Summary

This report summarizes work completed on the Golden Bear (Wolverine) Claims during the summer of 2015.

Surface work conducted during August of 2015 included mapping / rock sampling and soil sampling designed to expand upon the soil grids established in 2004 as well as target broad areas of copper gold anomalism identified in the early 1990's.

The Golden Bear (Wolverine) property shows gold-enriched structural zones broadly associated with widely anomalous Copper geochemical anomalies. The highly anomalous gold in soil sample identified during this program, located in the northwest potion of the property, is the highest priority target. Further expansion of the soil grid to the south from this location would help to determine the total length of the potential structural zone enriched in gold. Further work in this area should include soil sampling and trenching to identify the source of the soil sample containing > 1g/t Au.

Introduction

The Golden Bear (wolverine) property is located in Northwest BC approximately 105 km Southwest of Dease Lake, BC in the Atlin and Liard Mining Divisions. Garibladi Resources Corp. acquired the rights to the Golden Bear (Wolverine) Mineral Tenures covering and around the area of the historic "Wolverine" Minfile showing (104J 059) in the summer of 2015 and conducted preliminary soil sampling and geological mapping program following up and expanding the work conducted in 2004.

This assessment report summarizes the surface exploration work Garibaldi Resources conducted in August 2015, including geological observations, sampling, and soil and rock assay results obtained.

Location and Access

The Golden Bear (Wolverine) Property is located approximately 105 km southwest of the community of Dease Lake, and approximately 37 km northwest of the community of Telegraph Creek, northwest BC in the Liard and Atlin Mining Divisions (Figure 1).

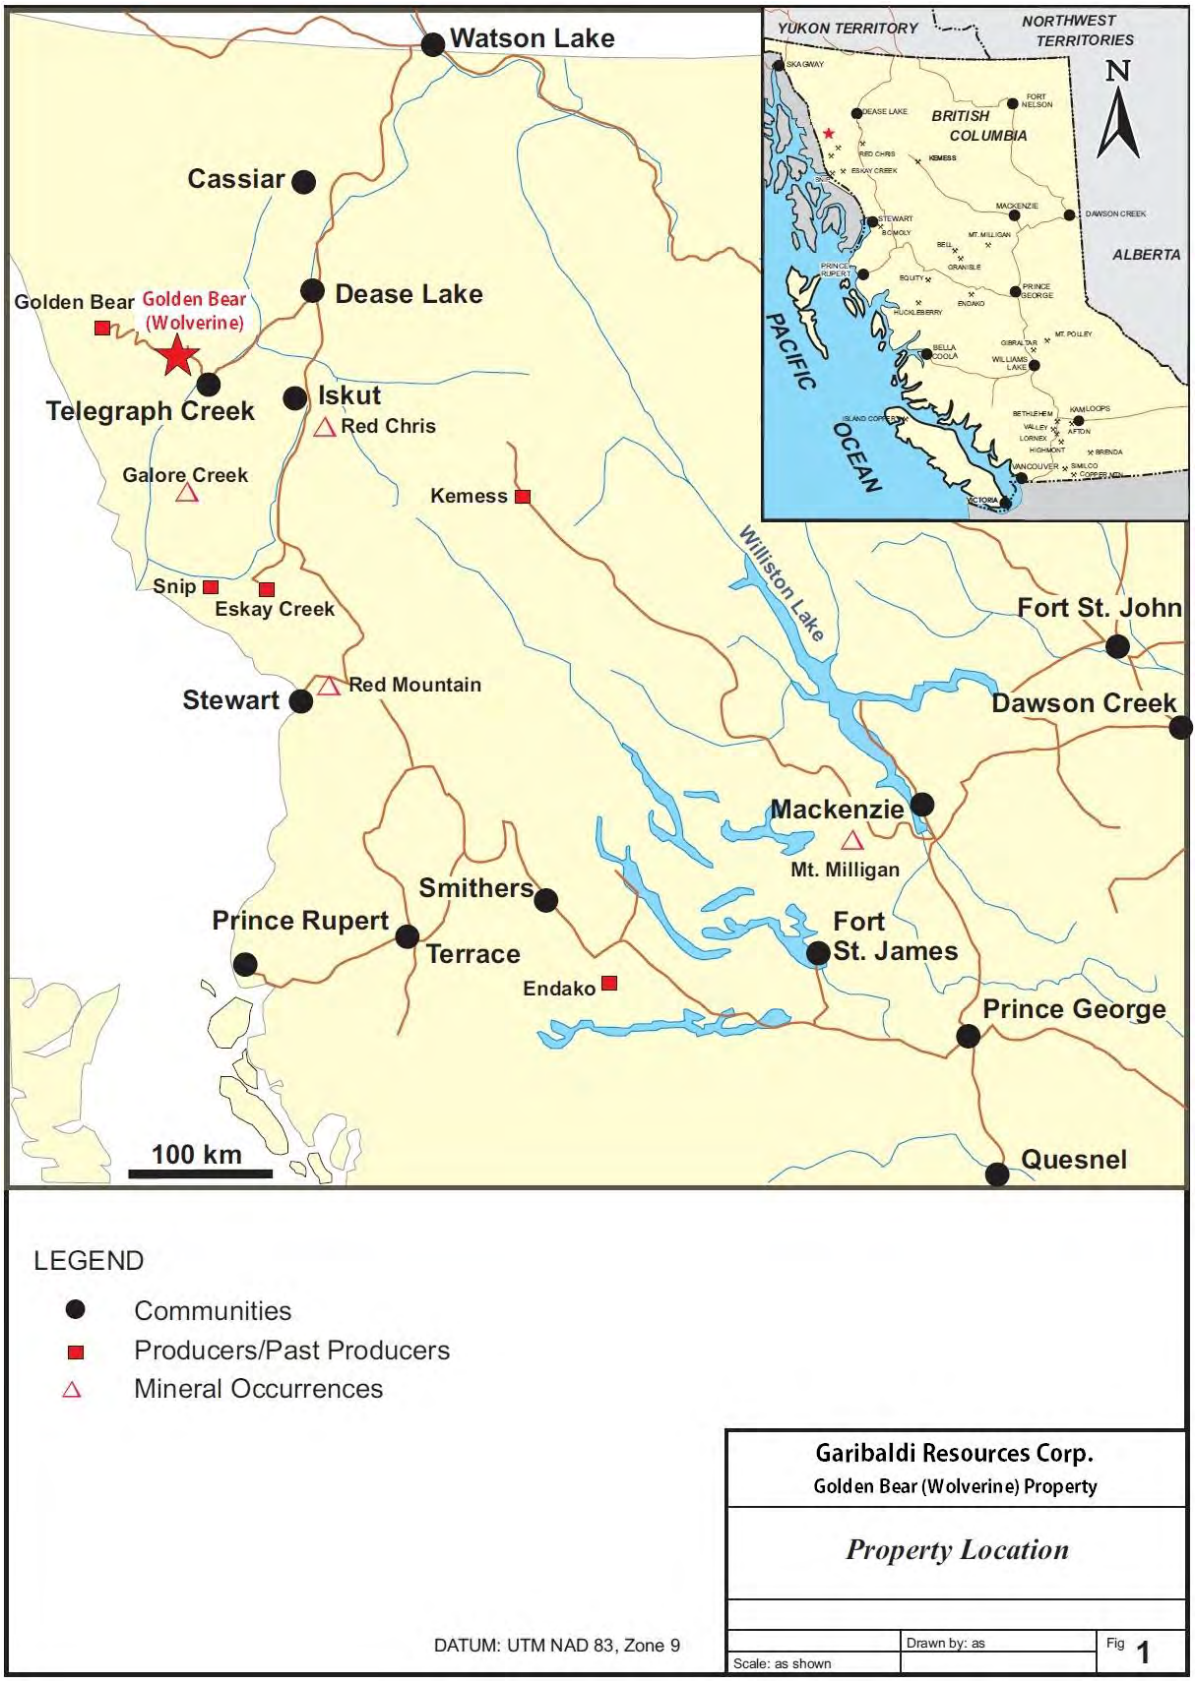

Figure 1: Property Location Map.

The property consists of 8 contiguous mineral tenures comprising 1384.7 Ha. The claims are located on Mapsheet 104J / 4 and BCGS sheets 104J / 02 & 104 J / 12. The center of the claim block is at Latitude: 58.108991N Longitude: 131.68539W, or UTM NAD 83 Zone 9: 341777mE and 6443994mN.

The property can be accessed by the way of Golden Bear mine access road (also known as Muddly Lake Road). Immediately west from the community of Dease Lake, the Telegraph Creek road is taken for approximately 80km to the Golden Bear mine road. The main camp location was along the road near the historic wolverine showing. The road is not maintained and there are several occurrences where the original bridge structures are damaged or washed out. Access is still available (with permission) by means of ATV along the road and is actively used by local community members. Helicopter access is also available from a fulltime base (PWH) at the Dease Lake airstrip approximately 45min away by air.

Physiography and Climate

The area immediately surrounding the claims is typified by warm summers and cold winters with moderate to low precipitation compared to coastal areas. Average temperatures at the closest community of Telegraph Creel are -5 to -10C in the winter months and 10-15 C in the summer months. The average annual precipitation for Telegraph Creek is 33cm/year.

The topography of the property ranges from around 900m in the northern portions of the claim to 1600m in the southern portion of the claims. Slopes are generally gentle to moderate throughout with steeper slopes within the creek canyons and valleys.

The vegetation consists of sub alpine spruce in the higher areas with poplar and pine and spruce covering the majority of the lower areas. Water for drilling and for camps is available from several small streams and lakes on and around the property.

Tenure Data

The Golden Bear (Wolverine) property is comprised of 8 contiguous mineral tenures comprising 1384.7 Ha in the Atlin and Liard mining divisions (figure 2). Garibaldi Resources Corp. holds 100% interest in all mineral Tenures subject of this report and listed in Table 1.

Table 1. List of Mineral Tenures (note: good to dates are subject to the acceptance of this report).

Exploration History

Mineral exploration has been active in the area of the Golden Bear (Wolverine) property since the early 1990's when the wolverine showing (MINFILE No 104J 059) was discovered, however there are records of previous work in area begging in the 1970's.

The first recorded exploration work within the current claims occurred with the staking of the VI claims in 1971 by Sumitomo Metal Mining Canada Ltd. Geological mapping and soil sampling (522 samples) were conducted between 1971 and 1972. This work identified a broad pyritized zone (1 km x 2.5 km) with some chalcopyrite located near the contact of plutonic and volcanic rocks and anomalous copper values in soil. Some of these anomalies were recommended for further prospecting, geologic mapping and possibly trenching or geophysical surveying.

No further recorded exploration work occurred on the claims until 1988 when construction began on a 155 kilometre long access road into the Golden Bear Mine. During construction, the road was mapped and sampled as part of a 50/50 joint venture between Chevron Minerals and North American Metals, which resulted in the discovery of several showings including Wolverine and Round Mountain (Rebic & Sketchley,1988). Follow up work on the Wolverine showing in 1989 located a massive sulphide bearing vein with significant gold and copper grades (Marsden et al. 1989). Chevron Minerals staked the Wolverine and Quick claims in November 1989 following the removal of the staking moratorium along the road corridor.

During 1990 Chevron and North American Metals completed an airborne magnetometer and VLF survey

as well as grid controlled sampling and mapping. The magnetometer survey differentiated intrusive bodies in the southwestern portion of the claims from poorly exposed Triassic flows and sediments in the eastern portion of the claims. Several gold-copper soil anomalies were outlined in the southwestern part of the Wolverine claim group by widely spaced reconnaissance soil sampling.

The largest multi-element soil anomaly measured approximately 1.5 km x 1.0 km, including a strongly anomalous core that measures 700 m x 250 m. The soil anomalies were believed to occur along a contact of the Jurassic diorite and upper Triassic volcanic rocks.

Also in 1990, Pass Lake worked their JC property off the southeast corner of Chevron and North American Metals Wolverine property, on ground that is now partially covered by the current claims. Pass Lake collected 7 silt samples and 12 rock samples and identified a diorite to granodiorite stock intruding Triassic volcanics near the western boundary, and Tertiary to Quaternary volcanics in the eastern portion of their claims. The intrusive rocks are sericite altered, contain magnetite and are malachite stained and correlate with an airborne magnetic anomaly. Limited rock sampling near the western boundary of their claims, now within the current claims, discovered samples containing disseminated pyrite, pyrrhotite and chalcopyrite assaying up to 2,290 ppm copper.

During 1991, North American Metals completed 13 line kilometres of grid on their Wolverine 5 claim to assist in soil sampling and geological mapping of a previous copper and gold in soil anomaly. A brief trenching program was performed during late September to expose bedrock below a small coincident copper-gold anomaly.

In April 2002, the Iskut North Syndicate staked the Wolverine 1& 2 claims. No work was recorded on the claims and cash-in-lieu was paid in order to keep the claims in good standing.

In April 2004 Amarc Resources optioned the Wolverine Property from the Iskut North Syndicate and acquired the surrounding GBR claims. Amarc Resources performed a surface exploration program on the property from June to September 2004. Geological mapping, soil and rock sampling and geophysical surveys were conducted over the claim block. In total, a 60 line-kilometre grid was established, 49 line-kilometres of Induced Polarization (IP) and Magnetics (mag) geophysical surveys were conducted and 1286 soil samples were collected. This work is applied as 3 years of assessment.

In 2015 Garibaldi Resources Corp. acquired 100% interest in the claims from Divitiae Resources Ltd. and

conducted a small field program to follow up on the detailed work conducted in 2004.

Regional Geology

The Telegraph Creek area lies on the western margin of the Intermontane Belt, within the Stikine Arch, near its contact with the Coast Plutonic Complex (Figure 3). In the region, Upper Triassic Stuhini Group island arc volcanic and sedimentary rocks unconformably overlie a sequence of Paleozoic to Middle Triassic marine sediments. These rocks have been intruded by Late Triassic to Jurassic syenitic stocks and by Jurassic to Lower Cretaceous quartz diorite and granodiorite plutons of the Coast Plutonic complex.

The oldest Paleozoic rock assemblage in the Telegraph Creek area consists of Devonian to Permian limestones, argillites, cherts, volcanic and epiclastic rocks, which host the Golden Bear Mine, located approximately 35 kilometres to the west-northwest of the Golden Bear (Wolverine) property.

Unconformably overlying the Paleozoic rocks is the Upper Triassic Stuhini Group, which is mainly composed of interbedded sediments, augite andesite breccias, conglomerates and volcaniclastic rocks.

This Upper Triassic assemblage is correlative with the rocks that host the Snip Gold Mine, approximately 160 kilometres to the south.

Small, oval or round syenite, pyroxenite and orthoclase porphyry stocks, dated as late Triassic to early Jurassic (Souther, 1971), intrude mainly Stuhini Group volcanic rocks. Regionally these intrusive rocks all fall within the Stikine Arch structural domain, a regional feature along which Early Jurassic intrusive and related (island arc type) volcanic activity took place. Commonly the alkalic intrusives, including those found on or near the Golden Bear (Wolverine) property, are associated with porphyry copper-gold and/or precious metal vein systems.

The rocks of the region have been strongly deformed by folding and faulting during three main periods of deformation. The first period, of middle Triassic or earlier age, formed tight, north trending, upright antiforms and synforms. Broader second stage northwest- trending open folds were caused by east-west shortening during the Jurassic. A series of normal fault structures related to the youngest period of deformation were caused by extensional tectonics during the Tertiary. Post-intrusive deformation is characterized by regional scale vertical, north-south trending faults and shear zones. Similar structures also trend northwest to southeast.

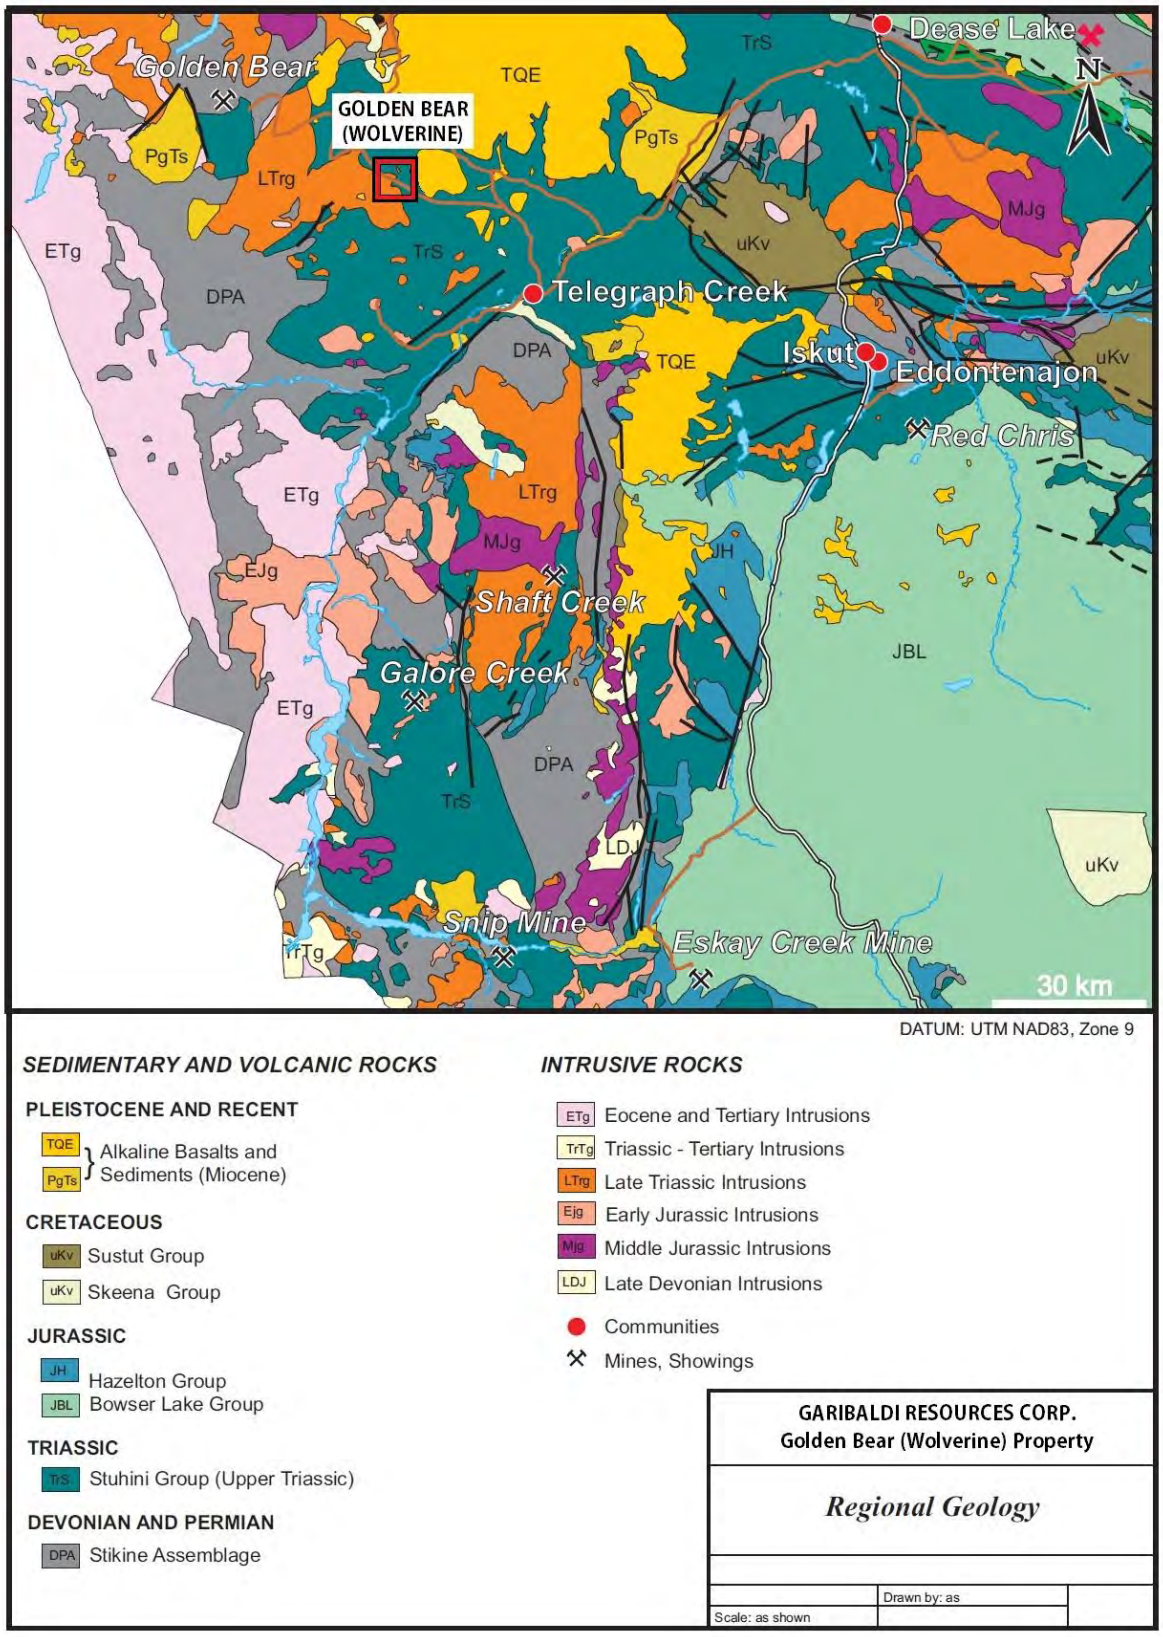

Figure 3. Regional Geology Map.

Property Geology

The property scale geology consists of Stuhini group sediments and volcanics (augite andesite breccias, conglomerates and volcaniclastic rocks) being intruded mainly as northeast oriented dykes and sills. The intrusives are predominantly of intermediate composition and appear to be related to the large diorite stock that occurs on the southwest margin and to the southwest of the property. The intrusives in general appear to follow the stratigraphic controls of the volcanics and sediments giving the overall north-south / northeast-southwest orientations.

In 2004 Jim Oliver conducted a detailed program of geological mapping in 2004 and concluded that there were 4 main types of intrusives. 1) The oldest gabbroic sills that are moderately magnetic, unaltered and contain no significant sulphides. 2) A megacrystic monzonite to monzo-gabbro with trace chalcopyrite but with insignificant alteration. 3) Hornblende diorite and quartz hornblende diorites with fine grained disseminated pyrite along fracture surfaces when near large scale fault structures. 4) The main intrusive mass in the area, a large quartz-diorite stock which exhibits primary igneous flow foliation and lacks significant tectonic fabric. In general the structural setting appears to be brittle in nature with the most apparent fault orientation cutting across the steeply dipping generally north-south oriented stratigraphic unit.

Property Mineralization

Known mineralization with appreciable copper and gold grades occur on the Golden Bear (Wolverine) property at the historic Wolverine showing (MINFILE No 104J 059). Mineralization consists of pods and or disrupted veins of massive pyrite and chalcopyrite which occur in a fault gouge cutting a microcrystalline marginal phase diorite over a mapped length of 8m. This showing yielded up to 154 g/t Gold over 0.4m width with several smaller segments yielding grades up to 16 g/t gold (ARIS report number 20945). However this was not the focus of the program.

Two separate areas with overlapping copper and gold in soil anomalies grades occur on the Golden Bear (Wolverine property); First, on the north western portion of the property over an area roughly 1.1 km long by 0.7km wide was identified by the sampling in the 2004 soil program conducted by AMARC (ARIS report number 27770). Second, on the southern most portion of the property, originally identified by Homestake in 1991, over an area approximately 1.1km by 0.8km (ARIS report number 22126). Follow up sampling during the summer of 2015 identified high grade copper mineralization in a heavily iron stained medium grained dioritic intrusive rock in the southern portion of the property (Sample GB-15-25)

Mineralization on other parts of the property occurs mainly as pyritic disseminations within the intrusive and volcanic rocks.

2015 field Program

Although know mineralization of appreciable Copper and Gold grades occur on the Golden Bear (Wolverine) property at the historic Wolverine showing, this was not the main focus of the work program. The main focus of the 2015 field program was to follow up on the large copper gold in soil anomalies identified by the historic soil sampling to try to identify larger areas with similar characteristics or grades to the historic Wolverine showing.

Two separate areas with overlapping copper and gold in soil anomalies occur on the Golden Bear (Wolverine property); First, on the north western portion of the property over an area roughly 1.1 km long by 0.7km wide was identified by the sampling in the 2004 soil program conducted by AMARC (ARIS report number 27770). Second, on the southern most portion of the property, originally identified by Homestake in 1991, over an area approximately 1.1km by 0.8km (ARIS report number 22126).

The 2015 sampling program was successful in identifying new anomalies and expanding the previously identified anomalous areas. Sampling consisted of 39 rock samples taken at widespread locations across the property, and 143 B - Horizon Soil samples taken along grid lines designed to expand the anomalous areas identified in the most recent 2004 work program. The soil lines were sampled at 50m intervals on 100m spaced lines where applicable to match existing grids on the property. Of the 143 soil samples, 98 were targeted to expand the northwest copper and gold anomalous zone, 24 targeting gold anomalies with marginal chargeability, and 21 targeting the furthest south wide spread copper and gold in soil anomaly. For complete results see the soil and rock sample maps included with Cu, Au, Pb, Zn, Mo values, and for complete list of elements see Appendix C containing all assay certificate. Locations of all samples are given in spreadsheet form on the included maps in UTM NAD 83 Zone 9 format. See Appendix A for Rock sample descriptions.

Discussion and Conclusions

The 2015 sampling program was successful in identifying new anomalies and expanding the previously identified anomalous areas. Sampling consisted of 39 rock samples taken at widespread locations across the property, and 143 soil samples taken along grid lines designed to expand the anomalous areas as

previously described in the Property Mineralization section. For complete results see the included soil and rock sample maps with Cu, Au, Pb, Zn, Mo values shown and for complete list of elements see Appendix C containing all assay certificate. Locations of all samples are given in spreadsheet form on the included maps:

It is important to note that this program was of limited duration and had to cover a large area using limited resources. Because of this no specific area was given a great deal of attention, instead the program was designed to cover as much area as possible to further refine the location for more detailed follow up work.

In general there are still 2 main areas of interest.

1) The northwestern anomaly along Wolverine Creek. Soil sampling in the northwest portion of the property identified Gold in soil anomaly of greater than 1g/t (sample # 43796). This area is directly south of the gold in soil anomaly that was historically identified by Cheveron in 1990 (ARIS 20945) and confirmed / better defined by AMARC (ARIS 27770). Due to the limited width of the anomaly and the high grade of the soil sample it is probable that this is representing a narrow high grade structurally controlled gold zone and warrants further field investigation by means of trenching.

2) The southern anomaly where two rock samples were taken from iron stained outcrop 80m apart, both with highly elevated copper values. Sample GB-15-25 assayed greater than 1% Cu (maximum analytical value for the procedure used) and 0.13g/t Au. At this time GB-15-25 has not been tested to determine total value of Cu. Sample GB-15-26 assayed 0.15% Cu with negligible gold. It is also interesting to note that the soils samples taken in this area did not show signs of elevated copper, however over 200m directly east a single soil sample assayed 0.15% Cu and .08 g/t Au. Due to the limited amount of work that was done in this area (one soil line and a total of 4 rock samples) this area warrant further follow up work in the form of additional soil sampling and bedrock mapping.

The anomalous gold in soil in the northwest potion of the property remains the highest priority target. Further expansion of the soil grid to the south would help to determine the total length of the zone enriched in gold. Further work in this area should include trenching to identify the source of the soil sample containing > 1g/t Au.

Q Quaternary Tills
Unstratified clast rich tills and related glacial fluvial deposits.
Supracrustal Rocks (Stuhini Group - mid-Triassic)
M a-l Mafic Agglomerates and Lapilli Pyroclastics
Poorly sorted coarse grained, heterolithic mafic pyroclastics. Sub- rounded to sub-angular volcanic, sedimentary and intrusive matrix supported clasts. Matrix pyroxene common, may contain flow dominant lenses, Mf
MtT Mafic Tuffs and Siltites
Well bedded pale green - grey mafic tuffs and fine grained locally quartz rich, brown weathering siltites. Sporadic graded beds.
Ct Crystal Tuffs
Crowded plagioclase phyric crystal tuffs. Plagioclase commonly exceeds 60-70% rock volume. Minor, less than 15 % hornblende and 5-8 % quartz grains. Locally well bedded.
Intrusive Rocks (mid - Triassic to Jurassic)
Gp Gabbroic Sills - Plagioclase Phyric.
Medium to coarse grained strongly plagioclase phyric sills. Locally glomeroporphyritic textural features. Calcic plagioclase phenocrysts are embayed within a fine grained green-grey matrix. Plagioclase, 1.5 - 5 mm, form typically less than 50 % rock volume.
Mh - D Hybrid Mafic Volcanic - Dioritic Intrusions (southeast map area)
Transitions between moderately plagioclase phyric light grey-green diorites and completely recystallized rocks of probable volcanic origin. Metasomatized volcanic rocks are dominated by masses of clinozoisite-feldspar +/- magnetite, no primary textures are preserved.
MG Monzo Gabbro.
Intrusive lithology dominated by calcic plagioclase. Plagiclase phenocryts frequently form mega-crysts, greater than 2.0 cm in length and forming more than 80 - 85 % of the rock volume, forming intersertal to myrmekitic textures with minor mafic mineral phases. Free quartz, <3%
GD Gabbro Diorites
Compact fine grained gabbro-diorites, reddish brown weathering surfaces. Equigranular fine (<1.0 mm) and m.g. (1-3 mm) phenocrysts phases common, occasionally gradational to gabbroic sills.
QD Quartz Diorites
Medium grained, locally foliated quartz diorites. Quartz averages 5- 10 % rock volume. Hornblende and biotite average 15-20 % rock volume. Mafic minerals locally form a weak penetrative foliation surface. Calcic plagioclase, 60% - 65%. Magnetite 3-5%. Well developed contact aureoles for 100 - 200 m external to the QD - supracrustal
Dh Hornblende Porphyritic Diorites
Fine to medium grained, grey to cream weathering hornblende porphyritic diorites. Hornblende lathes occupy 15% rock volume, pyroxenes less than 5%. Generally good magnetite response, 2-3% magnetite. Commonly plug significant fault zones, fracture controlled pyrite +/- trace chalcopyrite sulphide phases noted proximal to major fault zones. A single phase of this rock may has have elevated quartz contents, Dqh, and becomes gradiation to quartz diorites. A Variation of this unit is MD Monzo Diorites
Orange buff weathering, locally iron carbonate altered, fine to medium grained plagioclase and potassium feldspar rich monzo diorites
uD Micro Diorite
Very fine grained light buff weathering diorites. Homogeneous, minor 2-4%, mm to sub mm feldspar aggregates.

Intrusive Rocks (mid - Triassic to Jurassic)
Gp Gabbroic Sills - Plagioclase Phyric.
Medium to coarse grained strongly plagioclase phyric sills. Locally glomeroporphyritic textural features. Calcic plagioclase phenocrysts are embayed within a fine grained green-grey matrix. Plagioclase, 1.5 - 5 mm, form typically less than 50 % rock volume.
Mh - D Hybrid Mafic Volcanic - Dioritic Intrusions (southeast map area)
Transitions between moderately plagioclase phyric light grey-green diorites and completely recystallized rocks of probable volcanic origin. Metasomatized volcanic rocks are dominated by masses of clinozoisite-feldspar +/- magnetite, no primary textures are preserved.
MG Monzo Gabbro.
Intrusive lithology dominated by calcic plagioclase. Plagiclase phenocryts frequently form mega-crysts, greater than 2.0 cm in length and forming more than 80 - 85 % of the rock volume, forming intersertal to myrmekitic textures with minor mafic mineral phases. Free quartz, <3%
GD Gabbro Diorites
Compact fine grained gabbro-diorites, reddish brown weathering surfaces. Equigranular fine (<1.0 mm) and m.g. (1-3 mm) phenocrysts phases common, occasionally gradational to gabbroic sills.
QD Quartz Diorites
Medium grained, locally foliated quartz diorites. Quartz averages 5- 10 % rock volume. Hornblende and biotite average 15-20 % rock volume. Mafic minerals locally form a weak penetrative foliation surface. Calcic plagioclase, 60% - 65%. Magnetite 3-5%. Well developed contact aureoles for 100 - 200 m external to the QD - supracrustal
Dh Hornblende Porphyritic Diorites
Fine to medium grained, grey to cream weathering hornblende porphyritic diorites. Hornblende lathes occupy 15% rock volume, pyroxenes less than 5%. Generally good magnetite response, 2-3% magnetite. Commonly plug significant fault zones, fracture controlled pyrite +/- trace chalcopyrite sulphide phases noted proximal to major fault zones. A single phase of this rock may has have elevated quartz contents, Dqh, and becomes gradiation to quartz diorites. A Variation of this unit is MD Monzo Diorites
Orange buff weathering, locally iron carbonate altered, fine to medium grained plagioclase and potassium feldspar rich monzo diorites
uD Micro Diorite
Very fine grained light buff weathering diorites. Homogeneous, minor 2-4%, mm to sub mm feldspar aggregates.

kilometers			$0.00	$0.00	
ATV			$0.00	$0.00	
fuel			$0.00	$0.00	
	Camp and Crew		$2,000.		
Helicopter (hours)	Mobilization	4	00	$8,000.00	
Fuel (litres/hour)			$0.00	$0.00	
Other					
				$8,000.00	**$8,000.00**
Accommodation & Food	**Rates per day**				
Hotel	Travel from Vancouver	4.00	$150.00	$600.00	
Camp	Canvas tent and Geostove Rental	15.00	$50.00	$750.00	
Meals	25$ per person per day (15 x 4)	60.00	$25.00	$1,500.00	
				$2,850.00	**$2,850.00**
Miscellaneous					
Telephone	Satellite Phone	15.00	$25.00	$375.00	
Other (Specify)					
				$375.00	**$375.00**
Equipment Rentals					
Field Gear (Specify)	Soil Sampling Gear	15.00	$100.00	$1,500.00	
Other (Specify)					
				$1,500.00	**$1,500.00**
Freight, rock samples					
			$0.00	$0.00	
			$0.00	$0.00	
				$0.00	**$0.00**

TOTAL Expenditures **$47,760.00**

Statement of Qualifications

I, Adrian Smith, do hereby certify that:

1. I have a Bachelor of Science Degree from Simon Fraser University (Geology);

2. I have engaged in mineral exploration since 2007, for junior exploration and mining companies and as an independent geologist;

3. I am a Licensed Professional Geoscientist with the Association of Professional Engineers and Geoscientists of British Columbia;

4. My most recent personal inspection of the Golden Bear (Wolverine) property was in August, 2015;

5. I have co-authored the report entitled "Geochemical and geological Assessment Report on the Golden Bear (Wolverine) Property". The report is based on recent work carried out and on compilation of historical data;

6. I am not independent using the definition in Section 5 of National Instrument 43-101;

7. I am the President of Divitiae Resources Ltd.;

8. As of the effective date of this Report, to the best of my knowledge, information and belief, the Report contains all scientific and technical information that is required to be disclosed to make the Report not misleading.

Signed and dated at Vancouver, British Columbia, on the 20*th* day of December 2015.

_____

Adrian Smith B.Sc., P.Geo.

APPENDIX A:

PHONE (604) 253-3158

Client: **Divitiae Resources**
1304 Steeple Dr.
Coquitlam BC Canada

Submitted By: Adrian Smith
Receiving Lab: Canada-Vancouver
Received: August 27, 2015
Report Date: September 13, 2015
Page: 1 of 3

CERTIFICATE OF ANALYSIS VAN15002199.1

CLIENT JOB INFORMATION

Project: None Given
Shipment ID:
P.O. Number
Number of Samples: 39

SAMPLE DISPOSAL

PICKUP-PLP Client to Pickup Pulps
DISP-RJT Dispose of Reject After 90 days

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PRP70-250	39	Crush, split and pulverize 250 g rock to 200 mesh			VAN
AQ201	39	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
DRPLP	39	Warehouse handling / disposition of pulps			VAN
DRRJT	39	Warehouse handling / Disposition of reject			VAN

ADDITIONAL COMMENTS

Invoice To: Divitiae Resources
1304 Steeple Dr.
Coquitlam BC
Canada

CC: Steve Regoci

BRITISH COLUMBIA CERTIFIED ASSAYER
MARCUS LAU
Geochemical Laboratory Manager

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.
