dominant rocks of the Jurassic Bowser Group may occur locally on the property perhaps underlying the Ootsa lake formation. A possibly significant granitic intrusive body of Eocene age occurs close to the eastern boundary of the claim group and may play an important role in the mineralization found on the claim group.

4.00 ROCK GEO-CHEMISTRY RESULTS

4.10 ROCK GEOCHEM PROCEDURE

During the 2013 rock Geochemistry program samples 77 were collected. The samples were collected primarily from outcroppings and consisted mainly of grab or composite samples collected with hammers and picks. Locations were marked in the field with flagging and GPS readings were taken of each site with handheld GPS units. These samples were sent to ACME Analytical Laboratories where they were subjected to the Group ID and IDX multi-element assay package with gold given in ppb. Samples with over limits of lead, zinc, copper and silver were subjected to additional assay techniques to determine absolute levels given in percentages for base metals and ppm for silver.

Sample locations with values plotted for Molybdenum, Copper and Gold can be found on Figure 5A, Values for Lead, Zinc and Silver on Figure 5B and Values for Arsenic, Antimony and Bismuth on Figures 5C(in Pocket). A complete table of sample descriptions as well as UTM co-ordinates can be found in Appendix A, with Assay certificates in Appendix B

4.20 DISCUSSION OF RESULTS

Molybdenum:

Values for molybdenum of the samples collected were overall moderate to highly anomalous. Of the seventy seven samples collected sixty one samples ran above 5ppm with fifty three samples greater than 10ppm. Thirty one samples gave values over 25ppm with twenty one samples running 50ppm or above. Ten samples assayed above 100ppm

including the program highs of 163.7ppm(TK13-529), 199.2ppm(TK13-530), and 267.4ppm(TK13-586). Higher levels of molybdenum are commonly accompanied by elevations for lead. The program highs for molybdenum are also coincident with extremely high levels of silver and gold. In general molybdenum is the most widely dispersed anomalous element in the survey.

Copper:

Copper values obtained from the sampling program are low to weakly anomalous. Only eight samples gave values over 25ppm with three of these above 50ppm, comprising the program highs at sample sites TK13-526(66.2ppm), TK13-529(68.0ppm), and TK13-528(312.4ppm). The highest values of copper are coincident to those for lead, molybdenum, gold and silver, but it appears to be a minor constituent overall on the property.

Lead:

Overall moderate to elevated levels of lead were returned from the samples collected in the 2013 program. Forty one samples assayed above 25ppm with twenty six of them greater than 50ppm. Twenty two samples ran over 100ppm; twelve of which were above 250ppm and six above 500ppm. The program highs consisted of 1883ppm(TK13-526), 2073ppm(TK13-529), 3336ppm(TK13-528). Lead highs are commonly consistent to those of molybdenum, silver and to a lesser extent gold. The highest samples for lead are also coincident to those of gold and silver. Lead, with molybdenum are the most widely anomalous elements in the survey.

Zinc:

Fairly low levels of zinc were obtained in the samples collected. Only twelve samples ran above 50ppm with two above 100ppm; at TK13-592(126ppm), and TK13-528(262ppm). Zinc levels are too low to draw any obvious correlations or importance.

Silver:

Silver levels in the samples assayed are in general moderately to extremely elevated. Thirty three samples nearly half of those collected gave results above 5ppm, with twenty seven above 10ppm. Twenty three samples ran over 25ppm; eighteen of them higher than 50ppm. Fifteen samples ran over 100ppm and ten greater than 500ppm. Nine samples returned extremely high levels for silver of over 1000ppm with the program highs at TK13-529(2935ppm), TK13-526(4318ppm), and TK13-528(6049ppm). Silver appears to be related to lead, molybdenum and gold. The program highs for all are coincident and elevated levels of silver elsewhere have similarly elevated values of molybdenum and lead.

Gold:

Gold values from the program were moderate to highly anomalous. Thirty four or nearly half of the seventy seven samples collected, returned results above 25ppb, with twenty eight of these 50ppm and above. Twenty four samples gave values over 100ppb, seventeen samples above 250ppb, and fourteen over 500ppb. Eleven samples returned levels over 1000ppb, eight over 5000ppb and six greater than 10000. The program highs

consisted of 20235ppb(TK13-532), 27096ppb(TK13-526), 32634ppb(TK13-528). As noted above gold occurs with both molybdenum, lead and silver, the program highs for all occur together, and elsewhere elevated gold occurs most consistently with the higher samples for silver.

Arsenic:

Arsenic levels in the survey are in general rather low. Fourteen samples ran above 25ppm, six of these above 50ppm. Two samples assayed greater than 100ppm and comprise the program highs at TK13-530(157.2ppm), and TK13-535(201.7ppm). As with zinc; arsenic thus far appears to be a minor importance in the mineralized system on the property.

Antimony:

Antimony levels overall in the samples collected were low with local highs. Fourteen samples ran above 2ppm, nine greater than 5ppm and eight above 10ppm. Six samples ran above 25ppm, and three above 50ppm; the program highs of 53.9ppm(TK13-529), 70.3ppm(TK13-528), and 122.2ppm(TK13-526).

Bismuth:

Very low levels of Bismuth were obtained from the samples assayed with only one sample at TK13-386(3.8ppm) above 1ppm.

4.00 CONCLUSIONS AND RECOMMENDATIONS

The rock sampling program on the FOX property conducted in 2013 uncovered an area of extremely high values for silver and gold in conjunction with elevated levels of lead and molybdenum.

Additional sampling coupled with geological mapping, trenching and geophysics should be carried out in the area of known mineralization.

5.00 STATEMENT OF COSTS

Tom Kennedy 5 days @ \$500.00/day(vehicle inclusive)	\$2500.00
ATV Rental 3days@\$150.00/day	\$450.00
Tom Kennedy Report and Drafting	\$1200.00

APPENDIX 1

Rock Geo-chem Sample Descriptions and Co-ordinates

Sample No.	UTM E	UTM N	Description
TK13-321	338153	5976727	Rebrecciated ryholite and andesite with some druzy overprinting quartz with siliceous matrix brecciation and reddish oxide
TK13-322	337920	5976617	Narrow openspace quartz crystal veinlets zone with limonite alteration of host green volcanic with some reddish oxide -strike 10 degrees dip 75 degrees
TK13-323	337920	5976617	Vuggy quartz crystal veinlet material same location as above
TK13-324	337907	5976590	30 degree trending vertical dipping thin druzy quartz and crush brecciation in green volcanic with some limonite and fresh pyrite
			Pyrite flooded silicified ryholite feldspar porphyry with fresh pyrite disseminated and thin
TK13-325	338038	5976439	quartz veinlets in rebrecciated material -cloudy appearance to feldspars albitized?
TK13-326	338038	5976439	Same as above- some reddish oxide
TK13-327	338054	5976439	Same unit as above with sugary alteration and thin openspace quartz veinlets with some yellow oxide in rotted out clots
TK13-328	337946	5976317	Feldspar porphyry unit pyrite flooded in patches and cut by thin silica veinlets -disseminated fresh pyrite
TK13-329	337489	5976390	Feldspar porphyry unit with thin bleached fractures and rare coatings of druzy silica with hematite and limonite staining -amethyst vugs?
			Silicified feldspar porphyry with pyrite flooding and erratic quartz crystal openspace veining with some rebrecciation and silica coatings. Limonite and hematite staining with fresh pyrite
TK13-330	337240	5976876	and rotted blackish mineral galena? -grab sample of quartz veined material
TK13-331	337240	5976876	Same as Above
TK13-332	337193	5976890	Similar material to above white quartz veining with openspace quartz crystal cavities some limonite and pyrite with reddish oxide
TK13-333	337286	5976963	Same alteration as above samples pyrite flooded limonitic stained porphyry unit cut by crystalline quartz veins with openspace cavities some hematite
TK13-334	337308	5976918	Limonite/pyrite flooded porphyry unit micro and macro veined -openspace quartz crystal type with some rebrecciation and druzy quartz coatings -reddish oxide
TK13-335	337271	5976915	Thin N/S trending quartz veins with some sugary to crystalline texture in altered porphyry unit with pyrite and limonite with reddish oxide
TK13-336	337330	5977133	1m wide quartz breccia zone in porphyry unit with some limonite and pyrite alteration with quartz crystal vugs -50 degree strike dip to SE at 70 degrees
TK13-337	337275	5977116	Series of openspace quartz crystal vugs veins within limonite altered feldspar porphyry unit resilicified and brecciated with some pyrite coating quartz crystal cavities and some reddish oxide
TK13-338	337280	5977125	Pyrite altered feldspar porphyry unit silicified and cut by silica veining with some brecciation - grab of more densely veined material
TK13-339	337280	5977125	Same as Above
			Series of cm to half cm scale crystalline open space quartz cavity veining in porphyry unit with pyrite flooding sericite? Alteration -sample is grab of vein rich portion of zone with disseminated pyrite
TK13-340	337182	5977217	Same as Above
TK13-341	337182	5977217	Rebrecciated silicified porphyry unit with narrow zone of crush rebreccia containing some quartz fragments with limonite staining and reddish oxide
TK13-342	337035	5977005	Fractured re-fractured pyrite flooded feldspar porphyry unit with quartz crystal veining limonite and hematite staining and pink alteration of feldspar potassic?
TK13-343	337051	5977024	Rebrecciated pyrite/limonite altered porphyry unit with silica veining -openspace quartz crystal type
TK13-344	337051	5977024	Sericite altered pyrite flooded porphyry unit with some thin micro quartz veinlets and quartz crystal vugs
TK13-345	337110	5976998	Pyrite/limonite altered porphyry unit with white openspace quartz crystal veining and some hematite and limonite staining
TK13-346	337153	5976980	Pyrite/limonite and argillic altered porphyry unit with thin quartz veinlets of openspace crystal vugs filling variety
TK13-347	337153	5976980	Limonite and pyrite flooded porphyry unit with thin quartz veinlets-crystalline openspace type
TK13-348	337157	5976943	Openspaeo quartz veinaing with limonite and pyrite altered feldspar porphyry unit with some reddish staining and silification along vein margins
TK13-349	337192	5976927	Bleached argillic altered porphyry unit cut by thin openspace quartz veining - pyrite and limonite alteration of host along with zones of siliceous matrix brecciation and some pink around pyrite rims -hematite? Or potassic? Alteration
TK13-350	337082	5977454	Thin N/S trending druzy quartz veinlets cutting ryholite unit with bleaching and weak argillic alteration with pyrite and limonite
TK13-374	336938	5977543	

TK13-375	336938	5977543	Thin silica micro veining in altered rhyolite porphyry unit with argillic alteration and some limonite and pyrite flooding
TK13-376	336938	5977543	4 inch wide jigsaw like breccia cutting rhyolite with siliceous matrix reddish and limonite stained some quartz crystal veining -50 degree trend dip to SE 20degrees
TK13-377	336929	5977530	Zone of siliceous matrix brecciation in rhyolite with fresh pyrite and some limonite boxworks and thin open space quartz crystal veins
TK13-378	336917	5977509	Narrow openspace quartz vein with some limonite alteration in rhyolite and rebrecciation
TK13-379	336917	5977509	Series of openspace quartz crystal veinlets with limonite staining and yellow brown oxide -10 degree trend
TK13-380	336917	5977509	En echelon zone to above with similar material some black manganese and carbonate
TK13-381	336902	5977493	20 degree striking dip 70 degree to E fault breccia zone with silicification and narrow chalcedonic to crystal type quartz veinlets and cement along contact of rhyolite and other andesite volcanic unit -pyrite flooding and argillic alteration -5m wide - dimples is of argillic altered quartz breccia in felsic host with limonite and pyrite with a yellow staining
TK13-382	336902	5977493	Same zone as above -composite of a .5m wide section of milled breccia material with silica casts and limonite alteration
TK13-383	336902	5977493	Same zone as Above- sample is a bloc of veined and siliceous material argillic altered with limonite and pyrite
TK13-384	336901	5977472	Above fault zone - silicified matrix breccia with silicified clasts and pyrite flooding disseminated in bluish colored siliceous matrix
TK13-385	336901	5977472	Rhyolite feldspar porphyry subcrop cut by thin open space quartz crystal veinlets with pyrite and limonite alteration of host with a weak bleaching
TK13-386	337086	5977464	Road bed material of openspace quartz crystal veining in rhyolite host with some hematite and limonite alteration
TK13-387	337247	5977623	Rebrecciated feldspar porphyry unit with some reddish oxide and yellow staining with thin quartz crystal veinlets
TK13-519	336904	5977252	Argillic altered limonite flooded rhyolite with some quartz crystal veining
TK13-520	336921	5977241	Same as above material with crystalline quartz veinlets and limonite
TK13-521	336940	5977244	Subcrop of reddish oxidizing silicified rhyolite pyrite flooded and cut by thin openspace quartz veinlets
TK13-522	337001	5977062	Siliceous rhyolite rebrecciated with rare quartz veinlets with limonite and pyrite alteration
TK13-523	337020	5977087	Area of quartz veining trending 330 degrees dipping near vertical cutting pyrite flooded rhyolite porphyry unit with grey alteration of feldspars sample is a centimetre scale veinlets within limonite stained and pyrite flooded rhyolite
TK13-524	337069	5977141	Centimetre scale veinlets of openspace quartz with limonite and reddish oxide cutting pyrite flooded rhyolite
TK13-525	337069	5977141	Crystalline/blackish quartz with disseminated pyrite in host -4-6 inches in width
TK13-526	337069	5977141	6 inch wide openspace quartz crystal vein with disseminated pyrite and black mineral cutting pyrite flooded rhyolite
TK13-527	337069	5977141	Same vein as above grab of quartz breccia material with reddish oxide and pyrite
TK13-528	337069	5977141	Same vein as above grab of quartz material with quartz crystals and pyrite with black rotted mineral
TK13-529	337069	5977141	Same vein as above limonite rich quartz vein material with black weathering mineral reddish oxide
TK13-530	337069	5977141	Same vein network as above 0.5m wide -grab of quartz material with pyrite and blackish mineral and amethyst quartz
TK13-531	337069	5977141	Above vein on strike with blackish mineral and fresh pyrite -amethyst quartz
TK13-532	337069	5977141	Thin quartz crystal veinlets with some iron staining in pyrite flooded rhyolite
TK13-533	337069	5977141	Sulphide flooded porphyry with grey alteration and thin openspace quartz crystal veining with rotted out blackish mineral
TK13-534	337069	5977141	6inch composite of cm scale openspace quartz veinlets with some limonite and pyrite with a blackish mineral -in area of sample TK13-333
TK13-535	337287	5976957	6 inch to foot wide composite of thin quartz veinlets within limonite altered porphyry
TK13-536	337287	5976957	Veined and sheared pyrite altered porphyry unit with some reddish iron staining with openspace quartz veinlets and rare blackish mineral
TK13-537	337287	5976957	Foot wide composite of brecciated pyrite flooded limonite stained porphyry with some openspace quartz crystal veinlets
TK13-538	337287	5976957	Sulphide flooded porphyry unit with some white openspace quartz -composite of a foot wide interval of outcrop

TK13-540	337287	5976957	Grab of quartz veinlet cutting porphyry unit with purple reddish oxide with blackish mineral and pyrite
TK13-586	337734	5976528	Sulphide altered ryholite with limonite and reddish oxide with thin openspace to chalcedonic quartz
TK13-587	337194	5976915	Sulphide flooded grey porphyry with thin openspace quartz crystal veinlets
TK13-588	337160	5976933	Sulphide flooded and silicified grey ryholite porphyry cut by thin open space quartz crystal veinlets and some yellowish staining
TK13-589	337114	5977007	Thin quartz veinlets milky to crystalline rebroken material -30 degree trend
TK13-590	337114	5977007	En-echelon veinlets to above with some limonite staining
TK13-591	337114	5977007	Zone of pyrite flooded and silicified ryholite with thin silica veinlets
TK13-592	337129	5977078	Pyrite flooded silicified ryholite with yellow oxide and some reddish staining with fresh pyrite and openspace quartz crystal veinlets
TK13-593	337450	5977162	Weak limonite altered ryholite with thin openspace quartz crystal veinlets -rare reddish staining
TK13-594	337491	5977280	Cm scale crystalline quartz vein with some limonite staining of ryholite host with rare reddish oxide
TK13-595	337720	5977410	Broken and busted up outcrop of ryholite with some limonite staining and slips with openspace quartz crystal veinlets and thin rare reddish streaks
TK13-596	337572	5976632	Zone of quartz brecciation with some pyrite and reddish oxide in ryholite
