BC Geological Survey

Assessment Report
Title Page and Summary

TYPE OF REPORT [type of survey(s)]: Prospecting, Geochemistry, PAC withdrawal

TOTAL COST: \$61,476.98

AUTHOR(S): Jacques Houle, P.Eng.

SIGNATURE(S):

NOTICE OF WORK PERMIT NUMBER(S)/DATE(S): MX-8-32 / permit not required

YEAR OF WORK: 2013-4

STATEMENT OF WORK - CASH PAYMENTS EVENT NUMBER(S)/DATE(S): 5527229/2014/OCT/20;5527893/2014/OCT/24;5534269/DEC/13

PROPERTY NAME: Macktush

CLAIM NAME(S) (on which the work was done): prospecting work on 323118, 323121, 323122, 382850, 398841, 508051, 512247, 518164, 518167, 518171, 530258, 604993, 604995, 604996, 833065

COMMODITIES SOUGHT: copper, silver, gold, molybdenum, rhenium

MINERAL INVENTORY MINFILE NUMBER(S), IF KNOWN: 092F012,-103,-155,-168,-221,-360,-361,-362,-412,-549,-550,-551,-553,-555

MINING DIVISION: Alberni

NTS/BCGS: 092F/02W / 092F006,-016,-026

LATITUDE: 49 ° 11 '14 " LONGITUDE: 124 ° 53 '38 " (at centre of work)

OWNER(S):

1) Nahminto Resources Ltd.

2)

MAILING ADDRESS:

3009 Kingsway Avenue

Port Alberni, BC V9Y 1X7

OPERATOR(S) [who paid for the work]:

1) World Organics Inc.

2)

MAILING ADDRESS:

349 West Georgia Street PO Box 2012

Vancouver, BC V6B 3P8

PROPERTY GEOLOGY KEYWORDS (lithology, age, stratigraphy, structure, alteration, mineralization, size and attitude):

mafic volcanics, felsic intrusives, basalt, granodiorite, quartz diorite, jurassic, triassic, eocene, silicification, chloritization, skarn, porphyry, epithermal, vein, pyrite, chalcopyrite, bornite, molybdenite, copper, gold, silver

Introduction

Property location, access and physiography

The Macktush Property is located in NTS 092F02W, and situated in the Alberni Mining Division. The property is centred approximately 10 kilometres southwest of Port Alberni at Latitude 49° 11' North, Longitude 124° 54' West, or at UTM Zone 10 5450000 North 362000 East. The mineral claims that constitute the Property are contiguous, but contain two internal gaps, one due to a pre-existing Indian Reserve, and another due to a no staking reserve which post-dates the legacy mineral claims, but pre-dates the cell mineral claims. Therefore, the legacy claims in this area have been maintained and not converted to cell claims.

The Macktush property is easily accessed by a series of paved and gravel roads branching from the Pacific Rim Highway (Provincial Highway No. 4 also known as River Road) that runs between Port Alberni and Sproat Lake. The property can also be accessed by boat from Port Alberni, making use of occasional outwash beaches and embayments on the eastern limits of the property which are bounded by the tidewaters of the Alberni Inlet. An extensive network of active and deactivated forest access and logging roads exist within the Property, and provide excellent access to many portions of the Property.

The terrain over the Property consists mainly of steep-sided mountains with gentler topography in river valleys and areas of low elevation. Elevations range from 0 to 1,160 metres. The property is covered by a mixed forest of coniferous prime timber interspersed with second-growth forests and scattered clear-cut logged areas, with abundant streams and creeks in valleys. The climate is temperate coastal, cool and wet, with windstorms in late fall, and thick snow cover in the higher elevations from November to April, which may curtail exploration work. Temperatures range from highs of 25°C in the summer to lows of -10°C in the winter. There are typically hot dry spells in the summer when exploration work may be prevented due to forest fire hazard. The best time for exploration work is from April to October, with optimal months being June, July and September.

Port Alberni is a resource-based community of approximately 18,790 people with a sheltered deep sea port accessing the Pacific Ocean, and a paved highway accessing the rest of Vancouver Island. An underutilized railway network also exists between most of the major communities on the island, including Port Alberni. Various companies are actively logging portions of the property area and one of them holds surface rights over the north-east and eastern mineral claims of Macktush Property, as well as foreshore leases for booming cut logs along the shores of Alberni Inlet. Main haul roads and forest access roads throughout the property are maintained by various logging companies and the BC Ministry of Forests, Lands and Natural Resource Operations.

There are two aboriginal bands based in Port Alberni with interests and unsettled land claims for traditional territories that may cover portions of the Property, including the Hupacasath and the Tseshaht First Nations. The extreme southwestern portion of the Macktush Property is covered by treaty related lands of the Maa-nulth First Nations, established in 2011.

Property definition, owner, operator, geology and history

The Macktush Property is comprised of 39 contiguous mineral claims covering about 16,041 hectares, consisting of 17 legacy claims covering 6875 hectares and 22 cell claims covering 9166 hectares, held 100% held by Nahminto (see Table 1 below and Figure 1). On December 12, 2012 Nahminto completed an option agreement with World Organics Inc. (“WOI”) for a 90% interest in a portion of the Macktush Property consisting of 8 claims totaling 3,334 hectares, known as the Macktush North Property. The commitments include \$250,000 in cash payments, 3.6 million common shares, and \$1.2 million in exploration expenditures over 3 years, plus 2% NSR. Upon completion of all commitments and final execution of the option agreement by World Organics, a joint venture will be formed with World Organics holding a 90% interest and Nahminto a 10% interest in the Macktush Property. The 2% net smelter return can be purchased for \$2 million, and includes the 1% payable to G4G. However, as of the date of this report WOI has not fulfilled any of the terms of the option joint venture agreement, but did partially fund the work program covered by this report. In late October, Nahminto reduced the size of the Macktush Property along its north, east and south boundaries by reducing 4 cell claims, and allowing 4 claims to lapse, including 2 legacy and 2 cells claims.

Table 1 – Macktush Property Mineral Claims Status as of December 15, 2014

Vancouver Island consists of three tectonic terranes, the Wrangellia, Pacific Rim and Crescent. Wrangellia covers the northern 90% of the island, which also extends to the coastal mainland and the Queen Charlotte Islands. The Pacific Rim and Crescent terranes each cover about 5% of the south end of Vancouver Island and are thought to represent exotic tectonic plates, which collided with and became attached to Vancouver Island. Narrow slivers of the Pacific Rim terrane also exist along the southwest coast of the island. The terrane boundaries are marked by pronounced, east-west trending and north-dipping regional fault structures that contain major river systems on the southern island.

The rocks that make up Vancouver Island range in age from Paleozoic to Pliocene and represent three major volcano-sedimentary events (Paleozoic, Triassic and Jurassic), one major sedimentary event (Cretaceous) and four major intrusive events (Triassic, Jurassic, Eocene and Miocene/Pliocene). Major structural features consist of northwest-trending, north-south trending and north-east trending faults and folds. This includes many northwest-trending, low-angle thrust faults and fold axes. The oldest rocks are generally the most structurally disrupted, and areas of high metamorphic grades occur within and locally near the Pacific Rim terrane in the south and along the southwest coast of the island.

Port Alberni is located in Wrangellia in south-central Vancouver Island and is surrounded by some of the most varied and structurally complex geology on the island. Port Alberni also sits between two major uplifts exposing the island's oldest Paleozoic volcano-sedimentary rocks of the Sicker and Buttle Lake Groups, the Cowichan Uplift to the southeast and the Myra Falls Uplift to the northwest. Small stocks of the Triassic Mount Hall Gabbro suite occasionally intrude the Paleozoic rocks southeast of Port Alberni. The immediate Port Alberni area is mainly underlain by Triassic mafic volcanic rocks of the Karmutsen Formation of the Vancouver Group. These are commonly intruded by large granodiorite sills, stocks and dikes of the Jurassic Island plutonic suite. Locally inliers consist of Triassic Quatsino Formation sedimentary limestones of the Vancouver Group that are overlain by Jurassic volcanics of the Bonanza Group, sandstones, shales and conglomerates of the Cretaceous Nanaimo Group. All units are occasionally intruded by small quartz diorite stocks and dikes of the Tertiary-Eocene Mount Washington plutonic suite. The Macktush property is mostly underlain by Karmutsen mafic volcanics and Island felsic intrusives, with local inliers of possible Quatsino limestone and/or Parson Bay and Bonanza sediments and volcanics. These rocks are variably block-faulted and folded, and represent ideal settings for clustered copper-gold-silver-molybdenum porphyry, skarn and epithermal vein deposits. The Macktush Property hosts eighteen (18) documented BC MINFILE occurrences, including two prospects and one developed prospect, plus 58 other mineral occurrences identified and located by operators and documented by the author or others (see Table 8 below).

The following summary outlines the exploration history to the extent known of the area now covered by the Macktush Property. It is based primarily on information obtained from the BC government websites including MapPlace, Mineral Titles Online, MINFILE and ARIS. Source data from the author's files collected while consulting for SYMC or Nahminto, plus other data kindly provided by G4G, were used to produce technical figures. A list of reports completed and filed for mineral tenure assessment work on the Property and publicly available on the ARIS website appears in Table 2, and a summary of the key points mainly from selected ARIS reports follows Table 2.

1920 - An unknown party excavated two adits and a shaft targeting the Dauntless vein in the northeast part of the property (MINFILE 092F168).

1962 – Cruikshank Explorations Ltd. completed an I.P. ground geophysical survey along the western side of the Alberni Inlet covering old excavations containing copper mineralization in several MINFILE showings Holk (092F155), Dauntless (092F168), Bell (092F383) and Stamp 3(092F549) (Halloff, P.E. and Bell, R.A. 1968).

1968 – Amax Exploration Inc. discovered a pyritic alteration zone 250 m. wide by 1.35 km long containing molybdenite in quartz stringers and chalcopyrite-bearing float at the Rex showing (MINFILE 092F221) in the central part of the property (Fox, P.E. and Allan, J.F. 1968).

1976 – Cous Creek Copper Mines completed a ground magnetic survey over 4 km. long zone of copper-magnetite skarn mineralization, the Cous Creek prospect (MINFILE 092F360) discovered in 1972 in the north-central part of the property (Vollo, N.B. 1976).

1977 – Bethlehem Copper Corporation completed geological mapping and sampling, pulse electromagnetic surveys, and two percussion drill holes with negative results on the Cous Creek prospect (Anderson, R.E. and Nethery, R.J. 1977).

1981 – W.G. Timmins Exploration and Development Ltd. completed airborne magnetic geophysical surveys for two companies with separate properties covering what is now the northwestern part of the property, covering several MINFILE copper occurrences Kola 092F103, Cous Creek 092F360, Summit 092F361, Buck 1 092F362, Creek 092F553 and Sky 2 092F555, plus the Sproat Lake 092F412 limestone showing (Timmins, W.G. and Rolston, T. 1981).

1982-1983 - W.G. Timmins and subsequently Trans-Arctic Explorations Ltd. completed geological, geochemical, prospecting and ground geophysical surveys for Pacific Seadrift Resources Ltd. over the northwest part of the property including the Kola and Sky 2 occurrences. At the Kola MINFILE 092F103 prospect, trench sampling of massive sulphides yielded an average of 7.7% Cu, 124 g/t Ag and 6.5 g/t Au across 0.6 metres width along 4.5 metres length (Wing, B.J. and Timmins, W.G. 1982).

1984-1985 – Cous Creek Copper Mines completed geological work outlining the skarn potential at the Cous Creek MINFILE 092F360 prospect (De La Mothe, D. 1984; and Krueckl, G.P. 1985). There is anecdotal evidence of bulk sampling of copper, silver and gold mineralized rock from surface trenches and trucking to Kamloops, B.C. completed by Lornex Mines during this period (personal communication – McMaster, H. 2012).

1981-1986 - Herbert McMaster and Sylvester Tresierra performed work including prospecting, trenching and sampling over the Macktush occurrence (MINFILE 092F012) in what is now the mid/southern central part of the property (Houle, J. 2007).

1985-1986 - Amstar Venture Corporation completed a 221 sample geochemistry program, and a 22 hole drill program totaling 1,308m over the MC (MINFILE 092F103) prospect in centre of the northwest part of the property. The program was aimed at investigating and defining the series of shear related zones of massive chalcopyrite and pyrite pods and lenses which comprise the MC prospect, the main one of which is exposed for approximately 10m along strike. Highlights of the program include a grab sample that returned 7.27% Cu, 23 g/t Ag and 2.8 g/t Au, a 70 metre long gold anomaly in soil extending over the main sulphide zone, and definition of the main sulphide zone to a depth of 40 metres, open at depth, with returned values as high as 3.01% Cu, 37 g/t Ag, and 2.5 g/t Au (Marks, D.G. 1985; Sookochoff, L. 1986).

1986 – Trans-Arctic Explorations Ltd. completed geological mapping for United Chieftain Resources Ltd. in the northeast portion of the property covering five MINFILE occurrences Holk 092F155, Dauntless 092F168, Bell 092F383, Stamp 3 092F549 and Devils Den 092F551 (Royer, G.A. 1986).

1986 – Trans-Arctic Explorations Ltd. completed extensive geological mapping and limited rock and/or soil geochemistry for three companies on separate adjacent properties covering five MINFILE occurrences Cous Creek 092F360, Summit 092F361, Buck 1 092F362, Creek 092F553 and Sky 2 092F555 in the north-central part of the property (Royer, G.A. 1986).

1987-1988 – Ashworth Explorations Ltd. completed extensive geological mapping, rock and soil geochemistry and ground magnetic surveys for two companies on separate adjacent properties covering three MINFILE occurrences Cous Creek 092F360, Summit 092F361, and Sky 2 092F555 in the north-central part of the property (Laanela, H. 1987, 1988). The geological setting and target areas for both known and new Cu skarn mineralization were established.

1987 - SYMC Resources Ltd. purchased the 'Macktush' property, then much more limited in size, from Herbert McMaster and Sylvester Tresierra (SYMC Resources Limited (1998) Prospectus). Work included some photo-lineament interpretation, extensive trenching and rehabilitation, and sampling on a series of northeast trending quartz-calcite-sulphide veins in the southern part of the Macktush property known as the Fred, David, Sy and Jack Veins (Wilson, J.R. 1991). Ten short holes were drilled on the Fred Vein as well, three of which totaling 279.5m depth were logged and sampled under the supervision of John R. Wilson, P. Geo (Wilson, J. R. 1991). Core from the remaining holes was spilled on the ground and subsequently disposed of (personal communication from H. McMaster). This work occurred in the southeast part of the property. Highlights of the drill program are displayed in Table 3 below.

1988 - SYMC Resources Ltd. completed one short drill hole (DDH88-05) on the Fred Vein, in the southeastern part of the Macktush property (see Table 3 below) (Houle, J. 2007).

Table 3 - Drill Intercept Highlights from SYMC Resources 1987-1988

Hole	Interval (m)	Length(m)	Au (g/t)	Ag (g/t)	Cu (%)
DDH87-01	109.58-110.72	1.14	5.97	2.06	0.03
DDH87-03	33.50-34.29	0.79	3.84	16.46	0.80
	36.59-40.39	3.81	44.23	172.80	0.95
DDH87-08	71.63-72.88	1.25	9.94	1.71	0.03
DDH88-05	47.22-48.80	1.58	0.21	3.09	0.02

1988 – Napier Explorations Inc. conducted geological mapping and geochemical sampling on the northeast part of the property covering the MINFILE occurrences Holk 092F155, Dauntless 092F168 and Devils Den 092F551. Soil sampling identified two copper-zinc+/-gold anomalies, and rock samples from quartz-sulphide veins yielded up to 4.15 g/t Au from the Holk, and 1.7% Cu from Dauntless (Stritychuk Hopkins, J.M. and Leriche, P.D.)

1989 - Brockton Resources Inc. conducted geological mapping, grid layout, claim staking, soil sampling, trench blasting and VLF- EM and magnetometer geophysics over the northeastern quadrant of the Macktush property. The combined soil sampling and geophysics highlighted nine possibly targets on the property, most corresponding to anomalous gold or copper soil values or coincident mag-VLF-EM liniments (Kidlark, R.G. 1989).

1993 - SYMC conducted limited rock sampling over the Dauntless Vein, a northeasterly trending quartz-sulphide vein exposed on the Dauntless claims, in the northeast part of the property. The vein is believed to extend over a strike length of 400m and varies

between 1.5m to 0.5m thick. Highlights of the program included 24 grab samples of vein material contained 17.5 to 27.2% copper, up to 37.7 g/t silver, and up to 0.89 g/t gold (SYMC news release December 7, 1998).

1996 - SYMC conducted a trenching and chip sampling program over the Fred and David Showings and the Beach Road mineral occurrence. A limited program of geological mapping was also conducted. This work covered a limited area in the southeastern portion of the property.

1999 - SYMC contracted Canadian Environmental and Metallurgical Inc. (CEMI) who conducted preliminary metallurgical testing of a 25km composite sample from the Dauntless North vein, composed of vein material. Results returned a head grade of 17.61% copper, 0.24 g/t gold, 36.69 g/t silver and 21.11% sulphur and showed recoveries of 99.73% copper, 85.09% gold, 98.72% silver and 99.8% sulphur in the flotation concentrate. CEMI advised that high metal recoveries could be obtained using simple, conventional grinding and flotation circuits (Houle, J. 2007).

2000 - SYMC drilled four short holes to test the down-dip continuity of the Fred Vein. The holes were drilled northeast along the strike of Fred Vein from the 1987-88 holes. Core samples from these holes were destroyed during analyses, and no re-sampling was possible. Core log records however, suggest down-dip continuity of the Fred Vein structure. (documented communication between Mr. J. Houle, P.Eng. and Mr. R. Davey, P. Eng.).

2001 - SYMC conducted a moderate exploration program in the southwest portion of the property and discovered an extension of the Fred Vein. This extended the total known strike length of the Fred Vein to 1000m, leaving it open at both ends. In 2001 a representative sample of Fred Vein material was metallurgically tested by CEMI. The sample returned a head grade of 14.57 g/t gold, 59.66 g/t silver, 0.05% copper, and 3.134% zinc. It produced a flotation concentrate grading 131.31 g/t gold, 349.29 g/t silver, 0.36% copper and 28.50% zinc. It was determined by CEMI that this mineralized vein material would be relatively simple to process (SYMC news release June 7, 2001).

2002 - SYMC took samples of hanging wall and footwall material from the Dauntless North and Fred Vein and contracted CEMI to perform acid-base accounting on them. Acid-base accounting returned neutralizing to acid potential ratios of 4.2 and 4.8, respectively on the material taken from the Dauntless North Vein, indicating that the material sampled had contained neutralizing potential and is not acid generating. Acid-base accounting completed in 2002 on hanging wall and footwall material from the Fred Vein yielded neutralizing to acid potential ratios of 47.6 and undefined, respectively. The undefined value was due to the sulphur content of the sample being less than the analytical detection limit of 0.01%. These results indicated that the material sampled contained strong neutralizing potential and was not acid generating. SYMC also constructed a 1400m excavator road from the shore of Port Alberni Inlet to the dauntless vein, in the northeast portion of the property.

2003-2004 - SYMC linked the excavator road to the local network of logging roads in the northeast portion of the property, uncovering 5-10 sulphidic shear hosted veins running paralleling the road. These 5cm -10cm sulphidic veins were oriented at 150° to 205°, dipping 60° to 80° east. Individual shear veins contained up to 75% sulphides, mainly chalcopyrite, bornite, pyrite and possibly trace amounts of sphalerite, tetrahedrite, native

copper and covellite, and the zone was named the Tasha Zone. Four select grab samples were taken in 2003 of these veins. These samples returned an average grade of 5.58% copper, 0.095% zinc, 8.70 g/tonne Ag and 0.146 g/tonne Au over an average thickness of 0.2 metres (SYMC December 7, 2004 Technical Report). SYMC suggested that the mineralogy and geochemistry found at the Tasha Zone suggested that the property may host Volcanic Redbed copper-silver deposits as well as copper-silver quartz-sulphide stockwork veins (Houle, J. 2007).

2005 - In the spring of 2005, SYMC conducted limited rock sampling and trenching of the Dauntless South adit, which follows a vein oriented at 130/70, and the Herbert Jr. vein, oriented at 080/80. Ten select grab samples were taken from a rock dump and vein mineralization of the Dauntless vein. These samples yielded an average of 10.7% copper, 0.523% zinc, 27.9 grams of silver per tonne and 0.262 grams of gold per tonne over an average thickness of 0.6 metres (SYMC February 7, 2005 press release). Ten chip samples from trenching the Herbert Jr. vein yielded an average of 13.7% copper, 14.8 grams of silver per tonne and 0.294 grams of gold per tonne over an average of 1 metre. (SYMC March 16, 2005 press release).

SYMC also conducted preliminary prospecting in the Bowl Zone in 2005, a copper-molybdenum-gold-silver stockwork vein or disseminated porphyry occurrence located about 1,000 metres northwest of the Fred and David veins. Mapping and chip sampling of the Bowl zone failed to detect any significant in situ mineralization, though mineralized float samples were located in lower areas, suggesting that there may be mineralization under cover, and future drilling to test the Bowl Zone was advised (Houle, J. 2006).

In 2005, SYMC conducted a sequential diamond drilling program designed to delineate four of the more advanced exploration targets. SYMC also contracted Fugro Airborne Surveys Corp. (Fugro) who flew a detailed 1,661 line km. magnetic, electromagnetic and radiometric airborne geophysical program over the Macktush property in September. Several targets were identified. From May to December, 2005 a total of 2,136 metres in 35 holes of diamond drilling was completed on the Herbert Jr. Vein, Tasha Zone, Dauntless North Veins and David Vein (see Table 4 for drill highlights). Along with previous rock chip sample data, this drill data was used to estimate indicated mineral resources for all four zones. Low-angle (5-30 degree) plunge directions were also revealed within the vein systems in the two target areas which were more extensively drilled (the David Vein and Dauntless North Veins) and possibly within Dauntless Herbert Jr. Vein as well, suggesting an orientation which may have property-wide implications (Houle, J. 2006).

Table 4 - Drill Highlights from SYMC Resources Ltd. 2005

Hole	Vein	Interval (m)	Length(m)	Cu %	Ag (g/t)	Au (g/t)
DH-05-03	HJV	99.7-100.2	0.5	5.237	8.800	0.142
DT-05-03	Tasha	15.4 – 43.3	27.9	0.139	0.554	0.004
DV-05-09	DNV3	7.0 – 8.4	1.4	3.309	15.000	0.105
And	DNV4	16.2 – 16.7	0.5	4.261	5.000	0.039
MD-05-01	David	9.0 – 10.7	1.7	0.049	16.000	3.282
MD-05-02	David	9.9 – 11.4	1.5	0.061	16.000	3.159

Several indicated resource estimates were reported by SYMC in the 2006 assessment report (Table 5), updating and replacing prior mineral resource estimates (Houle, 2006).

Table 5 – Macktush Property Mineral Resource Estimates 2005

Vein/Zone	Tonnes	Gold g/t	Silver g/t	Copper %	Category
David Vein	16,278	5.65	25.6	0.310	Indicated
North Veins	14,171	0.043	6.16	2.05	Indicated
Herbert Jr. Vein	8,479	0.118	6.66	5.16	Indicated
Tasha Zone	20,423	0.005	0.564	0.160	Indicated

2006 - SYMC conducted an advanced prospecting program targeting geophysical targets picked out in the 2005 Fugro airborne survey, including 288 select rock grab samples, 26 stream moss mat samples and 66 soil samples. SYMC also completed an 11 hole diamond drilling program totaling 982 m targeting the Zinc, Jack and Moly Veins, as well as the MC 1, 2 and 3 zones (see Table 6 for drill highlights). Prospecting work returned elevated metal values in rock float and stream moss mat samples with selected highlights as follows:

- Sample 343652 from the West cluster yielded 1.37% Cu and 24.7 ppm Mo from a select grab of float sample of massive iron-copper skarn
- Sample 343856 from the Cous cluster yielded 5.55 g/t Au from a select outcrop grab of a rusty quartz-sulphide vein containing 5% pyrite
- Sample 343892 from the Rex cluster yielded 13.9% Cu, 0.126% Zn, 93.4 ppm Mo, 29 g/t Ag and 2.71 g/t Au from a select outcrop grab of a 0.25 m. thick, banded to brecciated sulphide-quartz vein containing chalcopyrite, bornite and pyrite

This work established the Rex cluster as an outstanding exploration target, with elevated mineralization in rock grab samples and stream moss mat samples. Four new targets in the Cous cluster, plus the West cluster were also identified and further prospecting mapping, sampling, trenching and/or drilling was recommended for all three targets (Houle, J. 2007).

Table 6 - Drill Highlights from SYMC Resources Ltd. 2006

Hole	Vein	Interval (m)	Length(m)	Cu %	Ag (g/t)	Au (g/t)
MC-06-01	MC2	62.5 – 79.1	16.6	0.164	2.051	0.194
Including		70.6 – 71.2	0.6	1.380	15.30	1.193
MC-06-02	MC1	32.5 – 32.8	0.3	1.009	24.00	0.692
MC-06-03	MC-2	70.9 – 72.6	1.7	0.306	4.000	0.218
MJ-06-02	Jack	82.0 – 82.6	0.6	0.020	0.900	2.161

Several indicated resource estimates were reported by SYMC in the 2007 assessment report (Table 7), updating and replacing prior mineral resource estimates (Houle, 2007).

Table 7 – Macktush Property Mineral Resource Estimates 2006

MC3 Zone	17,618	0.38	1.0	0.05	Indicated

2011 - G4G Resources conducted a partial grid based soil survey to the west of the REX MINFILE showing, and an extensive contour soil survey covering the majority of drainages on the Property, with 241 soil samples taken in total. Highlights included several samples with over 600ppm Cu and over 0.7ppm Ag proximal to the Rex showing. Reconnaissance geological mapping and rock grab sampling were also completed, with sample result highlights of 6.76% Cu and 18.9 ppm Ag from base metal veins near the Dauntless showing. The program supported the Rex showing as a possible target for a copper porphyry style deposit. A new area to the southwest of the Rex showing was also identified by elevated Cu and Ag values in soil samples (Sanabria, et al. 2011).

2012 – Auracle Geospatial Science Inc. completed a satellite remote sensing survey and analyses for Nahminto Resources Ltd. on the entire Macktush Property. Several areas on or near the Property were delineated as prospective targets, including one along the southern boundary of the Property as it existed at the time of the survey. As a result, two additional cell claims totaling 761 hectares were selected to extend the southern boundary of the property on May 8, 2012. An additional cell claim totaling 21 hectares was selected on May 23, 2012 to cover an internal gap between cell and legacy mineral claims. (McLelland, 2012)

2012 – Nahminto Resources Ltd. completed extensive prospecting of both old and new logging road exposures of blasted rock outcrop throughout the Macktush Property. The author visited the Macktush Property to inspect, locate by GPS, sample and map sites of newly discovered or recognized mineralization, including the Christine Zone and Canal Main South Zone.

2013 – Nahminto Resources Ltd. continued prospecting old and new logging road exposures of blasted rock outcrop throughout the Macktush Property. The author visited the Macktush Property to inspect, locate by GPS, sample and map sites of newly discovered or recognized mineralization, including the Canal Main North Zone, Mainline Zone, Quartz Sericite Zone, Quartz Sericite Porphyry Zone, Quartz Vein West Dauntless, West Holk Zone, North Christine Zone and West Christine Zone. On February 4, 2013 the 5 year Amended Mines Act Permit MX-8-32 was issued by the BC Ministry of Energy and Mines to Nahminto Resources Ltd. for a program of road rehabilitation, trenching and up to 20,000 m. of diamond drilling program at the Rex Target.

The indicated mineral resource estimates for all veins/zones tested by drilling completed to date on the Property are clearly too small and/or of too low grades to consider being subjected to scoping or other economic studies at this time. However, the estimates do provide baselines from which to measure possible future increases in mineral resources

if additional drilling or other work is successful in increasing the sizes and/or grades of the veins/zones, as per the recommendations in this report.

Table 9 - Macktush Property Mineral Resource Estimate Summary by Vein/Zone

Vein/Zone	Tonnes	Gold g/t	Silver g/t	Copper %	Category	Source

List of claims and work completed

From October 21, 2013 to December 9, 2014 intermittently for a total of 108 days, prospector Herb McMaster of Port Alberni, occasionally accompanied by others, used a 4x4 truck to locate and access old and new logging road exposures of blasted rock outcrop mainly in the northeast part of the Macktush Property. Mr. McMaster carefully prospected each new blasted rock outcrop exposure by walking along the road ditches, breaking selected and random rocks with a hammer, inspecting them for possible sulphide mineralization with a hand lens, tracing any mineralized rocks to their outcrop sources in the roadcuts, and flagging those sites with flagging tape. Due to a lack of available maps of the new roads, those lacking any apparent mineralization in blasted rock or bedrock have not been spatially located, with approximate prospecting traverses shown in Figure 2, and prospecting dates and observations shown in Appendix 2.

On October 22-23, 2014 the author visited the Macktush Property for a total of 2 days to inspect, locate by GPS, sample and map sites of newly discovered mineralization in areas of available access, accompanied by Mr. Herbert McMaster Sr. and Mr. Herbert McMaster Jr. On those dates the author collected 7 rock samples from the Macktush Property in 3 areas at sites shown on Figure 3, situated on mineral claims 512247 (3 samples in the MC Area shown on Figure 4), 833065 (2 samples in the Cous South Area shown on Figure 5), and 530258 (2 samples in the Canal Main West Area shown on Figure 6). All 7 rock samples are located in or adjacent to rock cuts of logging roads, and consist of outcrop samples, with sample site details shown in Appendix 1.

All 7 rock samples were taken in duplicate, and one of each duplicate sample pair was sent on October 24, 2014 by the author via Greyhound Bus Parcel Express to AGAT Laboratories in Burnaby, B.C. for geochemical analysis, as per the chain of custody form which appears in Appendix 1. The other duplicate sample pair was retained by the author, cut into 1 to 2 cm. thick slabs by the author using a rock saw, and analyzed using

a binocular microscope with descriptions shown in Appendix 1. On November 28, 2014 final geochemical results were received from AGAT Laboratories in Report 14V908379, which is also shown in Appendix 1.

Technical Data, Interpretation, Conclusions and Recommendations

The 2014 rock sample geochemistry data has been compiled with historic geochemistry data from the Macktush Property accumulated and documented by the author since 2003. Primarily the 2014 data is presented in detail in this report; historic data has been presented in previous assessment reports completed and submitted by the author (ARIS Report 28497, Houle, 2006; ARIS Report 28989, Houle, 2007; ARIS Report 33217, Houle, 2012; ARIS Report 34121, Houle 2013). Locations of historic mineral occurrences documented on the Macktush Property also appear in Figure 3.

Elevated geochemistry values in target and/or indicator elements were obtained from 6 of the 7 rock samples, including highly elevated values in copper, silver and gold plus indicator elements from 4 samples, which will be described by location as follows:

MC Area Mineral Claim 512247:

E5123183 – UTM 357769E 5450761N 605 m. elev.

Select outcrop grab sample taken by the author along the west side of the recently refurbished Cous 405 Road approximately 150 m. northeast of, and possibly contiguous with, the MC Zone from a 0.1 m. thick, locally magnetic copper skarn zone @ 235/70 hosted by silicified and chloritic mafic volcanics, containing 45% zoned massive sulphides including chalcopyrite, pyrite, pyrrhotite, magnetite and malachite. This sample yielded values of 9.46% or 94600 ppm copper, 89.6 g/t or ppm silver, 6.59 g/t or 6590 ppb gold, 367 ppm zinc, 674 ppm nickel, 660 ppm cobalt and 370 ppm arsenic. Geochemistry highlights appear in Figure 7. These results potentially extend the MC Zone, which was diamond drill tested by 3 short holes in 2005 (ARIS Report 28989, Houle, 2005) to the north. Additional detailed prospecting, detailed geological mapping and additional diamond drilling are recommended for this area.

E5123184 and E 5123185 – UTM 357715E 5450582 615 m. elev.

Select outcrop grab samples taken by the author along the west side of the recently refurbished Cous 405 Road at the MC Zone, consisting of a 0.5 m. thick, locally magnetic copper skarn zone @ 200/70 hosted by silicified and chloritic mafic volcanics. Sample E5123184 was taken from a chalcopyrite-rich portion of the zone containing 75% zoned massive sulphides including chalcopyrite, pyrite, sphalerite and a grey felted sulphide. This sample yielded values of 2.62% or 26200 ppm copper, 49.4 g/t or ppm silver, 1.31 g/t or 1310 ppb gold, 405 ppm zinc, 373 ppm nickel, 1150 ppm cobalt, 803 ppm arsenic, 34 ppm antimony and 64 ppm selenium. Sample E5123185 was taken from a pyrrhotite-rich portion of the zone containing 75% zoned massive sulphides including pyrite, pyrrhotite, chalcopyrite, magnetite, malachite and a grey felted sulphide. This sample yielded values of 1.04% or 10400 ppm copper, 30.3 g/t or ppm silver, 244 ppb gold, 401 ppm zinc, 393 ppm nickel, 1190 ppm cobalt, 1180 ppm arsenic, 38 ppm antimony and 66 ppm selenium. Geochemistry highlights appear in Figure 7. These

results are consistent with historical 1990's trench sampling from the MC Zone (documented in ARIS Report 28989, Houle, 2005). Detailed geological mapping and additional diamond drilling are recommended for this area.

Cous South Area Mineral Claim 833065:

E5123182 – UTM NAD83 Zone 10N 358314E 5449349N 872 m. elev.

Select outcrop grab sample taken by the author along the south side of the recently extended Cous 405 Road from a 0.5 m. thick sulphide-quartz stockwork zone @ 245/50 hosted by highly silicified probable mafic volcanics, containing 25% massive to net-textured sulphides consisting mainly of mainly pyrite, plus chalcopyrite and a grey felted sulphide mineral. This sample yielded values of 2880 ppm copper, 3.2 ppm silver, 120 ppb gold, 299 ppm arsenic and 78 ppm selenium. This sample is located approximately 700 m. southwest and possibly along strike of the MC Zone. Sample E5123181 was taken by the author from a similar but narrower structure located approximately 300 m. southwest and over a small knoll from sample E 5123182, and yielded lower geochemistry values. Geochemistry highlights for both samples appear in Figure 8. Additional detailed prospecting, geological mapping and possibly soil geochemistry are recommended over this area.

Canal Main West Area Mineral Claim 530258:

E5123186 – UTM NAD 83 Zone 10N 366918E 5443314N 160 m. elev.

Select outcrop grab sample taken by the author along the south side of an un-named logging road extending west from the Canal Main Road from a 10 m. wide rusty zone of granodiorite containing 10% quartz stringers @ 060/80 plus minor tourmaline, epidote, chlorite and calcite. This sample yielded values of 683 ppm copper and 0.458% sulphur. The sample is located approximately 800 m. southwest and possibly along strike from samples E5123067 and E5123068 taken by the author in 2012 (ARIS Report 33217, Houle 2012). Sample E5123187 was taken by the author from a single 0.25 m. thick quartz-chlorite vein located 5 m. east of sample E5123186, and yielded lower geochemistry values. Geochemistry highlights for both samples appear in Figure 9. Additional detailed prospecting, geological mapping and possibly soil geochemistry are recommended over this area.

The Macktush Property is an excellent and large exploration property with multiple targets of porphyry, skarn and epithermal veins at different stages of advancement. The three target areas explored in 2014 and other known targets and un-explored areas on the Property warrant continued systematic exploration programs. A 2 phase, 2 year, \$2.15 million exploration work program is proposed for the Macktush Property, summarized in Table 10 with key points for year 1 as follows:

Phase 1 Year 1 - \$850,000

- Prospector to continue inspecting and if warranted, prospecting new logging roads, and to establish and maintain cooperation with tenure holders
- Geologists and field assistants to conduct GPS-grid based soil geochemistry, prospecting and mapping of Rex target extensions, Cous target, and West target,

plus assumed other new target derived from geophysics; geologist to model data as received to establish priority trenching and drilling targets

- Prospector to supervise construction of new access trails and repairs to existing roads, subject to existing permit conditions and future amendments, required to undertake trenching and diamond drilling of priority targets, supervised by Geologist, with all required reports to follow
- Phase 2 – Year 2 program and other future programs subject to change based on results and recommendations from Phase 1 – Year program.

Table 10 – Macktush Property Proposed Work Program

Phase 1 – Year 1				
Item	Units	Unit Cost	Scheduling	Program Cost
Prospecting	40 days for 1 prospector	\$500 per day	Summer	\$ 20,000
Geochemistry/geology - Rex target	10 days for 1 geologist, 3 samplers	\$5,000 per day	Summer	\$ 50,000
Geochemistry/geology - Cous target	10 days for 1 geologist, 3 samplers	\$5,000 per day	Summer	\$ 50,000
Geochemistry/geology - West target	10 days for 1 geologist, 3 samplers	\$5,000 per day	Summer	\$ 50,000
Geochemistry/geology - Other target	10 days for 1 geologist, 3 samplers	\$5,000 per day	Summer	\$ 50,000
Access trails / road repairs/trenching	20 days for 1 backhoe, 1 prospector	\$2,500 per day	Fall	\$ 50,000
Diamond Drilling – 2000 metres	30 days, 1 drill, 1 geologist, 1 sampler	\$250 per metre	Fall	\$ 500,000
Reports	20 days for 1 geologist	\$750 per day	Winter	\$ 15,000
Contingency				\$ 65,000
Phase 1 Sub-total			1 Year	\$ 850,000
Phase 2 – Year 2				
Item	Units	Unit Cost	Scheduling	Program Cost
Access trails / road repairs/trenching	20 days for 1 backhoe, 1 prospector	\$2,500 per day	Spring	\$ 50,000
Prospecting	20 days for 1 prospector	\$500 per day	Spring	\$ 10,000
Property geological mapping	30 days for 1 geologist, 1 assistant	\$2,500 per day	Summer	\$ 75,000
Geochemistry/geology - Other target	10 days for 1 geologist, 3 samplers	\$5,000 per day	Summer	\$ 50,000
Diamond Drilling – 4000 metres	60 days, 1 drill, 1 geologist, 1 sampler	\$250 per metre	Summer/Fall	\$ 1,000,000
Reports	20 days for 1 geologist	\$750 per day	Winter	\$ 15,000
Contingency				\$ 100,000
Phase 2 Sub-total			1 Year	\$ 1,300,000
Phases 1 and 2 (2 Years)				
Phases 1 and 2 Combined			2 years	\$ 2,150,000

Additional work programs may be recommended conditional upon results.
Respectfully submitted by:

Jacques Houle, P.Eng.

Author's Qualifications

I, Jacques Houle, P.Eng. do hereby certify that:

I am currently self-employed as a consulting geologist by:
Jacques Houle, P.Eng. Mineral Exploration Consulting
6552 Peregrine Road, Nanaimo, British Columbia, Canada V9V 1P8

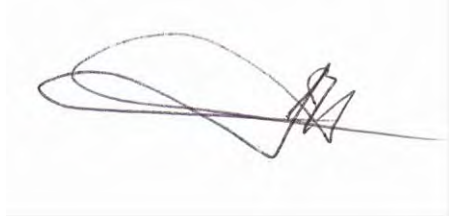

I graduated with a Bachelor's of Applied Science degree in Geological Engineering with specialization in Mineral Exploration from the University of Toronto in 1978.

I am a member in good standing with the Association of Professional Engineers and Geoscientists of British Columbia, the Society of Economic Geologists, the Association for Mineral Exploration British Columbia, and the Vancouver Island Exploration Group; I am also a member of the Technical Advisory Committee for Geoscience B.C., and of the advisory committee for the Earth Science Department of Vancouver Island University.

I have worked as a geologist for 36 years since graduating from university, including 5 years as a mine geologist in underground gold and silver mines, 15 years as an exploration manager, 3 years as a government geologist and 11 years as a mineral exploration consultant.

I previously worked on the Macktush Property from 2003 to 2007, and from 2011 to 2014, and I am independent of both Nahminto Resources Ltd. and World Organics Inc.

Dated this 15th Day of December, 2014.

Mineral Tenure Data

Macktush Property Cost Statement - Prospecting, Geochemistry - October 2013 - December 2014					
Exploration Work type	Comment	Days			Totals
Personnel (Name)* / Position	Field Days (list actual days)	Days	Rate	Subtotal*	
Herb McMaster / Prospector	Oct 21-28,30, Nov 1,2,4,6,7,9,10,13-15,19,21	21	\$400.00	\$8,400.00	
Herb McMaster / Prospector	Nov 23-25, Dec 15,20-22, Jun 1,2,4,7,8,14-15	14	\$400.00	\$5,600.00	
Herb McMaster / Prospector	Jun 17,19, Aug 2,9-14, 16-19, 22-24, 27-29, 31	20	\$400.00	\$8,000.00	
Herb McMaster / Prospector	Sep 6-11, 13-17, 20,21,23,25,27,28, Oct 1,2,4,5	21	\$400.00	\$8,400.00	
Herb McMaster / Prospector	Oct 22-25, 27-30, Nov 1,3,7-10, 12-19, 28-29	24	\$400.00	\$9,600.00	
Herb McMaster / Prospector	Dec 2-9, 2014	8	\$400.00	\$3,200.00	
Herbert McMaster / Field Assistant	Oct 22-24, 2014	3	\$250.00	\$750.00	
Dan Bruner / Field Assistant	Nov 10,17,18,28,29, Dec 2,3,9, 2014	8	\$250.00	\$2,000.00	
Jacques Houle / Geologist	Oct 22-23, 2014	2.00	\$756.00	\$1,512.00	
				\$47,462.00	\$47,462.00
Office Studies	List Personnel (note - Office only, do not include field days)				
General research	Jacques Houle - October 20,24, 2014	0.30	\$831.60	\$249.48	
Report preparation	Jacques Houle - Nov 9-11,28-29, Dec 11-13	2.65	\$831.60	\$2,203.74	
				\$2,453.22	\$2,453.22
Geochemical Surveying	Number of Samples	No.	Rate	Subtotal	
Rock	8 rock samples by AGAT Laboratories - estimate	7	\$25.04	\$175.25	
				\$175.25	\$175.25
Transportation		No.	Rate	Subtotal	
truck rental	McMaster's Dodge 4x4 pickup truck	108	\$100.00	\$10,800.00	
truck rental	Houle's Ford 4x4 pickup truck	1.00	\$378.00	\$378.00	
				\$11,178.00	\$11,178.00
Accommodation & Food	Rates per day				
Hotel - Houle Oct 22 - Port Alberni	\$151.20 per day including meals	1.00	\$151.20	\$151.20	
				\$151.20	\$151.20
Miscellaneous					
Other (Specify)	Rock samples to lab by Greyhound - estimate			\$19.51	
				\$19.51	\$19.51
Equipment Rentals					
Field Gear (Specify)	Houle field equipment and supplies	0.50	\$75.60	\$37.80	
				\$37.80	\$37.80
TOTAL Expenditures					\$61,476.98
