1.0 Executive Summary

The IMGM claims are located in the east of Tatsamenie Lake area in Atlin Mineral Division, northwestern B. C., Canada, about 135 km west of Dease Lake City, where grocery and food supplies. The property is within 1: 50,000 scaled NTS map sheet 104K08. The property is made up of 4 Claims totaling 5349 hectares (or 53.49 square km), centers at Latitude: 58° 18' 51" N, Longitude: 132° 10' 36" W. IMGM International Mining Canada Inc. 100% owned and first staked in 2013.

In September of 2013, just a few days after these claims were claimed, a small group and IMGM International Mining Canada Inc.'s technical crew spent two weeks tried to access the property for a quick researching a couple of Minfile showings within this property. The access afford was failed both to Phacops property by boat and to Tatsamenie Lake and Tatsamenie East property by land driving.

In summer of 2014, prospecting work conducted within Tatsamenie east claims while IMGM technical team was working on IMGM's other claims group at west of Tatsamenie Lake. Near four days of field work at Tatsamenie East claims have collected 9 silt samples and 8 rock samples. Samples are located within IMGM11 and IMGM12 claims. Claims IMGM13 and IMGM14 were partially prospected, however no sample collected.

All silt and rock samples assayed for 51 elements including pathfinder elements Au, Ag, Cu, Pb, Zn, As, Sb, Bi, Hg, W, Mo. Silt samples returned anomalous Cu and other pathfinder elements, as Au value to 49 ppb with average 17 ppb; Cu value to 3960 ppm with average 1047 ppm; Ag value to 1.44 ppm with average 0.67 ppm; As value to 298 ppm with average 124 ppm; Sb value to 112 ppm with average 38.2 ppm; Mo value to 155.5 ppm with average 45.0 ppm, however Pb, Zn and Hg returned weakly anomalous value. Rock samples returned generally flat values, except for pick up rock sample Q923875 assayed 1.79 g/t Ag, 255ppm Cu, 24.5 ppm Mo and

2.81 ppm W; and pick up rock sample Q923885 (suspending from neighbor claim) taken at a bulk quartz vein assayed higher Ag 8.54 g/t, Au 0.169 g/t, As 234 ppm, Sb 414 ppm, Mo 29.7 ppm; selected drill core sample Q923886 (from same neighbor claim) returned higher Cu 1100 ppm, Mo 9.13 ppm, Au 18 ppb, Ag 0.81 ppm (Au, Cu and As value in rock geochemistry refer to Figure 8,9 and 10). These samples are from Ant target (Minfile 104K32) area.

This assessment report encloses 2014 work expenditure and of sharing work expenditure carried in September of 2013, when an initial field assessment was done by IMGM filed crew. The expenditure for this assessment report sum up to CAN\$28,750.81 in all.

2.0 Introduction

IMGM International Mining Canada Inc. initiated claim staking in the Tatsamenie East area in August of 2013, the Tatsamenie East Property consisted of 4 claims covering over 5349 hectares that are 100% owned by IMGM International Mining Canada Inc. through staking (Figure 1).

The Tatsamenie East Property is an early exploration stage of Cu, Au project located in northwest of British Columbia, approximately 135 kilometers west of Dease Lake, British Columbia (Figure 2). The Tatsamenie East Property covers parts of NTS (1:50,000 scale) map sheets 104 K08, centers at Latitude: 58° 18' 51" N, Longitude: 132° 10' 36" W.

This assessment report documents the exploration work completed by IMGM International Mining Canada Inc. in 2014 on the Tatsamenie East property. The report was prepared following the general guidelines set forth by the Mineral Tenure ACT Regulation and Mineral Tenure ACT from Government of British Columbia.

This report covers the following aspects of the projects:

- Topography, landscape and access

- Regional and local geology, and mineralization
- Exploration history
- Summary of 2014 exploration expenditures by IMGM International Mining Canada Inc.

Author Mr. Yang Wanjin is director and chief geologist employed by IMGM International Mining Canada Inc. managed and conducted whole field work and monitored the data validation procession. The exploration data presented in this assessment report is believed to be reliable, and the author have no doubt as to the reliability of the historical data present in this report.

3.0 Property Description and Location

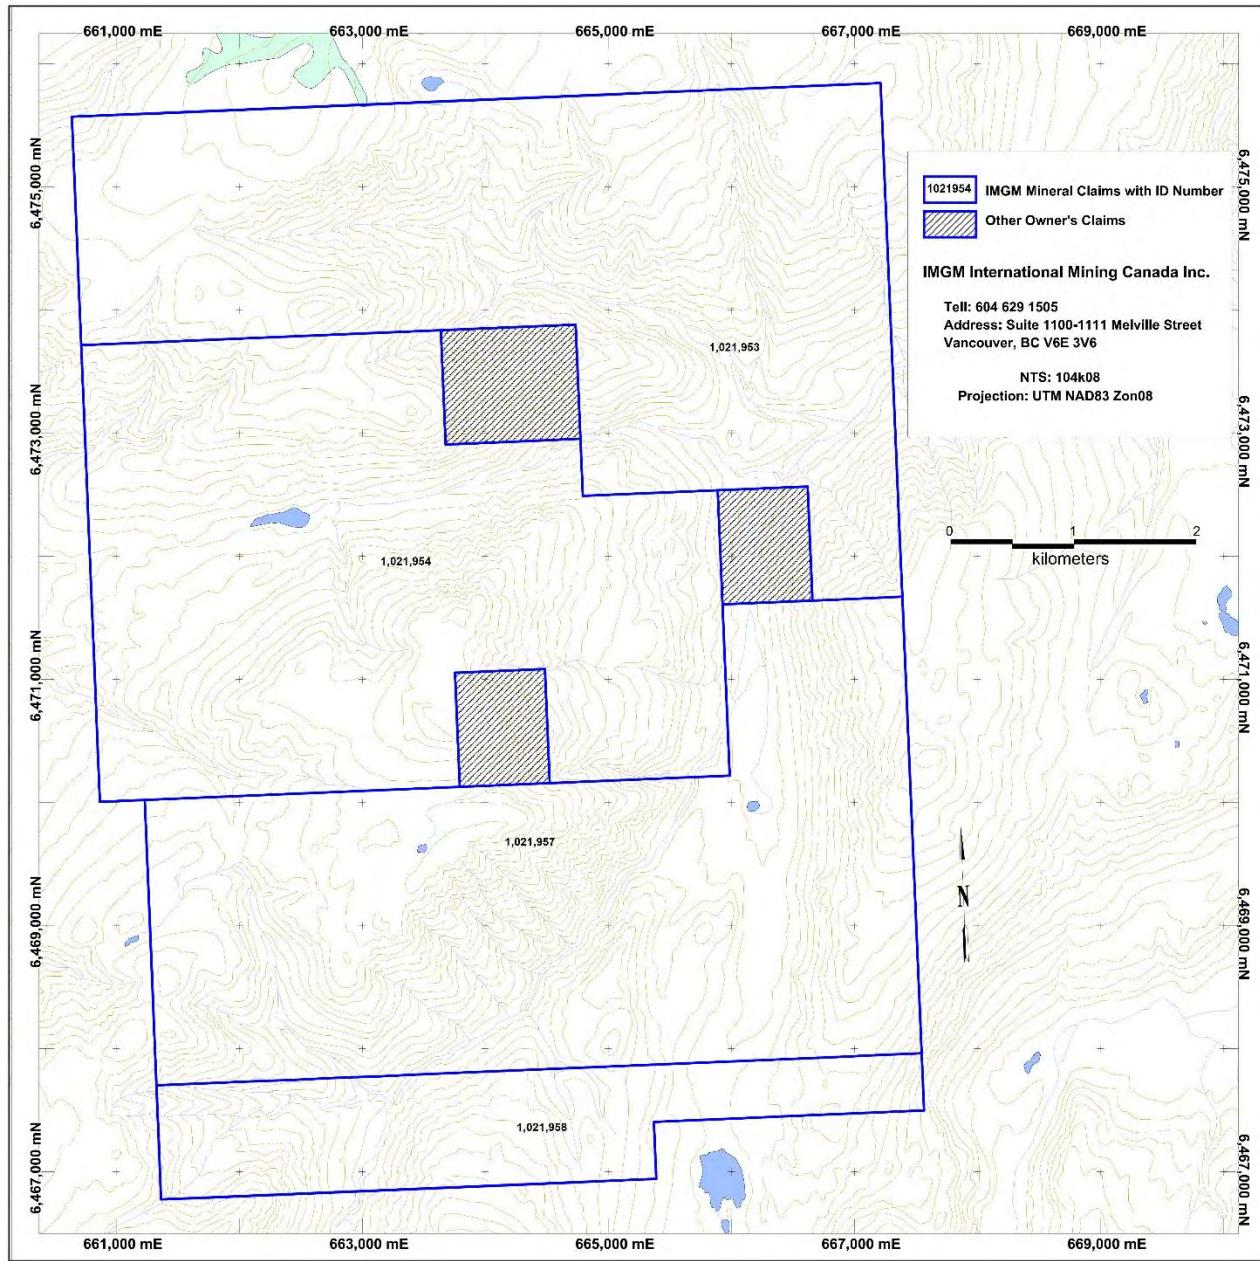

3.1 Land Tenure

IMGM Tatsamenie East Property claim block consists of 4 registered quartz mining claims covering 5349 hectares (or 53.49 square km) at east of Tatsamenie Lake area. The property is within NTS map sheet 104 K08, centers at Latitude: 58° 18' 51" N, Longitude: 132° 10' 36" W. IMGM International Mining Canada Inc. 100% owned and first staked in August of 2013. The boundary of the claim block is shown in Figure 1. Three shadowed blocks inside IMGM Tatsamenie East property are registered claims owned by prospectors Bot John and Chrisostom. The boundaries of the individual claims have not been legally surveyed. A list of the mining claims is given in Table 1 and the claims are graphically presented in Figure 1 and Appendix C.1.

Table 1. IMGM Tatsamenie East Project - Quartz Mining Claims

Figure 1. IMGM Tatsamenie East Property Claims Map

3.2 Underlying Agreements

IMGM International Mining Canada Inc. 100 % owns these IMGM 11-IMGM14, 4 claims, and first registered in august 2013.

3.3 Environmental Considerations

IMGM International Mining Canada Inc. conducts all exploration activities in a manner to minimize all environmental impacts to land, water, wildlife and cultural resources. All IMGM International Mining Canada Inc. Tatsamenie Project employees and sub-contractors were required to use best practice procedures for minimizing environmental impact due to exploration activities, and to ensure safe working conditions for all persons.

IMGM Tatsamenie East 2014 summer program is composed of prospecting program along with silt sample and rock sample program.

4.0 Accessibility, Climate, Infrastructure and Physiography

IMGM Tatsamenie East Property is located 135 km west of Dease Lake town. Base at Dease Lake access property by 40 minutes helicopter flight. Sheslay airstrip is about 10 km south east of property. The only direct access to the Tatsamenie East area is by helicopter. Another nearest community to the property is the Town of Atlin East, is 140 km to the north. Groceries, gas and basic supplies can be bought in Dease East at east and Atlin East at north. The climate of the Tatsamenie East area is defined as sub-arctic. The mean summer and winter temperatures are in the range of 15" C and -24" C respectively and the mean summer and winter precipitation average for northern B.C. are in the range of 25 cm and 22 cm respectively with a majority of the winter precipitation being in the form of snow. Main drainages that flow from the property Tatsatua creek that flow towards northeast cross whole property and merge into Sheslay River. It is understood that have year round water. There is no infrastructure on the property. The styles and types of vegetation through the property are spruce trees and willow dominated sub alpine wood and bush. Refer to Access map figure 2.

Figure 2 Tatsamenie East Property location

5.0 Exploration History

The Tatsamenie East property area has been explored sporadically by numerous companies since early exploration of the Bing porphyry system by Newmont in 1964- 1966. Exploration in the

area of the Tatsamenie East Property is documented in ten assessment reports available on the B.C. Ministry of Mines ARIS website (<http://llm-m~etn.gov.bc.cdcf/ai@>). In 1971, Souther published a 1:250,000 scale regional map of the Tulsequah map area (Figure 3) which outlined a large hydrothermal (silicification and pyritization) alteration zone extending from the west side of Tatsamenie lake to the Bing area, a distance of over 20 kilometres (Souther, 1971). The Icy Lake (MC or Ant) porphyry was identified initially by V. Cukor and P.H. Sevensma in 1970 for the Colorado Corporation; it was subsequently worked by Skyline Exploration and Brinex in 1971, and by Rio Tinto in 1976-1977. Discovery of the Golden Bear gold deposit in the 1980s spurred a renewed look at the area by Chevron and North American Metals as well as a number of junior exploration companies (ARIS report 29345, John, 2007).

One exploration programs selected are known to have been carried out within the current claim area since the early 1990's, one was in 2007, brief description as following:

ARIS Report No. 21987 dated March, 1991 and describes the 1991 work program carried out by Waterford Resources Inc. as consisting of geological mapping, rock sampling (315 samples), ground VLF/mag.

ARIS Report No. 29345 dated October 2007 describes the 2007 work program carried out by Paget Resources Corp. as consisting of geological mapping, rock sample program. A total of 83 rock samples were collected from various mineralized zones. Relocated Icy lake Zone, Bing Zone within Tatsamenie East Property area, though the author resulting in limited porphyry mineralization potential within Property area. “Alteration is neither strong nor spatially extensive. Weak propylitic alteration is patchy throughout the property and potassic alteration is only found in vein selvages near dykes, where it is extremely rare. This indicates that there is little potential for porphyry style mineralization” (ARIS report 29345, John, 2007) at Icy lake area.

ARIS Report No. 25150 dated October 1997 describes the 1997 work program carried out by Canamera Geological Ltd. as consisting of geological mapping, rock sample program, soil program, IP survey and ground Mag program. The authors concluded a drill hole suggestion for porphyry Cu Au mineralization test.

6.0 Geologic Setting and Mineralization

6.1.1 Regional Geology

Tatsamanie East property is regionally located within Stikine Terrane of intermountain belt of west Canadian Cordillera geographic Orogenic Belt. Stikine Terrane is Carboniferous to Early Jurassic (320-190 Ma) island Arc. After early to Middle Jurassic (190-178 Ma), there are related magmatic activities continued into the Tertiary. Late Triassic through Tertiary plutons intrude structurally imbricated Stikine and Cathe Creek Terranes.

The Tulsequah and Juneau map area, a 1/250,000 scaled geological map (published in 1971) of which is represented in Figure 3, features the rock originally defined as Stikine Arc and now referred to by the terrane assemblage term “Stikinia”. Stikinia includes four tectonostratigraphic assemblages, namely the Paleozoic-ages Stikine assemblage, several Triassic to Jurassic volcanic-plutonic arc complexes, the Middle to Late Jurassic Bowser overlap assemblage, and the tertiary Coast Plutonic Complex. All are well represented in the Tulsequah map area except for the Bowser assemblage, which is thought to be represented by an equivalent unit called the Laberge Group (refer to BCGS Website description).

The oldest map units (including legend symbols 1, 2, and 3,) in the area are Permian or older limestone, mudstone, and chert, probably equivalent to the Stikine assemblage, exposed to the southeast in the Golden Bear Mine area. These units are complexly folded and faulted, and are also cut by numerous intrusive (?) bodies of peridotite, serpentine, gabbro, and pyroxenite.

Lower Triassic units (legend symbol 4) include mudstone, cherts, subordinate limestone and mafic to intermediate volcanic rocks (, greenstone). Small bodies of peridotite, serpentinite and other mafic to ultramafic intrusive rocks may be locally abundant.

Large stocks and batholiths of diorite, quartz diorite, and granodiorite (legend symbols 6), of probable lower or Middle Triassic age have been observed to intrude the older rock units.

The Upper Triassic Stuhini Group (Legend symbols 7 and 8) comprises a monotonous sequence of greenstone, either basalt or andesite flows and pyroclastic breccia, tuff plus minor interbedded

mudstone, wacke and chert. Stuhini Group units are thought to be the major unit underlying the Metla Property.

Northeast of the Metla is an isolated klippe (?) of Upper Triassic Sinwa Formation (legend symbol 9). This unit is a valuable regional marker, being distinct in its appearance and composed to thin-bedded limestone, chert and sandstone.

Lower and Middle Jurassic laberge group, takwahoni Formation (legend symbol 11) is present north of Trapper East, Part of a regionally extensive unit trending both to the northwest and southeast. The Takwahoni comprises conglomerate, sandstone, and greywacke.

Upper Jurassic to Early Augite Diorite is noted south of the property, near Tatsamenie Lake (Legend symbol 14). This unit comprises an extensive unit of subaerial rhyolite, dacite and trachyte pyroclastic breccia, tuff and subordinate flows. Possibly co-magmatic quartz-feldspar porphyry plugs and dykes (legend symbol 15), and stocks of quartz monzonite (legend symbol 16) are also present, notably east and southeast of the Metla Property.

The significant of Stikinia lies in the fact that it hosts mines and mineral deposits throughout northwestern British Columbia including the Premier and Big Missouri gold deposits and the Granduc copper massive sulphide deposits (Stewart area), the Jonny Mountain and Snip gold mines and the Esky Creek gold-rich polymetallic massive sulphide deposits (Iskut River and Unik Rivers areas), and bulk tonnage copper-gold deposits (galore creek area, Schaft Creek Area), Closer to the project area the golden bear mine (gold) and former producers Polaris Taku (gold), Tulsequah Chief, and Big Bull mine copper.

6.1.2 Regional structure

The regional structure is dominated by a broad open fold trending southerly from Tatsamenie Lake, affecting Lower Triassic and Paleozoic units in the south, and a strongly developed units in the south, and a strongly developed northwest trending fold sequence affecting Cretaceous and older units. The older north-trending pattern of folding is thought to be the result of the Tahltania Orogeny, which left a marked hiatus or unconformity at the base of the Upper Triassic Stuhini Group. The Younger northwest-trending pattern of period of southeast-directed thrust faulting

along the King Salmon Fault. This latter period of deformation occurred at the close of the “Jurassic”.

Figure 3-1 Regional Geology Map

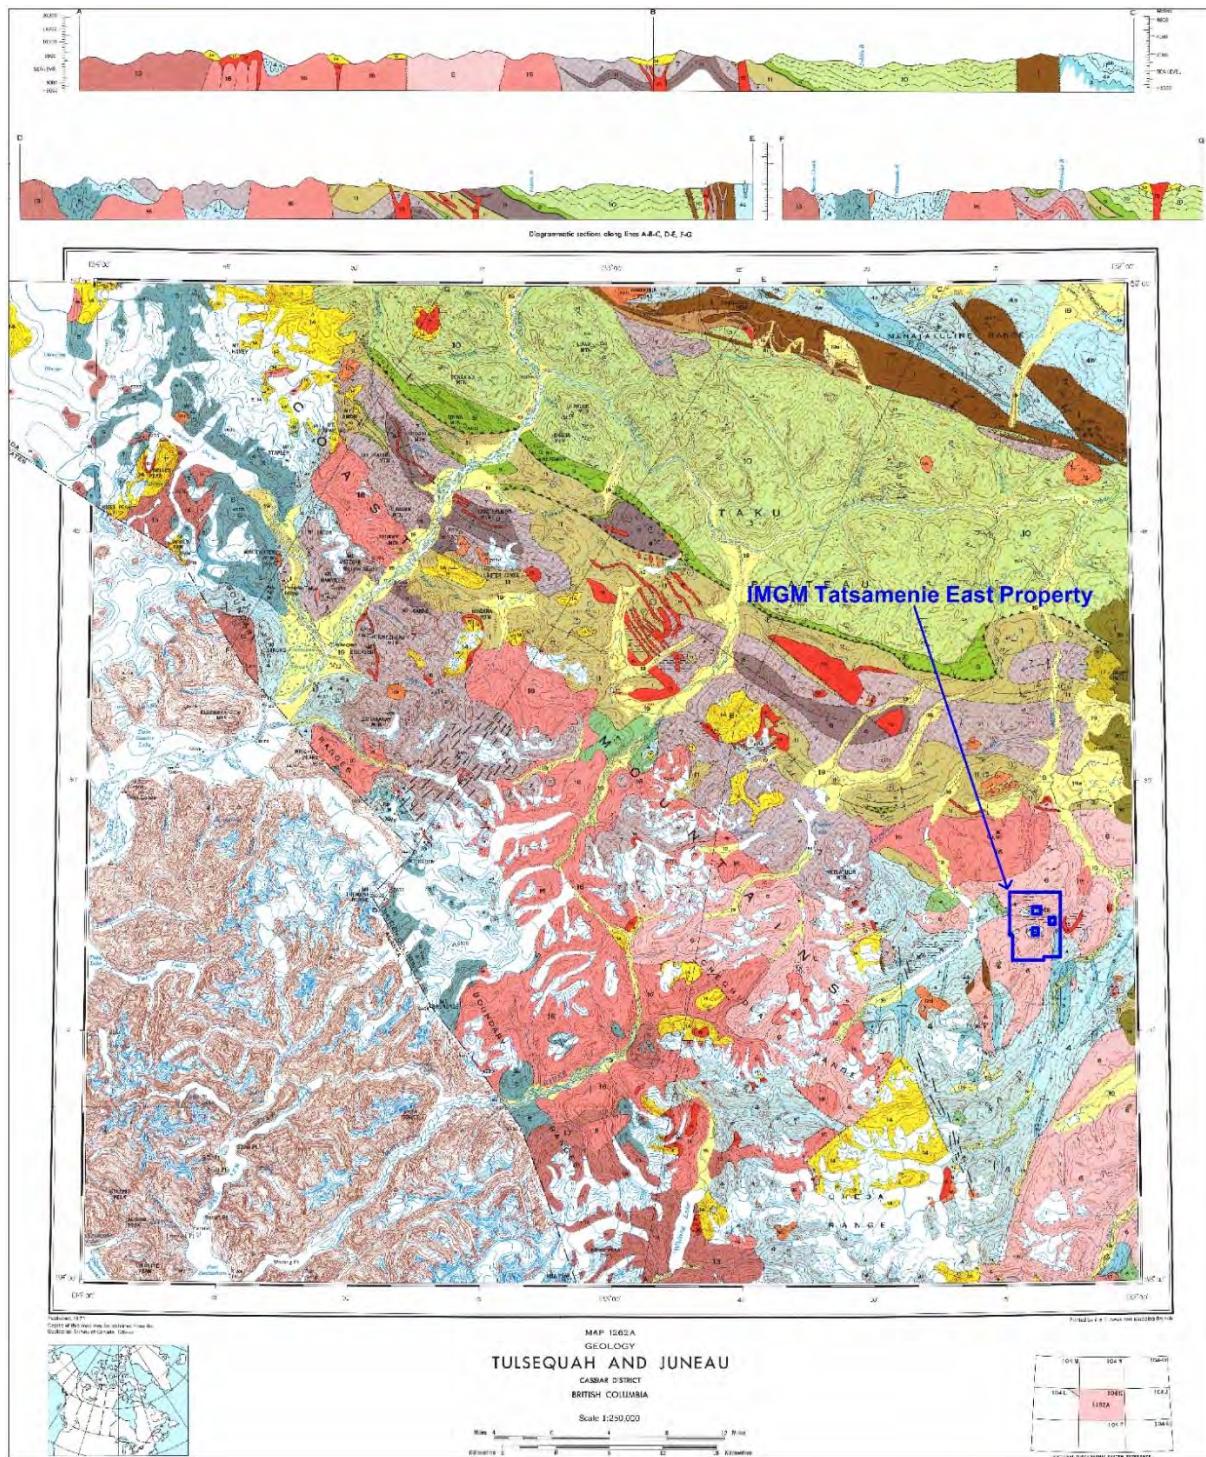

Figure 3-2 Regional Map-lithology Legend

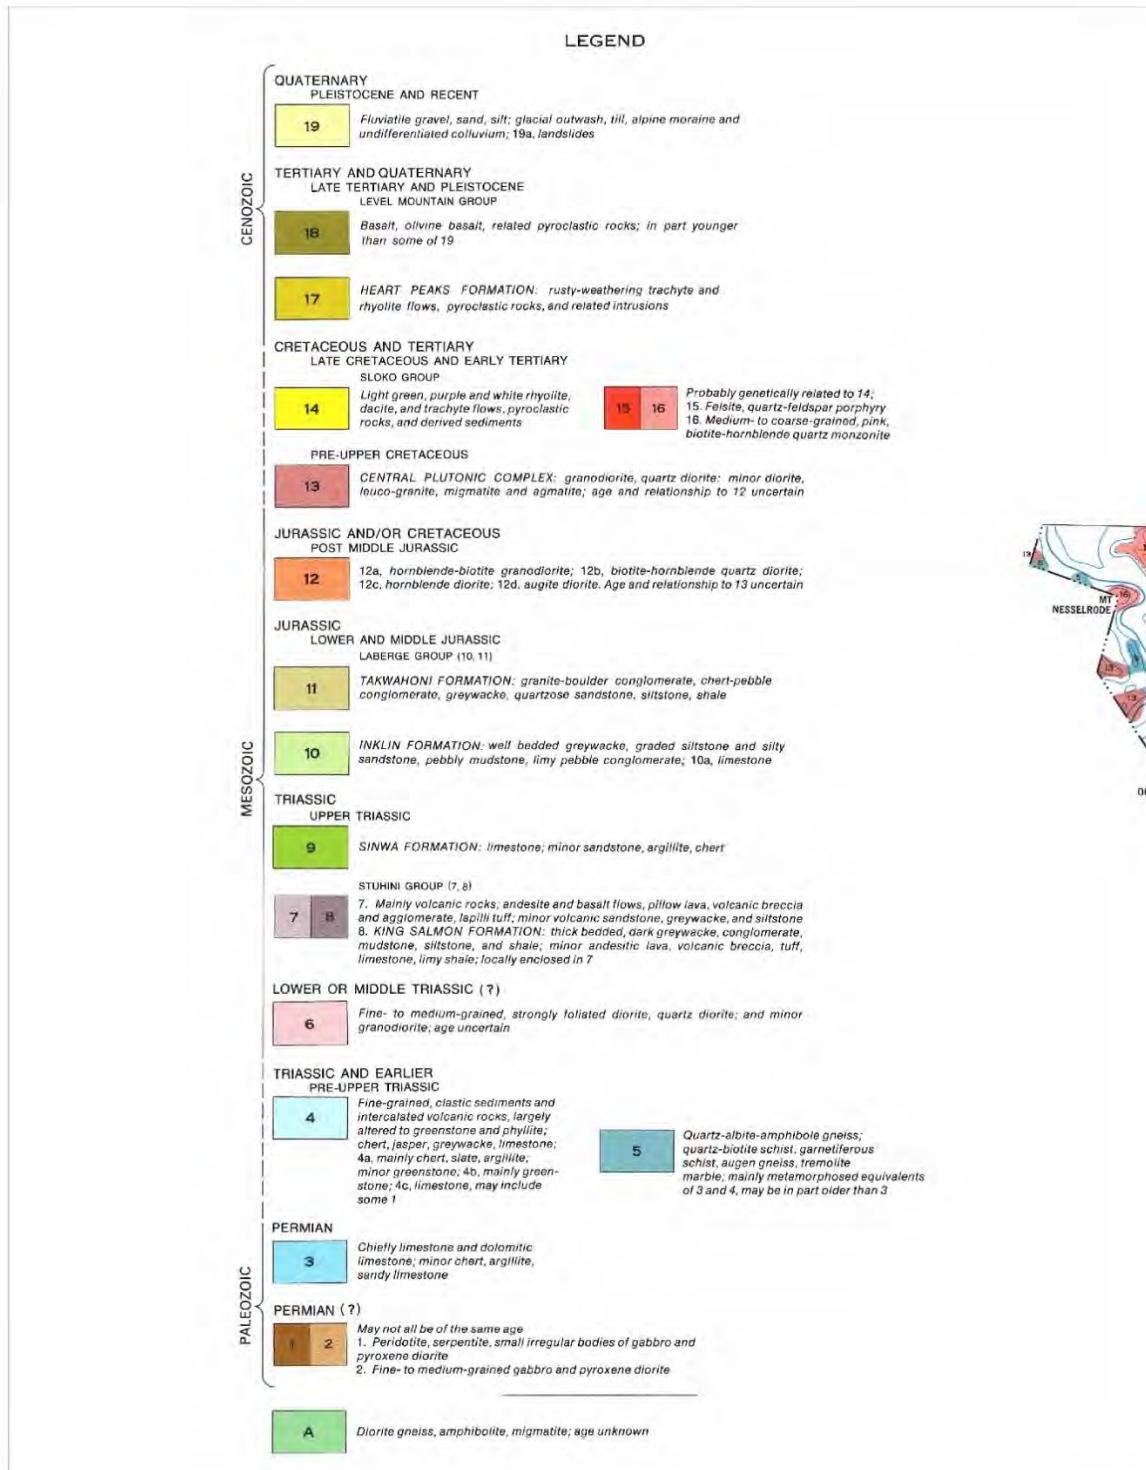

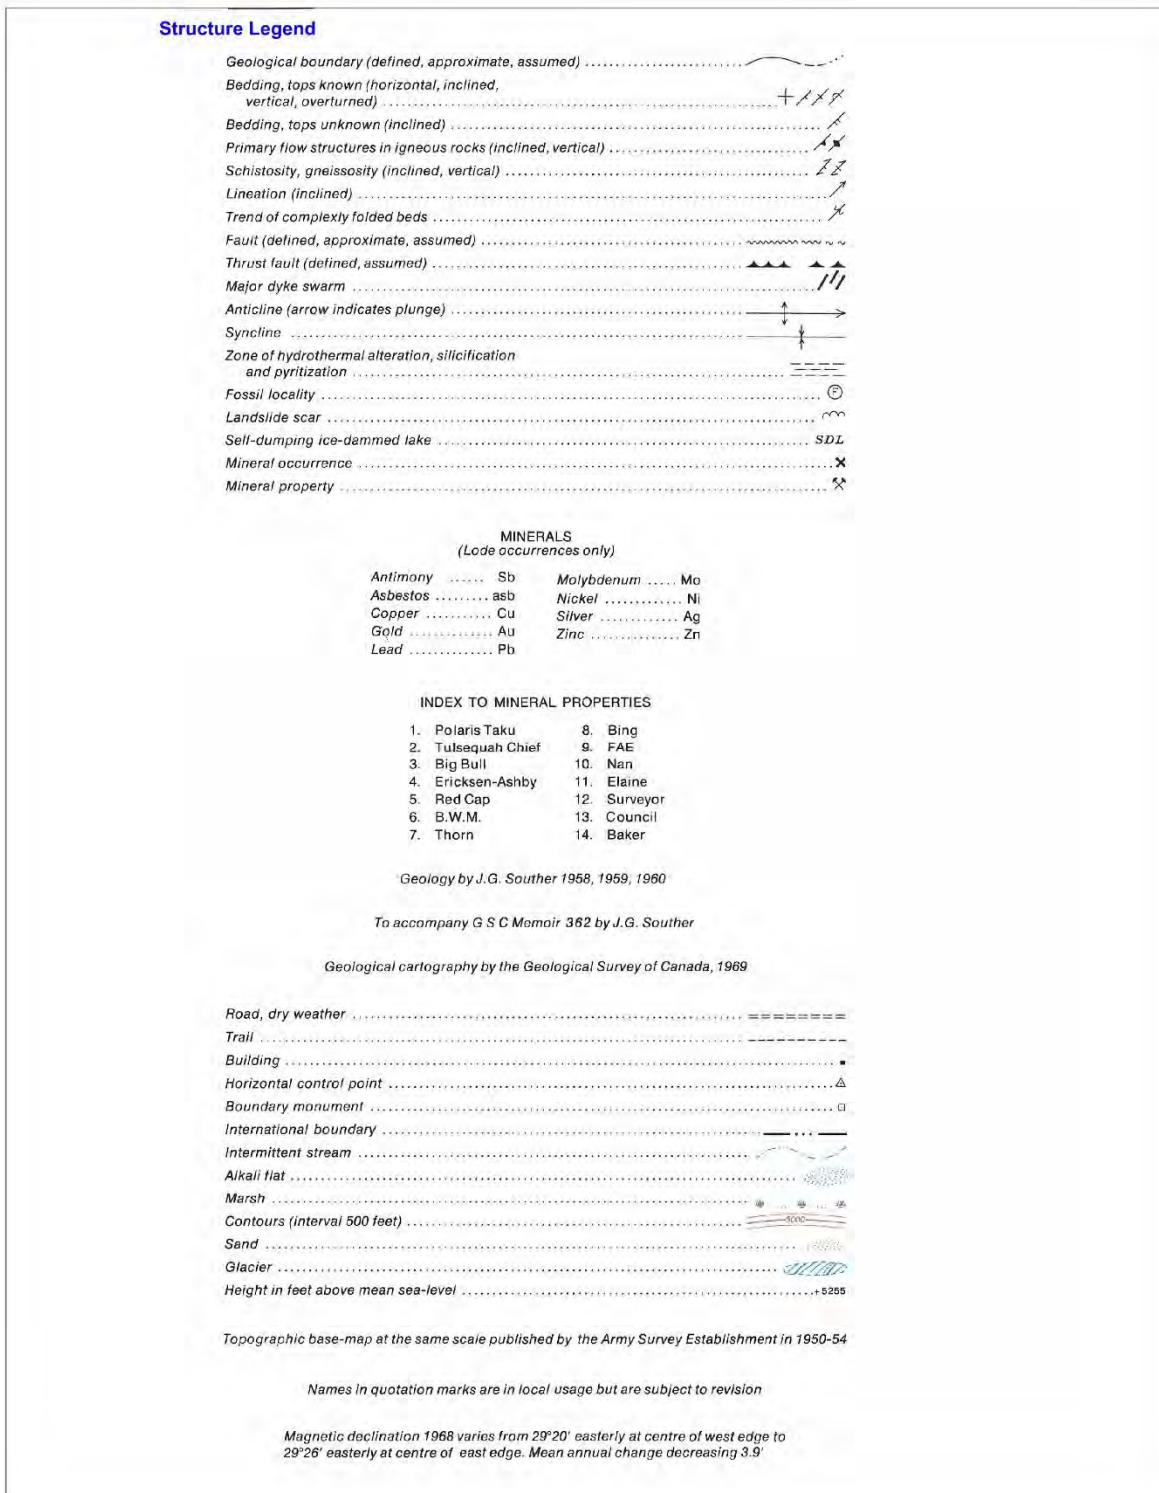

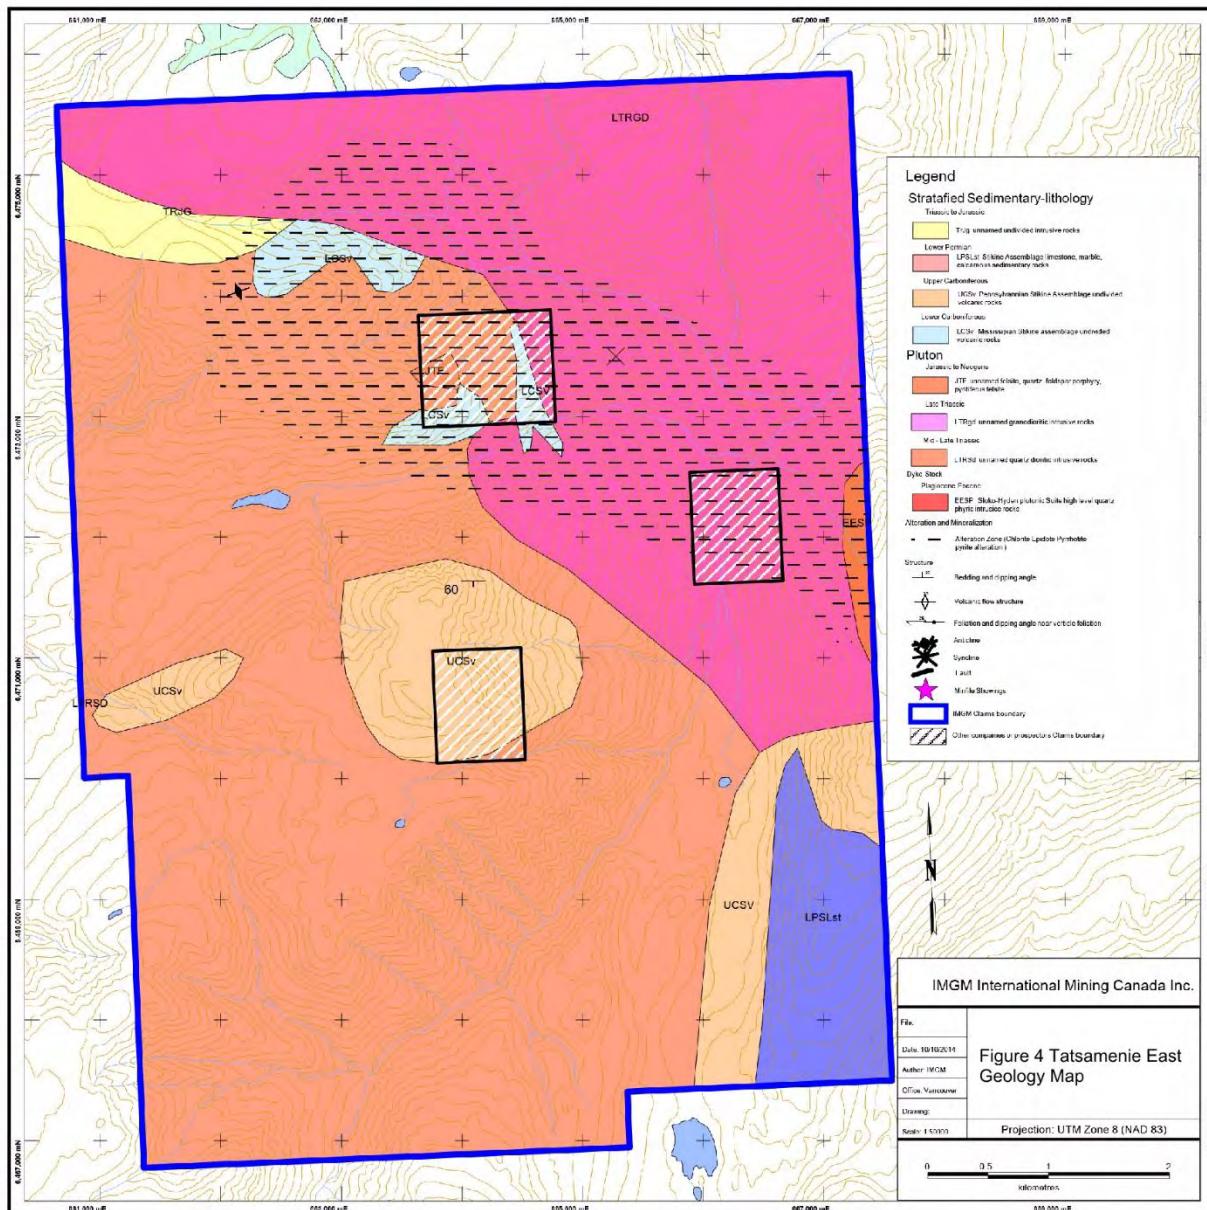

Figure 3-3 Regional Map-Structure Legend

6.2.1 Property geology

The Icy Lake area (mostly covered by mineral claim owned by prospector Bot John/Chrisostom) includes the central part of the property in the area of the Tatsamenie east porphyry copper-molybdenum prospect (MINFILE 104K 032), and was visited by four days between July 3rd and Aug 3rd, 2014. Dominantly andesitic country rocks in the area include a number of small roof

Figure 4 Tatsamenie East property Geology map

pendants in a diorite stock; however, most of the observed outcrops are intrusive. The majority

of the prospective and gossanous portion of the Icy Lake property is underlain by a medium grained, magnetite bearing equigranular diorite. The higher topographic reaches (ridge lines) of the property consist of diorite to granodiorite that appears a different character than the "lower" diorite: it is less altered, coarser grained, and appears to truncate dykes which are present in the lower diorite. This "upper" diorite may be a thick sill or flat-bottomed intrusion. The "lower" diorite and surrounding country rock are cross-cut by a variety of dyke lithologies, including plagioclase-biotite phryic quartz monzonite, green andesite and spherulitic rhyolite (ARIS report 29345, John, 2007).

6.3 Mineralization

6.3.1 Bing area mineralization

The Bing showing (MINFILE 104K 035) is a porphyry copper-molybdenum system with peripheral skarn-type copper mineralization. Alteration and mineralization in the Bing area are widespread and complex. Diorite, which underlies much of the property, has undergone polyphase alteration characterized by strong early stage actinolite-magnetite overprinted by K feldspar-magnetite and quartz veining as well as retrograde chlorite and epidote (John 2007 29345 assessment report). This alteration sequence is seen in the upper reaches of Chalco Creek, the southern of the two creeks with good rock exposures draining the eastern slope of the plateau. The zone is here exposed over a width of 75 meters. Similar alteration is exposed in the lower part of Moly Creek, the northern of the two creeks. More evolved felsic dykes (monzonite, quartz feldspar porphyry, quartz monzonite and granodiorite) crosscut the altered diorite and appear to postdate the main alteration system, as they typically contain unaltered feldspars and mafic minerals. Some remobilization of secondary copper minerals has taken place along dyke contacts. The felsic intrusions are strongly altered in the vicinity of quartz veins where thick (1 to 2 meter) envelopes of quartz-pyrite sericite clay are present. A second, weak K-feldspar alteration and veining event is widespread across the property and cross-cuts earlier alteration including the earlier potassic assemblages, and the felsic intrusive bodies. Three main types of mineralization were identified on the Bing property: (1) Cu±Mo associated with quartz veins and potassic alteration in diorite (porphyry style); (2) Mo±Cu associated with quartz, carbonate,

kaolinite veins (epithermal style); and (3) Cu in skarn altered volcanics and calcareous sediments intruded by diorite (skarn style) (ARIS report 29345, John, 2007).

6.3.2 Ant area mineralization

Visually the MC area (MINFILE 104K 032) is dominated by several large and nearly contiguous color anomalies which upon inspection comprise broad envelopes of pyritized intrusive and lesser volcanic rocks. Alteration is weak propylitic, with patchy epidote-chlorite accompanying 1-5% pyrite as fracture fillings and in scattered quartz veinlets; feldspars are generally fresh and unaltered even in moderately pyritized rocks. There appears to be no convincing evidence for potassic alteration despite the presence of bleached selvages (albite? K-spar?) to quartz veins.

The MC porphyry is impressive in appearance due to pervasive introduction of up to 10% pyrite in diorite. Pyrite occurs as disseminations, veins and along fracture surfaces. The majority of observed alteration and mineralization is found in close spatial relation to feldspar-biotite porphyritic dykes that occur on the main ridge which separates Deception and Icy Creeks. Two modes of alteration and mineralization are present: (1) molybdenite related to quartz veins, usually within the dykes, and (2) strong silicification with Cu±Mo mineralization in diorite along contacts with plagioclase-biotite phryic dykes. The first mode of mineralization is unrelated to any alteration; the plagioclase biotite phryic dykes are at most weakly iron carbonate altered with pristine feldspar and biotite. These rocks contain up to 1% molybdenite which occurs along the vein margins and disseminated in the rock. The second mode of mineralization is associated with strong silicification where, in places, the diorite adjacent to the dykes is completely replaced by fine grained silica. These zones of intense silicification contain up to 1% chalcopyrite, trace molybdenite, up to 10% pyrite and are weakly copper stained. The zones are irregular in shape and are not continuous along the contact with the dykes. In most places the contacts with the dykes are characterized by an increase in the proportion of pyrite and varying degrees of quartz veining with very rare examples of narrow (John Braford 2007 29345 report) less than 1 cm) sodic and potassic selvages. These pyritic zones are broadly coincident with widespread Cu and Mo soil anomalies (Cukor and Sevensma, 1970, 1971) which - in the alpine environment - are really more talus fines than true soils. Peak anomalies are of the same magnitude as those in the Rio Tinto drill holes (Holtby, 1976) and there is little scope or focus for higher metal

concentrations, at least at or near surface. The importance of locally intense iron carbonate alteration and narrow, polymetallic quartz veins on the ridge between Deception and Icy Creek is unclear, but this style does not seem to present an economically viable target.

At lower elevations on the north side of Icy Creek, the nature of alteration changes somewhat, in that there are relatively narrow, metric scale zones of more intense argillic to phyllitic alteration exposed in the steep northern walls of the incised valley. Alteration is most intense in a series of “granitic” (quartz-plagioclase-biotite porphyry) sills leaving intervening screens of foliated diorite host rock with the above mentioned propylitic alteration. Polymetallic (Au-Ag-Sb-Cu-Pb-Zn) veins have also been sampled in this area and likely are part of the same system sampled on the above ridge; these occurrences are undrilled. The ridge to the north of Deception Creek, although considered in previous exploration programs to be prospective, was only weakly propylitic altered and had only one occurrence of copper mineralization, where a spherulitic rhyolite dyke was weakly mineralized and had minor malachite staining. One 30 cm-wide vein discovered during the 2007 work program was very impressive (containing 30% chalcopyrite) although it was apparently unrelated to any alteration system or other mineralization on the property. Strong alteration envelopes extended 2 to 3 meters on each side of the vein. The envelopes contained quartz stringers and approximately 1 % chalcopyrite. All fracture surfaces around the vein were heavily copper stained. The vein did not extend upslope into prominent outcrops (ARIS report 29345, John, 2007).

6.3.3 Skarnface mineralization

MINFILE 104K 153 Skarn type Cu±Au mineralization. Numerous, minor patches of carbonate-diopside-epidote-chlorite-actinolite skarn occur around 6,470,500 N, 664,000 E. Skarn mineral assemblages occur in hybrid diorite to quartz diorite which is relatively carbonate rich and which has diffuse hypidiomorphic textures indicating assimilation of carbonate country rock. Skarn occurrences are isolated patches but appear to be part of a broad E-W zone around two creeks at about 6,470,000 N and 6,471,000 N. The skarn is probably associated with an E-W intrusive contact zone that extends into the Sing claims where it is manifested by skarn patches in diorite adjacent to a limestone-siltstone contact. Structural control on the skarn mineralization is unknown. 055° to 080° fracture orientations and shears are common along the E-W trend of the

skarn occurrences. Skarn occurrences contain trace to 5% pyrite and trace to 2% malachite. Eight grab samples of mineralized skarn returned minor to 2.2% Cu. Gold values are ~0.03 g/t and up to 0.1 g/t in one sample (56006). Silver values are 0.2-1 .2 g/t and up to 39.3 in one sample (66013) (ARIS report 25150).

7.0 Deposit types

7.1 Porphyry type Cu-Au (Ag, Mo) mineralization

Exploration assessment at Tatsamenie East property area historically focus on porphyry Cu, Au, and (Ag, Mo) mineralization. The closer porphyry copper gold system defined at Firesteel Resources Copper Creek property is located at 30 km south east of Tatsamenie East Property. Tatsamenie East Property Triassic granodiorite host late stage vein type precious and base metal mineralization that could be part of the porphyry mineralization system ever observed in other known porphyry deposit along Stikinia Terrane as similar mineralization features defined within exploration at Galore creek and Schaft porphyry type copper and gold mineralization.

8.0 2014 Exploration Data

8.1 Sample Geochemistry

A total of 9 silt and 8 rock samples were collected by IMGM International Mining Canada Inc. technical team during the 2014 exploration program (silt sample location map refer to appendix C). These 9 silt samples mainly distributed along IMGM11 and IMGM12 claims of the north part in Tatsamenie East property. Evaluation and interpretation of the silt geochemical dataset was the primary evaluation tool used to locate and define drainage basins with anomalous gold, copper and associated pathfinder trace elements for continuing prospecting and target definition. All silt samples were analyzed by ALS Laboratories. Assay certificates for all silt samples are presented in Appendix A. Sample locations and descriptions are presented in Appendix B. A 1:50,000 scale map showing silt geochemistry is located in Appendix C.

Silt samples were taken during the 2014 field seasons along primary and secondary tributary streams covering drainage catchment basins across the north part of Tatsamenie East property area (Appendix C). The stream sediment dataset represents the only north part of property

geochemical database. Fine grained silt materials were collected from several places at each sample locations in an attempt to get better sample representation.

All silt and rock samples assayed for 51 elements including pathfinder elements Au, Ag, Cu, Pb, Zn, As, Sb, Bi, Hg, W, Mo. Silt samples returned anomalous Cu and other pathfinder elements, as Au value to 49 ppb with average 17 ppb; Cu value to 3960 ppm with average 1047 ppm; Ag value to 1.44 ppm with average 0.67 ppm; As value to 298 ppm with average 124 ppm; Sb value to 112 ppm with average 38.2 ppm; Mo value to 155.5 ppm with average 45.0 ppm, however Pb, Zn and Hg returned weakly anomalous value (silt sample Au, Cu and Au assay value symbol map refer to figure 5,6,7). Rock samples returned generally flat values, except for pick up rock sample Q923875 assayed 1.79 g/t Ag, 255ppm Cu, 24.5 ppm Mo and 2.81 ppm W; and pick up rock sample Q923885 (suspending from neighbor claim) taken at a bulk quartz vein assayed higher Ag to 8.54 g/t, Au to 0.169 g/t, As to 234 ppm, Sb to 414 ppm, Mo to 29.7 ppm; drill core sample Q923886 (suspending from same neighbor claim) returned higher Cu to 1100 ppm, Mo to 9.13 ppm, Au 18 ppb, Ag 0.81 ppm (Au, Cu and As value in rock geochemistry refer to Figure 8,9 and 10).

8.2 Prospective area (targets)

8.2.1 Ant area (Minfile 104K032)

Ant area is projected in IMGM's property, is the main target area was prospected with silt and rock sampled in IMGM 2014 summer program. At Ant area (largely covered by other owners' claim), the ridge where two holes were drilled by Rio Tinto in 1977 had been interpreted to have indications of alteration associated with porphyry copper mineralization. Propylitic, Potassic,

phyllitic and argillitic assemblages had been mapped on the ridge by former geological workers. IMGM grabbed one sample from weakly propylitic, potassic altered dioritic drill core with pyrite and chalcopyrite strings and disseminations located at Rio Tinto ‘s historical exploration camp area returned lower Cu to 1100 ppm, Mo to 9.13 ppm, Au 18 ppb, Ag 0.81 ppm; IMGM’s other rock samples returned background or weakly anomalous Cu value, showing the Cu mineralization at surface and drill core are limited. Though, 9 silt samples prospecting has identified strong Cu, As, Mo, Au, Ag anomalies in silt interpreted caused by sporadic surface copper mineralization defined both in creeks and on upslope ridge.

8.2.2 Minfile 104K153

This Showing is located at central south of IMGM Property. IMGM Have prospected this area with no sample for assay. This area pertains skarn deposits potential indicated by, patches of talc-silicate skarn mineralogy, widespread disseminated magnetite, intrusive rocks with textural indications of limestone absorption by dioritic intrusive phases, and the occurrence of Carboniferous limestone basement rocks. Minfile describes Low Cu values or only small patches with up to 2.2% Cu in talc-silicate assemblages, the absence of Au and Ag, and widespread disseminated magnetite without Cu indicates that potential for economic skarn mineralization is low and that exploration by magnetic surveying may not be effective. However, an anomalous Au content of 101,617 ppb occurs in rock sample H248 at 6,469,960 N, 662,200 E. The only other element in an above background range in this sample is Ba at 645 ppm. The sample is from a tributary creek flowing 345°. The closest known mineralization in the area is a poorly exposed occurrence of mesothermal quartz-pyrite-chalcopyrite veins to the SW with an As Cu Sb Ba and minor Au Ag metal association, and the minor skarn occurrences to the east with a Cu association. Neither of these occurrence types are interpreted to be the cause of the Au rock anomaly (ARIS report 25150).

9.0 Sampling Preparation, Analyses and Security

The purpose of silt sampling program was to define the gold and trace element geochemical signature of primary, secondary and tertiary drainage basins in the Tatsamenie East Property area. The silt geochemical data allows for initial evaluation of relative mineral potential over a large area with little historic prospecting or exploration data.

The 2014 silt sampling program was carried out by IMGM International Mining Canada Inc. technical team to better define BCGS lower density silt programs and to infill areas with no previous silt sampling from BCGS dataset. Silt samples were taken from several locations at a particular site focusing on fine grained sediment within the active stream drainage. Sample locations, in UTM NAD-83 format, were recorded in the field using a non-differential handheld GPS. A daily GPS track were collected for reference. Samples were described as to percent fines, color, stream grade and width, date, sampler and comments. Samples were placed in Hubco bags with a sample tag designed by ALS Labs showing a unique sample number, and the bags were labeled and marked in the field. Rock samples were collected for test Cu, Au and Mo minealization in altered and mineralized rocks during prospecting along property area. Sample location recording using UTM-83 system non-differential handheld GPS.

All silt samples and rock samples were submitted to ALS Laboratories in Terrace, and North Vancouver, BC for 30 g trace gold plus 51 elements geochemical analysis- Aqua Regia /ICP-MS. Sample location data, field description data and geochemical analytical data were uploaded into IMGM International Mining Canada Inc. database.

10.0 Nearby Property

10.1 North American Corp -The Golden Bear Mine

The Golden Bear Mine (see figure 2) is located approximately 10 km south of the Tatsamenie East Property. Approximately 380,000 tonnes of ore were mined in 2000, the final year in which underground mining took place. There was limited production reported in 2001 and 2002 estimated to total 1040 kilograms of gold production that came from stockpiles and residual leaching. The mine closed in 2002.

The geology of the Golden Bear Mine is described in the B.C. MINFILE records as: "Mineralization consists of pyrite, trace arsenopyrite and scorodite, native gold, pyrrhotite, chalcopyrite in amygdules in lapilli and altered fuchsite-bearing(?) tuff, stibnite, tetrahedrite and hessite. Pyrite occurs as late stage veinlets and as earlier breccia matrix filling, fragments within breccias, wispy rims on silicified limestone fragments in breccia, and local laminations in fine bleached tuff. Locally, gypsum is associated with mineralization."

One deposit, the Bear Main, and two showings, the Fleece Bowl (104K 087) and the Totem Silica (104K 088) zones, occur along the major north trending structure. The deposits are about 1.5 kilometres apart and exploration and development is progressing from the south to north deposit. The Bear Main zone is a pod composed of silicified dolomitized limestone and brecciated and altered tuffs. The zone has been traced by drilling along a length of 1 kilometre, across a width of 10 metres and to a depth of at least 200 metres. The dolomite locally displays a quartz stockwork with resistant veinlets of quartz. Heterolithic and monolithic breccias occur between the silicified dolomite and altered tuff. The hanging wall Bear fault cuts the tuffaceous rocks and is marked by a zone of black gouge. A thick section of ash, lapilli and crystal tuffs and mafic flows occur above the hanging wall. The lapilli tuff contains a chalcopyrite marker zone. A one metre wide dyke of black basalt (Tertiary) intrudes the mineralized zone.

Alteration minerals in the zone include quartz, dolomite and pyrite within the limestones and dolomite, kaolinite, sericite, illite, chlorite and pyrite in the metavolcanics. Age dating of sericite from the alteration zone, which gave an apparent age of 204 Ma plus or minus 7 Ma, suggests the main period of mineralization occurred in Early Jurassic (Fieldwork 1986)."

10.2 Firesteel Resources Ltd – Copper Creek Target

The Copper Creek property, owned by Firesteal Resources Inc. is located approximately 30 km southeast of the Tatsamanie East Property. The property was optioned to Prosper Gold Ltd that carried a drilling program in 2014 defined 107 m grading 0.77% copper, 0.407 g/t gold and 1.02 g/t silver for a copper equivalent of 1% in drill hole S045 at Star targets, an earlier copper gold discovery was declared years ago. The property is described in the Firesteel Resources website as:

The 4000 Hectare property is situated 50 km northwest of Telegraph Creek and 6 km southeast of the Sheslay airstrip. The access road to the Golden Bear Mine is located 8 km to the southeast. The property covers an alkalic porphyry copper gold target in the Stikine Arch area and is analogous to that which hosts the Galore creek (284 million tonnes of 0.67% copper. Red-Crish (120 million tonne of 0.58 % copper and 0.47 g/t goldand the GJ property owned by International Curator. The Copper Canyon deposit, which was recently optioned to Spectrum Resources, is in the same belt. A portion of the central Zone at copper Canyon hosts an estimated

inferred of 35.7 million tonnes grading 0.75% copper 1.17 gram per tonne gold and 17.2 grams per tonne silver.

A unique characteristic of the porphyry (large low grade copper/gold deposit) system at copper Creek is that the parent rocks have been weathered through water and atmospheric exposure such that a 50-55 meter blanket overlays the parent rocks (hypogene sulphides). The blanket is called a supergene zone and the zone contains favorable copper/gold mineralization. Frequently supergene enrichment occurs at the base of the supergene zone being redeposit at the top of the present hypogene sulphides.

The supergene zone when mined in conjunction with the underlying hypogene zone can provide substantial economic benefits to an overall mining operation.

Previous work on the Copper creek Property has identified several significant targets. The Copper Creek target comprises a 530 by 940 meter Cu in soil anomaly (larger than 350 ppm) with coincident gold values up to 230 ppb. An open ended IP chargeability anomaly and magnetic anomaly is coincident with this Cu-in soil anomaly. Six holes were drilled in this area prior to 1970. The best intersection graded 0.49% copper over 43.6 meters including a 1.37 meter intersection of 2.6% copper and 4 g/t gold. The geochemical and geophysical anomalies are open to the south.

11.0 Interpretation and Conclusions

11.1 Bing area (Minfile 104K035)

Bing is located east of IMGM's claims that cover just its west margin area. The only mineralization with potential at Bing area for significant tonnage is the porphyry style Cu-Mo mineralization. The indications of silicified zones in limestone with Au-Ag mineralization are small and very low grade but represent a possible, unexplored target. However, the absence of significant Au values from existing work indicates that the economic potential of these mineralization types is low. Newmont drilled six known holes in 1966 for porphyry type mineralization that projected further east outside of IMGM's claims. Newmont's drilling had tested the south end of a linear chargeability anomaly, associated with fracture controlled

mineralization, where it is coincident with the best resistivity anomaly. However, selected sampling of Newmont core indicated average grades of 0.06 % Cu with no other significant metals. Limited surface exposures, core examination and soil and rock geochemistry indicates that overall average Cu grades are even lower (ARIS Report 25150).

11.2 Ant area (Minfile 104K032)

Ant area is projected in IMGM's property, is the main target area was prospected with silt and rock sampled in IMGM 2014 summer program. At Ant area, the ridge where two holes were drilled by Rio Tinto in 1977 had been interpreted to have indications of alteration associated with porphyry copper mineralization. Propylitic, Potassic, phyllitic and argillic assemblages had been mapped on the ridge by former geological workers. IMGM grabbed one sample from weakly propylitic, potassic altered dioritic drill core with pyrite and chalcopyrite strings and disseminations located at Rio Tinto 's historical exploration camp area returned lower Cu to 1100 ppm, Mo to 9.13 ppm, Au 18 ppb, Ag 0.81 ppm; IMGM's other rock samples returned background or weakly anomalous Cu value, showing the Cu mineralization at surface and drill core are limited. Though, 9 silt samples prospecting has identified strong Cu, As, Mo, Au, Ag anomalies in silt interpreted caused by sporadic surface copper mineralization defined both in creeks and on upslope ridge.

Canamera Geological Ltd. described the propylitic alteration and rare, weak possible potassic alteration in dioritic rocks on the ridge between Icy and Deception Creeks is associated with isolated, minor occurrences of pyrite and a Cu Mo (Au) metal association. No potential is indicated for economic porphyry type mineralization (ARIS report 25150). Paget Resources Corp. described in its 2007 assessment work at Ant area resulted in limited porphyry mineralization potential within Ant area. "Alteration is neither strong nor spatially extensive. Weak propylitic alteration is patchy throughout the property and potassic alteration is only found in vein selvages near dykes, where it is extremely rare. This indicates that there is little potential for porphyry style mineralization" (ARIS report 29345, John, 2007).

However, scarce outcrops at ant area and limited exploration work have done at this area still left opportunity to define its porphyry Cu, Mo and Au potential. Detail surface structure mapping and Eocene intrusions, its alteration and mineralization mapping are much interested in their relevant Cu mineralization along their contact with dioritic rocks. Furthermore, in historical report one float is epithemal type mineralization with pyrite-galena-sphalerite veins in fresh diorite which returned 3.14 g/t Au and 334.6 g/t Ag is indicating higher Au and Ag mineralization exist at Ant area within IMGM Property.

11.3 Minfile 104K153

This Showing is located at central south of IMGM Property. IMGM Have prospected this area with no sample for assay. This area pertains skarn deposits potential indicated by, patches of talc-silicate skarn mineralogy, widespread disseminated magnetite, intrusive rocks with textural indications of limestone absorption by dioritic intrusive phases, and the occurrence of Carboniferous limestone basement rocks. Minfile describes Low Cu values or only small patches with up to 2.2% Cu in talc-silicate assemblages, the absence of Au and Ag, and widespread disseminated magnetite without Cu indicates that potential for economic skarn mineralization is low and that exploration by magnetic surveying may not be effective. However, an anomalous Au content of 101,617 ppb occurs in rock sample H248 at 6,469,960 N, 662,200 E. The only other element in an above background range in this sample is Ba at 645 ppm. The sample is from a tributary creek flowing 345°. The closest known mineralization in the area is a poorly exposed occurrence of mesothermal quartz-pyrite-chalcopyrite veins to the SW with an As Cu Sb Ba and minor Au Ag metal association, and the minor skarn occurrences to the east with a Cu association. Neither of these occurrence types are interpreted to be the cause of the Au rock anomaly (ARIS report 25150).

12.0 Expenditures

The 2013 -2014 exploration program at the Tatsamenie East Property Project has defined large areas of gold anomalous silt, and rock geochemistry in geological settings favorable for Vein type Precious-Base Metal mineralization systems and Porphyry copper gold (silver, moly) mineralization system. The results of the exploration work by IMGM International Mining Canada Inc. over the 2013 -2014 field seasons are of sufficient merit to continue exploration

expenditures on the Tatsamenie East Property in 2015. Total expenditure for this assessment report sum up to CAN\$28,750.81. Expenditure details are listed in Table 3 below.

Minfile No. 104K 032, 35

ARIS Report No. 21987 dated March, 1991 and describes the 1991 work program carried out by Waterford Resources Inc. as consisting of geological mapping, rock sampling (315 samples), ground VLF/mag.

ARIS Report No. 29345 dated October 2007 describes the 2007 work program carried out by Paget Resources Corp. as consisting of geological mapping, rock sample program. A total of 83 rock samples were collected from various mineralized zones. Relocated Icy lake Zone, Bing Zone within Tatsamenie East Property area, though the author resulting in limited porphyry mineralization potential within Property area.

ARIS Report No. 25150 dated October 1997 describes the 1997 work program carried out by Canamera Geological Ltd. as consisting of geological mapping, rock sample program, soil program, IP survey and ground Mag program.

Appendix D

Statement of qualifications, Wan Jin Yang B Sc in Geology

I, Wan Jin Yang, B. Sc. in Geology, an employee of IMGM International Mining Canada Inc. Resident at 236 East 17th St. North Vancouver BC, do hereby certify that:

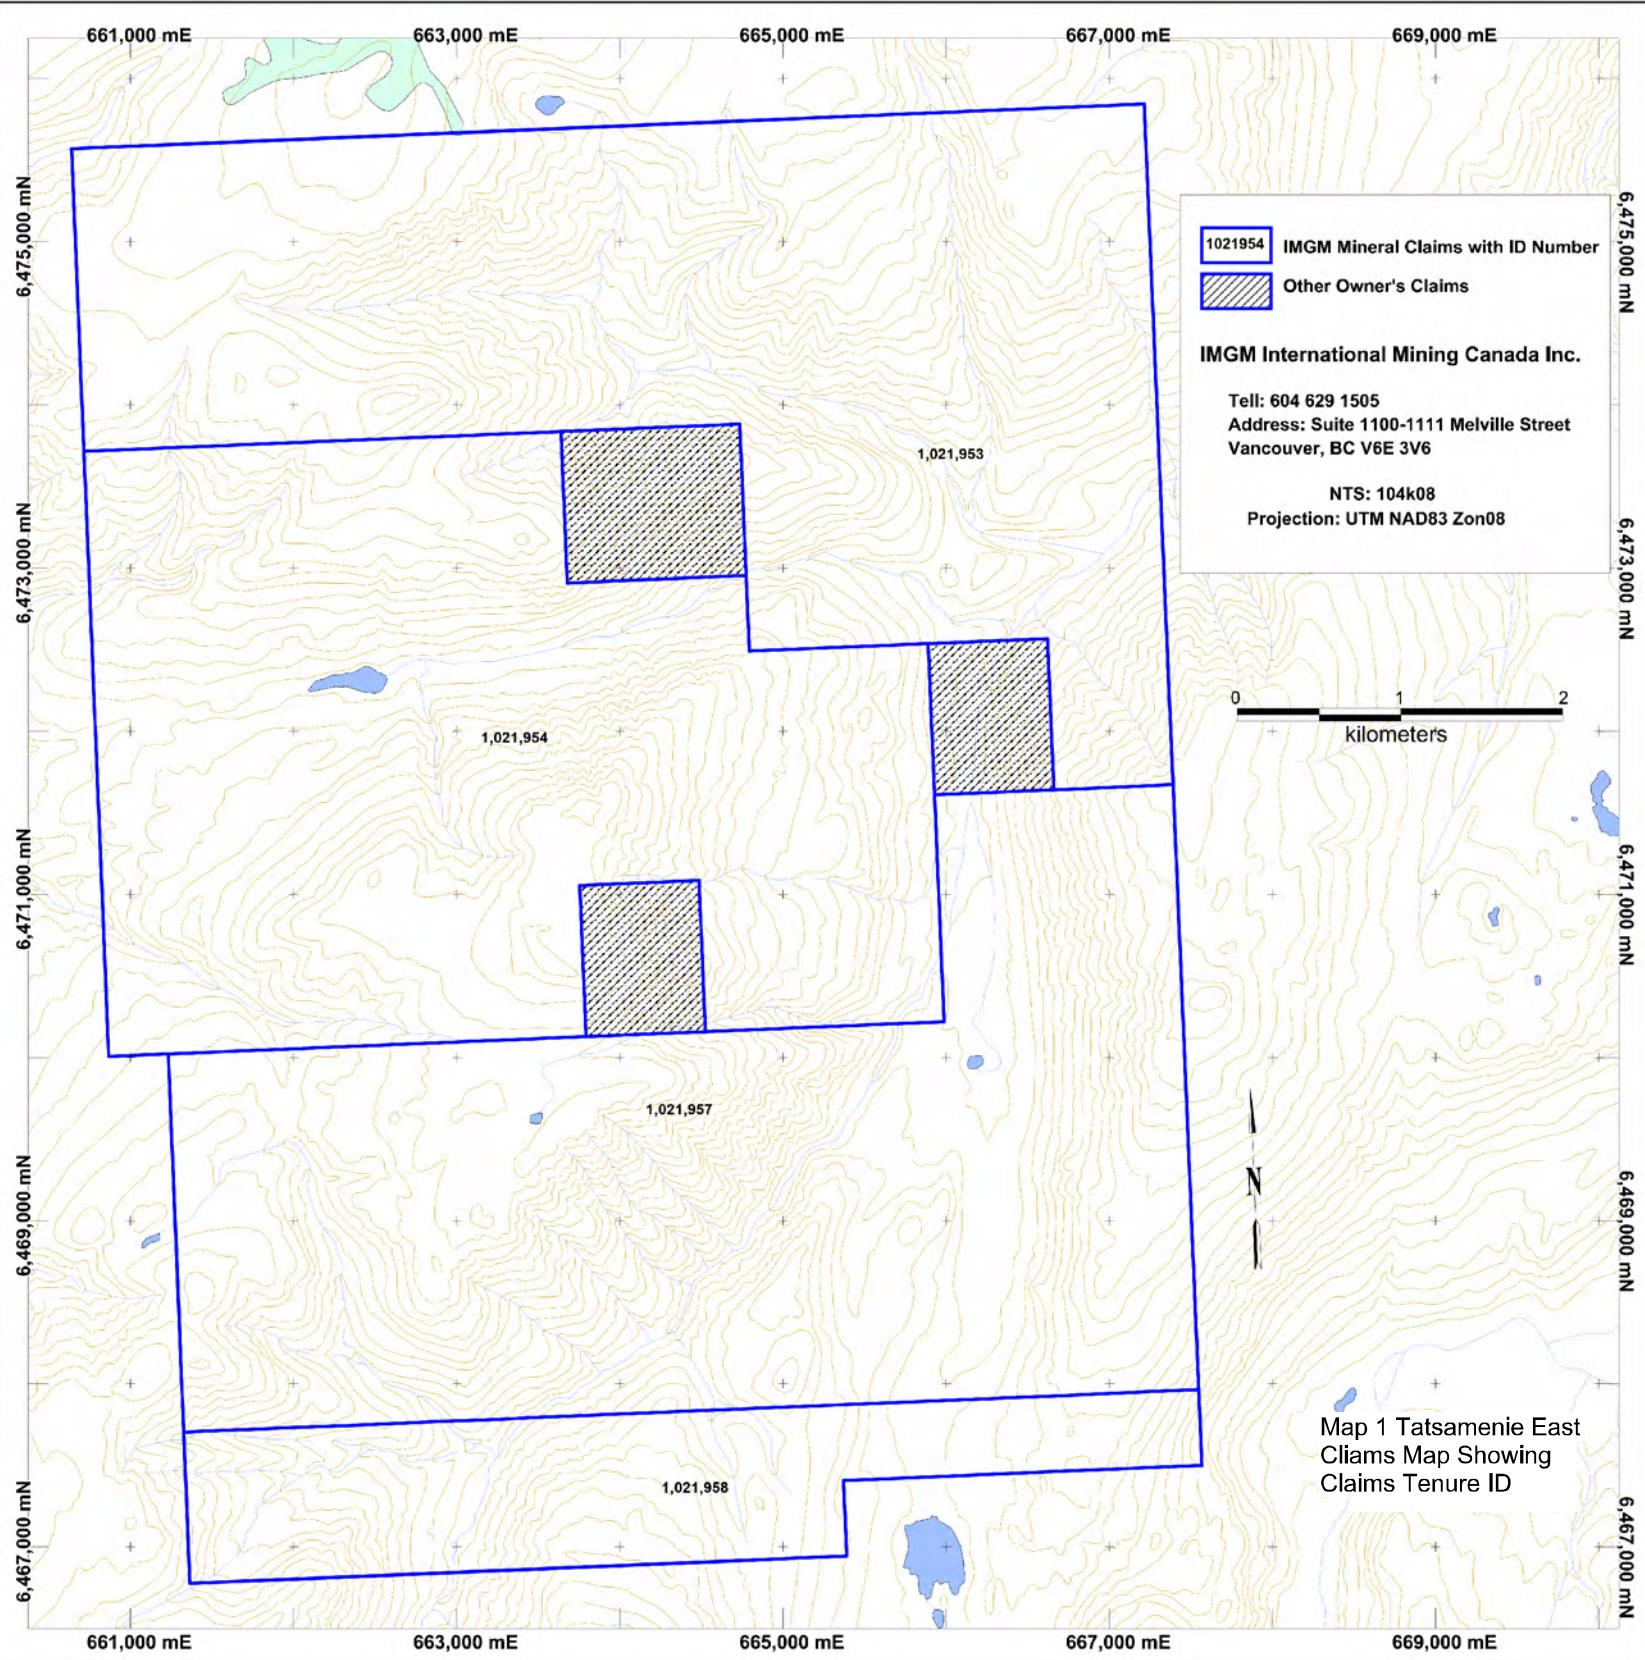

- I have worked primarily in geochemistry, geology survey, mineral exploration, mining, geological service in China, Australia and Canada since 1990.
- I am a registered Senior Geologist in China mining association system and a candidate for registration membership of Association of Professional Geoscientists of British Columbia with ID 164672.
- I graduated with the degree of Bachelor of Science in Geology from China University of Geoscience, 1990. I have ten years of exploration geochemistry, mineral exploration experience in China government geology, geochemical survey system and more than twelve years of commercial mineral exploration experience at Canadian mining industry.
- I have upgraded my knowledge in geoscience and mineral exploration technology by domestic and international short study courses, tour and widely involving in mineral exploration since I graduated from university.
- I have read the definition of Quartz Mining Act and certify that by reason of my education, my past relevant work experience in Canadian mining industry. I fulfil the requirements to be a geologist for the purposes of dedicating my work in this assessment report.
- I am responsible for this assessment report dated November 20th, 2014.
- As of the date of this certificate, to the best of my knowledge, information and belief, the portion of the report for which I am responsible contains all scientific and technical information that is required to be disclosed to make the portion of the Assessment Report for which I am responsible not misleading.

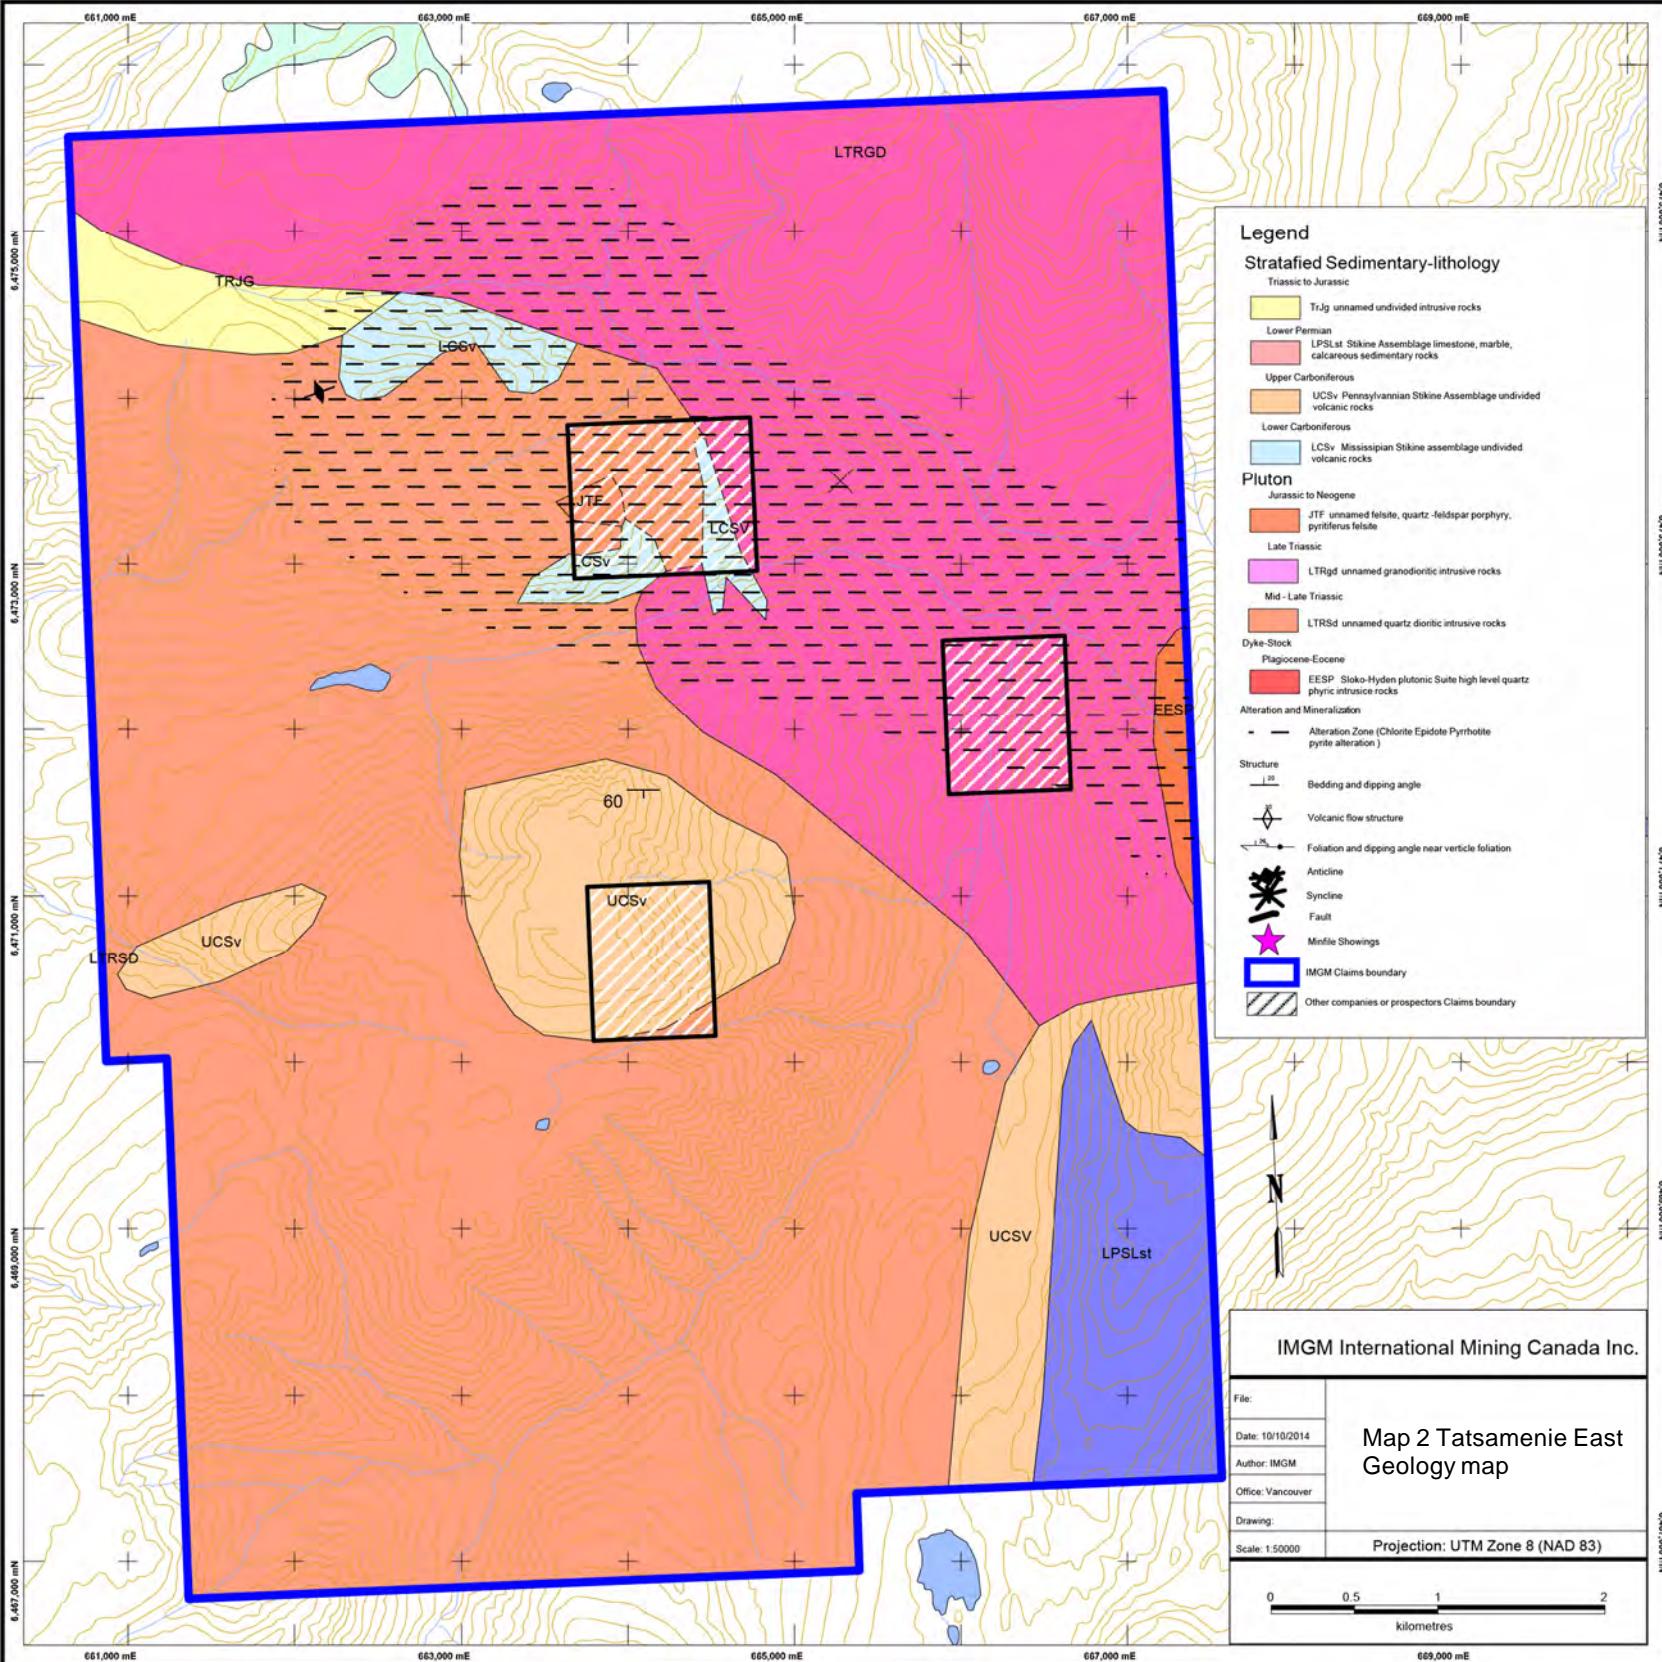

X Wanjin Yang

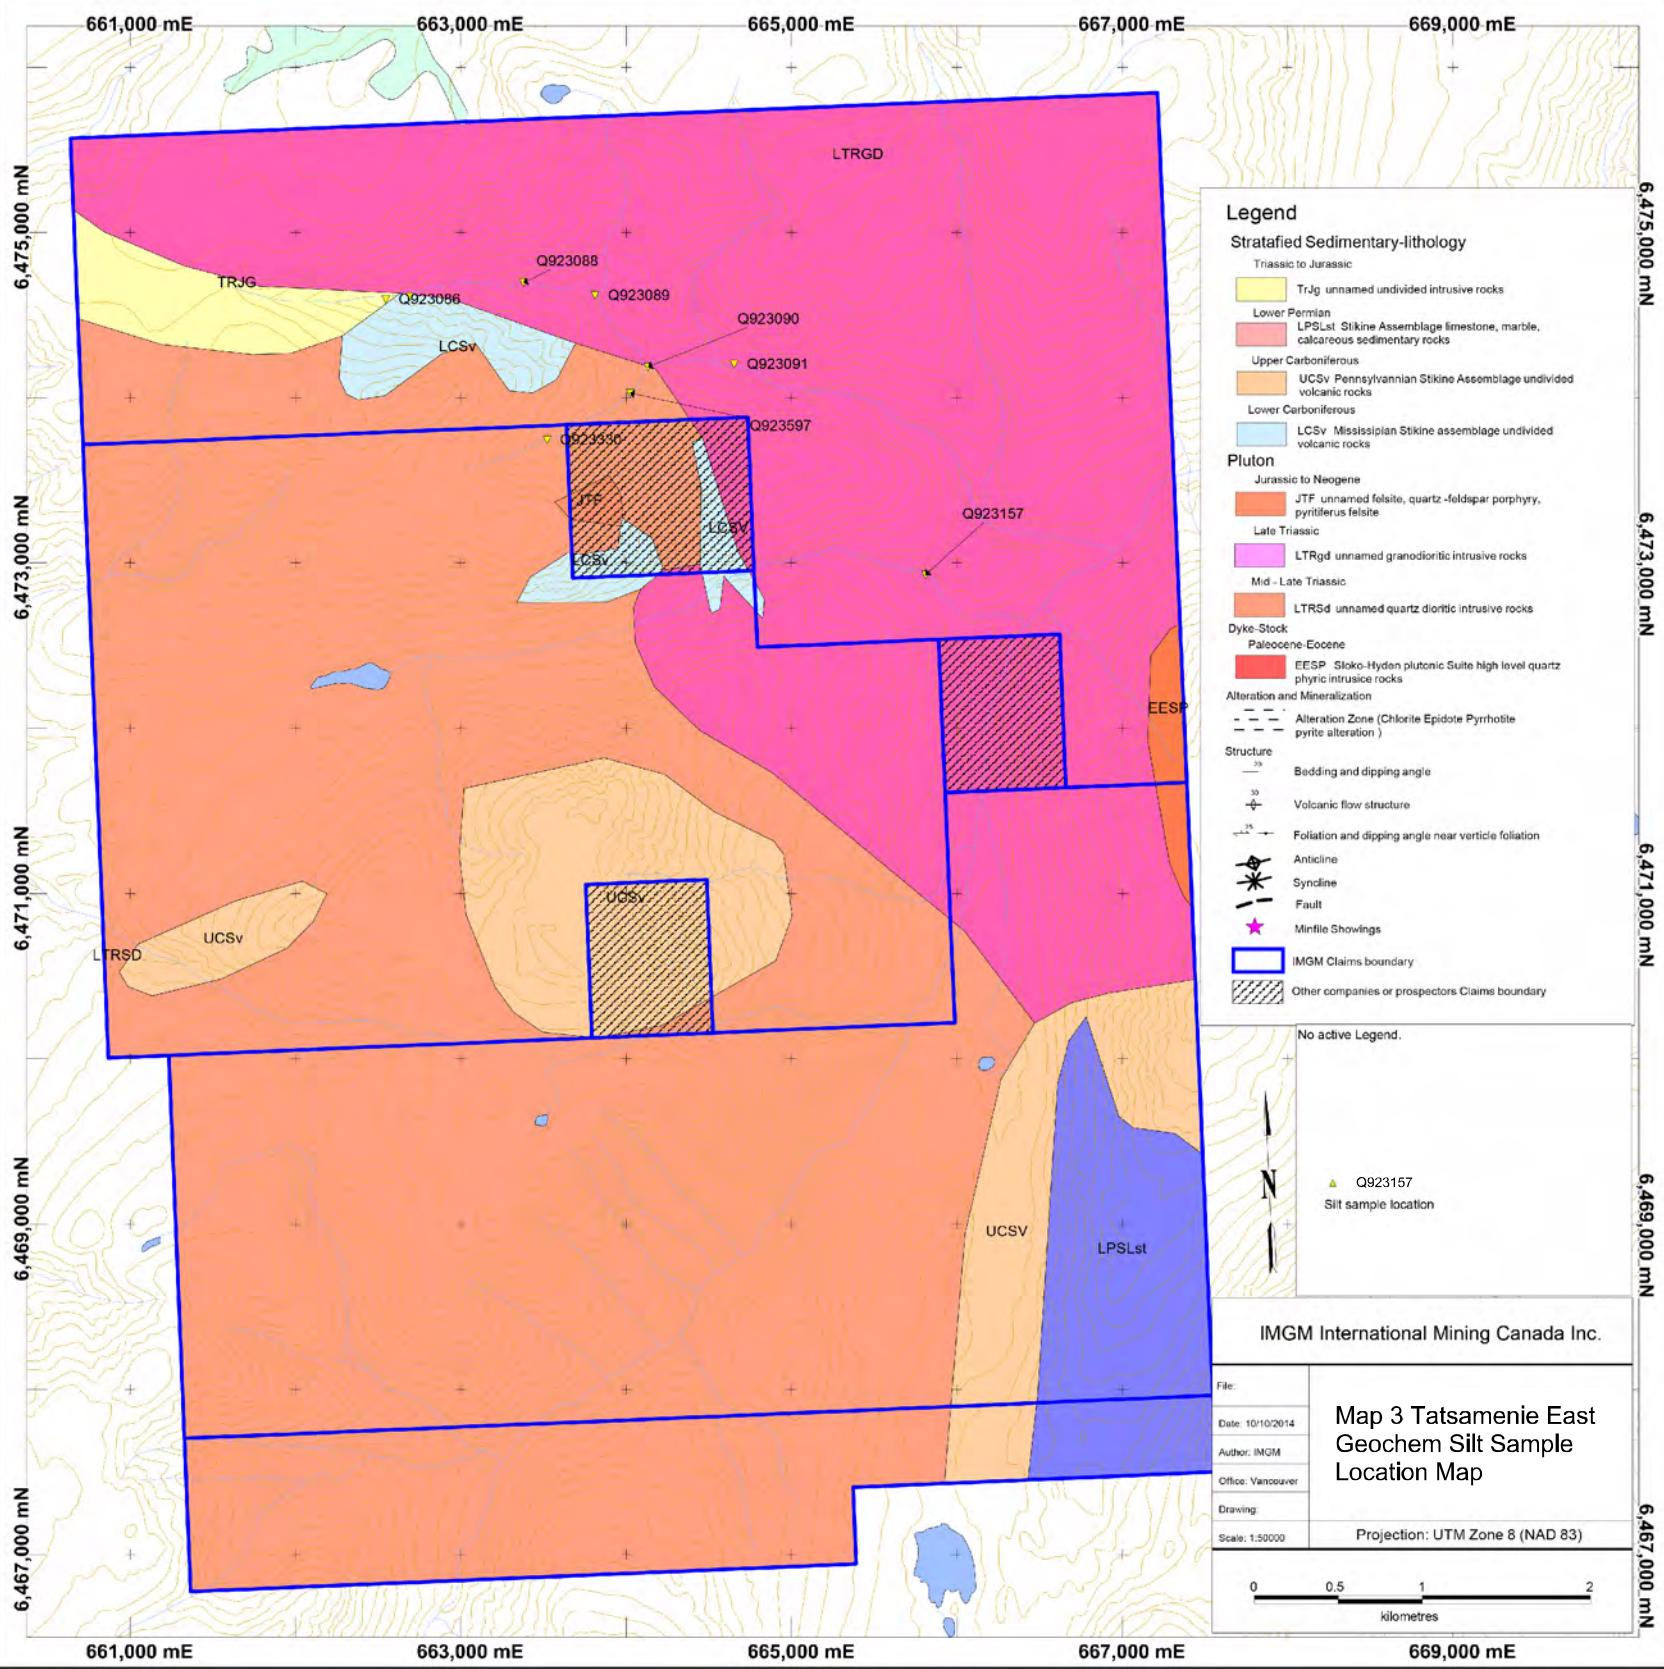

Wan Jin Yang
Bachelor Science

CERTIFICATE TR14085977

Project: Dease Lake

This report is for 74 Rock samples submitted to our lab in Terrace, BC, Canada on 19-JUL-2014.

The following have access to data associated with this certificate:

WANJIN YANG

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% <2mm
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME- MS41	51 anal. aqua regia ICPMS	
Ag- OG46	Ore Grade Ag - Aqua Regia	VARIABLE
ME- OG46	Ore Grade Elements - AquaRegia	ICP- AES
Cu- OG46	Ore Grade Cu - Aqua Regia	VARIABLE
Pb- OG46	Ore Grade Pb - Aqua Regia	VARIABLE
Au- ICP21	Au 30g FA ICP- AES Finish	ICP- AES

To: IMGM INTERNATIONAL, CANADA INC.

CERTIFICATE VA14113169

Project: Dease Lake

This report is for 150 Silt samples submitted to our lab in Vancouver, BC, Canada on 23-JUL- 2014.

The following have access to data associated with this certificate:

WANJIN YANG

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
LOG- 24	Pulp Login - Rcd w/o Barcode
SCR- 41	Screen to - 180um and save both
DRY- 22	Drying - Maximum Temp 60C

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au- TL43	Trace Level Au - 25g AR	ICP- MS
ME- MS41	51 anal. aqua regia ICPMS	

To: IMGM INTERNATIONAL MINING CANADA INC.
ATTN: WANJIN YANG
1100- 1111 MELVILLE STREET, BOX 11
VANCOUVER BC V6E 3V6

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

***** See Appendix Page for comments regarding this certificate *****

Comments: LBR- 01: for screening extra 6 samples.

CERTIFICATE VA14113180

Project: Dease Lake

This report is for 150 Silt samples submitted to our lab in Vancouver, BC, Canada on 23-JUL- 2014.

The following have access to data associated with this certificate:

WANJIN YANG

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 24	Pulp Login - Rcd w/o Barcode
LOG- 22	Sample login - Rcd w/o BarCode
SCR- 41	Screen to - 180um and save both
DRY- 22	Drying - Maximum Temp 60C

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au- TL43	Trace Level Au - 25g AR	ICP- MS
ME- MS41	51 anal. aqua regia ICPMS	

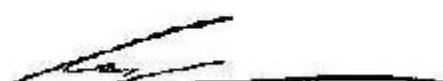

To: IMGM INTERNATIONAL MINING CANADA INC.
ATTN: WANJIN YANG
1100- 1111 MELVILLE STREET, BOX 11
VANCOUVER BC V6E 3V6

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

***** See Appendix Page for comments regarding this certificate *****

Comments: LBR- 01: for screening extra 16 samples.

CERTIFICATE VA14122625

Project: Dease Lake

This report is for 126 Silt samples submitted to our lab in Vancouver, BC, Canada on 11-AUG- 2014.

The following have access to data associated with this certificate:

WANJIN YANG

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
LOG- 24	Pulp Login - Rcd w/o Barcode
SCR- 41	Screen to - 180um and save both
DRY- 22	Drying - Maximum Temp 60C

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au- ST43	Super Trace Au - 25g AR	ICP- MS
ME- MS41	51 anal. aqua regia ICPMS	
Au- AROR43	Au AR Overrange - 25g	

To: IMGM INTERNATIONAL MINING CANADA INC.
ATTN: WANJIN YANG
1100- 1111 MELVILLE STREET, BOX 11
VANCOUVER BC V6E 3V6

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.
