REPORT KEYWORDS (lithology, age, stratigraphy, structure, alteration, mineralization, size and attitude. **Do not use abbreviations or codes**)
Iron Lake covers a mafic to ultramafic intrusive body of early Jurassic age occurring in proximity to a slightly older granodiorite batholith that has been determined to be Upper Triassic Early Jurassic. The Iron Lake Complex hosts disseminated and massive sulfide mineralization of a probable magmatic source that is significant for its copper, gold, platinum, palladium and to a lesser extent nickel content. A new geochemical copper anomaly was located in 2015 on a satellite magnetic feature located further to the east that may have porphyry copper attributes.

INTRODUCTION:

The Iron Lake Project, located in south central British Columbia, is a regionally distinct copper, gold and platinum group elements encompassing an area of 9,389 hectares (23,220 acres) 45 kilometers northeast of the City of 100 Mile House.

Iron Lake covers a mafic to ultramafic intrusive body of early Jurassic age occurring in proximity to a slightly older granodiorite batholith that has been determined to be Upper Triassic Early Jurassic. Field relationships support the interpretation that the mafic to ultramafic body, named the Iron Lake Complex, intrudes the granodiorite batholith and presumably also the surrounding volcanic rocks belonging to the Nicola Group, both of which are part of the Quesnel Terrane.

The Iron Lake Complex hosts disseminated and massive sulfide mineralization of a probable magmatic source that is significant for its copper, gold, platinum, palladium and to a lesser extent nickel content. A prominent aeromagnetic high covering several square kilometers centered on the complex resulted in exploration starting in the mid 1970's directed at porphyry copper. Significant platinum and palladium anomalies were discovered in soils in the late 1980's.

In 2000 mineralized olivine pyroxenite rubble was discovered while prospecting a 1989 soil site which had returned a value of 392 ppb Pd. By 2012 several prospecting initiatives had located a total of eight samples of this material with an average metal content of 0.72% Cu, 0.70g/t Au, 324 ppb Pd+Pt and 416 ppm Ni. The bedrock source remains elusive.

In 2004 a helicopter borne airborne survey was completed over much of the claim group and a number of conductors identified some of which were further detailed by a 2006 UTEM ground survey. Targets from both surveys were drill tested in 2005 and 2006 with significant thicknesses of pyrrhotite dominant massive sulfide being intersected (e.g. an aggregate 6.1 metre massive sulfide interval in hole 05-03), massive sulfide being defined as >60% sulfide. Base metal values, while low to moderate in grade indicate that the sulfide mix includes copper, nickel and cobalt consistent with a magmatic sulfide model.

Two styles of magmatic sulfide mineralization present opportunities for discovery at Iron Lake. The first being disseminated sulfide with economically significant values of copper, gold, platinum and palladium; and the second massive sulfide with economically significant values in copper, nickel and cobalt. A hybrid of the two styles of mineralization with the full suite of elements is also possible.

In 2015 new grids were established peripheral to the area of recent exploration delineating a previously unknown soil copper anomaly with possible porphyry copper attributes.

In 2016 claims were added on the southeastern side of the property to capture an area of arsenical gold mineralization associated with megacrystic feldspar porphyry. Soil values in this area reach 12 grams per tonne gold and select rock samples reach 74.9 grams per tonne. No significant work has been undertaken in this area in recent times but this area will be more thoroughly assessed in the next field program.

PROPERTY DESCRIPTION:

The Iron Lake property, covering some 9,389 hectares, is located in the Clinton Mining Division of southern British Columbia (Figure 1). The property is situated 45 kilometres northeast of the City of 100 Mile House at latitude 51° 57'N longitude l20°54'W (UTM 645500E 575700N). The Iron Lake property is comprised of 21 mineral claims owned 100% by Eastfield Resources Ltd. subject to a 1.5% NSR (reducible to 0.5%).

The following table details claim information:

Total Area 9,389 hectares (23,200 Acres)

Clinton mining Division, BC

Several exploration permits have been issued to Eastfield over a number of years without difficulty allowing Eastfield to conduct a wide range of activities including geophysical surveys, trenching, road construction and diamond drilling. The most recent permit was issued on April 17, 2015 and is valid until April 17, 2018.

LOCATION, ACCESSIBILITY, CLIMATE AND LOCAL REOURCES:

The Iron Lake property is accessible by paved roads to the settlement of Eagle Creek, then a further 8 kilometres along the all weather Hendrix Lake Road provide access to the southern boundary of the property. Recent logging and previously permitted exploration trails generally provide good access to much of the property area. The climatic statistics for the area indicate annual temperatures ranging from -30°C to +30°C with 100 to 150 centimetres of precipitation as both snow and rain.

The infrastructure available from the community of 100 Mile House and its surrounding communities are strongly supported by the forest resource industry and would support the development of an economic ore body if one was delineated on the Iron Lake property. Hydroelectric lines are in close proximity (±10 km) to the project and there is a significant local supply of water from lakes and creeks on and in proximity to the property.

This region consists of generally broad valleys and gently rolling hills. The elevations in this area range from 3000 feet (915 meters) to 4500 feet (1370 meters) above sea level. The claims occupy a moist vegetative zone dominated by various coniferous (pine-spruce-fir) and deciduous (birch-poplar) trees combined with variable undergrowth of brush. A significant portion of the Iron Lake property and adjacent lands have recently been clearcut logged in response to a bark beetle epidemic. This logging has been beneficial to the project in terms of improved access and occasionally new bedrock exposure.

HISTORY:

The first documented exploration in the area of the prospect occurred in the early 1970's when Pickands Mather and Company, an American based iron ore company (now Cliffs Natural Resources Inc.), conducted exploration for porphyry copper. The area of the Iron Lake Prospect was targeted because of a 1968 government airborne survey which indicated a very strong airborne magnetic feature. An initial geochemical survey outlined some modest copper anomalies and a six-hole diamond drill program was initiated in 1974. The drill program did not result in significant porphyry copper intercepts being obtained but indicated that the airborne magnetic anomaly was due to heavy accumulations of magnetite. The magnetite was found to occur in mafic to ultramafic rocks (gabbro to olivine pyroxenite) in concentrations high enough to encourage the company to complete a number of Davis Tube iron analyses to evaluate the potential of the property to host a magnetite deposit. The magnetite content was ultimately determined to be too low and the claims were allowed to expire in 1974.

In 1975 the area was re-staked as the Sheri Claims by geologist/prospector Herb Wahl who had previously managed the Pickands Mather office. Wahl completed additional soil geochemical surveying and minor hand trenching before abandoning the claims.

In the late 1980's Canevex Resources Ltd., controlled by J.W. Morton and G.L. Garratt, staked the area of the current Iron Lake claims. The property was first optioned to a private group and later to a public VSE company, Cepeda Minerals Inc., which completed a program on the claims with an emphasis on gold, particularly around the periphery of the intrusion. Platinum group metals were for the first time included in the analytical suite. This work indentified a number of significant palladium and platinum soil and rock anomalies including analysis to 933 ppb platinum from select roadside rubble samples and to 392 ppb palladium in soils. Shortly after completing this program Cepeda withdrew from the project and Canevex along with a privately owned company continued exploration and in 1989 completed an induced polarization survey over part of the intrusion. Despite the detection of significant induced polarization anomalies the claims were allowed to expire in 1992.

Eastfield Resources Ltd. acquired the data base for the Iron Lake property and staked the area of the Iron Lake occurrence in February 2000. In October 2000 Eastfield, while investigating soil palladium anomalies from the 1989 soil survey, discovered mineralized olivine-pyroxenite rubble containing significant disseminated bornite and chalcopyrite. Two samples were collected from the rubble field with the first sample grading 0.59% Cu, 0.53g/t Au, 308 ppb Pt + Pd and 0.04% Ni, the second sample 0.56% Cu, 0.54g/t Au, 287 ppb Pt +Pd and 0.04% Ni.

In 2001 Eastfield optioned the right to earn a 60% interest in the property to Lysander Minerals Corp who conducted modest surface prospecting programs prior to terminating the option in 2002.

In 2003 Eastfield granted an option to Argent Mining Corp. (later Avion Resource Corp.) to earn an interest in the project. Argent subsequently completed expansions to the 1989 soil grid in 2003 and in 2004 completed 603 line kilometers of helicopter borne geophysical survey including total field magnetics and multi-frequency electromagnetics (DigHem). A large and very strong

magnetic anomaly was outlined over an area 5 square kilometers in extent within which 405 conductors were located of which 15 were interpreted to be caused by discrete entities in bedrock.

In 2005 Argent completed four diamond drill holes with two of the holes targeting electromagnetic conductors. A massive sulfide intercept of 1.2 metres was obtained in the hole targeting the first electromagnetic anomaly and an aggregate intercept of 6.1 metres of massive sulfide was obtained (within a 17-metre interval that was estimated to consist of greater than 60% sulfide) in the hole targeting the second electromagnetic anomaly. The massive sulfide intercepts were largely pyrrhotite with lesser chalcopyrite grading up to 1.10% copper, 0.09% nickel and 0.13% cobalt over individual 1.1 metre sample intervals. The fourth hole of the 2005 program targeted an induced polarization response indicated in the 1989 survey. This hole, drilled some distance to the east of the other holes encountered olivine-pyroxenite which is believed to be the important lithology in hosting the platinum group mineralization discovered in rubble in 2000.

In 2006, Argent completed 17 kilometres of ground based UTEM survey. The UTEM survey was completed over a portion of the property to the north and south of the first three 2005 drill holes but did not extend as far east as the fourth hole. The survey was successful in further detailing and extending the lengths of the 2004 airborne anomalies and detecting weaker and deeper conductors missed by the 2004 survey. In May and June 2006 five holes totalling 681 metres were completed in the general area of the 2005 drill holes with the first two holes following up the massive sulfide discovery of 2005. The first of the 2006 holes was lost after the drill string became stuck just as the prospective target zone was reached and the second hole was inadvertently drilled parallel to the strike of the conductor at 90° to its design (driller error). Interestingly the second hole never-the-less intersected a narrow zone of massive sulfide.

In 2007 a program of targeted prospecting was completed. A field crew consisting of two field technicians systematically checked a number of anomalies indicated in the data set (predominantly originating from prior geophysical surveys). 143 rock samples and 180 soil samples were collected.

In 2008 Cobre Exploration Corp. (later Calico Resource Corp.) entered into an option agreement with Eastfield Resources Ltd. and the soil grid was expanded. A total of 478 soil samples were collected and analysed.

In 2009 a program of excavator trenching, largely drawing from the 2007 program was completed. The depth of overburden often proved to be deeper than expected and many attempts to reach bedrock failed.

In 2011 a program of rock sampling and reconnaissance induced polarization and magnetometer surveying was completed. The predominant objective of the 2011 geophysical survey was to investigate the contact between the Iron Lake Ultramafic Complex and the Takomkame Batholith. Two new strong “IP” anomalies with corresponding magnetic anomalies along with several weaker ones were identified.

In 2012 the Hidden_one claims were staked contiguous to the north and west of the Iron Lake claims to cover unexplored areas of the Takomkame Batholith thought to share commonalities

with the Woodjam copper gold project located 40 kilometres to the northwest, currently being explored by Consolidated Woodjam Copper Corp. Later in 2012 Calico Resources Corp (formerly Cobre Exploration) withdrew from the project. A program of rock sampling, induced polarization and magnetometer surveying was subsequently completed. A strong and coherent induced polarization anomaly was identified south of the western end of Beverley Lake and a second strong anomaly 1,000 meters further to the north. These anomalies are coincident with an arcuate total field anomaly occurring near the edge of the larger magnetic feature indicated in the 2004 airborne survey.

In 2013 further grids were cut and additional rock and soil sampling conducted to fill in and more precisely define anomalies indicated from the 2011 and 2012 geophysical work.

In 2015 new grids were established peripheral to the area of recent exploration on a separate airborne magnetic feature. A previously unknown soil copper anomaly with possible porphyry copper attributes was discovered.

On January 10, 2016 claims were added on the southeast side to capture arsenical gold anomalies that became open and which are associated with feldspar porphyry. Soil values in this area include values up to 12 grams per tonne Au and select gold analysis up to 74.9 grams per tonne.

GEOLOGIC SETTING:

Regional and Local Geology

Geologically, the Iron Lake property is located within the accreted Quesnel terrane; a narrow, north north-westerly trending disrupted but nearly continuous belt from the southern to northern provincial boundaries. Collision of the Quesnel Terrane with the North American Craton occurred at about 180 Ma with subduction with the North American continent continuous from 180 to 150 Ma. The belt consists of volcanic, sedimentary and intrusive rocks of Triassic to Jurassic Age pre-accretion in age which host alkalic porphyry copper – gold and porphyry copper-molybdenum-gold deposits.

The generalized local geology (Figure 3) is derived after 2006 work by the BC Geological Survey. This work was focused on Mesozoic arc volcanic and plutonic rocks of the Quesnel Terrane in the vicinity of the Takomkane batholith and included the Iron Lake property. The oldest rocks in the property area occur along the eastern edge of the property and are volcanic breccias and volcaniclastics of the Upper Triassic Age Nicola Group. The Late Triassic Early Jurassic Schoolhouse Lake Unit, monzonite and granodiorite, forms the predominant phase of the Takomkame batholith in this area. The Takomkane Suite has intruded the Nicola Group rocks and the Iron Lake ultramafic suite has intruded the Takomkame Suite (based on radiometric age dates).

The Iron Lake property is centered on the Iron Lake Complex comprised of ultramafic and mafic plutonic rocks. These rocks intrude the Nicola volcaniclastic succession and are in contact with the Schoolhouse Lake unit of the Takomkane Batholith across poorly exposed but probably intrusive contacts to the north and northwest. The Iron Lake Complex is divided into an

ultramafic unit and a mafic unit. The ultramafic unit consists mainly of clinopyroxenite and hornblende clinopyroxenite, but also includes olivine clinopyroxenite, wehrlite, hornblendite, gabbro, diorite and intrusion breccia. The mafic unit consists mainly of medium to coarse-grained hornblende-pyroxene gabbro to monzogabbro, medium to fine-grained hornblende diorite, microdiorite and albite-hornblende pegmatite including breccias of the same. Melanocratic gabbro from the ultramafic unit of the Iron Lake complex yielded Ar/Ar plateau ages of 187.7 ±1.1 Ma and 186.34 ±0.96 Ma on hornblende and biotite separates, respectively. These Early Jurassic dates are significantly younger than the dates obtained from the Boss Creek and Schoolhouse Lake monzonites (195.0 to 202.0 Ma), indicating that the Iron Lake Complex is younger than the Takomkane Batholith, and has presumably intruded the batholith as well as the Nicola Group.

Near the northwest corner of the ultramafic unit hornblende pyroxenite, hornblende-feldspar pyroxenite, gabbro and diorite have been mapped by the BC Geological Survey as parallel sheets defined partly by modal layering and partly by dikes, giving some evidence of magmatic layering.

The Takomkame Batholithic rocks on the property, although locally well exposed are also extensively till covered in much of the property. Lithology of these rocks is dominantly granodiorite and varies from equigranular to weakly porphyritic in texture. Mafic minerals are dominated by hornblende with lesser biotite.

DEPOSIT MODEL
(for the Gold and PGM rich Ultramafic hosted Copper Sulfides):

In 1987 the “Kevitsa” deposit was discovered in Finland and in 2008 it was acquired by a subsidiary of First Quantum Minerals Ltd. who put it into production in 2012. Kevitsa is a PGE and gold enriched copper, nickel deposit with reserves of 157 million tonnes grading 0.41% copper, 0.31% nickel, 0.12 g/t gold, 0.24 g/t platinum and 0.18 g/t palladium. Mineralization is hosted in olivine pyroxenite and is disseminated in style and is considered to be magmatic in origin. Kevitsa shares many attributes with the disseminated mineralized rubble discovered at Iron Lake including the suite of elements (copper, gold, platinum, palladium and nickel) and the host rock to the mineralization which in both cases is olivine pyroxenite.

Another possible model for mineralization at Iron Lake is the Aguablanca Ni-Cu-PGE mine located in Spain. At Aquablanca a gabbroic pipe is interpreted to have been emplaced along with and at the edge of a calc-alkaline plutonic complex and hosts a copper and nickel orebody with remaining reserves of 2.8 million tonnes grading 0.60% nickel and 0.40% copper included in remaining resources of 7.4 million tonnes grading 0.70% nickel and 0.60% copper. Aquablanca was discovered by Rio Tinto in 1993 and was placed into production by Rio Narcea Gold Mines in 2003 (now Lundin Mining). The association of the mafic to ultramafic Iron Lake Complex with the granodiorite dominant Takonkame Batholith may be comparable to Aquablanca’s setting.

Fig. 4

The Iron Lake Complex is also comparable in several respects to the Turnagain Complex in northern BC and the Tulameen Complex in southern BC. Both of these occurrences, as may be the case for Iron Lake may be Alaskan type ultramafic-mafic intrusive complexes. Complexes of this type in Russia host significant deposits of precious metals, particularly platinum with historical alluvial production alone exceeding ten million ounces platinum.

It should also be noted that the prolific Norilsk nickel-copper-PGM deposits also in Russia are hosted in Triassic aged olivine pyroxenite, comparable in age and host rock petrology to Iron Lake.

MINERALIZATION:
(Within Iron Lake Mafic-Ultramafic Complex)

Exploration of the Iron Lake property area in the mid 1970's (within the Iron Lake Ultramafic Intrusive Complex) identified low grade copper mineralization. Ongoing work by Eastfield has also identified gold, platinum and palladium mineralization (plus minor nickel and semi-massive magnetite) associated with the complex.

The observed opaque minerals in order of abundance are magnetite, pyrite, hematite, pyrrhotite, chalcopyrite and bornite.

Two styles of mineralization are currently the focus of exploration in the Iron Lake Ultramafic Intrusive Complex; the first being disseminated sulfides containing copper, gold and platinum group metals similar to a number of samples of rubble located south of the eastern end of Island Lake and the second as massive sulfide mineralization discovered 250 metres to the southwest by drilling airborne conductors. The disseminated style of mineralization occurs as intergrowths of chalcopyrite and bornite with minor pyrrhotite in a silicate assemblage of interlocking clinopyroxene and lesser olivine. The olivine, which varies between 15-20%, has been partially altered to serpentinite along crystal edges. Approximately 3-4% magnetite is scattered throughout and forms rims around sulfide grains in and around olivine.

Four diamond drill holes (05-IL- 02 & 03 and 06-IL-05 & 06) have intersected massive sulfide mineralization. Observations from this analysis indicate that copper, nickel, gold, palladium and platinum are all positively correlated in the disseminated style of mineralization but not so much so in the massive sulfide style. Cobalt, which is more prevalent in the massive sulfide style of mineralization, is not as correlative in the disseminated style perhaps indicating that the disseminated and massive sulfide styles of mineralization are quite separate.

The anomalous magnesium values in the disseminated style of mineralization (olivine-pyroxenite) are interpreted to be indicative of serpentinization of olivine. The incidence of olivine-pyroxenite, which may be diagnostic to the disseminated style of mineralization, can perhaps therefore be inferred in areas of till cover where high magnesium content is indicated in the soil. The following table summarizes the results of analysis of eight samples of disseminated mineralization:

Disseminated Mineralized Rubble Results

Exploration:

Airborne Geophysical Surveys

In 2004 Fugro Airborne Surveys Corp., on contract to Argent Mining Corp., completed 603 line kilometers of DIGHEM multicoil, multifrequency electromagnetic survey supplemented with a high sensitivity magnetometer survey. The electromagnetic survey identified 405 conductors of which 15 were interpreted to be derived from discrete bedrock sources and one from a conductive bedrock unit with the remaining 389 conductors interpreted to be conductive cover. Two of the 15 discrete conductors were drill tested in 2005 and 2006. The drill testing occurred on adjacent airborne survey lines located approximately 500 metres south of the south-eastern tip of Island Lake. Drill holes 05-IL-2 and IL-05-3 drilled to test these conductors intersected 1.4 and 6.1 meters (within 17 meters of >60% sulfide) of massive sulfide mineralization respectively (pyrrhotite dominant). In 2006 holes 06-IL-05 and 06-IL-06 intercepted narrower zones of mineralization (06-IL-05 was lost prematurely while 06-IL-06 was drilled at an incorrect azimuth).

The coincident 2004 Fugro magnetic survey outlined a large broad and highly magnetic feature with a dynamic magnetic range of 9500 nT, covering an area exceeding 5 km^2.

In 2005 the Geological Survey of Canada released multisensor (gamma ray spectrometric and magnetic) airborne geophysical information covering the Eagle (Murphy) Lake area (Open File 5292). A strong magnetic feature is indicated. This survey superseded an earlier high elevation fixed wing survey completed by the Geological Survey of Canada in 1968 (Geophysics Paper 5231, Canim Lake).

Ground Based Electromagnetic Surveys

In 2006 Argent Mining Corp. completed 17 kilometers of UTEM surface electromagnetic survey (S.J Geophysics Ltd.) over an the area flanking, and drilled in 2005 . This survey confirmed the features in this area indicated in the 2004 airborne survey and detected several weaker features

not detected by that survey. Hole 05-IL-04, which intersected olivine-pyroxenite containing weak nickel mineralization to the east of the disseminated mineralized float, was not included within the area of the UTEM survey.

Induced Polarization Surveys

In 1972 a small area in the southern part of the current claims was surveyed by a junior company, Aragon Exploration Ltd. In 1973 Pickands Mather and Company completed some induced polarization surveying in the vicinity of Iron and Island Lakes. In more recent times (1991) 10.2 line kilometers of induced polarization surveys was completed on a portion of the central region of the claims by Canevex Resources Ltd. Much of the area of the 1991 survey is highly responsive with chargeability commonly exceeding 20 mV/v and sometimes exceeding 70 mV/v. Interpretation of these results is complex due to the large surface extent of the response and the possibility that the high magnetite content may be influencing the results. Changeable features in this survey, as opposed to several anomalies indicted in subsequent surveys, were not “discrete”.

In 2011 reconnaissance induced polarization and magnetometer surveying was completed along several logging roads on the property (12.7 km). The reconnaissance work was successful in indicating several new “discrete” anomalies, particularly one southeast of Island Lake and one immediately east of Beverly Lake.

In 2012 a further 23.9 kilometers of “IP” and “magnetic survey” was completed. Eight kilometers of this work was completed on the original Iron Lake claims while 15.9 kilometers was completed on new claims to the north. Two new discrete strong chargeable and magnetic anomalies were identified in the Iron Lake ultramafic complex while one new discrete strong chargeable and magnetic anomaly and one weaker one was identified within Takomkame intrusive rocks in the northeast sector of the property. A strong and coherent induced polarization anomaly was identified south of the western end of Beverley Lake and a second strong anomaly 500 meters further to the north. Interestingly these anomalies are coincident with an arcuate total field anomaly occurring near the edge of the larger magnetic feature indicated in the 2004 airborne survey. No drilling has yet been completed in these features.

Geochemical Surveys

The initial soil geochemistry completed in by Pickands Mather and Company in 1974 and Wahl in 1975 was superseded with surveys over much of the same area in 1989 which are considered more relevant because of a much larger suite of elements analyzed for including palladium and platinum. The property lies in glaciated terrain and the glaciated expression of mineralized bedrock can be masked or transposed. In the Iron Lake area published ice direction maps suggest that the predicted source of anomalies and float would generally be from the northeast.

The 1989 survey comprised 706 samples (100 meter spaced lines with 50 meter spaced samples)

and was completed by Canevex Resources Ltd. which indicated that a number of platinum group soil anomalies existed. Palladium and platinum are included in all soil surveys starting in 1989. Anomalous soil values reach 392 ppb palladium, 260 ppb platinum and 449 ppb gold.

In 2002 an additional 1.6 kilometer of soil grid was established (16 samples) and in 2003 an additional 10 line kilometers of soil grid was added (216 samples).

In 2007, 180 additional soil samples and 143 rock samples were obtained in a single sampling routine conducted contemporaneously with a targeted prospecting program. In 2008 478 additional samples were collected analysed.

In 2011 two outcrops were noted with apparent glacial striae trending 270° and 250° respectively. A published surficial geology map indicates that striae trending 225° has been mapped northwest of Succour Lake.

In 2012, 108 rock samples were collected and analyzed.

In 2013 a further 261 soils and 50 rocks were collected and analyzed.

In 2015 three new soil grids were established (577 samples). Two of the grids extended the soil coverage over a smaller airborne magnetic feature located to the east of where work has historically been completed. Outcrop in this region is scarce but does include an area of pyritic (and pyrrhotitic) diorite developed as a borrow pit for road construction. Alteration exposed in this pit includes significant garnet in calcareous sediments indicating that skarning has occurred.

Drilling

Diamond Drill holes have been completed by Pickands Mather and Company in 1974 and by Argent Mining Corp. in 2005 and 2006. Seventeen holes totalling 1,878 metres have been completed. The 1974 drilling was BQ in diameter while the 2005 and 2006 drilling was NQ.

DISCUSSION:

Starting in the late 1980's Exploration at the Iron Lake project has predominantly focussed on magmatic gold and platinum group metal rich copper sulfides associated with ultramafic rocks. The geology of Iron Lake supports this model but also supports other styles of mineralization as a consequence of the project being located at a "geological triple point" where the ultramafic Iron

Lake complex intrudes both arc derived intermediate volcanic and related sediments belonging to the Mesozoic aged Quesnel terrane and the Mesozoic aged Takomkame batholith.

Recent exploration beginning in 2011 has focused successfully on developing geophysical targets (induced polarization) targeting massive and disseminated gold and platinum group metal rich copper sulfides hosted by ultramafic rocks. Several drill targets have been defined and permitted.

Two other targets have inadvertently evolved as exploration on Iron Lake has progressed. The first is a porphyry copper (gold?) target situated on a satellite magnetic feature south east of the ultramafic stock. This area was the focus of soil surveying completed in 2015 where a substantial soil copper anomaly was identified. Outcrop in this feature is limited excepting a roadside ballast quarry located on the north side of the grid where pyritic and pyrrhotitic rich diorite, and skarned sediments are exposed. Induced polarization surveying would be a logical next step in the exploration of this target.

The second target occurs on the extreme southeastern side of the claim group. Here a number of gold-arsenic showings and anomalies have been developed over a distance of 1,500 meters (predominantly in the early 1990's). Recently the southern portion of this target came open and was successfully re-staked and added to the Iron Lake property. Soil arsenic values exceeding 500 ppm are common and select rock samples have returned values up to 74.9 g/t gold. Gold mineralization here may be related to pyritic megacrystic porphyry dykes and small stocks that outcrop in this area and which intrude Mesozoic aged Nicola volcanic rocks. A renewed prospecting and geophysical initiative would be a logical next step in the exploration of this target. Access into this area is via historic logging roads that while in generally good condition are heavily overgrown and need to be slashed.

RECOMMENDATIONS:

Historically two styles of magmatic sulfide mineralization present opportunities for discovery at Iron Lake. The first being disseminated sulfide with economically significant values of copper, gold, platinum and palladium; and the second being massive sulfide with economically significant values in copper, nickel and cobalt. An opportunity currently exists to complete follow up to the massive sulfide discovery of 2005 with more drilling and at the same time to complete an initial drill on an undrilled airborne conductor located to the north as well as drill test several discrete and well defined induced polarization anomalies outlined in 2011 and 2012 to the east and south.

Additional opportunity was added to the project in 2015 with the identification of a soil copper anomaly coincident with a 2004 airborne magnetic anomaly. This area justifies completing an induced polarization survey with porphyry copper mineralization being the target.

In 2015 competitor claims expired on the southeastern side of the property allowing new claims to be staked in 2016 to capture an area of anomalous gold and arsenic. Geochemical results here include up to 12.4 grams per tonne gold in soil and up to 74.9 grams per tonne gold in select rock samples associated with widespread anomalous arsenic and possibly related to a pyritic megacrysic feldspar porphyry intruding Mesozoic aged mafic volcanic rocks.

Sample 1632761, pyritic, detailed sample description missing.

Sample 1632762, abundant magnetite, detailed sample description missing.

Sample 1632763, pyritic with magnetite, detailed sample description missing.

Iron Lake Rock Samples 2015

Field Sampling Procedures

Rocks and Rubble. Samples are selected so as to be representative. The sample is broken and one half is placed in a plastic sample bag along with a sample number written on a piece of ribbon with a felt marker or in some cases a sample tag provided by the lab. The other half of the sample is given to the project geologist to describe and is kept for posterity. A location is obtained using a hand held GPS unit.

Soil Samples. The sample sites are located by navigating to the site using a hand held GPS unit. At the site a waypoint is established and recorded in the GPS unit and the soil sample taken by digging a hole with a soil mattock. The hole is, wherever possible, dug deep enough to get below the surface humus horizon into "mineral" soil. At Iron Lake soil sample depths were typically 30 to 40 centimeters. Soil samples were placed in brown paper soil sample bags and air dried before shipment to the laboratory.

Laborarory Name and Address

Bureau Veritas Commodities Canada Ltd.
(Formerly Acme Analytical Labs Ltd.)
9050 Shaughnessy St Vancouver BC V6P 6E5 CANADA
PHONE (604) 253-3158

Lab Procedures

Rock samples are crushed such that 70% passes a -10 mesh screen
Soil samples are dried and screened to get a sample passing a -80 mesh screen.
Samples were analysed using an aqua regia digestion on a 15 gram sample using multi-element ICP-MS procedures.

CERTIFICATE OF ANALYSIS VAN15001509.1

CLIENT JOB INFORMATION

Project: Iron Lake
Shipment ID:
P.O. Number
Number of Samples: 271

SAMPLE DISPOSAL

RTRN-PLP Return
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
Dry at 60C	271	Dry at 60C			VAN
SS80	271	Dry at 60C sieve 100g to -80 mesh			VAN
AQ251_PGM	271	1:1:1 Aqua Regia digestion Ultratrace ICP-MS analysis	15	Completed	VAN
DRPLP	271	Warehouse handling / disposition of pulps			VAN

ADDITIONAL COMMENTS

Invoice To: Eastfield Resources Ltd.

Submitted By: Bill Morton
Receiving Lab: Canada-Vancouver
Received: October 26, 2015
Report Date: November 17, 2015
Page: 1 of 2

CERTIFICATE OF ANALYSIS VAN15002852.1

CLIENT JOB INFORMATION

Project: IRON LAKE, PAT & CHG
Shipment ID:
P.O. Number
Number of Samples: 13

SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage
DISP-RJT Dispose of Reject After 90 days

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PUL85	13	Pulverize to 85% passing 200 mesh			VAN
PULSW	13	Extra Wash with Silica between each sample			VAN
AQ251_PGM	13	1:1:1 Aqua Regia digestion Ultratrace ICP-MS analysis	15	Completed	VAN
DRPLP	13	Warehouse handling / disposition of pulps			VAN
DRRJT	13	Warehouse handling / Disposition of reject			VAN

ADDITIONAL COMMENTS

Silt Sluiced samples.

Submitted By: Bill Morton
Receiving Lab: Canada-Vancouver
Received: October 27, 2015
Report Date: November 17, 2015
Page: 1 of 2

CERTIFICATE OF ANALYSIS VAN15002899.1

CLIENT JOB INFORMATION

Project: IRON LAKE, PAT & CHG
Shipment ID:
P.O. Number
Number of Samples: 8

SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage
DISP-RJT Dispose of Reject After 90 days

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
BAT01	1	Batch charge of <20 samples			VAN
PRP70-250	8	Crush, split and pulverize 250 g rock to 200 mesh			VAN
AQ251_PGM	8	1:1:1 Aqua Regia digestion Ultratrace ICP-MS analysis	15	Completed	VAN

ADDITIONAL COMMENTS

Invoice To: Mincord Exploration Consultants Ltd.
