TABLE OF CONTENTS

SECTION A: REPORT

INTRODUCTION

The Fandora Gold Property covers the historic Fandora development workings on shear-controlled, mesothermal, gold (Au)-bearing quartz veins. The Property is located on the west coast of Vancouver Island, 19 km northeast of Tofino, BC and is owned by Selkirk Metals Corp. of Vancouver, BC. Following the staking of the Fandora property in 1940 a series of substantial exploration drifts were established along quartz veins hosted within basalt and andesite of the Upper Devonian Sicker Group - Nitinat Formation.

The Fandora property had not until recently been subjected to modern exploration methods as previous exploration work was primarily trenching and drifting on the known vein system. Geochemical sampling programs conducted in 2009, 2011, 2013 and 2014 identified stream catchment areas with anomalous Au values in stream sediment and inferred the presence of Au bearing quartz veins through soil geochemistry well beyond the existing exploration drifts. Multiple Au in soil anomalous trends have been identified along strike and sub-parallel to the known vein system and have identified new areas for exploration. The 2016 program was designed to build on the results of 2009 - 2014 work by targeting the newly identified anomalous Au in soil trends. The soil geochemical sampling grid, established in 2013, was extended to the southwest and northeast, along strike from the old Fandora workings, testing a series of sub-parallel mineralized vein systems and now covers 4 km of strike length.

PROPERTY:

The Fandora Gold Property is 100% owned by Selkirk Metals Corp. ("Selkirk"), a wholly-owned subsidiary of Imperial Metals Corporation. Selkirk acquired its interest as a result of its acquisition in 2007 and subsequent amalgamation in 2009 with Doublestar Resources Ltd.

The property is located 19 km northeast of Tofino, BC near the head of Tranquil Inlet on the west side of Vancouver Island (Figures FAN-16-1 & FAN-16-2) and consists of 24 mineral tenures (5 Crown granted mineral claims and 19 cell claims / 239 cells) totaling 244 units and covering a gross area of 5,119.70 ha (Figure FAN-16-3).

The details of the mineral tenures that comprise the Property are set out in Section B of this report. The "good to" dates shown are based on the Statement of Exploration and Development Work registered on Mineral Titles Online on December 8, 2016 as Event #5628686 and assume that the work contained in this report will be accepted for assessment purposes.

LOCATION AND ACCESS:

The Fandora property covers the mountain range between Fortune Channel and Warn Bay on the west and the Tranquil Creek drainage on the east immediately to the north of Tranquil Inlet on west coast of Vancouver Island, southwestern British Columbia.

Access to the Fandora property is possible by boat, fixed-wing aircraft or helicopter. Boat access is gained either from Tofino or from a barge facility at Berryman Cove, which is accessed from Highway 4 (Port Alberni-Tofino) by the well maintained West Main and Deer Bay Main Forest Service Roads. From Berryman Cove it is approximately 4.5 km across Tofino Inlet to Rankin Cove, where a well-established dock and barge facility is maintained, or 6.5 km to the head of Tranquil Inlet. Tranquil Inlet the Tranquil Creek Main Forest Service Road leads to and traverses the Fandora property. There are secondary deactivated and active forest access roads that can be used on the property. The main portal on the property, the 1500-level, was at one-time road accessible but the road has been deactivated. Helicopter flight time from the Tofino airport to the 1500-level portal is approximately 10 minutes each way and there are numerous other helicopter accessible landing sites across the property.

The property spans two NTS map sheets 92F/04E and 92F/05E and can be found on BCGS map 092F022. The approximate centre of the work area on the property lies at the 1500-level portal located at 49° 14′ 58″ North latitude and 125° 40′ 39″ West longitude with corresponding UTM coordinates being 5 458 630 N and 305 150 E (NAD 83, Zone 10).

CLIMATE, TOPOGRAPHY AND VEGETATION:

The climate of the region is classified as West Coast Marine, with mild but wet winter seasons and cool drier summers. Mean annual precipitation on the property is 3,808 mm as rain and 373 mm as snow with a mean annual temperature of 7.7°C. Summer temperatures average 14.1°C while winter temperature average 1.6°C (UBC, 2014). Temperatures are moderated by the proximity of the ocean so that prolonged periods of freezing weather are unusual, but due to the basin-like nature created by the high relief landscape colder winter periods and summer highs are amplified within the valley. Snowfall is highly variable but tends to be modest at the low elevations of the property (100 - 200 m) while higher elevations can receive substantial amounts of snow. Snow can persist on the property from November through May making it most easily worked from June through October.

The Fandora property is located in the Clayoquot Sound region of western Vancouver Island. This area is dominated by the Estevan Coastal Plain, a gently undulating terrain that has been broken into numerous islands and peninsulas by inlets and channels. Steep highly dissected rocky hills dominate much of the western edge of the Vancouver Island Mountains. The property covers an area containing steep mountainous ridges, some precipitous topography, and covers the lower reaches of the Tranquil River. Elevations range from sea level at the western and southern margins of the property to 1100 m on the northern limit and 1000 m on the eastern edge of the holdings.

The property is covered in a typical vegetation assemblage of the Coastal Western Hemlock biogeoclimatic zone consisting of thick stands of western hemlock, red cedar, amabilis fir and yellow cedar. Thick undergrowth of salal and salmonberry occurs throughout the area. Old growth vegetation still dominates the landscape but significant areas of forest land have been harvested by conventional methods at low to moderate elevations and a lesser amount of helicopter-assisted logging has been completed at higher elevations within the property boundaries and nearby areas.

HISTORY:

In the late 1800's and very early 1900's Vancouver Island and the Coastal Mainland of British Columbia saw extensive mineral exploration and mine development. The Fandora Mine and several lesser auriferous quartz veins in the Tranquil Creek and adjacent watersheds of the Clayoquot Sound were first discovered in the late 1930's. Initially, these discoveries were explored on surface by hand trenching and other limited exploration techniques. In 1940, the Fandora property was staked by E.G. Brown and P. Donahue to cover what is now defined as the Bell No 1-4 Crown Grants (Report of the Minister of Mines Report, 1947). The site was subsequently taken over by Privateer Mines, who in conjunction with Canamac Mining Company,

carried out most of the underground development on the Property. Four main adits on the 2100, 1900, 1700, and 1500 foot elevations were driven utilizing hand steel and wheelbarrows over the course of one year (Campbell, 1950). In 1947 three main properties (Goldflake, Tofino, and Fandora) were amalgamated and placed into the newly formed Tofino Gold Mining Company. For several years, the Property was heavily explored, chiefly by a series of open cuts along the strike of the high-grade zones of the Fandora vein structure. This exploration period culminated in the late 1950's with the driving of two additional exploration drifts on the 1265 and 1010 levels. As with the previous episode of mining, no substantial volumes of ore were removed for milling (H.W. Agnew, 1959).

Between 1957 and 1964 a new phase of development was initiated by a group organized by Moneta Porcupine Mines. A 35 tonne/day mill was constructed in conjunction with drift expansion on the 1500 and 1700 levels. Within these levels, several high-grade zones were stoped and connections were made by two raises from the 1500 to the 1700 levels. A full 20 man camp was constructed, as well as an access road, telegraph line, and tram line connecting the lower beach camp with the upper mining camp (Report of the Minister of Mines, 1960 and 1963).

This phase of development was the last major episode the Fandora Property saw. In the 1970's and 1980's several small conformational sampling and mapping projects were conducted but nothing more substantial. In 1998, Doublestar Resources Ltd. purchased the five Fandora Crown granted mineral claims from Phrygian Mining Corporation (formerly New Privateer Mine Limited) and in 1999 conducted a series of exploration programs which included rehabilitating the 1500 portal entrance, dewatering the 1500 level adit, the removal of 1,000 kg of Fandora quartz vein material, metallurgical testwork on the Fandora vein material and associated environmental and ARD lithological studies. Also a terrain stability program focused on re-opening the last kilometer of the Fandora access road (which had been deactivated the previous year) was conducted.

The Doublestar programs succeeded in highlighting the ease of recovery of the gold within the Fandora vein material and in initiating baseline environmental work on the Property.

Selkirk Metals Corp. acquired the property as a result of its acquisition in 2007 and subsequent amalgamation in 2009 with Doublestar Resources Ltd. Selkirk conducted silt and soil geochemical sampling programs during 2009, 2011, 2013 and 2014, the results of which are described in the Geochemical Sampling Reports dated February 23, 2010 (BC Assessment Report #31379), October 11, 2011 (BC Assessment Report #32456), February 26, 2014 (BC Assessment Report #34601) and November 22, 2014 (BC Assessment Report #35040).

REGIONAL GEOLOGY:

The West Coast of Vancouver Island is underlain by the Wrangellia Terrane, an exotic assemblage accreted to the North American Cordillera in the Mesozoic, and the West Coast Complex. The Paleozoic (Upper Devonian) Sicker Group is the oldest member of the Wrangellia Terrane and underlies all other lithologies. The Sicker Group is defined by two main assemblages of marine island-arc deposition: the Nitinat and the McLaughlin Ridge Formations.

The Nitinat Formation is dominanted by pyroxene-feldspar-porphyritic basalts and basaltic andesites. These typically occur as agglomerates, breccias, lapilli tuffs and crystal tuffs that formed as pyroclastic flows, debris flows and lahars. Pyroxene-phyric, amygdaloidal, pillowed and massive flows are also developed. The Nitinat Formation passes upwards transitionally (over a thickness of about 150 m) into the McLaughlin Ridge Formation, a sequence of volcaniclastic sediments dominated by thickly bedded, massive tuffites and lithic tuffites, interbedded with thinly bedded tuffites and laminated tuffaceous

sandstone, siltstone and argillite (Massey, 1995). Carboniferous to Permian shallow marine deposited strata of bioclastic limestone, sandstone, and shale of the Buttle Lake Group conformably overlie the Sicker Group. The unconformable Middle Triassic Karmutsen Formation volcanics (basaltic pillow lavas, flows, and breccias) complete with a suite of hypabyssal sills and dykes, lie atop. A Late Triassic shallow marine sequence of Limestone (Quatsino Formation) overlies the Karmutsen, and is in turn overlain by thinly banded units of calcareous metasediments and argillites of the Parson's Bay Formation (Gunning, 1932).

All these lithologies are unconformably overlain by the thick Bonanza Volcanic sequence. These rocks consist chiefly of variably colored (red, green, and maroon) welded to massive dacitic tuffs and pyroclastic andesites. The Bonanza units trend prevalently northwesterly and are in turn intruded by the Lower Jurassic Island Intrusions; the cause of associated regional and contact metamorphism.

The West Coast Complex lies on the extreme western margin of Vancouver Island. The Complex is composed of a chaotic assemblage of lithologies defined by melanges of Lower Cretaceous mudstones, sandstones, and cherts overlying an older Volcanic Arc Complex. The northwest striking West Coast Fault separates this Mesozoic complex from the aforementioned Paleozoic and associated rocks of the rest of the Wrangellia Terrane on Vancouver Island (Brandon, M.T., 1985).

PROPERTY GEOLOGY:

The Fandora vein system is hosted by andesites and basalts of the Nitinat Formation. These lithologies have been altered to greenstone by Jurassic plutonism including a coarse gabbrodiorite, several stages of feldspar porphyry dykes and sills and andesitic dykes (particularly in the vicinity of the Fandora mine workings) (Seraphim, 1981). These intrusive rocks are known locally as the Island intrusions. Where the intrusives are in contact with Nitnat units widespread honfelsation is common. Numerous steeply dipping fractures cut the greenstones, and trend north-northwest on average.

The Fandora vein system trends at approximately 075° and dips steeply (65°-70°) to the north. The vein pinches, swells and bifurcates, however it averages a width of 1-1.4 m. The Fandora vein system is predominantly comprised of two to three distinct veins separated by a highly sheared central andesite dyke. The vein is remarkably continuous with a strike length that has been developed (adits and opencuts) and traced on surface for over 2 km. The vein has been tested down dip for a minimum of 330 m, and it is reasonable to assume it has a far greater down dip extension. The Fandora Vein System is apparently controlled by a shear zone, and more or less parallels the described andesite dyke. However, little alteration of the country rock is evident greater than approximately 0.5 m from the vein-greenstone contact.

The auriferous Fandora vein system is dominated by quartz, is sheeted and thinly banded and contains varying amounts of brown-orange weathered carbonate (ankerite). Sulphide content ranges from 5% to 15% and includes both fine (disseminated to massive) sulphides on fracture and sheet boundaries, to coarser crystalline habits within the bull quartz of the vein itself. Observation and metallurgical testing indicates the gold in the vein system occurs chiefly as free gold contained within the quartz zones (Tse, 1999; Yee, 2006). Pyrite is the dominant sulphide present, however sphalerite, galena, chalcopyrite and arsenopyrite have been noted (Campbell, 1950).

2016 GEOCHEMICAL SAMPLING PROGRAM:

The 2016 Fandora exploration program was designed to build on the successful 2009 – 2014 campaigns utilizing soil geochemical sampling to identify additional Au targets on the property. The primary goal of the program was to continue to extend the geochemical grid to the northeast and southwest, testing for

strike extensions to the Fandora vein system. The anomalous Au in soil trends along strike and sub-parallel to the Fandora vein remained open in both directions following the 2014 program.

A team of Selkirk geologists and Ahousaht First Nation field crew visited the property between March and November 2016. A total of 8 days were spent expanding the soil geochemical grid, predominantly in June, with an additional 2 days spent prospecting the Au geochemical trends and relocating historic workings. The field team was based in Tofino for the duration of the program and accessed the claims by helicopter daily from the Tofino airport.

An additional 9 survey lines were added to the Tranquil River end of the existing grid. A control baseline (800 m at 240°) was flagged from the eastern edge of the Crown Granted claims out to the northeast at a bearing of 060°. Sampling lines were spaced 100 m apart and extended from the riverbank to the northwest (330°) for 300 – 600 m with samples of the soil B-horizon collected every 25 m. Several of the lines could not be completed to the planned 600 m length due to steep terrain with bluff sections and deeply incised drainages. The majority of these lines lie within relatively young second generation planted cut blocks with thick understory growth.

At the opposite end of the geochemical grid, sampling within the Virge Creek drainage amounted to 4 northwest (330°) oriented lines, 600 m long and spaced 100 m apart with samples collected every 25 m. Due to the steep topography and non-optimal positioning of the 2013 – 2014 baseline in this area of the property, a new baseline (240°) was flagged at the northwest end of the 2016 sampling lines to more easily target extensions to the Fandora vein at mid elevations within the Virge Creek basin.

One reconnaissance soil geochemical line was sampled from the northern edge of the Crown Granted claims 600 m northwest to the ridgeline above the Fandora mine. This was the first line completed in this part of the property to test for additional Au-bearing veins northwest of the Fandora vein system. The Report to the Minister of Mines 1946 (p. 188) notes that additional quartz veins have been found about 1400 ft (425 m) northwest and north of the Fandora workings.

Rock chip samples (14) of prospective quartz veins encountered throughout the course of the program were collected across the property. All rock and soil samples were submitted to Bureau Veritas for geochemical assay.

Geological reconnaissance and prospecting on the claims successfully relocated and surveyed the majority of the known adits developed as the Fandora and Gold Flake mines. The portals developed as the Fandora 2100, 1900, 1700, 1500 and 1265 levels were all relocated and surveyed using handheld GPS (Table 1). The 1400 or Lower Craig level and 1010 level portals were not re-located this season, but locations for both have been estimated from historic plans. An old cut trail still remains evident both above and below the 1500 level portal linking the historic workings. With the exception of the 1500 and 2100 levels, all adit entrances are caved and no longer accessible. As previous authors have noted, the upper Fandora workings are located within a shallow gully-like feature presumably resulting from preferential weathering of the Fandora shear zone. It is likely that this feature is recognizable elsewhere on the claims.

The Gold Flake adit is located in the upper reaches of Gold Flake Creek within a portion of the property characterized by tall bluff sections. This creek is dry during summer months and forks 100 m below the workings, which are located on the east side of the western fork. The adit remains open and the partially stoped vein structure is visible cross cutting the slope.

Table 1. Fandora and Gold Flake Mine workings

Working	Level	Easting NAD83_10	Northing NAD83_10	Elevation (m-GPS)	Elevation (ft-original)	Date Located	Comments
Fandora	2100' Level	304934	5458471	670	2121	23-Nov-16	Timbered entrance in narrow gully, remains open
Fandora	1900' Level	305022	5458529	614	1900	23-Nov-16	Timbered entrance in narrow gully, caved
Fandora	1700' Level	305081	5458578	577	1698	23-Nov-16	Caved entrance in narrow gully, rail tracks, ore cart
Fandora	1500' Level	305150	5458636	504	1533	23-Nov-16	Adit reamins open, terminus of upper access road, heli pad
Fandora	1400' Level/Lower Craig	305226	5458652	470	1404	-	Estimated location from historic plans
Fandora	1265' Level	305418	5458757	431	1265	23-Nov-16	Collapsed inclined adit, vein visible @ approx 065/75N
Fandora	1010' Level	305604	5458885	360	1010	-	Estimated location from historic plans
Goldflake	Goldflake Adit	304257	5458098	760		11-Oct-16	Goldflake Creek, on east side of upper western fork, adit remains open

Results from the 2016 soil geochemical sampling (Figures FAN-16-4, 5, 6, 7 & 8) identified anomalous Au in soil values within both the Tranquil River and Virge Creek grid extensions. Within the Tranquil River grid coverage spot highs were in general weaker than within the earlier grid coverage, but still appear to be correlated along linear trends. Assay results from the 2016 soil geochemical coverage of the Virge Creek area show isolated Au spot highs, but these do not correlate well with the interpreted Fandora vein trend. The soil geochemical line completed to the northwest of the Fandora workings returned only one sample with weakly elevated Au.

Rock chip sampling during 2016 identified low level Au anomalism (~230 ppb) in quartz veins at the northeast end of the Tranquil River sampling grid (1700N+325W). This veining was exposed in cliffs interpreted to lie approximately 75 m into the footwall of the Fandora vein structure. **Sampling of quartz vein material from the Gold Flake dump and within the gully immediately down slope returned values up to 68.1 g/t Au and 11.4 g/t Ag. The 4 mineralized samples collected averaged 30.4 g/t Au and 4.8 g/t Ag**. High grade Au-bearing samples from the Gold Flake workings were from a quartz vein up to 8 cm wide with epidote alteration, up to 2% disseminated pyrite and trace arsenopyrite hosted in andesite volcanics.

CONCLUSIONS:

The anomalous Au geochemistry in soils across the property continues to confirm that the Fandora vein system extends well beyond the historic workings. Along the anomalous Au trend interpreted to represent the Fandora vein, soil values range from 50 to almost 1700 ppb Au.

It appears that the 2016 program may have closed off the Fandora vein within the Virge Creek basin. The last 5 lines (500 m) at the southwest end of the grid show no sign of Au anomalism along the interpreted Fandora vein trend. This corresponds with a change in bedrock lithology to granodiorite and diorite as indicated by regional BCGS mapping and confirmed during sampling on the southern side of Virge Creek. It appears likely that the contact between these intrusive rocks, assigned to the Early to Mid Jurassic Island Intrusive Suite, and the Upper Devonian Nitinat Formation volcano-sedimentary rocks marks the southwest limited of the Fandora vein system. The linear Au anomalism interpreted to represent the Fandora vein has been traced 2,100 m southwest of the 1500 level portal.

The Fandora vein continues to remain open to the northeast within the Tranquil River valley. Not all lines completed in this area during 2016 were able to cross the interpreted location of the vein structure. The northernmost anomalous sample interpreted to lie on the Fandora trend occurs at 1500N+375W although an unusual incised gully occurs between 1700N+400W and +425W that is thought the be the weathered

surface expression of the Fandora vein structure. This incised gully lies 1,200 m along strike to the northeast of the 1500 level portal and no sampling has yet been completed beyond this point.

Sampling of vein material from the Gold Flake workings confirms that high Au grades are still evident within the Fandora vein system 1,000 m southwest of the 1500 level portal. It is not yet clear as to whether the mined Gold Flake vein occurs on the same structure as the Fandora vein, or if it is located (approximately 50 m southeast?) in the footwall of the Fandora structure.

There are several anomalous Au trends within the Fandora geochemical grid. While these do not appear to be as extensive as that of the Fandora vein trend, strongly anomalous Au values do occur on these sub-parallel geochemical trends. At least two auriferous veins were explored within the Fandora mine workings and it seems highly likely that there are additional Au-bearing veins on the property. Surface follow up of these geochemical anomalous trends is difficult due to the likely narrow (<0.5 m) veins, steep terrain and/or limited bedrock exposure. Drill testing will likely be the most effective method to locate these sub parallel mineralized veins.

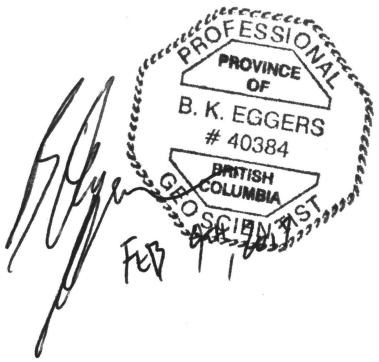
RECOMMENDATIONS:

The auriferous Fandora vein structure has now been identified along 3,300 m of strike length and while an estimate of grade continuity cannot be made from soil geochemistry, this grid sampling method has proved very effective for locating the Fandora mineralized structure and other geochemically anomalous trends interpreted as additional Au-bearing veins.

Soil geochemical surveying will continue to be an effective tool for exploration on the Fandora property and should be used to continue to trace the Fandora vein structure to the northeast. Additional prospecting along this interpreted structure is still warranted in order to confirm the surface expression of the vein.

Drill testing of the Nitinat Formation host sequence should be undertaken, initially from the existing access road, to target the Fandora vein between the Gold Flake and Fandora mine workings. A minimum of 3 relatively flat diamond drill holes (600 – 800 m) should be completed along 700 m of strike length as a first pass program for a total of 2,400 m of drilling. It is highly likely that there are a series of stacked Au-bearing veins either side of the Fandora vein structure. The mine access road would require reactivation in some form prior to drilling to reduce the need for and cost of helicopter support.

Respectfully submitted,



Benjamin Eggers, P.Geo.
Blackbird Geoscience Ltd.

STATEMENT OF QUALIFICATIONS:

For: Benjamin Eggers of 321 Olsen Road, Tofino, British Columbia.

I am a Consulting Geologist and Director of Blackbird Geoscience Ltd. with offices at 321 Olsen Road, Tofino, British Columbia V0R 2Z0;

I graduated from the University of Otago, New Zealand with a Bachelor of Science Degree with Honours in Geology (2004) and have been practicing my profession as a geologist in mineral exploration and mining continuously since graduation;

I am a registered member in good standing as a Professional Geoscientist with the Association of Professional Engineers and Geoscientists of British Columbia (Licence #40384);

The observations, conclusions and recommendations contained in this report are based on supervision of the described program, field examinations and the evaluation of results of the exploration program completed by the operator of the property.

CERTIFICATE OF ANALYSIS VAN16001017.1

CLIENT JOB INFORMATION

Project:	FANDORA
Shipment ID:	FAN2016-01
P.O. Number	
Number of Samples:	8

SAMPLE DISPOSAL

DISP-PLP	Dispose of Pulp After 90 days
DISP-RJT	Dispose of Reject After 90 days

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PRP70-250	8	Crush, split and pulverize 250 g rock to 200 mesh			VAN
AQ201	8	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
DRPLP	8	Warehouse handling / disposition of pulps			VAN
DRRJT	8	Warehouse handling / Disposition of reject			VAN

CERTIFICATE OF ANALYSIS VAN16002358.2

CLIENT JOB INFORMATION

Project: FANDORA
Shipment ID: FAN2016-02
P.O. Number
Number of Samples: 38

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
Dry at 60C	38	Dry at 60C			VAN
SS80	38	Dry at 60C sieve 100g to -80 mesh			VAN
AQ201	38	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
DRPLP	38	Warehouse handling / disposition of pulps			VAN

ADDITIONAL COMMENTS

Version 2: SS80, AQ201 for Sample 400N-1325W & 400N-1350W included.

AQ300, AQ200

Package Description	Geochemical aqua regia digestion
Sample Digestion	HNO3-HCl acid digestion
Instrumentation Method	ICP-ES (AQ300, AQ200), ICP-MS (AQ200)
Legacy Code	1D, 1DX
Applicability	Sediment, Soil, Non-mineralized Rock and Drill Core

METHOD DESCRIPTION:

Prepared sample is digested with a modified Aqua Regia solution of equal parts concentrated HCl, HNO3 and DI H2O for one hour in a heating block or hot water bath. Sample is made up to volume with dilute HCl. Sample splits of 0.5g are analyzed optional 15g or 30g digestion available for AQ200.

Element	AQ300 Detection	AQ200 Detection	Upper Limit

V*	1 ppm	2 ppm	10000 ppm
W*	2 ppm	0.1 ppm	100 ppm
Zn	1 ppm	1 ppm	10000 ppm

* Solubility of some elements will be limited by mineral species present. ^Detection limit = 1 ppm for 15g / 30g analysis.

Limitations:

Au solubility can be limited by refractory and graphitic samples.

SECTION E: SAMPLE LOCATIONS

Coordinate locations recorded in UTM NAD83 Zone 10.

Historic Workings Locations and Descriptions

Working	Level	Easting NAD83 10	Northing NAD83 10	Elevation (m-GPS)	Elevation (ft original)	Date Located	Comments
Fandora	2100' Level	304934	5458471	670	2121	23-Nov-16	Timbered entrance in narrow gully, remains open
Fandora	1900' Level	305022	5458529	614	1900	23-Nov-16	Timbered entrance in narrow gully, caved
Fandora	1700' Level	305081	5458578	577	1698	23-Nov-16	Caved entrance in narrow gully, rail tracks, ore cart
Fandora	1500' Level	305150	5458636	504	1533	23-Nov-16	Adit reamins open, terminus of upper access road, heli pad
Fandora	1400' Level/Lower Craig	305226	5458652	470	1404	-	Estimated location from historic plans
Fandora	1265' Level	305418	5458757	431	1265	23-Nov-16	Collapsed inclined adit, vein visible @ approx 065/75N
Fandora	1010' Level	305604	5458885	360	1010	-	Estimated location from historic plans
Goldflake	Goldflake Adit	304257	5458098	760		11-Oct-16	Goldflake Creek, on east side of upper western fork, adit remains open
