PROPERTY GEOLOGY KEYWORDS (lithology, age, stratigraphy, structure, alteration, mineralization, size and attitude):

Volcanic and Marine sedimentary rocks of the Permian-age Cache Creek Group, intruded by sill-like ultramafic bodies which hosts Ferguson and Scottie Creek mineralization. Both older rocks are overlain by extensive cover of volcanic flows and breccia's of Eocene-age, Kamloops Group. Large deposits of volcanic ash (industrial minerals Pozzolan, zeolite and Bentonite)

INTRODUCTION

The Ferguson Creek Chromite occurrences are located near its headwaters, about 15.5 km north of Cache Creek, B.C. and 3 km east of Highway 97. The showings are on a prominent bluff on the north side of the creek. Serpentized dunite and Harzburgerite are exposed in the showings. The serpentized dunite is massive and locally may have granular texture. The dunite trends northerly and has steep eastward dip. It has been traced across the creek and is inferred to continue further north and south. The rock type is exposed across 61 meters. Tilava has conducted a geochemical survey in 2007/2008 exploration seasons on the south side of the creek and successfully traced the dunite and harzburgerite southern extension. The proven and inferred (historic) resources are estimated at 30,000 tones of Cr₂O₃ of an average grade of 18% developed in an adit (1920' by Consolidated Mining and Smelting Company – Re Minfile 092 NW 035). The prospect has never been drilled.

The location of the showing coupled with low grade of the deposit, price of chromite and world wide deposits including Ontario's "Ring of Fire" rendered the Ferguson Creek Chromite only as geological curiosity. Before abandoning the project in 2016 Tilava carried a substantial exploration, both north and south of the prospect. Geochemical survey carried in 2007-2008 has successfully traced dunite and associated minerals Chromite, Nickel and Cobalt for some distance south from the Ferguson Showing however; the anomalies are erratic and relatively narrow. No anomalies were detected during the survey north of the showing.

During the 2012 and 2014 exploration season carried by Tilava over previously not surveyed north-west part of WK property Tenures No, 521739 and 521666 numerous Cu anomalies were detected in 50-250 ppm range which may represent the extension of the "Maggie Stock" which was the subject of Hunter Dickenson's

(Constantia) associated company. Constantia carried substantial diamond, including deep drilling during 2013-2015 exploration season

The purpose of 2016 survey is to establish grid and infill geochemical survey previously surveyed north-west part of WK property Tenures No.521739 and 521666, covering the ground immediately East of Highway 97 and West of Pozzolan and the Ferguson Creek showings and to delineate possible extension to the east of previously established Cu anomalies. This infill survey was necessary to confirm the validity of large Cu anomaly due to steep and numerous pick and valley terrain.

LOCATION AND ACCESS

The property is located on Ferguson Creek in south-central British Columbia (Fig. 1). The geographic coordinates of claims are 50° 57' North and 121° 23' West. NTS Map 92 I 094. Access is via Highway 97 from Cache Creek to Ferguson Creek about 15.5 km north of Cache Creek; thence 3 km east on private road connecting to logging road #5100. The second access is via Scotty Creek road and logging road #5100 (both industrial roads with estimated distance of 25 km, suitable for transportation of minerals from the claims). Western part of WK Property is accessible directly from the Hwy 97.

PROPERTY AND OWNWRSHIP

The WK Group of claims described in this report consists of 9 Tenures, all in one block, totaling 733 ha. The claims are a 100% owned by Tilava Mining Corporation and are described as follows:

Tenure No.	Hectares	Expiry Date
521739	40.72	August 20, 2017
521666	122.12	August 20, 2017
522313	81.47	August 20, 2017
522312	40.73	August 20, 2017
522150	203.70	May 30, 2018
839404	61.11	March 1, 2018
510619	101.82	August 1, 2016
1044256	61.10	May 21, 2017
1044258	20.37	May 21, 2017

TOPOGRAPHY AND PHISICAL ENVIROMEN

The Claims straddle Ferguson Creek, approximately 3 km of its confluence with Bonaparte River. Relief within Ferguson Creek Valley is high, ranging from 1250 meters in the north to less than 900 meters in the south-west. The climate is semi arid with temperature ranging between -25 and +30. The snowfall is moderate and the property is open for exploration from March to November. There is sparse to moderate growth of pine, fir, aspen and low underbrush within the claims. Past logging operations, both north and south of Ferguson Creek, have harvested large ponderosa pine and jack pine, providing road access but little bedrock exposure.

Outcrop is rare and is mainly confined to cliffs along the creek valley and the rest of claim is covered with glacial drift.

PREVIOUS WORK

The historic work was described in Minfile 092 NW 035, referring to work dating from 1920' to 1990'. The period from 1993 to 2007 is described in details in the Assessment Report for Tilava Mining Corporation by W. Kovacevic, dated December 22, 2007 (Ass. Report 29540).

The most of Tilava's exploration effort was concentrated on industrial minerals Pozzolan and Bentonite. Very large deposits of Pozzolan (additive to production of Portland cement) were mapped and chemically analyzed including the physical testing which proved suitability of Tilava's Ferguson Creek Pozzolan as admixture for hydraulic Portland cement. There are many bentonite deposits of known bentonite in British Columbia however; most of these deposits are of calcium (non swelling type) and not sodium (swelling type). The Ferguson Creek Bentonite may be classified as calcium type but, since it possesses unique swelling capabilities, it may find many applications in construction industry notably as earth liners requiring large tonnage of bentonite. The existence of Chromite on WK claims has been known since 1920' and was postulated that the known showing will continue under the cover to both north and south of the showings however, no detailed work or drilling was undertaken. During 2007-2008 exploration seasons Tilava conducted geochemical surveyed on the south side of the Ferguson Creek and successfully traced dunite and harsburgite southern extension.

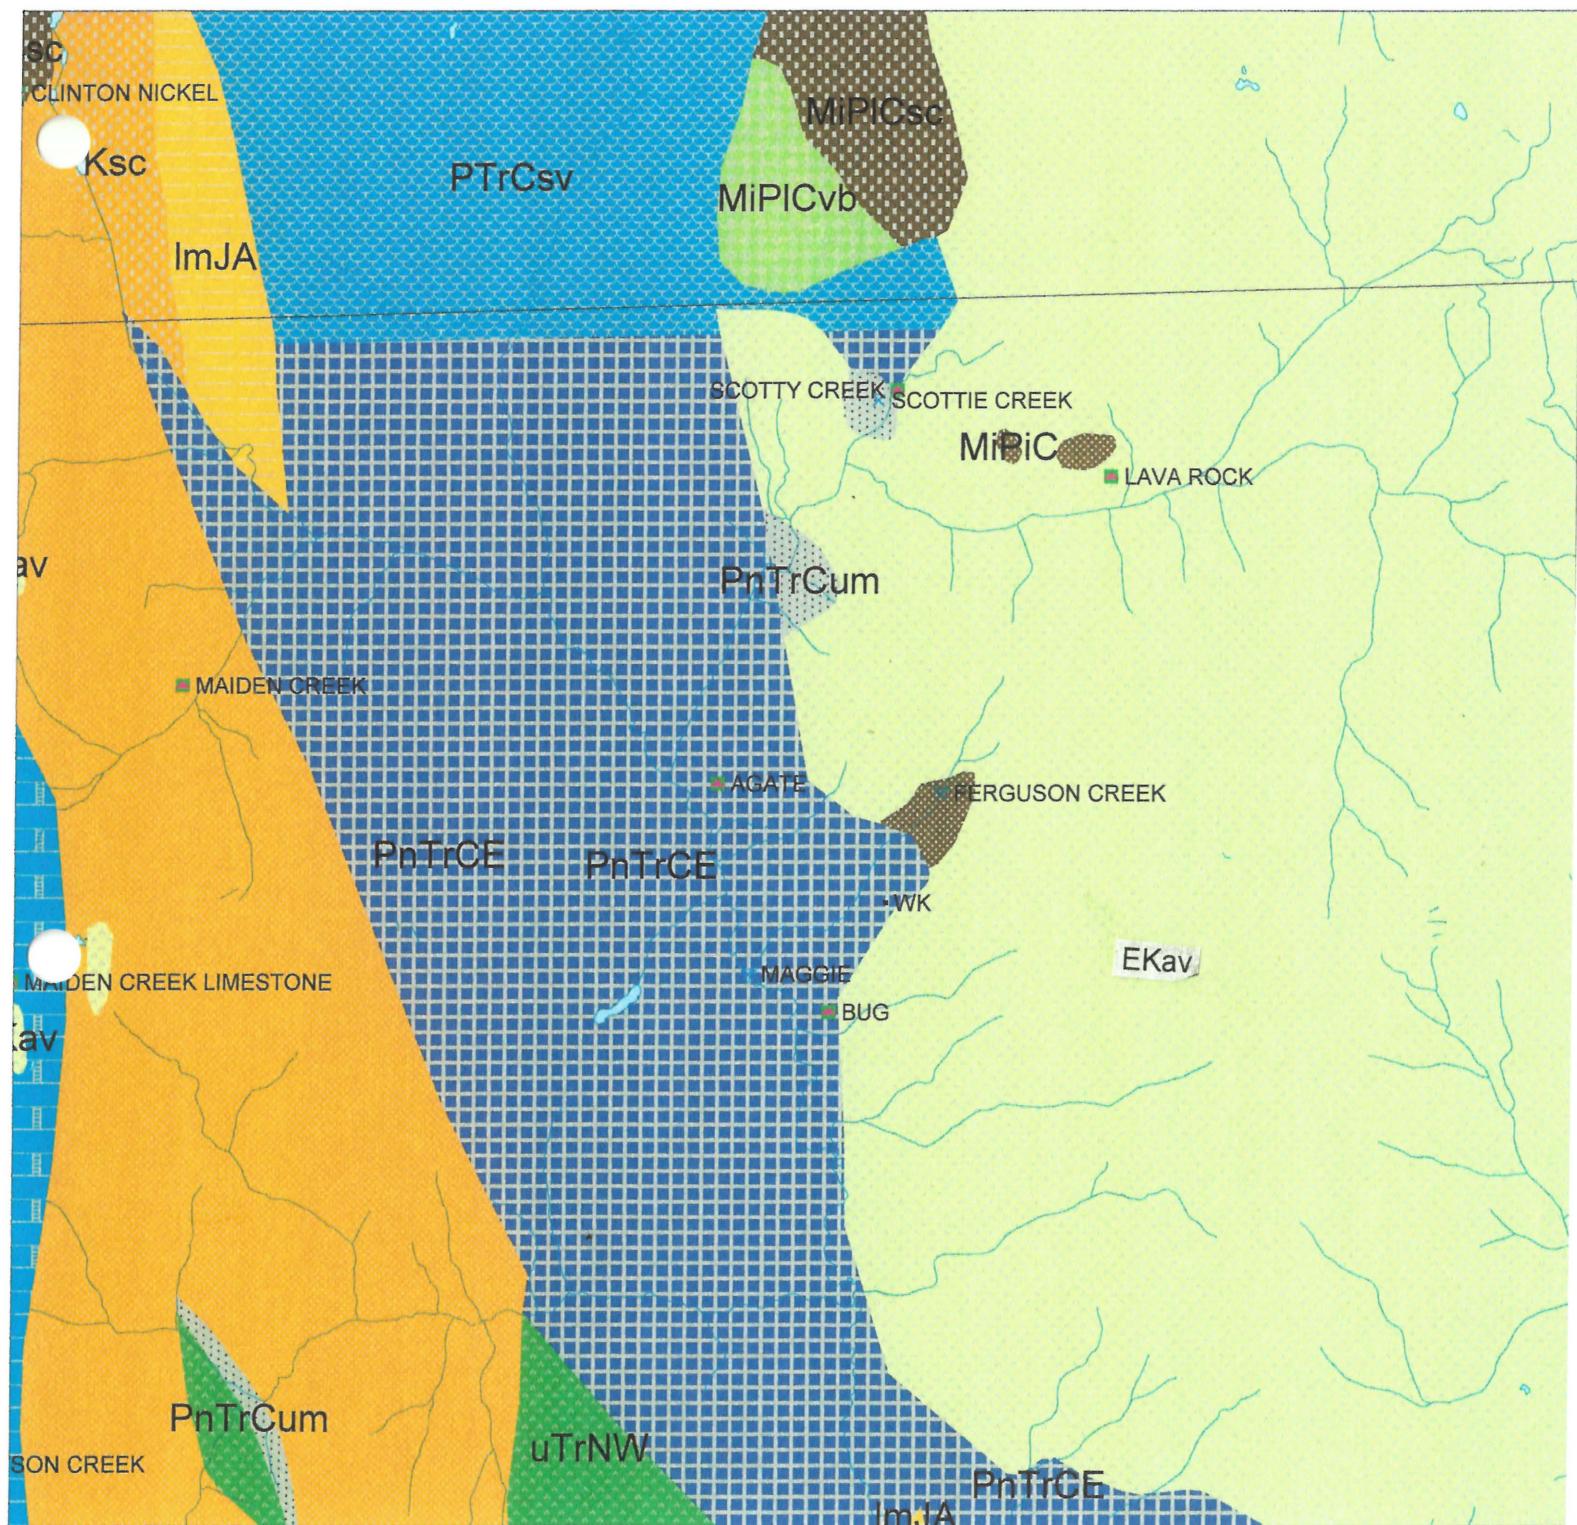

During 2009 – 2012 Tilava established grids in western part of the WK property which were geochemically surveyed (Assessment Report # 33260).

The results of the summer 2016 work is the subject of this report with the emphasis on low grade large tonnage copper and molybdenum (the Maggie porphyry copper-molybdenum type) and Nickel/Cobalt / PGM.

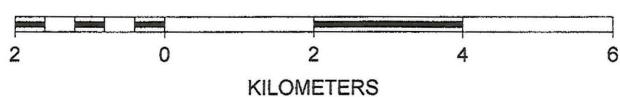

REGIONAL GEOLOGY

The claims are underlain by volcanic and marine sedimentary rocks of the Permian-age Cache Creek Group. These rocks have been intruded by sill-like ultramafic bodies which host Ferguson older rocks and nearby Scott Creek chromite mineralization. Both older type rocks are uncomfortably overlain by extensive cover of volcanic flows and breccias belonging to Eocene-age Kamloops Group.

Outcrops on the property are generally restricted to Ferguson Creek gorge. The chromite bearing ultrabasics form the rugged "hoodoo" like outcrops for over 400 meters along the north side of the Ferguson Creek. Serpentinized dunite and harzburgerite are exposed in outcrops and workings but the prospect is largely covered by thick mantle of the alluvium. The serpentined dunite is massive and locally may have granular texture. Chromite occurs as parallel layers of grains in dunitic rocks. The dunite trends northerly and has a steep eastward dip. It has been traced across the creek and is inferred to continue further north and south.

2016 EXPLORATION WORK COMPLETED

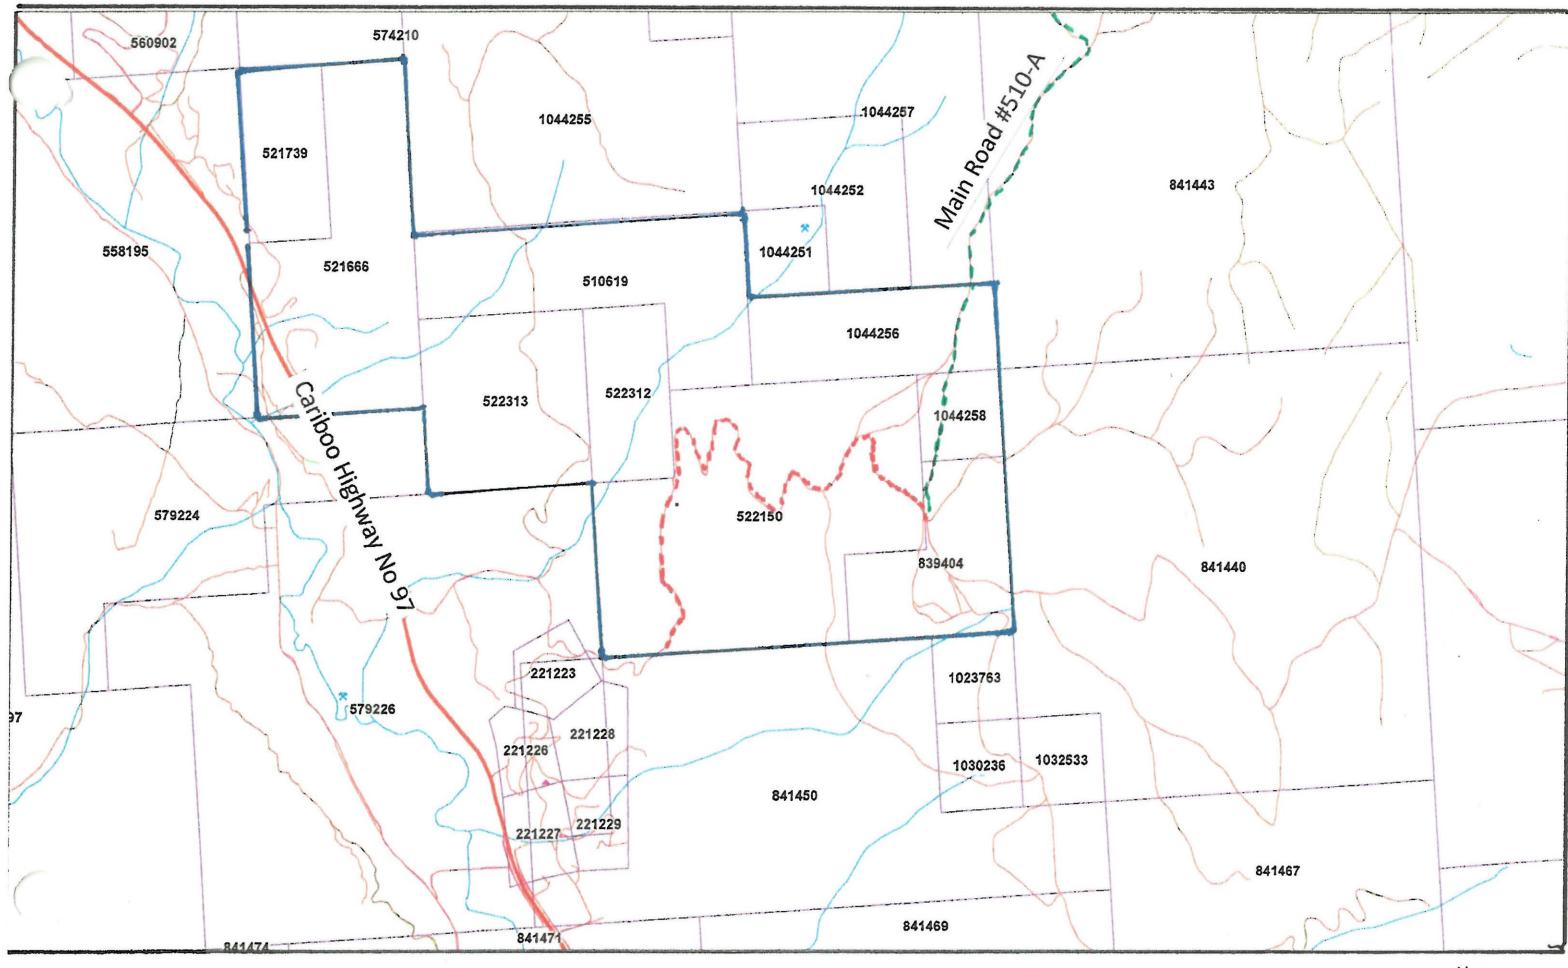

Preparatory Work

During the 2016 exploration season infill grid was established consisted of 3,100 meters of infill grid lines. The ground is basically grass land and no cutting of lines was required. All infill lines are marked with orange color flags and 25 meters stations are marked with two color flags. All lines are GPS verified.

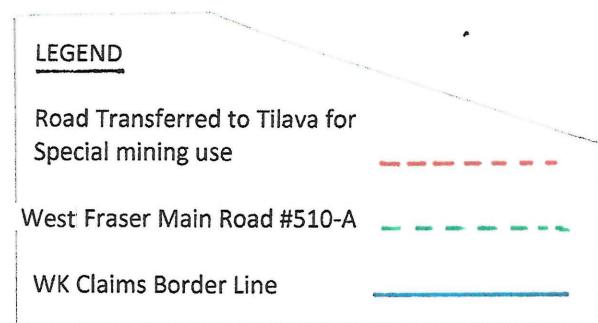

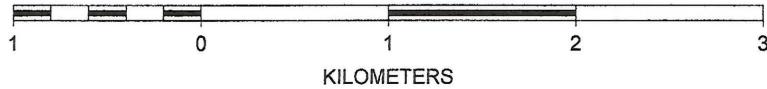

Access by Logging Road # 5100

By the agreement between West Fraser, B.C. Ministry of Forest and Tilava Mining Corporation a part of the road was transferred to Tilava to be used as special mining road access and is no longer considered to be a public road nor it will be further maintained by West Fraser. Tilava may adjust the road if required and may post gates. The road is presented in Figure 7 . The author of this report accompanied with excavator contractor Ken Bolster from Clinton B.C. visited the property on April 6, 2016 and May 6, 2016. The Mr. Bolster concluded that, in connection to the Road # 5100 the main road maintained by West Fraser, a ramp must be constructed which may include removal of some trees. Mr. Bolster, after examined the entire part of the old road from The Bentonite Mine to the gate posted by Walter Klenner from Kamloops, B.C., stated that with small repairs this part of the road well constructed and used by logging companies should be used for transportation of minerals from the Bentonite Mine. The use of this access, including the private part of it, will shorten the hauling distance from 30 kilometers to some 4 kilometers.

Tilava was in dispute with five previous private owners and Arbitration Board Order 395 by which Tilava has the right to use this part of the privately owned road under certain conditions. By arriving of Constantia (Hunter Dickenson company) the number

SCALE 1 : 40,000

Tilava Mining Corporation
WK Claims
Logging Road #5100

FIG. 7

Of private owners was reduced from five to only two since Constantia purchased certain privately held parcels. This new situation has prompted Tilava to re-examine this access road.

Tilava, by the Permit MX-3-215 has the right to extract 10,000 tons of bentonite and this was discussed by Mr. Bolster. Since known thickness of exposed bentonite above the road is 4 meters and at least 4 meters below the road, which is proven by auger drilling, Mr. Bolster Suggested that the portion of the road (app. 100 meters facing the exposed bentonite) to be moved a short distance to the west. By moving the road at least 8 meters thickness of bentonite will be available for extraction. This road adjustment will require no large expenditures nor additional permit application since this is part of Work Permit No MX-3-215.

Geochemical Survey

2016 the grid was soil sampled by Willy Kovacevic the author of this Report in part assisted with Al Harvey, prospector of Clinton, B.C. The soil samples were collected from "C" horizon at 25 meters intervals at station marked by two color flags. The samples were collected into standard kraft paper soil sampling bags and air dried in bags before shipping to ALS Lab in Kamloops, B.C. In total 92 soil samples were analyzed for 31 elements (ICP). Analytical results are stored in Appendix "A".

Copper in soil results

Copper values obtained in 2016 Geochemical Survey are similar to the value obtained in 2012 over the same ground. Out of total 92 Cu soil samples assayed –

- 56 Samples are in 50ppm to 99 ppm possible anomalous
- 24 Samples are better than 100 ppm considered to be anomalous

The 2016 Copper in Soil Map (Fig. 6) is over exposed on the 2012 Copper in Soil Map (Fig.5) for comparison.

Copper value obtained by both, 2012 and 2016 surveys, are low to moderate however the persistence of the anomaly rendered it to be valuable and credible. In combining both surveys, out of 333 samples the number considered to be possible anomalous were 176 samples and 47 samples are considered to be anomalous.

The best Cu numerical values, up to 256 ppm are located in the northwest corner of the map and the best combined Cu values are in the southwest corner of the map which area is closest to the Constantia Maggie Mine drilling area.

The area of the survey is mostly grass land with succession of grassy rounded knolls and deep galleys (Re: Photo Gallery Appendix "D"). The overburden is mostly light.

SUMMARY AND CONCLUSION

During 2011 Hunter Dickenson and associated have staked sizable group of claims renewing the interest in Maggie Mines located some 1.2 km south-west from the location of the Tilava's 2012 geochemical sampling. In 1970, drilling outlined a deposit containing indicated reserves of 181,440,000 tones grading 0.28 per cent copper and 0.029 per cent molybdenum (Maggie stock). Maggie stock does not outcrop but is projected to continue north to northwest from the Maggie Mine. During 2013-2015 season Hunter Dickenson (Constantia) conducted a series of deep diamond drilling (1,000 meter plus). Continuation of the deep diamond drilling is expected to continue.

Tilava's 2016 geochem survey has outlined low to moderate grade Cu in soil with anomalous values of 50 ppm to 256 ppm which may represent the extension of the Maggie stock, complementing and confirming the previously outlined copper anomaly however extended geochem 2014 survey indicated that the Cu anomalies do not extend east beyond the 2012 survey Cu anomalies. To the north and northeast the outlined Cu anomaly is cut by series of serpentine intrusion and the anomaly is at present about 500 x 500 meters large. The best Cu results are obtained in the southwest part of the grid which is closest to the Constantia drilling project some 800 meters to the south of WK claims giving the rise to speculation that WK ground may be extension of the "Maggie stock" presently explored by Constantia.

Statement of Qualification

I, Willy Kovacevic, of the Village of Clinton, British Columbia, DO HEREBY CERTIFY THAT I have the following prospecting and related experience:

- 1971 Completed the Canadian Securities Course (The Investment Dealers Association of Canada)
- 1972 Attended a prospecting course (hard rock) organized by the B.C. & Yukon Chamber of Mines.
- 1975-1976 Developed and shipped polymetallic ore from Adams Plateau, B.C. to Cominco (Borex Mining Ltd. Spar 1 and Spar 2 claims).
- 1976 Attended a prospecting course (placer gold recovery) organized by B.C. & Yukon Chamber of Mines.
- 1977-1978 As the President of Lorcan Resources Ltd. (VSE public company) supervised and participated in geophysical survey and diamond Drilling (Lost Cabin Mine, California), worked as diamond driller helper
- 1977-1979 Prospected and geochemically surveyed group of claims owned by Mineta Resources Ltd. (VSE public company) in Monashee Range, B.C. Prospected and geochemically surveyed in south-central B.C. for Tilava Mining Corporation (as owner).
- 1980-1983 Explored for oil and gas in USA, produced and marketed oil in Clinton County, Kentucky for Robico Investment Ltd (as owner) and for group of VSE public companies, Mineta Resources Ltd., Westam Oil Ltd and Boram Oil Ltd (as principal).
- 1983-1990 Supervised and participated in various phases of exploration of the properties owned by Star of Mineta Ltd (VSE public company) as principal (Kirkland Lake, Ontario, Adams Plateau, B.C. and the Golden Loon claims, Little Fort, B.C.)
- 1993-2016 Prospected Golden Loon Claims, Little Fort, B.C. for Star of Mineta (VSE public company) as principal and Tilava Mining Corporation as owner and WK and AW claims group, Clinton, B.C as owner mainly for Industrial minerals: Chromium, Pozzolan and Bentonite.

CERTIFICATE KL16141633

This report is for 30 Soil samples submitted to our lab in Kamloops, BC, Canada on 25-AUG-2016.

The following have access to data associated with this certificate:

WILLY TILAVA

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to - 180um and save both

ANALYTICAL PROCEDURES

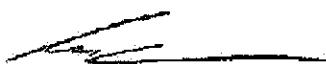

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP- AES	ICP- AES

To: TILAVA MINING
ATTN: WILLY TILAVA
BOX 372
CLINTON BC V0K 1K0

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

APPENDIX "D"

LOOKING SOUTH—Photo taken from the south end of the Baseline #2 (2012) showing HWY #97 and the hay field in background which was the center of Constantia Maggie Mine drilling (2011-1016). The distance from WK Claims is about 900 meters.

LOOKING NORTH – Photo taken from 17 Mile Ranch the site of Constantia's most northern drill holes. Note Serpentine outcrops on WK Claims in the centre background.

LOOKING NORTHEAST – showing the typical ground on which Tilava conducted Geochemical Survey (2012-2016) outlining copper anomaly.

LOOKING EAST – Photo taken from the Grid line L 250 S (2016). The appearance of Serpentine outcrop in the back ground delineating the eastern extension of cooper anomaly.

LOOKING NORTHEAST – Photo taken from the L 250 S (2016) showing the typical ground covered by Geochemical Survey (2011-2016). Note grass land and dry gullies covered by copper anomaly.

LOOKING SOUTH – Showing typical grass land on higher ground. Note the gossan outcrops in the central left of the photo which are located west and above of Maggie Mine.
