Summary

In early August during a mapping traverse the Sitka showing, a massive barite quartz vein structure hosting abundant sphalerite and galena mineralisation was discovered. This prompted the staking of the Sitka property along the eastern boundary of the Akie property. The showing is located along the thrust contact between the Road River Group Silurian siltstones and the black shales of the Earn Group. Several additional prospecting traverses along strike of the showing discovered a number of narrow quartz-barite veins hosting spectacular sphalerite and galena mineralisation. These veins are hosted within the Kwadacha limestone and appear to be spatially associated with the Sitka showing. Grab samples taken from the showing and these occurrences returned grades of up to 43.55% Zn and 12.04% Pb. A channel sampling program on the Sitka showing outcrop revealed highly anomalous Zn mineralisation consistently in excess of 1,000 ppm and grades up to 5.12% as well as enrichment in Pb with grades up to 3.72%. The soil sampling program that was being conducted on the adjacent Akie property was extended to cover the area in the immediate vicinity of the Sitka showing as well as provide limited coverage along strike. The soil sampling revealed the presence of a large Ag anomaly with values consistently in excess of 1,500 ppb and up to 15,765 ppb. This anomaly currently measures 2.25 kilometres long and 300 metres wide and is open along strike in both directions.

Additional infill soil sampling, mapping and prospecting is recommended along strike of the showing to gain a better understanding of this showing. Preliminary mapping on the remainder of the Sitka property is also recommended.

1.0 Introduction & Terms of Reference

This report documents exploration work carried out in 2013 by Canada Zinc Metals Corp. (the company) on the Sitka property. Expenditures related to the exploration work have been applied to the Sitka property. The author directed the field work that is the subject of this report and was supported by an able field crew supplied by Coast Mountain Geological. The exploration activities on the Sitka property consisted of prospecting, soil sampling and channel sampling. Field data was recorded in Universal Transverse Mercator (UTM) projection using North American Datum (NAD 83), located within Zone 10. All measurements in this report are in metric units. Monetary amounts are expressed in Canadian dollars.

2.0 Property Location & Description

Canada Zinc Metals owns 100% of the Sitka property. The Sitka property consists of a single mineral claim covering a total area of 942 hectares. The property is located in the western ranges of the Northern Rocky Mountains in the province of British Columbia, Canada (Figure 2-1). The claim is in good standing until 2018 (Table 2-1). The property can be seen in Figure 2-2. The nearest town is Mackenzie BC, located approximately 250 kilometres southeast of the property (Figure 2-1). The property is located within NTS topographic map sheets 94F07.

Tenure #	Claim Name	Owner (100%)	Expiry Date	Area (Ha)
1021745	SITKA	202429	23 Apr 2018	942

Table 2-1: Sitka property tenure listing. Note: Owner # 202429: Canada Zinc Metals Corp.

3.0 Accessibility, Infrastructure, Climate & Physiography

Access to the Sitka property is by helicopter from the company's Akie exploration camp, located at the 24.5 kilometre mark on the Akie FSR (Forestry Service Road) (Plate 8-1). Chartered aircraft from Northern Thunderbird Air (NT Air) currently provides air transport services on a daily basis during the week to a gravel airstrip at the village of Tsay Keh Dene, BC. Tsay Keh Dene is located at the northern end of Williston Lake and is approximately 60 kilometres southwest of the Akie exploration camp.

Prince George is the largest population centre in central British Columbia and is located 420 kilometres to the south. The city is a major hub for supplies, transportation, communications, and commerce. Some supplies are derived locally in Tsay Keh Dene or from Mackenzie; the latter is located at the southern end of Williston Lake 250 kilometres southeast of the property (Figure 2-1). A series of year round accessible gravel forestry service roads connect Tsay Keh Dene with Mackenzie. These local communities have an active forestry industry as well as a growing mining and exploration industry. Nearby mines include the recently closed Kemess South mine and the newly opened Mt Milligan mine.

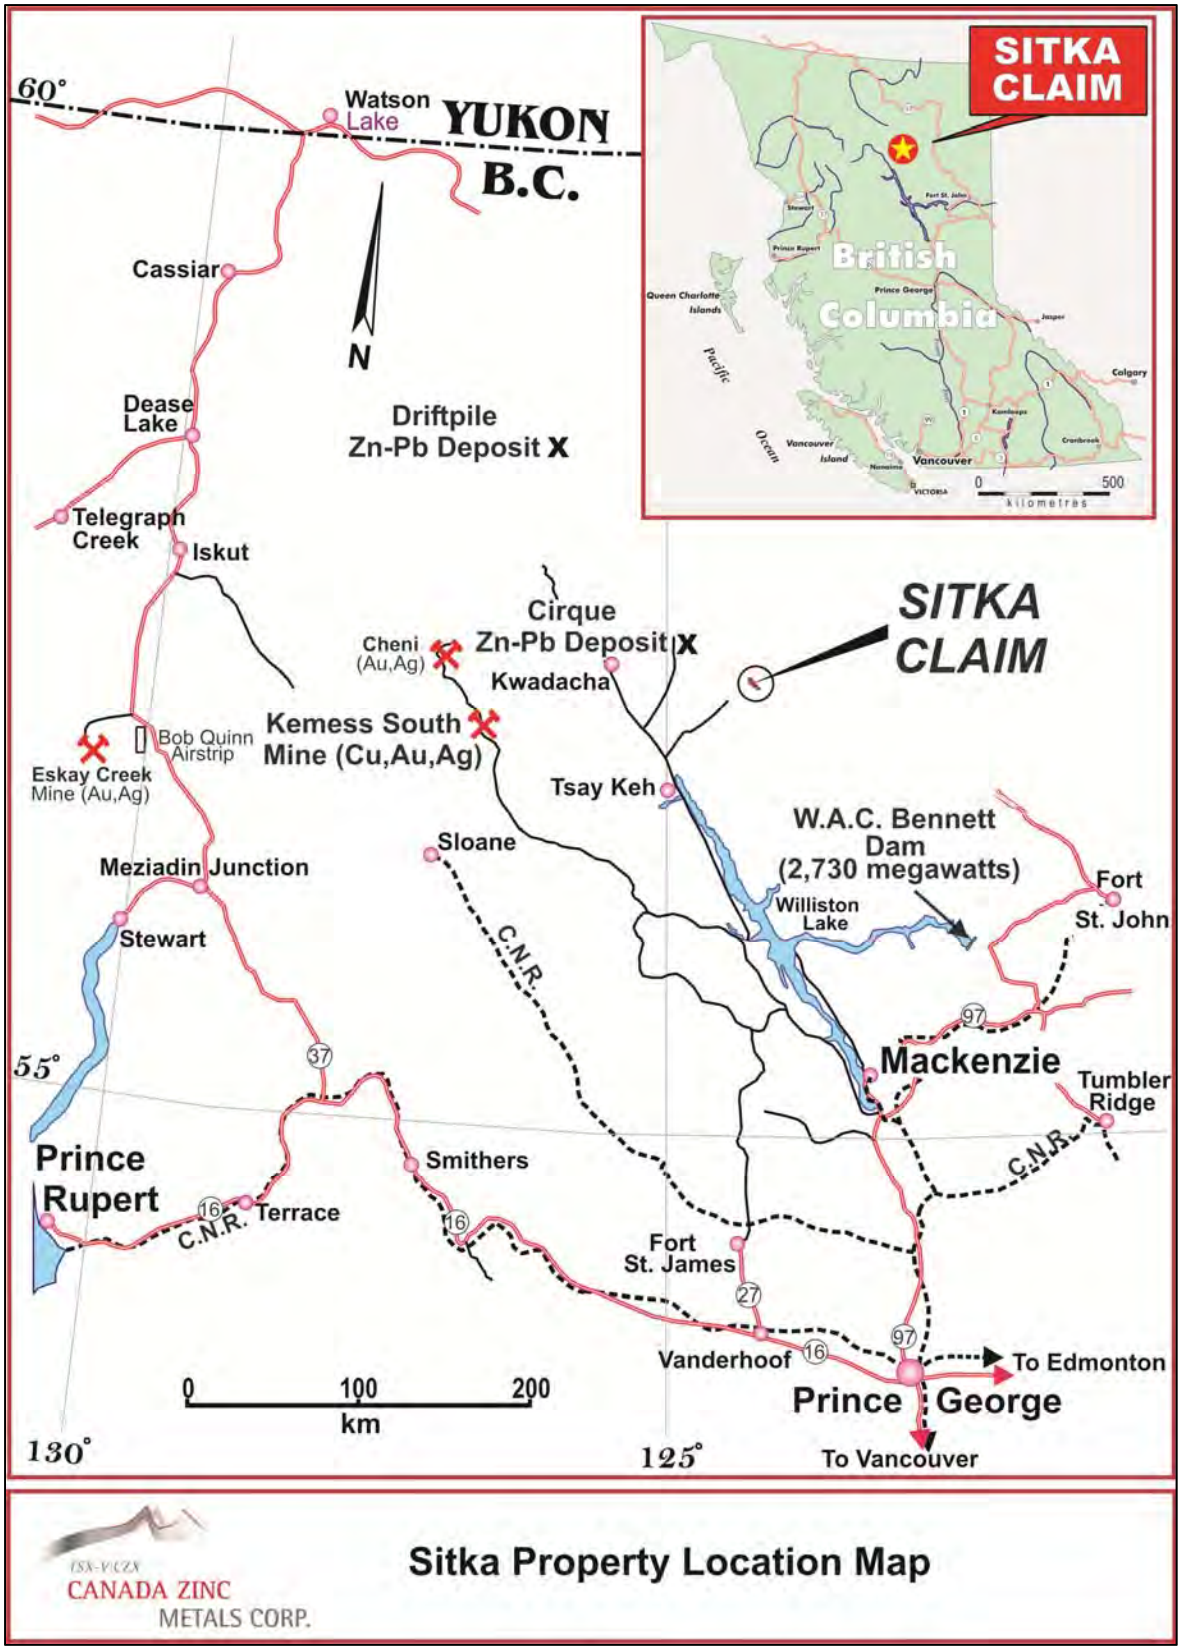

Figure 2-1: Property location map.

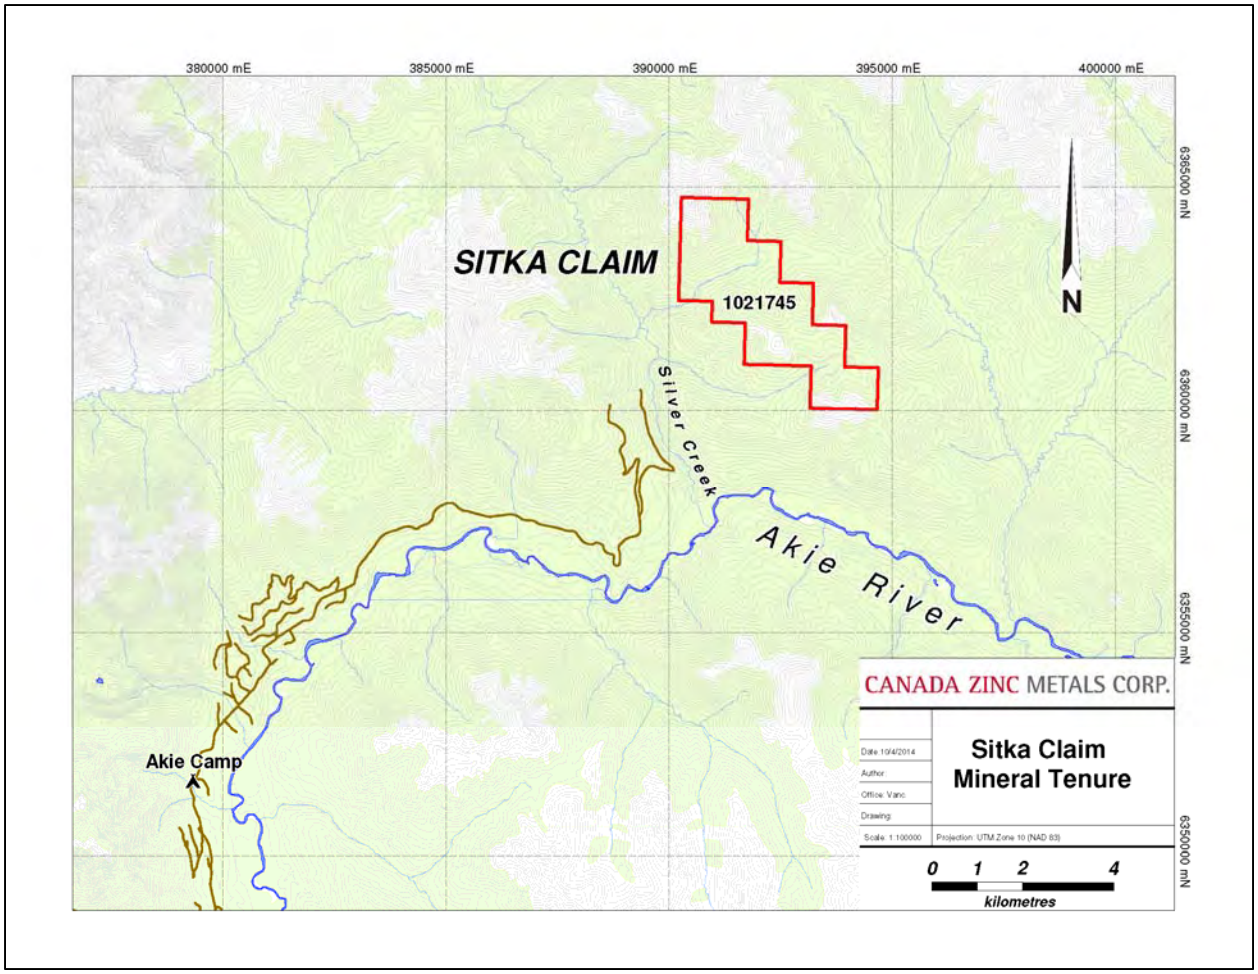

Figure 2-2: Mineral tenure map for the Sitka property.

The nearest BC Hydro electric transmission power source is the W.A.C. Bennett dam, capable of up to 2,730 megawatts of electricity, located on the Peace River approximately 220 kilometres southeast of the property (Figure 2-1). The privately owned Kemess power line runs north from BC Hydro's Kennedy substation, near Mackenzie, to the idled Kemess South mine west southwest of the Akie property. The straightline distance from the Akie to the Kemess mine is approximately 145 kilometres. Individual diesel generators supply electricity to the local villages.

The property and surrounding region is an area of moderate to steep mountainous terrain, ranging between 800 to 2300 metres above sea level. Mountain tops and ridgelines above the treeline are typically covered by alpine meadows with mosses, lichen and alpine flowers in the summer. Sparsely vegetated talus and scree commonly cover steep slopes. At lower elevations hillsides are thickly forested with a mixture of lodgepole pine and black spruce giving way to willows, alders and black birch in the river valleys.

Northwest – southeast trending ridges predominate, following the dominant geological strike direction, transected by northeast trending drainages such as the Akie, Paul and Kwadacha rivers.

In general, northeast facing ridge slopes are generally steep with abundant outcrop exposure while southwest facing ridge slopes tend to dip more moderately and are covered in vegetation.

The climate is influenced by both the Pacific Coast and the Rocky Mountains, resulting in highly variable, localized conditions for rainfall, snowfall, temperature and hours of daylight. During the summer months temperatures range between +5 to +30 degrees Celsius with moderate rainfall and/or snowfall at higher altitudes. During winter, temperatures can drop to minus 40 degrees Celsius, and can be accompanied by moderate accumulations of snow. The optimal season for field work is from May or June; when valleys become free of snow, through to late September; when winter weather generally returns.

4.0 Exploration History

The Sitka property is a newly registered mineral tenure. No exploration activities are known to have occurred on the property. The Sitka property is adjacent to the Akie property which has seen an extensive amount of exploration over the past 30 years with the bulk of work being completed over three time periods; the late 1970's to early 1980's, the mid 1990's and from 2005 to present. Exploration work has consisted of grassroots prospecting, sampling and mapping through to drilling and geophysical surveys.

5.0 Geology

5.1 Regional Geology

For a comprehensive review of the regional geology of the Akie River district, which includes the Akie property, the reader is referred to the 1998 B.C. Ministry of Energy and Mines Bulletin 103 entitled *Geology, Geochemistry and Mineral Deposits of the Akie River Area, Northeast British Columbia* by Don G. MacIntyre. The following represents a summary of the information contained within that report.

The Sitka property is located within the Rocky Mountain fold and thrust belt of northeastern British Columbia and in the central region of the Kechika Trough. The Kechika Trough is interpreted to be the southeastern extension of the large sedimentary Selwyn Basin bounded by the shallow water sedimentary rocks of the Cassiar (west) and MacDonald (east) platforms (MacIntyre, 1998). Situated along the ancestral continental margin of North America, the basin is host to clastic and carbonate rocks ranging in age from the late Cambrian to late Triassic (MacIntyre, 2005) (Figure 5-1). A generalized stratigraphic column depicts the key geological units (Figure 5-2). A summary of the lithological units are described in detail below. The regional geology and legend are presented in Figures 5-3 and 5-4.

5.1.1 Windermere Supergroup and Gog Group (Proterozoic to Cambrian)

The oldest rocks exposed in the Kechika Trough are the Proterozoic to early Cambrian coarse grit units thought to be representative of the Windermere Supergroup and the early to late quartzites and massive limestone correlative to the Gog Group (MacIntyre, 2005). These rocks are not exposed in the general vicinity of the property. They are restricted to the northern and

northeastern edge of the Kechika Trough and to the immediate west of the property (Gog Group) (MacIntyre, 2005). The grit units of the Windermere Supergroup are thought to act as important aquifers for fluids involved in the formation of sediment and carbonate hosted lead-zinc-silver deposits of the Selwyn Basin and Kechika Trough (MacIntyre, 2008).

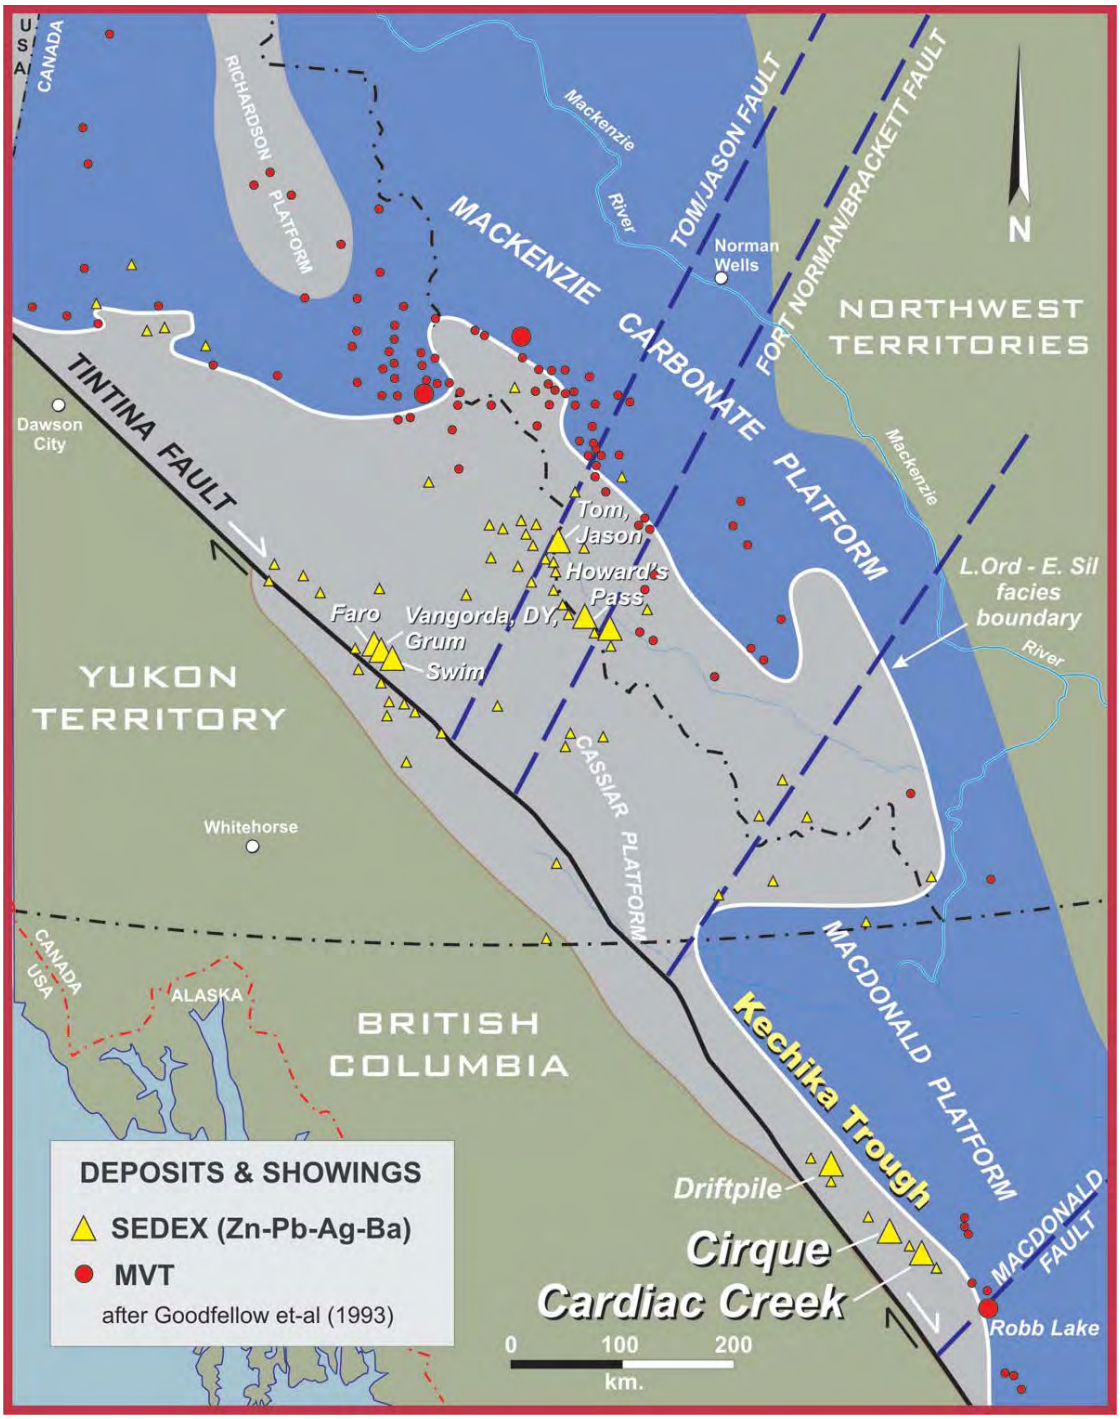

Figure 5-1: Geological Setting of Selwyn Basin and Kechika Trough (modified after Goodfellow et al, 1993)

5.1.2 Kechika Group (Cambrian to Ordovician)

A thick, approximately 1,500 metre succession of cream coloured to light grey weathered, talcy, phyllitic mudstone and wavy banded nodular (boudinaged) limestone characterize the rocks of the Kechika Group (MacIntyre, 2005; Demerse and Hopkins, 2008). Volcanic activity is marked by the presence of thinly bedded green weathered tuffs (MacIntyre, 2005) and cross cutting thin felsic dykes within the sediments of the Kechika Group. Kechika Group rocks are prominent in the southern Kechika Trough thinning northwards where they are rare to absent altogether (MacIntyre, 2005). These rocks are relatively common along the western margins of the property.

5.1.3 Skoki Limestone (Ordovician)

Locally, in the vicinity of Pesika Creek and the Kwadacha River (the southern and eastern section of the Kechika Trough, respectively), an approximate 500 metre thick buildup of thinly bedded limestone of Ordovician age overlie the Kechika Group rocks. These rocks are generally absent in the n~~N~~orthern Kechika Trough (MacIntyre, 2005).

5.1.4 Road River Group (Ordovician to early Devonian)

The rocks of the Road River Group unconformably overlie those of the Kechika Group and are represented by a collection of fine grained clastics, carbonates and minor volcanics of Ordovician to early Devonian age (MacIntyre, 1998). They are pervasive throughout the Kechika Trough and can be informally broken into three distinct groups: the Lower Road River Group, the Ospika Volcanics and the Silurian Siltstone (MacIntyre, 2008). The Road River Group is thought to represent the transition between platformal and marine basinal rocks (MacIntyre, 2008).

The Lower Road River Group is comprised of a basal cream, beige to reddish brown weathered, thin-bedded calcareous siltstone and shale with minor limestone turbidites and debris flows. This siltstone grades up section into a distinct middle to late Ordovician aged black graptolitic shale (MacIntyre, 1998). The graptolite fossil assemblage allows for relatively easy differentiation from the lithologically similar and prospective rocks of the Devonian (MacIntyre, 2008). Locally the shale is interbedded with black chert horizons in the vicinity of the REB massive pyrite lens in the southern Kechika Trough and in the east they are locally interbedded with quartz wackes, arenites and pebble conglomerates.

The Ospika Volcanics are present throughout the central Kechika Trough area (Akie River, Paul River and Ospika River) and are represented by a series of discontinuous lenses and beds of green mafic flows, microdioritic sills and orange weathered ankeritic crystal lapilli tuffs that are interbedded with the rocks of the Lower Road River Group. It is suggested that based on their orientation these rocks were emplaced along fault structures bounding the basin (MacIntyre, 1998). In 2009, a gabbro/diorite intrusive plug was discovered along the Del Creek which is thought to represent one such possible bounding fault structure as well as the source for the lenses of volcanic rocks found in the area.

The upper Road River Group is represented by the early to middle Silurian Siltstone and unconformably overlies the Ordovician graptolitic black shale (MacIntyre, 2008). At the base, a <1 to 20 metre thick unit consisting of thin-bedded to cross laminated limestone and dolostone beds is interbedded with laminated grey calcarenite, dark grey dolomitic shale and minor debris flows. To the east the limestone/dolostone beds are commonly interbedded with quartz wacke and arenite and is known as the Silurian limestone. The Silurian limestone is overlain by a 100 to 500 metre thick tan to orange brown weathered dolomitic thin-bedded to platy siltstone with minor orange weathered limestone and dolostone interbeds. The thicker bedded siltstone is commonly bioturbated, containing worm burrows and feeding trails. Minor graptolites and sponge impressions are present in the thinly bedded to platy sections (MacIntyre, 2008).

The last unit of the Road River Group is informally recognized as the Paul River formation (Pigage, 1986) and consists of deep water marine turbidites comprised of black chert, interbedded black shale with limestone debris flows, and rusty weathered, dark grey to brown weathered silty shale and siltstone (MacIntyre, 2008). In the Akie River area the rusty weathered silty shale partially onlap with the early to middle Devonian Akie and Kwadacha Reefs. These reefs can range up to 200 metres in thickness and are characterized by medium to thick-bedded micritic to bioclastic limestone interbedded with minor shale beds. Locally, to the east, pebble conglomerates directly overlie these reefs (MacIntyre 2008). It is the author's opinion that the Paul River formation rocks are of the Earn Group based on observations made from the Akie drill core.

5.1.5 Earn Group (Middle Devonian to Mississippian)

Rocks of the Earn Group conformably overlie those of the carbonate reefs as well as the Silurian Siltstone and are characterized by carbonaceous, siliceous shale, cherty argillite, phyllitic shale and coarse quartzose turbidites of Middle Devonian to Mississippian age (MacIntyre, 1998). The Earn Group has been subdivided into three distinct formations: the Warneford, the Akie and the Gunsteel (Pigage, 1986; MacIntyre, 1998). These rocks are representative of a major marine transgression that halted reef growth, resulting in the onlapping of fine clastic sediments onto the MacDonald platform to the east (MacIntyre, 1998).

The rocks of the Gunsteel formation are the oldest within the Earn Group of Middle to Late Devonian age. They weather to a distinctive "gunsteel" silvery blue and are comprised of carbonaceous and siliceous shale, argillite and cherty argillite (MacIntyre, 1998). The Gunsteel formation is the primary group of prospective rocks within the Kechika Trough hosting the Cirque, Cardiac Creek and Driftpile deposits as well as the Fluke, Elf, Pie and Mount Alcock prospects. Occurrences of laminar pyrite and nodular barite are common and are characteristic of Gunsteel formation rocks. They are overlain by the Akie formation characterized by soft, medium to dark grey phyllic shale to silty shale and siltstone which typically weather to a rusty brown, tan or silvery colour (MacIntyre, 1998; Demerse and Hopkins, 2008).

The youngest group of rocks within the Earn Group (the Warneford formation) are interpreted to be proximal to medial turbidites represented by grey weathered chert pebble conglomerates, quartz wacke and siltstone and are intercalated with the soft shale of Akie formation (MacIntyre, 1998). The rocks of the Earn Group are present on the Sitka property.

5.1.6 Triassic Siltstone (Mississippian to Triassic)

The youngest rocks of the Kechika Trough occur in the core of a major northwest trending synclinorium in the area northwest of the Kwadacha River. They are represented by dolomitic siltstone and limestone similar in character to the Silurian siltstone but can be differentiated by the presence of Triassic brachiopods (MacIntyre, 1998).

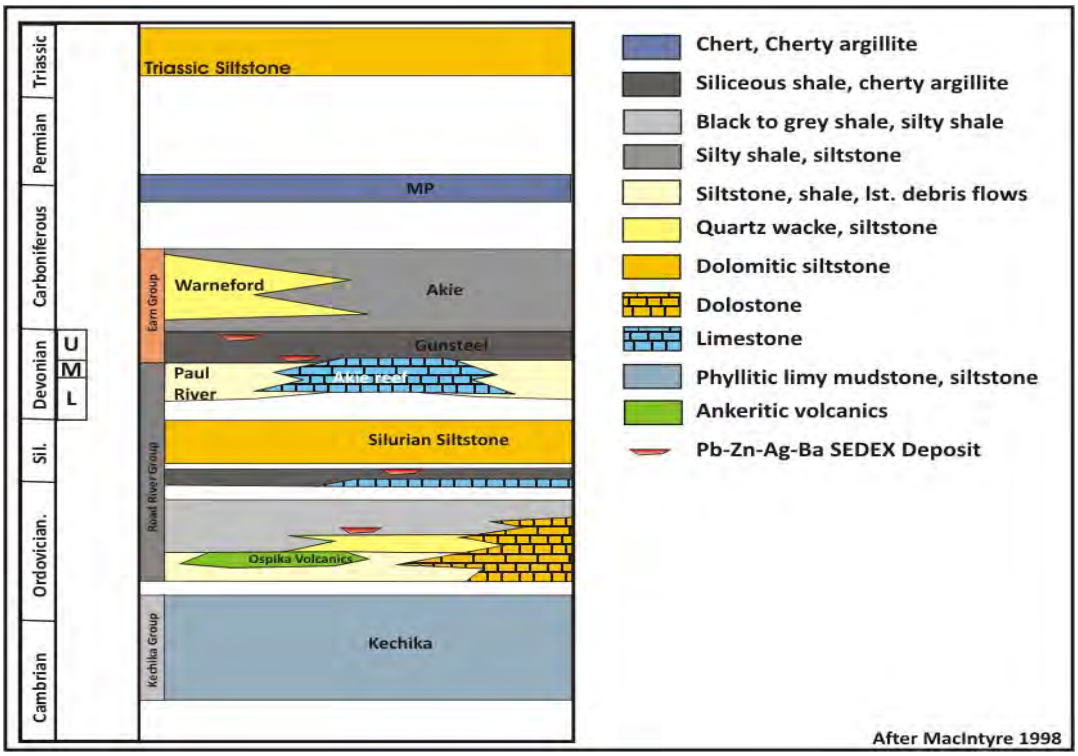

Figure 5-2: Kechika Trough Generalized Stratigraphic Section (after MacIntyre, 1998)

5.2 Regional Structure

The following section is an unabridged excerpt from the previous technical report entitled *Geology, Diamond Drilling and Preliminary Resource Estimation, Akie Zinc-Lead-Silver Property, Northeast British Columbia, Canada* by Donald G. MacIntyre and Robert C. Sim, 2008. This NI 43-101 compliant report can be found at www.sedar.com. The contained information remains current.

"The linear nature of the geology of the Akie River area reflects the "thin-skinned" tectonic style of the Rocky Mountain Fold and Thrust Belt. Northeast-directed compression resulted in detachment of the Paleozoic strata from a rigid crystalline basement and partial stacking of the detached plates along a series of imbricate thrust faults. The thrust plates, which are composed of relatively incompetent basinal facies rocks, have been internally folded during thrusting. In general, incompetent strata below overriding thrust plates have tight isoclinal folds with southwest-dipping axial planes whereas rocks in the overriding plate are asymmetrically folded and often have northeast-dipping axial planes. This style of folding may be related to the

development of inversion structures similar to those described by McClay et al., (1989) in the Driftpile Creek area.

The structural style changes from west to east across the map area. In the west, imbricate, southwest dipping reverse faults bound asymmetric overturned folds with southwest dipping to vertical axial planes. To the east, large scale upright folds occur within major synclinoriums that are bounded by outward dipping reverse faults that truncate folds within overriding anticlinoriums. Devonian strata are preserved within the synclinoriums. This structural style suggests that high angle growth faults bounding depositional troughs in Devono-Mississippian time were reactivated during Tertiary compression and became the locus of major thrust faults in the district. That major high angle thrust faults may be localized along much older crustal breaks is also suggested by close spatial association of Paleozoic mineralization, reef building, coarse clastic fans and volcanism to such faults.

Detailed studies of the structure of the Cirque deposit led to the recognition of two coaxial phases of deformation (Pigage, 1986). The earliest deformation, which is recognizable throughout the study area, includes northwest-trending, tight asymmetric folds that verge northeast and have gently dipping southwest limbs and steep to overturned northeast limbs. The steep limbs are often broken and offset by high angle reverse faults, resulting in the juxtaposition of Ordovician and Silurian strata against the Mid- to Late- Devonian Gunsteel formation shale. The high angle reverse faults may coalesce at depth into a major detachment surface possibly rooted in the highly attenuated Kechika Group. Shale typically has a pervasive slatey cleavage that is axial planar to the macroscopic folds; a closely-spaced fracture cleavage is found in the more competent strata.

The second phase of deformation folds the early slatey cleavage and develops a penetrative crenulation cleavage. This cleavage is axial planar to the late folds, which may have an amplitude of up to 30 metres (Pigage, 1986). The folds are open to upright, trend northwest and have northeast convergence. High-angle listric normal and reverse faults are also common in the Akie River area and generally trend parallel or at slight angles to the major high angle thrust faults. These faults are probably related to brittle failure of thrust plates during detachment and thrusting. Displacements of up to several hundred metres have been documented at the Cirque deposit (Pigage, 1986).

North to northeast trending high angle faults offset earlier thrust and listric normal faults. Some of these faults have a strike-slip movement and may be synthetic shears related to an oblique compressional stress regime. This compressional event is believed to be Tertiary in age."

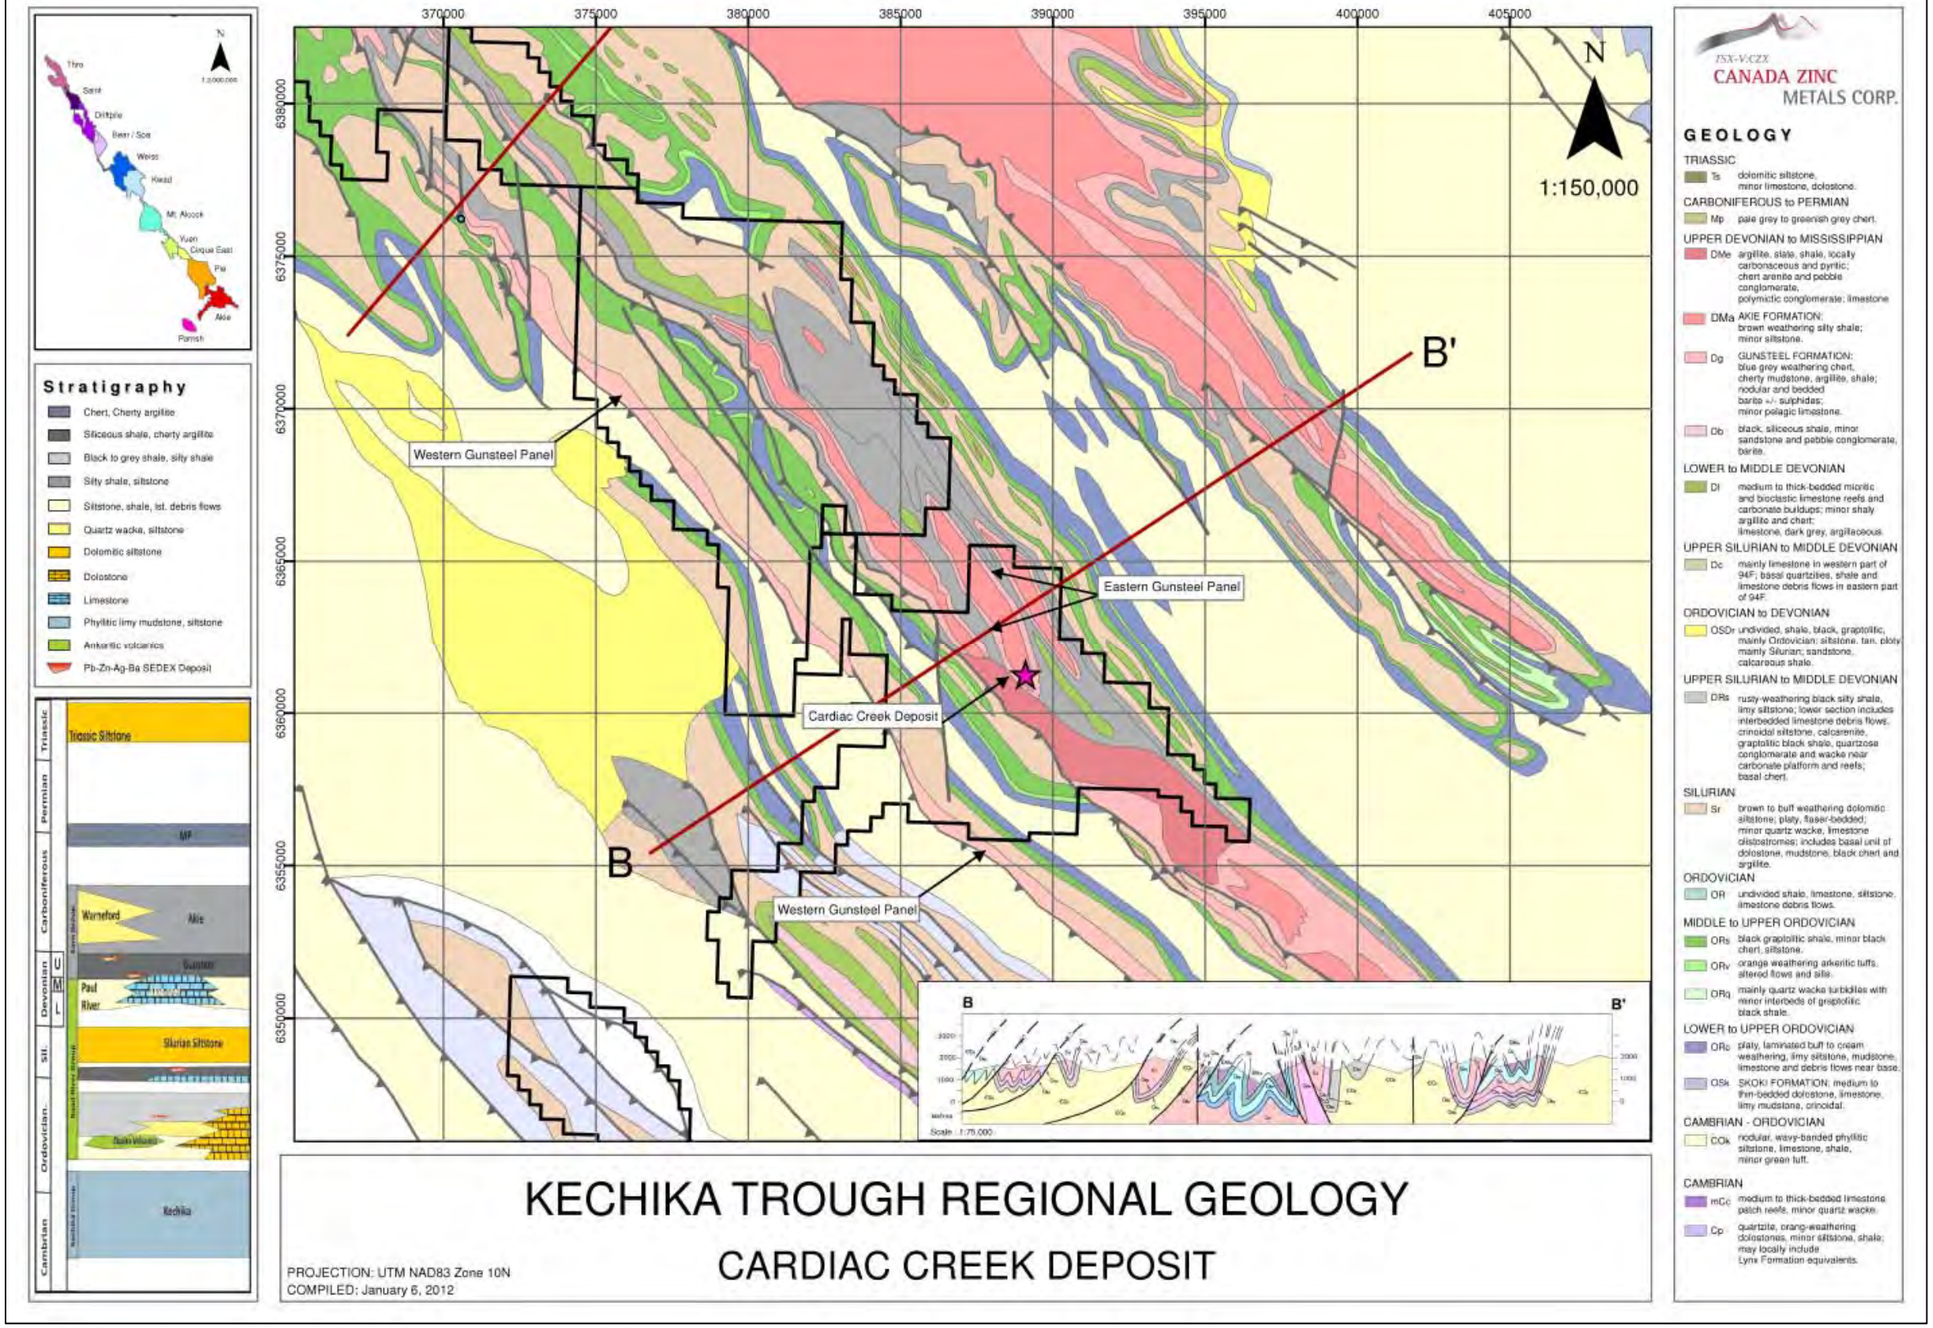

Figure 5-3: Regional geology of the Akie, Pie and Sitka properties. (after MacIntyre 1998).

Figure 5-4: Legend for regional geology depicted in figures 5-3 and 5-4 (after MacIntrye 1998)

6.0 Deposit Type & Model

The Cardiac Creek, Cirque, Driftpile, and other Pb-Zn-Ag-Ba occurrences within the Kechika Trough are characterized as sedimentary exhalative (SEDEX) deposits. The following is a summary of this deposit type and its characteristics. For a detailed review of SEDEX deposits the reader is referred to the excellent overview paper of Canadian SEDEX deposits by Wayne D. Goodfellow and John W. Lydon, entitled *Sedimentary Exhalative (SEDEX) Deposits* from the publication *Mineral Deposits of Canada: A Synthesis of Major Deposit Types, District Metallogeny, the Evolution of Geological Provinces, and Exploration Methods* by the Geological Association of Canada, Mineral Deposits Division, Special Publication No. 5.

The Pb-Zn-Ag-Ba deposits and occurrences found within the Kechika Trough (e.g. Cirque, Driftpile and Cardiac Creek), the Selwyn Basin (e.g. Howards Pass, Tom, Jason, Faro and Grum), the Belt-Purcell District (e.g. Sullivan, Ruddock Creek), in Australia (e.g. HY, Century, Mount Isa), and the Brookes Range in Alaska (Red Dog) all share common characteristics and are generally considered to be SEDEX deposits (Goodfellow and Lydon, 2007). Carne and Cathro (1982) popularized the SEDEX deposit type in their early description of the deposits of the Selwyn Basin and Kechika Trough. In general, SEDEX deposits can be characterized as a strataform, tabular body of sulphide mineralisation that is interbedded with its host sediments, typically shales, siltstones and occasionally sandstones. This type of deposit shares many similar characteristics with VMS (volcanogenic massive sulphide) and MVT (Mississippi Valley Type) deposits suggesting a shared genetic link (Goodfellow and Lydon, 2007).

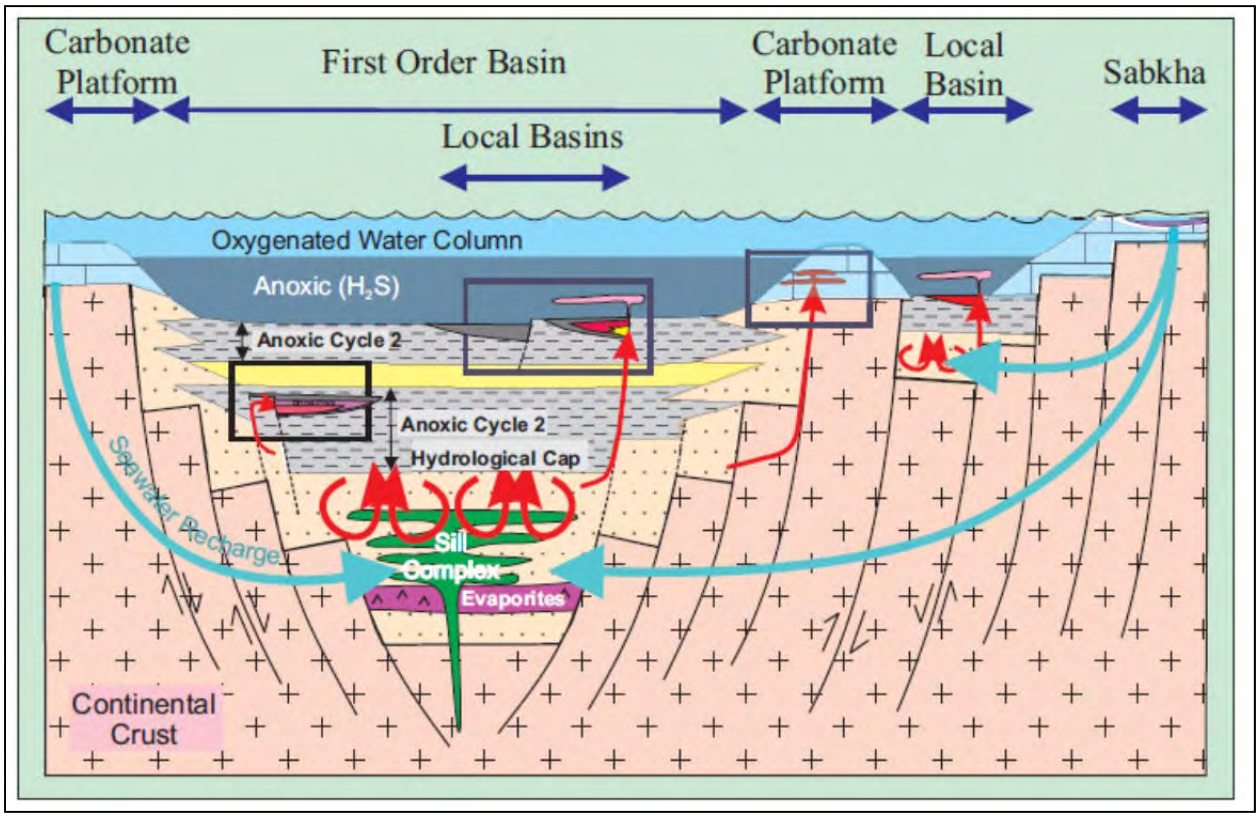

Figure 6-1: Genetic model of SEDEX deposit formation (Goodfellow & Lydon 2007)

Extensive research has been conducted on SEDEX deposits examining the geological characteristics, genetic models and the physiochemical controls (MacIntyre, 2008). This work has resulted in a general consensus regarding the formation of SEDEX deposits. It is generally thought that SEDEX deposits are formed from the precipitation of sulphide and sulphate minerals from metalliferous brines exhaled out onto the seafloor along re-activated rift faults that generated by rapidly subsiding graben or half-graben structures (MacIntyre, 2008; Goodfellow and Lydon, 2007). However recent work is beginning to test this theory which may not apply to all SEDEX deposits. The metal-bearing fluids are likely derived from dewatering of fine to coarse grained clastic sediments or carbonate hydrothermal reservoirs (Goodfellow and Lydon, 2007) where leaching has scavenged the zinc and lead and other elements (Figure 6-1). In the Selwyn Basin and the Kechika Trough the coarse clastic grits of the Windermere Super Group are thought to have acted as the hydrothermal reservoir for the mineralizing fluids (MacIntyre, 2008).

Goodfellow and Lydon (2007) recognized two sub-types of SEDEX deposits: vent-proximal and vent-distal. The two type of deposits result from either a buoyant metalliferous brine that precipitates sulphides in close proximity to the source fault structure or a bottom hugging brine that precipitates sulphide mineralization within localized third order basins at a distance from the source fault structure (Figure 6-2). Examples of the vent-proximal deposits include Sullivan, Tom, Jason and Rammelsberg and are characterized by four distinct features including: bedded sulphides; a recognized vent complex; a stringer zone; and distal hydrothermal sediments (Goodfellow and Lydon, 2007). Vent-proximal deposits are typically wedge-shaped, exhibiting a moderately high aspect ratio of length versus thickness.

In contrast, vent-distal deposits have well-bedded sulphides, are generally weakly zoned and their morphology conforms to the local basin. This type of deposit is typically tabular to sheet-like in nature with very high aspect ratios (Goodfellow and Lydon, 2007).

Typically, SEDEX deposits are hosted in basinal marine sediments such as fine-grained clastics, carbonaceous chert and shale. In some cases, the shale can be interbedded with turbiditic siltstone and sandstone and localized coarse grained sediments (Goodfellow and Lydon, 2007).

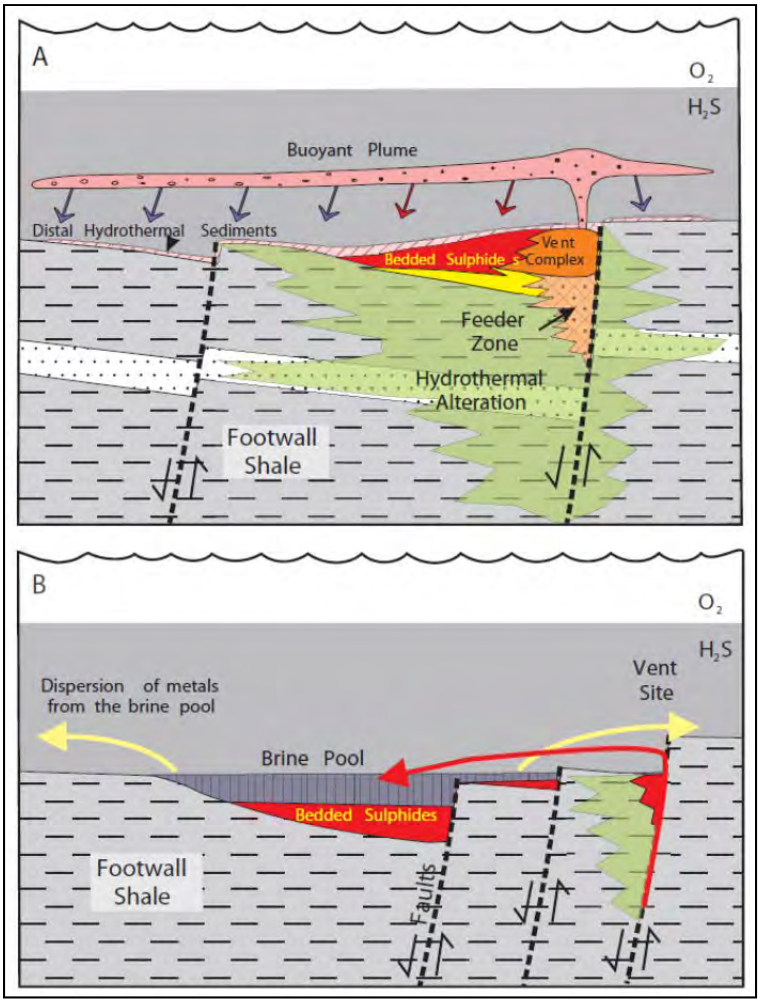

Figure 6-2: Vent-proximal and vent-distal sub-types of Selwyn basin SEDEX deposits (Goodfellow & Lydon, 2007).

The mineralogy associated with this type of deposit is typically simple with pyrite, sphalerite, galena and barite being most common. Associated with these minerals are a suite of elements that may include: Fe, Mn, P, Ca, Mg, Hg, Cd, As, Sb, Se, Sn, Ga, Bi, Co, Ni, and Tl (Goodfellow and Lydon 2007). Typically the gold content of this type of deposit is quite low; however, deposits found in Anvil district (Vangorda, Dy) of the Selwyn Basin in the Yukon territory contained mineable grades of the precious metal (Goodfellow and Lydon, 2007). These elemental enrichments commonly exhibit a refined zonation across many of the deposits allowing specific ratios to be utilized as exploration tools guiding exploration towards possible source vents and economic deposits (Goodfellow and Lydon, 2007). Common metal ratios include: Zn/Pb, Pb/Ag, Cu/(Pb+Zn), Pb/(Pb+Zn), Fe/Zn, Ba/Zn and SiO2/Zn (Goodfellow and Lydon, 2007).

7.0 Exploration Program

7.1 Introduction

The 2013 exploration program on the Sitka property was conducted from a trailer camp located at 24.5 kilometres on the Akie mainline forestry service road and is situated in an old Canfor forestry cut block (Plate 7-1). The seasonal camp can accommodate up to a maximum of 50 people and was re-opened in late June. The exploration program, part of the much larger Akie exploration, took place over several days from 18 of August to the 1 Oct 2014.

An expediter in Mackenzie provided logistical support for the camp, arranging the shipment of major supplies. Minor supplies were obtained locally from the village of Tsay Keh Dene located at the northern end of the Williston Lake reservoir. There were a variety of contractors on site providing services to the program. The key contractors are listed below.

- **Coast Mountain Geological Inc.:** Provided logistical support and technical staff such as geologists and geotechnicians.
- **Yellowhead Helicopters:** Provided helicopter support to the project.
- **ESS:** Provided catering and management services for the camp.
- **Kwadacha Natural Resources LP:** Provided local field assistants.

Plate 7-1: Camp Photograph (Photo taken by Gil Graham 2011)

Claimed expenditures on the Sitka property during the 2013 exploration program total $25,2463.20 spent primarily on prospecting, channel samples, and soil sampling. The breakdown of these costs can be found in Section 11.0 Statement of Expenditures.

7.2 Program Objectives

The exploration on the Sitka property was initiated upon the discovery of the Sitka showing during a mapping traverse along the eastern edges of the adjacent Akie property. The discovery prompted additional prospecting, a channel sampling program on the discovery outcrop and the much larger Akie soil sampling program was extended to cover certain areas of the Sitka property. These different aspects of the program are discussed below.

7.3 Field Protocol

Sample Collection

Soil samples were collected from a series of regularly spaced lines across the eastern edges of the Akie property and onto the Sitka property. An approximate 500 gram sample was collected from the B soil horizon if possible, after the removal of humus and other overburden and placed into a paper Kraft bag. Soil samples were marked in the field with a fluorescent flag tied nearby and each sample was GPS located and described. Bags were then sealed and wrapped in plastic, for transportation to camp. Once in camp, soil sample bags were hung to dry. Once dry, the soil samples were laid out in order and bundled together in approximate groups of 20 and placed into a clean and clear polypropylene plastic sample bag. The samples were packed in such a manner to give the sample bag a brick like shape and taped shut.

Channel rock samples were taken using a portable rock saw to cut two parallel lines approximately an inch apart, to the desired length of the sample. A chisel and hammer were used to chip out the material between the two cut lines. The chipped-out rock was placed into a polypropylene plastic sample bag along with a sample tag and sealed with a zip-tie. The azimuth, length and a rock description was recorded for each sample. Grab samples collected during prospecting traverses were placed into polypropylene sample bags with a sample tag and sealed with a zip-tie. The sample location was marked with flagging tape and GPS located and recorded along with a rock description for each sample.

In preparation for transportation to the designated laboratory the samples were then placed into rice sacks. Due to the weight and subsequent handling of the rice bags the number of samples per sack was restricted as follows, 4 to 5 soil bundles per bag, 5 to 10 grab samples per bag and 5 channel samples per bag. The rice bags were then sealed with a zip-tie. Information such as the address and contact information of the designated laboratory as well as the sample sequence and contents, and the contact information of the camp expeditor in Mackenzie BC, were written on each bag. This information as well as the weight of each rice bag was recorded separately for tracking and shipping purposes.

Sample Security and Transport

All samples were stored and kept dry in a canvas tent located in close proximity to the office trailer to await transportation. For shipping, the rice bags were stacked onto wooden pallets and shipped backhaul via Gautier Ventures to the camp expeditor, Vicki Podgorenko, in Mackenzie. The samples were then shrink-wrapped onto wooden pallets and shipped via a bonded freight carrier to Acme Analytical Laboratories in Vancouver.

Analytical Procedures

All of the samples from the 2013 exploration program were analyzed at Acme Analytical Laboratories Ltd. of Vancouver with an address at 9050 Shaughnessy St. Vancouver BC, V6P 6E5. The Vancouver facility is an ISO 9001 and ISO/IEC 17025:2005 accredited lab.

Sample preparation for the soils, rocks and channel samples differed slightly. Soil samples were prepared using the SS80 process which involves drying the sample 60°C. Once dry 100 grams of material is collected after passing through an -80 mesh sieve. The rocks and channel samples were prepared using the R200-250 process which involves crushing the sample until 80% of the material passes through a 10 mesh sieve. A split of 250 grams is collected and then pulverized until 85% of this material passes through a 200 mesh sieve. Once prepared a number of analytical analyses were conducted on the samples.

All samples were analysed using the geochemical process Group 1F04. This analysis involves taking a 0.5 gram split from the pulp material and digesting the material in a modified Aqua Regia solution (HNO3-HCL acid) with equal parts concentrated HCl, HNO3 and distilled water for a period of one hour in a hot water bath. The sample is then made up to volume with diluted HCl in a class A volumetric flask. Analysis is then completed by inductively coupled plasma emission spectrometry (ICP-ES). Rock or channel samples which had any overruns in Pb or Zn were analysed using the Group 7AR process. This involves taking a 1 gram split from the pulp material and digesting the material in a modified Aqua Regia solution (HNO3-HCL acid) with equal parts concentrated HCl, HNO3 and distilled water for a period of one hour in a hot water bath. The sample is then made up to volume with diluted HCl in a class A volumetric flask. Analysis is then completed by inductively coupled plasma emission spectrometry (ICP-ES). Due to the insoluble nature of barite whole rock analysis was completed using the Group 4A process for the rock and channel samples. This involves total fusion of a 0.1 gram split of the pulp using a lithium metaborate flux followed by digestion in dilute nitric acid. Subsequent analysis was done by inductively coupled plasma emission spectrometry (ICP-ES).

7.4 Prospecting Program

Prospecting during a limited number of mapping traverses resulted in the discovery of the Sitka Showing. The showing was discovered by field geologist Andrew Wilkins and was named after his dog Sitka.

The showing is located on the western facing slope just below the saddle on what is referred to as “Repeater Hill” and is situated in a sparsely treed mountain meadow near the crest of the

mountain (Table 7-1). At a distance the outcrop has a prominent white weathered appearance which prompted the initial investigation of the area.

Name	Description	UTM E (m)	UTM N (m)
Sitka Showing	Massive, coarse grained subhedral barite with quartz and weathered sphalerite and galena	392,016	6,361,651

Table 7-1: Sitka showing location

The showing outcrop measures approximately 6 metres long by 3 metres wide with a general NW-SW orientation and consists of massive white to off-white barite, quartz and carbonate with minor red brown sphalerite and galena that is situated along the thrust contact between the Silurian siltstones of the Road River Group and the black shales of the Earn Group (Plate 7-2). At this time the showing is considered to be a vein occurrence. The barite appears to have a pinch and swell character to it suggesting that it has been boundinaged. A second, smaller, showing is located approximately 50 metres to the southeast (Appendix 1).

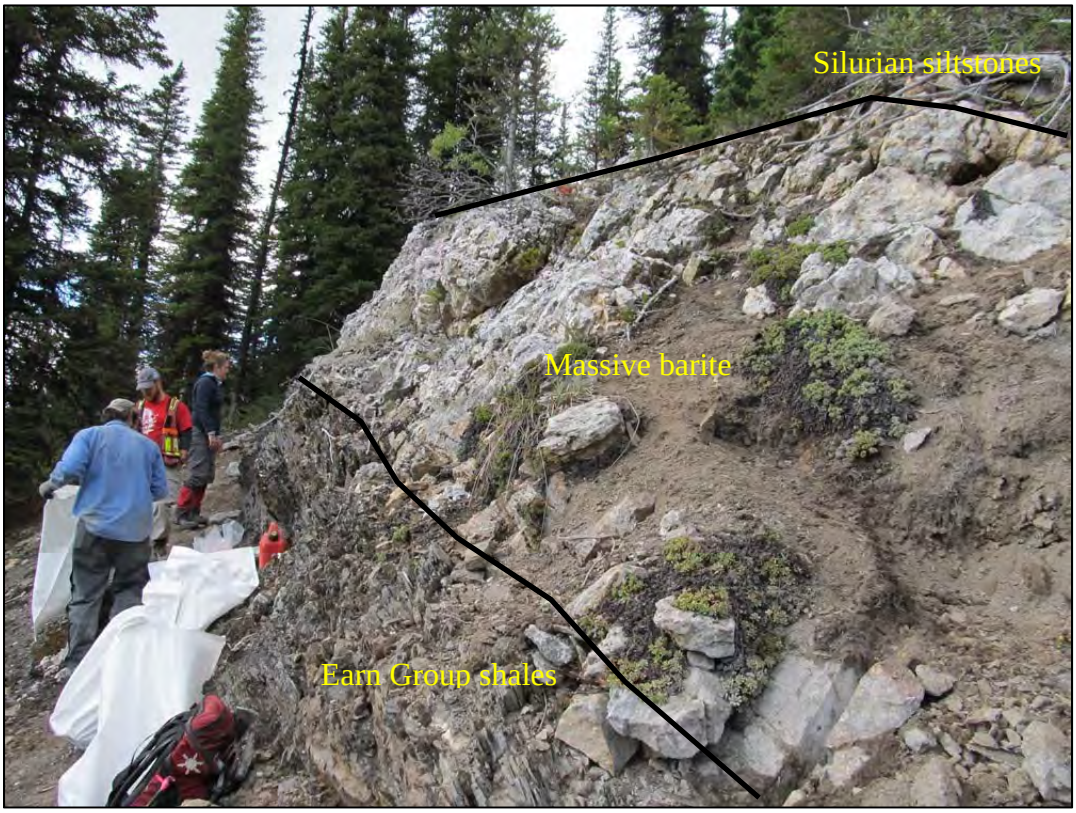

Plate 7-2: Channel sampling at the Sitka Showing (Photo taken by N. Johnson 2013)

The red brown coarse-grained sphalerite is disseminated throughout the barite whereas the galena is concentrated within localized pods or seams (Plate 7-3). The sulphides preferentially weather giving the outcrop a pockmarked appearance in places.

Plate 7-3: Representative sample taken from the Sitka showing with concentrated galena hosted in massive barite (Photo taken by N. Johnson 2013)

Additional prospecting along strike of the Sitka showing to the south east along a prominent limestone cliff (Plate 7-4) resulted in the discovery of quartz, barite veins and float boulders with minor sphalerite and galena displaying similar characteristics to that of the Sitka showing.

Plate 7-4: Quartz-carbonate-barite veins with minor sphalerite and galena within the Kwadacha limestone (Photo taken by N. Bruemmer 2013)

Plate 7-5: Concentrated galena in Qtz-barite veins in the Kwadacha limestone (Photo taken by N. Bruemmer 2013)

A total of 7 grab samples were collected on the Sitka property during prospecting traverses that returned highly anomalous values of Pb, Zn and Ba. Table 7-2 highlights the key results from the samples collected. A full table of results is presented in Appendix 2. All 7 of the grab samples returned highly anomalous Zn and Pb values that required assay reruns with grades reaching 43.55% and 12.04% respectively (Plate 7-5).

Sample #	Utm E (m)	Utm N (m)	Pb (ppm)	Zn (%)	Ag (ppb)
1197017	392202	6361400	3730.88	9.35	1739
1197018	392362	6361276	12.04 (%)	7.64	12152
1197019	391956	6361714	1308.89	5.87	773
1197020	392604	6360997	415.44	43.55	1354
1197021	392581	6361000	5.40 (%)	20.87	8200
2379009	393304	6360085	3.01	7.98	142
2379010	393317	6360070	52.96	4.48	56

Table 7-2: Grab sample results on the Sitka property, highlights.

In addition to the prospecting, preliminary mapping was completed along the western edges of the Sitka property. The majority of the property has not been mapped. Mapping was generally restricted to the ridge tops and creeks where outcrop is typically exposed. The mapping identified and delineated the NW-SE trending easterly dipping thrust fault that generally marks the eastern boundary to the Akie property. Lithological units encountered were restricted to the

Silurian siltstones that are in thrust contact with the black shales of the Earn Group in the immediate vicinity of the Sitka showing; and the Kwadacha limestones to the southeast of the showing. To the northwest of the showing it appears that the Earn Group shales and the Kwadacha limestone form an overturned antiform that is pinched out by a westerly dipping thrust fault (Appendix 1).

7.5 Channel Sampling Program

The discovery of the Sitka Showing prompted a short two-day channel sampling program on the outcrop. A portable rock saw was utilised to cut a series of channels into the main Sitka showing and the smaller showing located to the southeast. Six channels were cut across the length and width of the main Sitka outcrop and a single channel on the smaller outcrop. A total of 23 samples were collected from these channels. The key results are shown in Table 7-3. The full table of results from the channel sampling can be seen in Appendix 3.

Sample #	Channel	Unit	Utm E (m)	Utm N (m)	Pb (ppm)	Zn (ppm)	Ag (ppb)

1195473	7	Earn Group	392076	6361623	26.50	1206.60	284.00

Table 7-3: Sitka showing channel samples results, highlights

The results indicate that the barite structure is consistently anomalous in Zn with the Pb values being quite localized within the outcrop. Of the 23 samples taken 7 required reruns due to over limits being reached in Zn and or Pb. These assay reruns returned zinc grades of up to 5.12% and Pb grades of up to 3.72%. Sampling that occurred outside of the barite vein material in either the Silurian siltstones or Earn Group shales also returned highly anomalous Zn values in excess of 0.1% and Pb values in excess of 100 ppm. The extent in which the anomalism continues into the host sedimentary rocks is unknown (Appendix 1). The Ag values are muted in comparison to the Zn and Pb with only a few samples returning values in excess of 1000 ppb (Appendix 1).

7.6 Soil Sampling Program

The soil sampling program on the Sitka property was a small subset of the much larger program that took place over the eastern side of the Akie property. A series of 200 metre spaced lines with sample stations every 50 metres were extended onto the Sitka property in response to the discovery of the showing. A total of 149 samples were collected on the property. The sample location map and key results for Zn, Pb, Ag and Tl can be seen in Appendix 1. A full table of the results can be seen in Appendix 4.

The sampling defined a prominent Ag anomaly in the immediate vicinity of the Sitka showing. The anomaly measures approximately 2.25 kilometres long by 300 metres wide and extends along strike from the Sitka showing to the northwest and south east. Silver values within the anomaly are consistently in excess of 1,500 ppb and can reach 15,765 ppb. The Pb and Zn soil values are muted in their response with no defined anomaly that correlates with the Ag values.

7.7 Discussion

The Sitka showing discovery represents the first significant occurrence of Ba-Pb-Zn mineralisation on the eastern side of Silver Creek in what is referred to as the Eastern Panel of Gunsteel formation shales or Earn Group shales. The mineralisation occurs along the thrust contact between the Silurian siltstones and the Earn Group shales. Based on the subhedral coarse grained nature of the barite and fine grained quartz it appears that the showing is a vein occurrence. No sedimentary layering or bedding was observed within the barite however one could also consider that its coarse grained character is the result of recrystallization due to the folding and thrust present in the region. This idea is speculative as this point. The showing also appears to be spatially linked to a second, much smaller outcropping with similar mineralisation and to several quartz-barite veins hosted within the Kwadacha limestone located over a kilometre to the southeast. Soil sampling in the immediate vicinity of the showing appears to indicate that it is associated with a prominent Ag anomaly with spectacular values in excess of 15,000 ppb. However it is surprising that there does not appear to be a corresponding Pb or Zn anomaly of any measurable significance associated with the Sitka showing especially considering the spectacular Pb and Zn grades observed from the channel sampling.

At this time only a cursory understanding of the Sitka showing and its exploration impact and potential is known. Further work is required.

8.0 Conclusions and Recommendations

Geological mapping and prospecting at the eastern limit of the Akie property resulted in the discovery of the Sitka showing. This discovery prompted the staking of the Sitka property and a short exploration program was conducted in and about the showing.

1. The Sitka showing appears to be a vein occurrence situated along the thrust contact between the Silurian siltstones and the black shales of the Earn Group. The mineralisation consists of coarse grained barite hosted in a fine grained quartz matrix that hosts disseminated red-brown sphalerite and locally clustered seams of galena.

2. Additional prospecting discovered a second, much smaller showing located approximately 50 metres to the southeast and a number of vein occurrences of similar character were discovered within a prominent outcropping of Kwadacha limestone located approximately one kilometre away along strike to the southeast.

3. Channel sampling program on the Sitka showing indicates that the showing is consistently anomalous in Zn while the Pb content is a bit scattered.

4. The extension of the Akie property soil sampling program onto the Sitka property revealed the presence of a prominent Ag anomaly situated in the immediate vicinity of the Sitka showing. Ag values can be in excess of 15,000 ppb. There does not appear to be corresponding Pb and Zn anomalism.

Based on these preliminary results and observations several recommendations are made for a follow-up exploration program on the Sitka property to better understand this occurrence of mineralisation.

1. Additional soil sampling is necessary to provide more extensive coverage of the areas along strike of the Sitka showing both to the northwest and southeast.

2. Preliminary mapping and prospecting of the Sitka property should be completed with a focus on the areas along strike of the showing. Mapping of the property will provide a better understanding of its stratigraphy and whether the regional mapping conducted by the BCGS is a good representation of the geology on the property.

3. Future exploration on the Sitka property should occur in conjunction with exploration activities on the Akie property and the 2013 data should be merged with existing information from the Akie property.

10.0 Statement of Qualifications

I, Nicholas L. Johnson, do hereby state:

1. That I am a resident of Ontario, with an address of 436 Alfred St., Kingston, Ontario, K7K 4H9.
2. That I am a graduate of Queens University (B. Sc. Hons in Geology, 2001);
3. That I have been continuously employed in the mineral exploration industry since May of 2002 after graduating from Queens University.
4. That I am currently under the employ of Canada Zinc Metals Corp. a British Columbia corporation with a business address of Suite 2050 1055 West Georgia Street, Vancouver, B.C., V6E-3P3.
5. I oversaw the work described in this report and I am the sole author of the report entitled "Prospecting, Soil and Channel Sampling Program on the Sitka Property: Summary Report"

Dated in Vancouver, B.C., on the 15th of April, 2014.

Deg - Undefined Gunsteel Fm: Silty shales, silcecous shales, carbonaceous shales

DWcg - Dark grey sandstone to black chert pebble conglomerate

DAp - Medium grey soft shale

DAps - Medium grey pinstriped shale

DAs - Medium to light grey siltstone

DGps - Dark grey to black pinstriped shale

DGsh - Black carbonaceous, siliceous shale, immediate host to mineralisation

DPdf - Polymictic debris flow hosted in black shale

DPss - Silty shale (Turbidite flows)

Dkwad - Kwadacha fossiliferous limestone

RRG - Undefined Road River Group (dolomitic siltstones, interbedded shale with limestone and black shales)

APPENDIX 2
Grab Samples

SAMPLE_NO	TYPE	SUBTYPE	LENGTH__cm	YEAR	PROPERTY	COMPANY	LAB	DIGESTION	METHOD	UNIT	LITHO	MINERALS	DESCRIPT	COMMENTS
1197017	ROCK	Grab		2013	Sitka	Canada Zinc Corp	Acme	Aqua Regia, Lithium Borate Fusion	ICP-MS (GC), ICP-ES (A, WR)	BXqzcb	quartz carbonate breccia		subcrop of faulted contact between Sss and Dea, quartz carbonate breccia, white quartz + yellow gossanous carbonate with limonitic gossan staining, boxwork weathering of sulphide (trace galena)	
1197018	ROCK	Grab		2013	Sitka	Canada Zinc Corp	Acme	Aqua Regia, Lithium Borate Fusion	ICP-MS (GC), ICP-ES (A, WR)	BXqzcbsx	quartz carbonate sulphide breccia		quartz carbonate sulphide breccia with limestone, 50 cm wide zone, sulphides mostly weathered out, but in places can find up to 50% galena, quartz is grey and massive with some euhedral crystals linning occasional small vugs, possible weathered sphalerit	
1197019	ROCK	Grab		2013	Sitka	Canada Zinc Corp	Acme	Aqua Regia, Lithium Borate Fusion	ICP-MS (GC), ICP-ES (A, WR)	De	Silicified shale?		more massive, medium grey weathered, dark grey fresh, siltstone, lots of small quartz, calcite veins with possible barite, possible sphalerite, sample taken in area with orange to deep red gossan, silicified a bit, no buff weathering	
1197020	ROCK	Grab		2013	Sitka	Canada Zinc Corp	Acme	Aqua Regia, Lithium Borate Fusion	ICP-MS (GC), ICP-ES (A, WR)	Dkr	Limestone		barite vein 5cm wide, gossaneous with barite and weathered out sulphide, orange-pink gossan, weathered out sulphide within host limestone, vein is undulatory/rough and roughly parallel to suspect bedding	
1197021	ROCK	Grab		2013	Sitka	Canada Zinc Corp	Acme	Aqua Regia, Lithium Borate Fusion	ICP-MS (GC), ICP-ES (A, WR)	Dkr	Limestone		barite and weathered out sulphide and quartzhosted in fossiliferous limestone, galean found in vein material but encased in silica so not weathered out, veining is anastomosing with splays, veining maybe roughly parallel to bedding with splays along frac	
2379009	ROCK	Grab		2013	Sitka	Canada Zinc Corp	Acme	Aqua Regia, Lithium Borate Fusion	ICP-MS (GC), ICP-ES (A, WR)	Dkr	Fossiliferous Limestone		high grade sample of grey quartz with fine grained sphalerite within barite lens, hand sample taken	
2379010	ROCK	Grab		2013	Sitka	Canada Zinc Corp	Acme	Aqua Regia, Lithium Borate Fusion	ICP-MS (GC), ICP-ES (A, WR)	Dkr	Fossiliferous Limestone		sample taken across barite lens

APPENDIX 3
Channel Samples

SAMPLE_NO	TYPE	SUBTYPE	LENGTH__m_	Azimuth	YEAR	PROPERTY	COMPANY	LAB	DIGESTION	METHOD	UNIT	LITHO	MINERALS	DESCRIPT	COMMENTS
1195451	ROCK	Channel	0.7	30	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	De	Shale		First Line: brecciated footwall shales, silicified, dark grey to black shales, barite-quartz veining with orange gossan, and box work weathering	
1195452	ROCK	Channel	0.65	42	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	BXbaqzcbsx	barite pod w sulphides		more massive white barite, with patches of dark grey barite (?), 0.5cm nodules of sphalerite (red and resinous) and galena, orange gossan. Above this is an unsampled section of shales	
1195453	ROCK	Channel	0.6	10	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	BXbaqzcbsx	barite pod w sulphides		upper barite pod with bands of gossan that contain box work weathering and 2-5% sphalerite and galena clots, massive white barite with orange yellow staining and clots of dark grey barite	
1195454	ROCK	Channel	1	10	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	BXbaqzcbsx	barite pod w sulphides		upper section of upper pod, last 10cm into siltstone, massive barite with dark grey barite nodules, and trace clots of galena and sphalerite	
1195455	ROCK	Channel	1	36	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	De	Shale		Second Line: black shales in footwall, muddy, fissile, gunsteel like, weakly silicified	
1195456	ROCK	Channel	1	36	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	BXbaqzcbsx	barite pod w sulphides		3cm nodules of white barite within a matrix of dark grey barite, several massive bands of galena with orange gossan staining around it in the barite, semi-massive barite, few specks of sphalerite	
1195457	ROCK	Channel	0.5	36	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	BXbaqzcbsx	barite pod w sulphides		massive barite with clots of dark grey barite	
1195458	ROCK	Channel	0.9	40	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	BXbaqzcbsx	barite pod w sulphides		massive white barite with dark grey quartz clots, box work weathering, orange-yellow gossan	
1195459	ROCK	Channel	0.8	40	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	BXbaqzcbsx	barite pod w sulphides		massive white barite, at top of channel in contact with dark shales, grey barite clots, and orange yellow gossan staining	
1195460	ROCK	Channel	0.9	40	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	Sss	siltstone		dark grey siltstone, fissile	
1195461	ROCK	Channel	0.3	42	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	De	Shale		Third Line: footwall black shales, fissile, orange gossan towards contact with stringer veins of barite and quartz	
1195462	ROCK	Channel	1.15	30	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	BXbaqzcbsx	barite pod w sulphides		massive white barite with clots of dark grey barite, orange to yellow gossaneous staining, few specks of galena	
1195463	ROCK	Channel	0.64	65	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	BXbaqzcbsx	barite pod w sulphides		white massive barite with orange yellow gossaneous staining and box work weathering, end of sample marked by glob of galena, clots of dark grey barite	
1195464	ROCK	Channel	0.4	18	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	De	Shale		Fourth Line: black fissile shales with orange gossaneous pockets of barite, quartz, calcite stringer veins running parallel to foliation	
1195465	ROCK	Channel	0.4	20	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	BXbaqzcbsx	barite pod w sulphides		white and grey barite with orange yellow gossan and box work weathering, few specks of galean and sphalerite	
1195466	ROCK	Channel	0.3	18	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	Sss	siltstone		dark grey siltstone, massive (not fissile), hard with a few white barite quartz veins	
1195467	ROCK	Channel	0.7	18	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	BXbaqzcbsx	barite pod w sulphides		white massive barite with grey clots, minor gossaneous staining and box work weathering, strong sulphur smell	
1195468	ROCK	Channel	0.6	18	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	BXbaqzcbsx	barite pod w sulphides		white massive barite with grey, orange yellow gossaneous staining, band of red gossan with box work weathering running along strike of pod, fine grained disseminated sphalerite in gossaneous bands	
1195469	ROCK	Channel	0.55	67	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	BXbaqzcbsx	barite pod w sulphides		upper pod, 2-5% sphalerite clots and disseminated, red and resinous, whtie to grey barite, with gossaneous orange yellow staining, one crystal of sphalerite has a blue hue to the crystal	
1195470	ROCK	Channel	0.65	67	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	BXbaqzcbsx	barite pod w sulphides		mix of breccia of dark grey siltstone with white barite-quartz veins, slight gossan, fissile towards end of channel, massive for the most part	
1195471	ROCK	Channel	0.6	67	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	Sss	siltstone		medium grey siltstone with few narrow white veins of barite-quartz-calcite, massive siltstone with sections of fissile shales (?)	
1195472	ROCK	Channel	0.6	42	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	BXbaqzcbsx	barite pod w sulphides		Creek line: massive white to yellow barite with occasional clast of black wall rock, gossaneous on weathered surfaces with leaching along fractures, no visible sulphides, grey barite	
1195473	ROCK	Channel	0.7	42	2013	Sitka	Canada Zinc Corp	Acme	Lithium Borate Fusion (WR), Aqua Regia (GC)	ICP-ES (WR, A), ICP-MS (GC)	De	Shale		light grey to silvery shale with erratic veinlets up to 1cm wide of quartz and barite

APPENDIX 5
Analytical Certificates
(Sitka samples are highlighted)

Acme Analytical Laboratories (Vancouver) Ltd.
9050 Shaughnessy St Vancouver BC V6P 6E5 CANADA
PHONE (604) 253-3158

www.acmelab.com

Client: **Canada Zinc Metals Corp.**
Suite 2050 - 1055 W. Georgia St.
PO Box 11121, Royal Centre
Vancouver BC V6E 3P3 CANADA

Submitted By: Nick Johnson
Receiving Lab: Canada-Vancouver
Received: August 07, 2013
Report Date: August 27, 2013
Page: 1 of 9

CERTIFICATE OF ANALYSIS VAN13003045.1

CLIENT JOB INFORMATION

Project: AKIE
Shipment ID: CZM-Aug 01-13
P.O. Number
Number of Samples: 223

SAMPLE DISPOSAL

RTRN-PLP Return
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
Dry at 60C	223	Dry at 60C			VAN
SS80	223	Dry at 60C sieve 100g to -80 mesh			VAN
1F04	223	1:1:1 Aqua Regia digestion Ultratrace ICP-MS analysis	0.5	Completed	VAN

ADDITIONAL COMMENTS

Invoice To: Canada Zinc Metals Corp.
Suite 2050 - 1055 W. Georgia St.
PO Box 11121, Royal Centre
Vancouver BC V6E 3P3
CANADA

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CERTIFICATE OF ANALYSIS VAN13003537.1

CLIENT JOB INFORMATION

Project: AKIE
Shipment ID: CZM-AUG 29-13c
P.O. Number
Number of Samples: 140

SAMPLE DISPOSAL

RTRN-PLP Return
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
Dry at 60C	140	Dry at 60C			VAN
SS80	140	Dry at 60C sieve 100g to -80 mesh			VAN
1F04	140	1:1:1 Aqua Regia digestion Ultratrace ICP-MS analysis	0.5	Completed	VAN

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CERTIFICATE OF ANALYSIS VAN13003698.1

CLIENT JOB INFORMATION

Project: AKIE
Shipment ID: CZM-SEPT 06-13
P.O. Number
Number of Samples: 199

SAMPLE DISPOSAL

RTRN-PLP Return
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
Dry at 60C	199	Dry at 60C			VAN
SS80	199	Dry at 60C sieve 100g to -80 mesh			VAN
1F04	199	1:1:1 Aqua Regia digestion Ultratrace ICP-MS analysis	0.5	Completed	VAN

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.
