## 1.0 Summary/Introduction

The two claim Triple 9 claim group (“Property”) covering an area of 717.22 hectares, is located 343 kilometres northeast of Vancouver, 95 kilometres northeast of Merritt, and six kilometres north of Sicamous in the Kamloops Mining Division of south-central British Columbia.

The Property is within 11 kilometres of Sicamous which is located on the Trans-Canada Highway and on the main line of the Canadian Pacific Railroad.

As indicated by the BC government supported MapPlace geological maps, the Property is entirely underlain by Upper Proterozoic to Paleozoic Eagle Bay Assemblage of greenstone, greenschist, metamorphic rocks.

Peripheral to, and included within the Property are four mineral prospects and/or showings and two sedimentary/quartzite/silica sandstone deposits; one of which was a former producer of silica. On the Property, a quartzite band is 9.1 to 12.2 meters thick, dipping at the shallow angle of 10°, with assays of grab samples from all the workings analyzing 97.28% SiO<sub>2</sub>.

The Property history includes an 1897 Minister of Mines Report which states that reported assays "averaging \$29.62 per ton gold and as high as \$698 per ton gold in a vein 50 feet wide and not less than 3,000 feet in length." In addition, numerous surface and underground workings including an adit 91 metres in length that explore skarn zones and quartz breccia zones.

On the Property reported mineralization is commonly of pyrrhotite and chalcopyrite associated with a quartz breccia. This mineralization is indicated to come from north-northeast trending zones up to 7.6 meters wide at the Bluenose (South) prospect. At the Bluenose (Upper) prospect a 425 metre NNE trending mineralized structure is indicated by a

magnetometer high zone with the anomalous zone waning to the NNE.

The prospecting program started from July 1<sup>st</sup> 2017 to Sept 13<sup>th</sup> 2017 for 3 trips total to the property. The purpose of the program was to ascertain the potential of the high grade gold assays stated from the historical results as written in the 1897 report. Steep terrain was one factor that made it somewhat difficult to get to some locations. 500 feet of rope was purchased to descend down to the lower Adit on one occasion. Two new showings were discovered by means of digging in a ravine and one was found by a fallen tree exposing mineralization. The vein was traced in one location 700 meter to the north of the schaft and Adit but was float downslope from the cliffs above. The terrain makes it very difficult to sample the vein since it is in a cliff. Most of the samples were concentrated around the upper schaft where it is most easily accessible to sample the structure. The program was not successful in finding the high grade gold from historical reports. Gold grades were typically quite low. This may be due to the schaft being filled with water and sampling the vein at depth was not possible due to the terrain and no accessibility to sample the schaft at depth. All of the Assays were analysed for gold only, a total of 17 samples were submitted for fire assay and gravimetric finish at two laboratories.

## 2.0 Location

The Property is located within BCGS Map 082L.085/.095/.096 of the Kamloops Mining Divisions, 343 kilometres from Vancouver, 95 kilometres from Merritt, 28 kilometres northeast of Salmon Arm, and six kilometres north of Sicamous. The centre of the work area is at 5639473N 356871E (NAD 83).

## 2.1 Location Map

Figure 1. Location Map

## 2.2 Claim Location Map

(From MapPlaza & Google)

### 3.0 Claim Status/Property Ownership

Tenure	Type	Claim Name	Good Until (HA)	Area
1052831	Mineral	Triple 9	2019/03/25	580.34
1052827	Mineral	Triple 9	2019/03/25	136.88
			Total	717.22

The property is owned 50 percent by the author FMC number 141575 and 50 percent by Guy Delorme FMC number 106466.

### 4.0 Accessibility/Climate/Local Resources/Infrastructure and Physiography

From Sicamous, which is on the Trans-Canada Highway, the Property is accessed by a network of logging roads taken northward for 11 kilometres to the southeastern border of Tenure 1029937.

The region is situated within the dry belt of British Columbia with precipitation about 551 mm between 25 and 30 cm per year.

Temperatures during the summer months could reach a high of 35° and average 27°C in July with January highs averaging -1.5°.

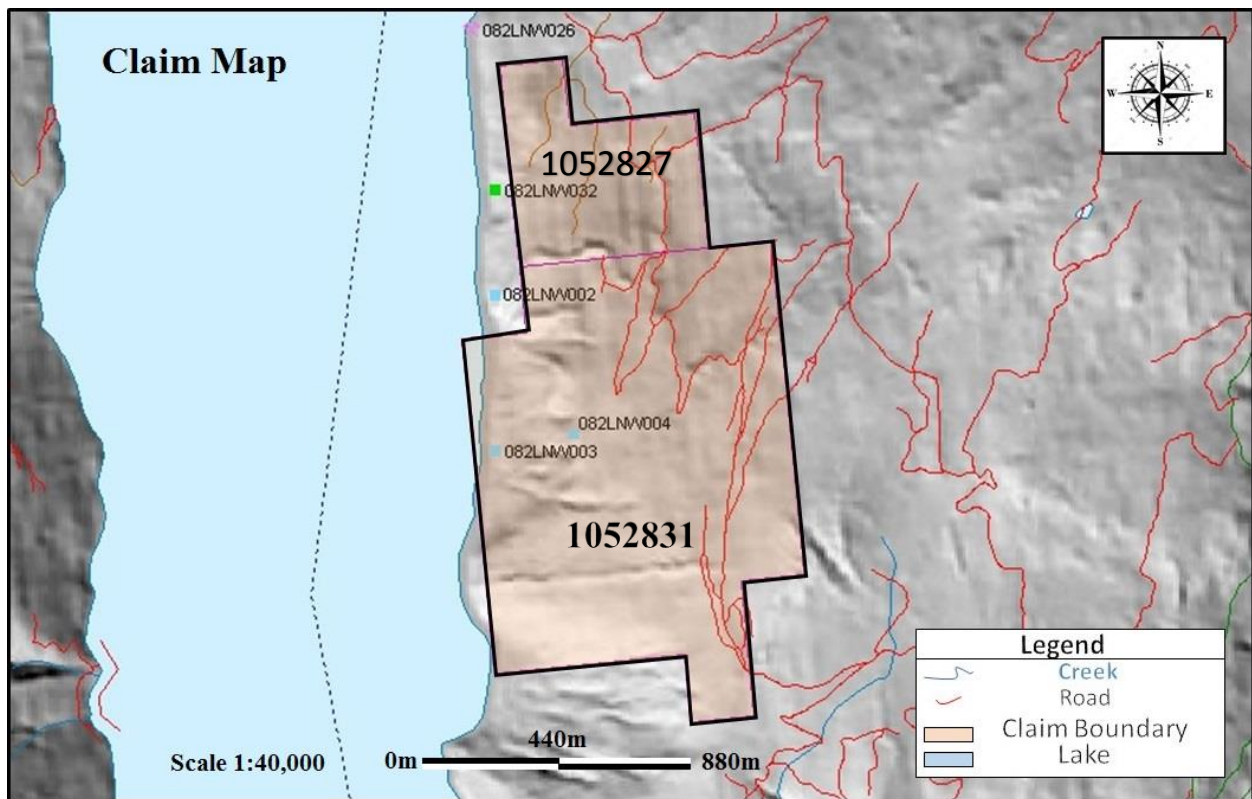

Revelstoke, Kamloops, and/or Sicamous, could be a source of experienced and reliable exploration and mining personnel. Kamloops is serviced daily by commercial airline and is a hub for road and rail transportation. The Canadian Pacific Railroad main line is within five kilometres of the Property.

Vancouver, a port city on the southwest corner of, and the largest city in, the Province of British Columbia is three hours distant by road and less than one hour by air from Kamloops.

The Property covers a forested area with occasional clear-cut areas. The topography is moderate too steep with elevations ranging from 356 metres at Shuswap Lake to 1,375 metres at the southeastern boundary.

## 5.0 Claim Map

## 6.0 History/Property Area

The history of the mineral MINFILE reported, prospects and showings peripheral to the Triple 9 Claim Group are reported as follows.

### **BLUENOSE (NORTH) Prospect (Cu Skarn)**

*MINFILE 082LNW002*

*200 metres west*

*The North zone is about 91 metres above the lake and is poorly exposed over a length of 91 metres by several pits, cuts and trenches.*

*1897: Reported assays averaging \$29.62 per ton Au and as high as \$698 per ton gold in a vein 50 feet wide and not less than 3,000 feet in length. (1897 Minister of Mines Report).*

### **BLUENOSE (SOUTH) Prospect (Skarn)**

*MINFILE 082LNW003*

*Within Tenure 1029684*

*The South zone, about 61 metres above the lake, is exposed by two cuts, a shaft and an adit reported to be about 76 metres long.*

*About 122 metres south of the main showing, two adits are driven into paragneiss and are both about 15 metres long.*

### **BLUENOSE (NORTH) Prospect (Cu Skarn)**

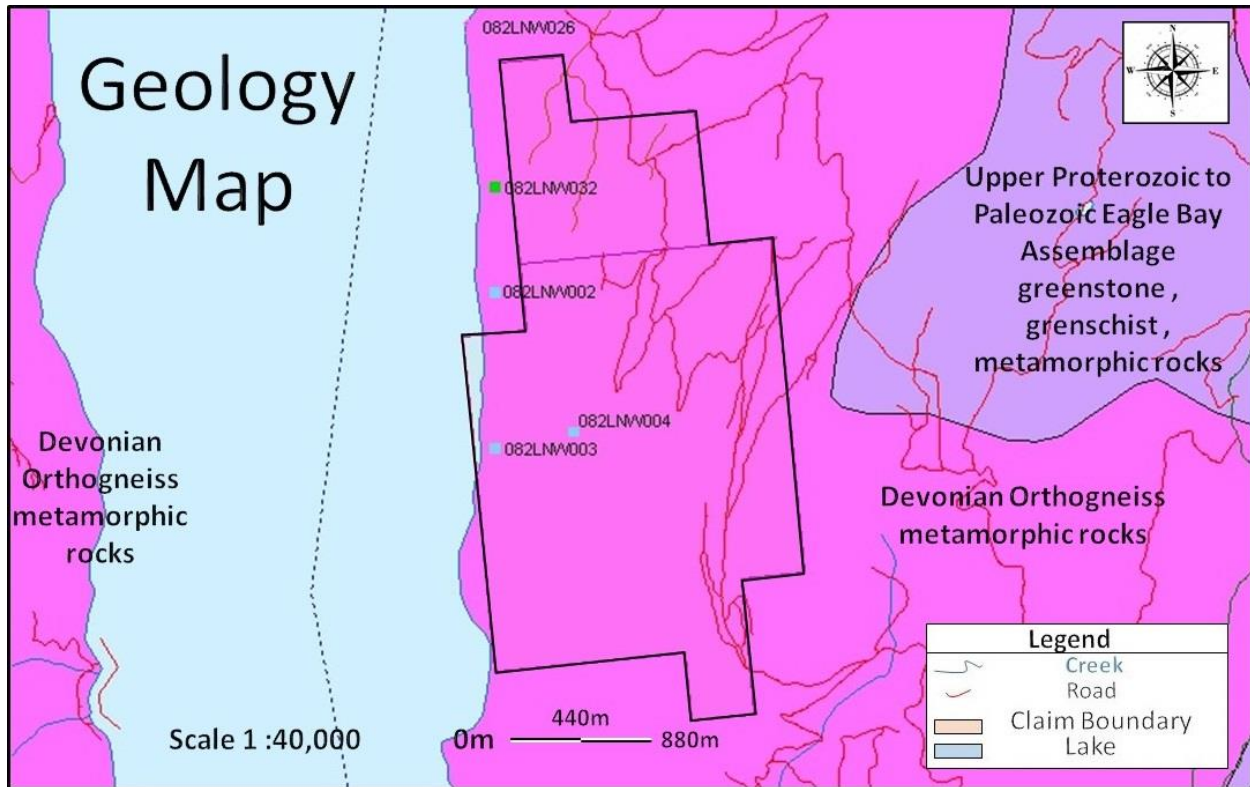

*MINFILE 082LNW002*

*200 metres west*

*The Bluenose property is underlain by rocks of the Hadrynian? to Paleozoic Eagle Bay assemblage. These comprise quartzite, marble, hornblende-rich skarn and pink to grey paragneiss. In general, bedding or gneissosity dips at low angles to the east. The rocks are highly*

*deformed and minor tight folds are very abundant. The North zone is about 91 metres above the lake and is poorly exposed over a length of 91 metres by several pits, cuts and trenches. It occurs in a hornblende-garnet? Skarn with limy sections. Pyrrhotite and chalcopyrite are irregularly distributed over a width of at least 6 metres, with some fairly massive sections. A pit, about 30 metres southwest of the main trend of workings, contains abundant malachite and minor chalcopyrite in a hornblende-rich skarn. Coarsely porphyritic dikes trending slightly east of north and dipping steeply, cut paragneiss about 61 metres above this showing.*

**CERTIFICATE KL17152242**

This report is for 3 Rock samples submitted to our lab in Kamloops, BC, Canada on 24-JUL-2017.

The following have access to data associated with this certificate:

CHRISTOPHER DELORME

**SAMPLE PREPARATION**

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test

**ANALYTICAL PROCEDURES**

CERTIFICATE COMMENTS	
	<b>LABORATORY ADDRESSES</b>
Applies to Method:	Processed at ALS Kamloops located at 2953 Shuswap Drive, Kamloops, BC, Canada. CRU-31 CRU-QC LOG-22 PUL-31 PUL-QC SPL-21 WEI-21
Applies to Method:	Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada. Au-GR22

## 13.0 Discussion of Results

The 2017 geochemical survey was unsuccessful in finding historical grades and widths from previous historical files for gold Mineralization.

## 14.0 Conclusions and Recommendations

The 2017 program was difficult to fully ascertain the full potential of the property. Terrain made it difficult to trace the vein which is in a cliff for several hundred meters or more. Samples taken near the schaft and on top of the cliff could have been very close to the desired target but from previous reports they indicate the samples were taken at the bottom of the schaft which is currently filled with water. Copper mineralization was observed in several samples but not assayed for additional elements. There is a possibility of the nugget effect from the rock samples, a whole rock assay of choice sampling could be utilised in the future. A 31 element ICP is recommended for the pulps in the total amount of samples sampled for gold to determine the alteration characteristics of the rocks and the potential of other minerals since widespread mineralization was observed. Hiring someone with experience with rappelling or rock climbing is also recommended to get true values from the vein. The bottom adit appeared to have been driven to make an easier means of method to mine the above schaft due to the nature of the vein. A drone may also be used in the future to map the vein in greater detail. Hand trenching in some of the zones may be useful in finding more mineralization that is under vegetation.

## 15.0 Authors Qualifications

The author has spent over 20 years in the exploration industry. Work related experience has been over the past 20 years or more, staking mineral claims in the USA and Canada, conducting or working on the crew of geophysics with methods of VLF, Magnetometer, Induced Polarization and Self-Potential Survey's. Conducted numerous soil sampling surveys and also line cutting. I have also worked on over 15 different types of diamond drills, have experience in roadbuilding and heavy equipment operation, completed reclamation requirements on mineral properties, researching mineral properties, evaluating data, prospecting and report writing and preparation as well as permitting and first nation consultation. The Author has also worked on an operating mine from weighing in the trucks of ore to final stages of shipping the ore.

## 16.0 Cost Statement
