INTRODUCTION

SKY PILOT GOLD

This report covers all claims prospected by Murray Halliday during 2014-2015 on the Sky Pilot Gold property. The property is about ten kilometers south of Squamish and is accessed by the Stawamus river road. This property is part of the Britannia-Stawamus-Indian river pendant that is known as the Lower Cretaceous Gambier Marine Group.

Located a few kilometers northwest of this property is the historic Britannia Mine (1905-1974). The commodities were copper, zinc, lead, cadmium, silver and gold.

The property currently consists of five claims with a combined total of twenty nine units which is approximately six hundred and six hectares. The majority of these claims are located on Mount Baldwin between the Stawamus river and Raffuse creek.

Murray Halliday is the sole owner and operator of Sky Pilot Gold.

CLAIMS PROSPECTED

SKY PILOT GOLD

Sky	886969	Six Units
Coco	895610	Two Units
Colleen	1004822	Eight Units
Sky Pilot	1020897	Eight Units
Whistler	1025356	Five Units

PROSPECTOR'S QUALIFICATIONS

The discipline and self-reliance I obtained from four years of post-secondary education I have applied to informally educating myself about geology and prospecting.

In recent years I have made several significant discoveries including the results in this report.

PROSPECTING REPORT

SKY PILOT GOLD

The Sky Pilot Gold property is located on Mount Baldwin about ten kilometers south of Squamish.

Geologically this area is located in the eastern portion of the Britannia-Indian river pendant which hosts the historic Britannia Mine (092GNW003) to the west. Mineralization is typically massive and occurs in association with quartz veins in silicified andesite breccia. For more information refer to minfile number 092GNW006.

The encouraging results of the 2013-2014 geochem survey confirmed that 3S-63 creek and the SP-1 showing are the most significant mineralized zones located so far.

A follow up survey of fourteen silt samples were collected with a trowel from a depth of two to six inches adjacent to the bedrock. All samples were screened, dried, bagged, labeled and delivered to AGAT Laboratories for assaying by Aqua Regia Digest or Fire Assay for gold.

In order to compare the silt sampling more accurately all samples were obtained from fast moving water as most samples could not be obtained any other way. As a comparison silt sample 3S-63-3C (0.036 ppm gold) was taken adjacent to the more ideal location where the previous sample (3S-63-2C) produced 0.224 ppm gold.

The Fire Assays confirm that gold on both 3S-63 creek and 63 creek is consistent over an extensive distance. More testing on both these creeks will be done to locate the best zones and more accurately estimate the extension of this mineralization. The base metal assays also indicate an extension of copper, zinc and vanadium over the same distance as the gold on 3S-63 creek. In addition significant molybdenum, chrome, nickel, cobalt and magnesium are indications of a thermal driver.

The SP-1 area at the summit was not sampled but extensive prospecting resulted in a potential zone that will be soil sampled at a later date. Currently the top priority is prospecting the Sky and Colleen claims in the zone adjacent to Kidd Creek Mines soil survey that produced prospective gold results. Fortunately 63 creek provides the best access route to this area and its results also support the potential for this zone.

After three geochem surveys it has become obvious that different mineralized zones may have similar base metal content, but only 63 creek and 3S-63 creek have produced gold results. Both the consistency and extensions of these zones indicates an exciting opportunity to explore for a potentially large ore body of both base and precious metals.
