## 1.

## INTRODUCTION

This report describes the exploration completed in 2017 on the group of mineral tenures referred to as the Honeymoon Property (the “Property”), located in southeast British Columbia (Table 1). The tenures are currently held by SolidusGold Inc. A statement of work has been filed with respect to the exploration described in this report (Event Number 5677552).

Dahrouge Geological Consulting Ltd. was contracted to perform exploration on the Property in 2017. The field program was completed in mid-August and focused on the western portion of the Property, near the Lucky Bear and NSP showings. Exploration in 2017 consisted solely of ground magnetic surveying for confirming known showings and identifying potential new metalliferous zones in the subsurface. The area of exploration lies within the traditional territory of the Simpcw First Nation.

### 1.1 GEOGRAPHIC SETTING

#### 1.1.1 Location and Access

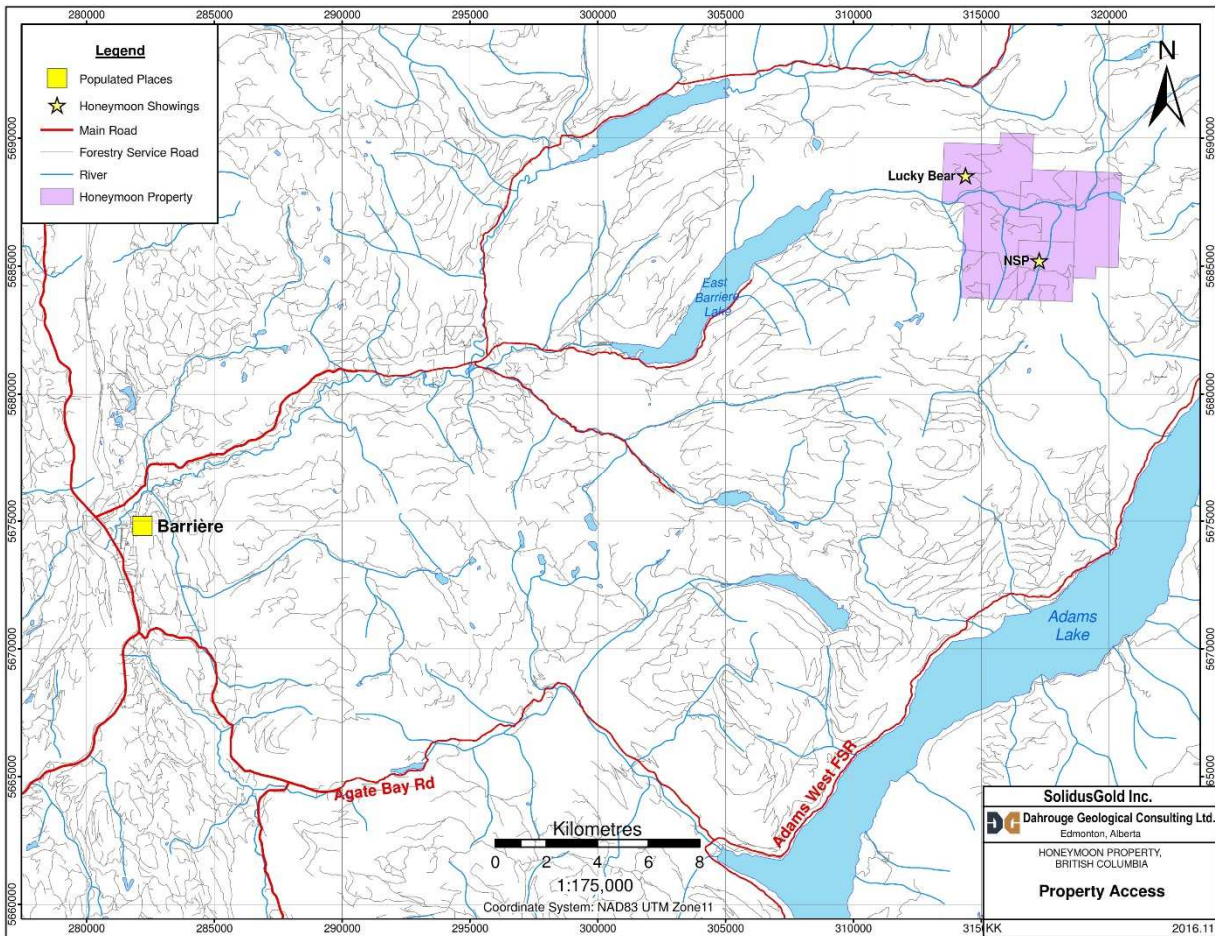

The Honeymoon Property is located approximately 35 km east-northeast of Barriere, BC. Barriere is 66 km from Kamloops via Highway BC-5 N. From Barriere, the northern portion of the Property is best accessed via the Barriere Lakes Road, connecting to East Barriere Lake Forest Service Road. The southern portion of the Property may be accessed via the Agate Bay Road, connecting to Adams Lake West Forest Service Road.

Local access throughout the Honeymoon Property is by an extensive network of four-wheel-drive logging roads, branching off from East Barriere Lake Forest Service Road and Adams Lake West Forest Service Road. Trails and roads that were no longer suitable for truck access were traversed on foot.

Figure 1. Location Map

**Figure 2. Property Access**

### 1.1.2 Topography, Vegetation and Climate

The Honeymoon Property is tree covered, but areas have been extensively logged, with numerous haul roads, spur roads, and skidder trails or dozer trails throughout. Approximately 40% of the Property has been logged, providing good access and exposing new outcrop. Tree harvesting is active at various locations on the Property. Several of the oldest logging roads are brushing in and/or have immature trees growing on them. Topography ranges from 400 m at Adams Lake level to rolling plateau tops reaching elevations of 1,920 m on the central west side of the Property. Summers are warm and dry, with temperatures up to 30 degrees Celsius. Winters are long and cold, with temperatures reaching lows of -30 degrees Celsius. The field season, when snow is minimal (depending on the elevation), is generally from late April to late October.

The Property is located within the Northern Wet-Belt Climatic Region and the North Wet-Belt Transition Climatic Region (Lloyd et al., 1990). More specifically, it is within the Interior Cedar Hemlock (ICHmk2, ICHmw3, ICHmw2) Biogeoclimatic Zone (BGCZ), the Engelmann Spruce Sub-Alpine Fir (ESSFdc2, ESSFwc2) BGCZ, Interior Douglas-fir (IDFmw2) BGCZ, and the Montane Spruce (MSdm2) BGCZ. The Interior Cedar Hemlock (ICH) climate is continental, dominated by easterly moving air masses, resulting in cool, wet winters and warm, moderately dry summers. Snow fall is moderate to high, and can reach extremes of more than 2 m. Frost occurrences during the summer are uncommon.

There are three large lakes in the Honeymoon Property Area: Adams Lake, East Barriere Lake and North Barriere Lake, which may moderate the effects of the climate conditions. Likewise, the proximity of the Dunn Peak snow pack may also influence climatic conditions at Russell Creek and Sprague Creek, especially in the spring and fall.

## 1.2 PROPERTY

The Honeymoon Property consists of 4 mineral tenures, with a total area of 3,415 hectares (Table 1; Figure 3). SolidusGold Inc. currently holds 100% ownership of the tenures. SolidusGold Inc. previously held the tenures under their former name, Mantra Capital Inc. The tenures were originally optioned by Mantra Capital Inc. from prospector David James Piggitt on September 3<sup>rd</sup>, 2013.

### 1.3 HISTORY AND PREVIOUS INVESTIGATIONS

The early history of exploration on the Honeymoon Property is not well known, although historic placer mining was conducted on Spapilem Creek and on tributaries of East Barriere Lake. A brief summary of more recent history in the Property area is given in Table 2, with all major showings illustrated in Figure 5. The Cam-Gloria discovery to the west side of the Property was made by Berubé in 1997, following up the release of the results of a BCGS till survey (OF-1997-9; samples 208; 292). This occurrence was drilled by Teck Corp. in 1999. Details of the history of the Honeymoon claims area have been summarized by Britliffe and Pigginn, 2012. Prospecting, trenching and sampling by C. Berubé and D. Pigginn is summarized in a number of assessment and prospectors' reports (Table 3).

**Table 2. Summary of Honeymoon Property Area History**

Year	Operator	Showing	Work Conducted
1997-1998	Camille Berubé	Cam-Gloria	Follow-up of 1997 BCGS till survey resulted in discovery of showing; conducted prospecting, trenching, and rock sampling. 2 blast trenches-60 m <sup>2</sup>
1999	Teck Corp.	Cam-Gloria	Optioned property and conducted 1:10,000 geological mapping, with 4.7 km <sup>2</sup> grid to support VLF survey; trenched 390 m with excavator in 13 trenches and pits; completed 7 NQ diamond drillholes (836 m drilled)
2006	Dave Pigginn	Mal-001, Mal-002	New Cu, Ag prospects were discovered prospecting, sampling included 21 stream sediments, 16 moss mats and 15 rock samples
2007	Dave Pigginn	Spapilem	Discovered new quartz-magnetite veins with Au values; prospecting and hand trenching, 10 stream sediments, 74 rock samples, 5 moss mats
2008-2009	Acrex Mining		Prospecting and physical work, including 1 stream sediment, 1 moss mat, 30 rock samples, petrology
2010	Dave Pigginn	Spapilem	Prospecting, 41 stream sediments, 42 moss mats, 60 rock samples
2011-2012	Astral Mining	All showings	Visited and sampled all prospects, analyzed soils (502 samples) from Spapilem grid; helicopter Mag-EM survey by Fugro Airborne Surveys (901 line-km)
2014	SolidusGold Inc.	All showings	Mapped and sampled all showing areas, analyzed soils (931 samples), rock (51 samples) and stream pan

			concentrate sediments (5 samples), archaeological investigation by the Adams Lake First Nations Band
2016	SolidusGold Inc.	Lucky Bear, NSP	Mapping, sampling, collecting 152 soil samples

In 1999, Teck Corp. drilled 7 NQ holes for a total of 836 m, and 149 core samples were split and analyzed for gold and 30-element ICP (Evans, 1999). The drilling tested only the core area of the Cam-Gloria showing for continuity of the main vein. In addition, they constructed 13

trenches, totaling 390 line-m, and several pits. A 4 line-km ground VLF survey was also conducted over the Cam-Gloria showings.

The following is an overview of their 1999 trenching and drilling results:

- (i) Trench 99-01: Up to 9.36 g/t Au over 2 m. Main vein averages 5.2 m wide at surface and is typically milky with quartz vein with minor hematite on fractures. Sample #5220 with 1 m interval: 17.62 g/t Au, 66.2 g/t Ag, 745 ppm Bi, 1372 ppm Pb.
- (ii) Trench 99-02: Sample #5233 - 2.65 g/t Au, Sample #5234 – 7.12 g/t Au.
- (iii) Drill Hole CC99-01: Drilled below Trench 99-01. Encountered the main vein (10.7 m) and its altered structure (33 m interval). Suggests 60 degree dip to the NW. Sulphide-rich upper portion contained a 1 m section 9.57 g/t Au, 128.4 g/t Ag, 160 ppm Bi, 1896 ppm Pb.
- (iv) Drill Hole CC99-03: Tested the down dip of Berubé Trench #2 on the thickest part of the vein. Intersected 7.3 m interval of the main vein within a 27.9 m interval of altered shear zone. The highest value was 1.1 m grading 0.685 g/t Au, 8.6 g/t Ag, 25 ppm Bi, and 376 ppm Pb.

The following is a summary of the MINFILE Occurrences and Showings on/near the Honeymoon Property:

**NSP MINFILE 082M-127:** This occurrence is apparently located within Tenure 673988. Bruce Madu, P.Geo. Ministry of Natural Resource Operations advised this was a Noranda Inc. option from the 1970's and no exploration data was on file. The occurrence has not been located to date. There is a need to compare the NSP to the newly discovered MAL001 and MAL002 showings south of Honeymoon Creek.

**CAM-GLORIA MINFILE 082M-266:** Portions of Tenures 672823 and 673883 were part of the CAM-GLORIA PROPERTY, which was optioned to Teck Corp. by Camille Berubé (prospector). This work was reported in BC Assessment Report 26216 (G. Evans, 1999). Drill hole CC99-01 returned 9.57 g/t Au, 128.4 g/t Ag, 160 ppm Bi and 1896 ppm Pb over 1 m and Trench 99-01 returned 9.36 g/t Au over 2 m. The GPS coordinates in the MINFILE database were not correct. The GPS coordinates for 082M 266 are as follows: NAD 83 Zone 11: 321533E and 5680511N.

**LUCKY BEAR MINFILE 082M-275 (Au Bi, minor W):** Located in Tenure 673906, it was discovered by Berubé, Pigginn and Pigginn. The showing is described as intrusive gold in a granodiorite host with vertical quartz veins and pyrrhotite. The best results include:

06394 LITSEC: 1.30 g/t Au; 115 ppm Bi; 166 ppm Cu; massive pyrrhotite in quartz vein.

06395 LITTA: 1.38 g/t Au; 130 ppm Bi; 171 ppm Cu; semi-massive pyrrhotite in quartz vein.

**HONEYMOON DISCOVERY – MAL001 MINFILE 082M-285 and MAL002 MINFILE 082M-289:** Cu-Ag in paragneiss located in Tenure 673903. They were discovered by Lorne Warner, P. Geo., and David Pigginn in 2006. The best results include:

MAL1Q1: 0.78 % Cu; 35.3 g/t Ag; 11 ppm Mo.

MAL1G: 0.86 % Cu, 5.88 g/t Ag, 11 ppm Mo.

MAL1D: 0.64 % Cu, 34.8 g/t Ag, 25 ppm Mo.

MAL1RE: 0.62 % Cu, 33.1 g/t Ag, 54 ppm Mo.

**SPAPILEM CREEK MINFILE 082M-292 (Au, Bi) and SPAPILEM GOLD100 MINFILE 082M-290:** New discoveries by Pigginn in an intrusive gold/quartz vein within tenure 673864. Quartz veins associated with magnetite. The best results include:

SPAPILEM CREEK (aka SPAGOLD): Quartz vein with sulfides and magnetite returning 1.29 g/t Au; 60 ppm Bi; >10% Fe; 10 ppm Mo; and 0.15% Ti. Magnetite (next to quartz vein) returned 6.01 g/t Au; 165 ppm Bi; >10% Fe; 20 ppm Mo; and 0.29% Ti.

SPAPILEM GOLD 100 (100 m along road, east of SPAPILEM CREEK MINFILE 082M-292): Quartz vein with magnetite returned 3.4 g/t Au. Host granite with quartz and magnetite returned 2.60 g/t Au; 25 ppm As; 6.74% Fe; 1.04% S; and 10 ppm W. Soil samples returned up to 4565 ppb Au; 0.4 ppm Ag; 20 ppm As; and 3 ppm Mo.

#### **1.4 PURPOSE OF 2017 WORK**

The work described herein was undertaken to support future drilling plans surrounding historic showings by identifying magnetic anomalies on the Property via ground surveying.

Magnetic survey lines overlaid several previously completed soil sampling grids, in order to confirm the presence of mineralization in the subsurface.

## **1.5 SUMMARY OF 2017 WORK**

From August 23<sup>rd</sup> to 28<sup>th</sup>, 2017, Dahrouge Geological Consulting Ltd. (Dahrouge), on behalf of SolidusGold Inc., conducted a four-man magnetic ground survey program on the western half of the Honeymoon Property. A total of 16 magnetic traverse lines, representing a distance of 26.8 line-km were completed over the course of the program (Appendix 4, Fig.'s 6-9). The collected magnetic data was then sent to Ed Cunion at Red Rock Geophysical Consulting Ltd. for correction and analysis (Appendix 3).

Magnetometer readings were obtained over a series of traverse lines on the Property (Appendix 4). Readings were recorded with two GEM System GSM-19 integrated Overhauser effect proton precision magnetometers. The magnetic sensors remained at a distance of approximately 1.75 m above the ground surface during traverses. GEMLinkW software version 7 was utilized to download the readings on to a field laptop. The magnetic readings were corrected for diurnal field magnetic variation using a stationary GSM-19 base station. The base station location was chosen to ensure minimal interference from active roads, railroads, powerlines and hikers (Figure 6). The magnetometer data was corrected (Appendix 4) and profiled (Fig.'s 7, 8 and 9). Magnetic recordings were collected in nanoteslas (nT) along the traverse lines. Base station recordings were then correlated to traverse line recordings using time of day, using Coordinated Universal Time (UTC). Base station recordings were subtracted from their corresponding traverse recordings. Finally, a datum of 54,000 nT, which had been pre-programmed into the magnetometer unit, was added to each value. Diurnally corrected data was then sent to a registered geophysicist at Red Rocks Geophysical Consulting for further corrections (Appendix 3). Raw and corrected data is provided in Appendix 4. Whenever possible, magnetic traverse lines were oriented approximately perpendicular to the trend of known structures. Field maps were completed on 1:10,000 scale map sheet. A magnetic declination of 17°49' east was used.

Personnel were based in accommodations in Barriere, B.C. Access to and from the Property was by four-wheel-drive vehicle. Within the Property, survey traverse lines were accessed by extensive hiking. ATV access was banned for the 2017 field season due to extensive wildfires in the province.

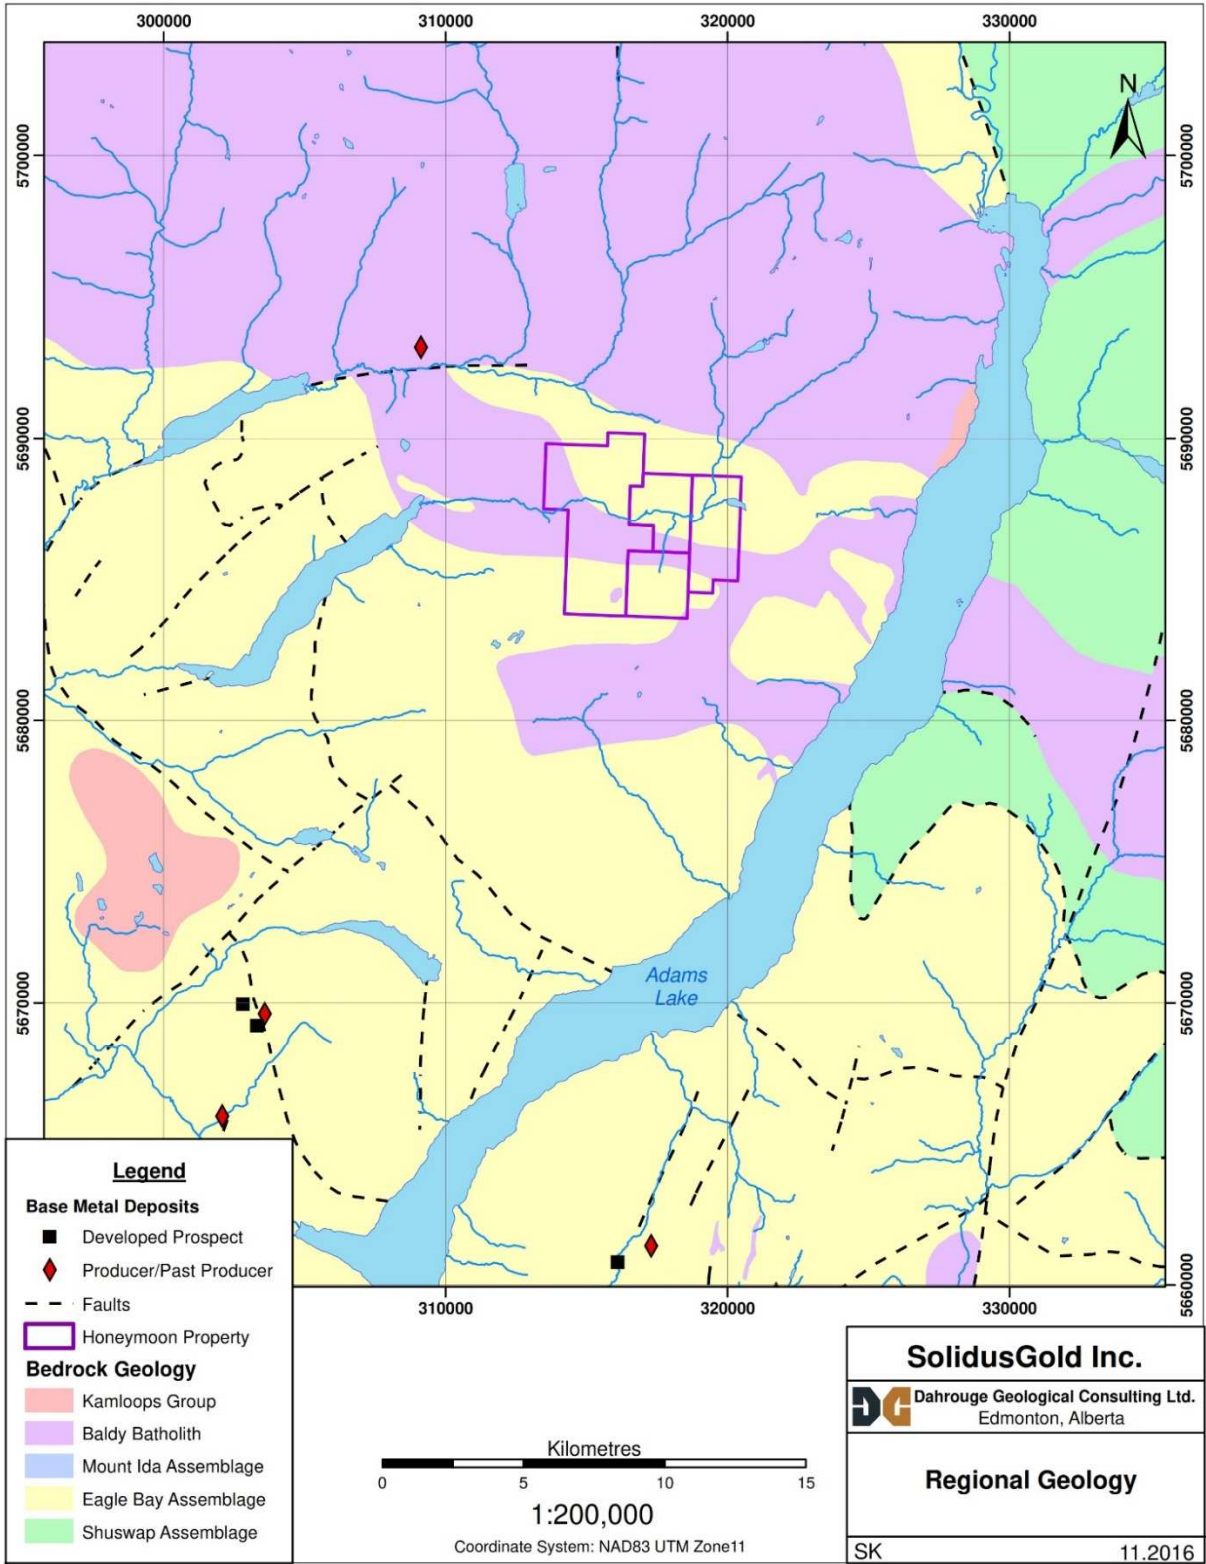

## 2.

## REGIONAL GEOLOGY

The Honeymoon Property is located within the Adams Plateau - Clearwater Exploration area which lies near the southern end of the Omineca Crystalline Belt, one of the five morphological belts of the Canadian Cordillera. High-grade metamorphic rocks of the Shuswap Complex lie to the east of the Property, and rocks of the Intermontane Belt to the west (Figure 4). Paleozoic meta-volcanic and metasedimentary rocks of the Fennel Formation and Eagle Bay Assemblage underlie the area. The Fennell and Eagle Bay rocks were deformed and metamorphosed together during the Jura-Cretaceous orogeny. The metamorphic grade in most of the area is lower greenschist, but increases to amphibolite facies in places along the eastern and northeastern margins (Schiarizza, 1987). Devonian granitic orthogneiss locally intrudes Eagle Bay rocks, while Paleozoic rocks are cut by Mid-Cretaceous quartz monzonite and granodiorite of the Baldy and Raft batholiths, as well as Early Tertiary basalt, feldspar porphyry, and lamprophyre dykes. The area is overlain by Eocene volcanic and sedimentary rocks of the Kamloops Group and Miocene plateau lavas (Schiarizza, 1987).

### 2.1 Eagle Bay Assemblage

The Eagle Bay Assemblage, described by Schiarizza and Preto (1987), comprises Lower Cambrian to Mississippian rocks that are intruded by Late Devonian orthogneiss and Jurassic-Cretaceous granodiorite and quartz monzonite of the Raft and Baldy batholiths. Within the study area, the Eagle Bay Assemblage is contained between four west-directed thrust slices. The assemblage consists of clastic metasedimentary rocks named units EBH and EBQ, mafic meta-volcanic rocks and limestone (unit EBG), and structurally overlying clastic metasedimentary rocks, with minor carbonate and volcanic rocks (unit EBS), all of which are interpreted as Cambrian in age (Schiarizza, 1987). These units are overlain by Devonian-Mississippian mafic to intermediate meta-volcanic and metasedimentary rocks (units EBA and EBF, respectively), which are overlain by meta-clastic rocks (unit EBP).

## **2.2 Fennell Formation**

From Schiarizza and Preto (1987), the Fennell Formation comprises imbricated oceanic rocks of Slide Mountain terrane that were tectonically emplaced onto Mississippian clastic rocks of the Eagle Bay Assemblage prior to syn-metamorphic, southwesterly directed folding and thrusting. The formation comprises two major divisions. The lower structural division is a heterogeneous assemblage of bedded chert, gabbro, diabase, pillowed basalt, sandstone, quartz-feldspar-porphry rhyolite and intraformational conglomerate. Conodonts extracted from bedded chert range in age from Early Mississippian to Middle Permian, while zircons extracted from quartz-feldspar porphyry yield a Devonian uranium-lead age. The distribution of dated units indicates that the lower division is segmented into at least three (and locally four) imbricate thrust slices. The upper division consists almost entirely of pillowed and massive basalt, together with minor amounts of bedded chert and gabbro. Conodonts from two separate chert lenses within the division are respectively Early Pennsylvanian and Middle Permian in age. The two divisions are therefore the same age, at least in part, and are inferred to be separated by a thrust fault.

## **2.3 Baldy Batholith**

Schiarizza and Preto (1987) describe that megacrystic monzonite is found as the distinctive phase of the Mid Cretaceous Baldy batholith with low magnetic susceptibility. It consists of a medium grained matrix (40-60% plagioclase-orthoclase), 15-20% chlorite altered pyroxene/hornblende and biotite, as well as very distinctive 1-3 cm zoned orthoclase megacrysts (5-20%). Very rarely this unit has 5-10% 1-2 mm quartz phenocrysts. Typically the mafics in this rock have been pervasively altered to chlorite (sometimes with epidote alteration to feldspars). Hematite/chlorite coated fractures are common. A fine-grained monzonite phase is chemically similar to the previous phase, and in areas gradational with it. Visually the difference is a finer grained porphyritic texture with an absence of the zoned megacrysts. The relationship between these phases is not clear, with amorphous contacts making it difficult to separate them as distinct phases.

## **3. PROPERTY GEOLOGY**

The Property geology and rock type descriptions are based upon work by Schiarizza and Preto (1987), Dixon-Warren et al. (1997) and Logan and Mann (2000). The Property is mainly

underlain by the Eagle Bay Assemblage and Fennel Formation, which are intruded by the Cretaceous Baldy Batholith (granite and granodiorite) (Fig.'s 4 & 5). Lithologic descriptions which follow are those of Schiarizza and Preto (1987), with abbreviations for the Eagle Bay Formation from MEMPR Preliminary Map 56, and those for the Baldy Batholith and Honeymoon Bay Stock from BCGS-OF-2000-7.

### **3.1 STRATIGRAPHY**

#### **3.1.1 Baldy Batholith: Cretaceous**

Megacrystic monzonite is found as a distinctive phase of the batholith. This rock type hosts the mineralization in the Cam-Gloria area and is distinctive with a very low magnetic susceptibility. **Kg** consists of granite and granodiorite; **Kgp** includes abundant pegmatite; **KBBmg** consists of medium to coarse grained, pink potassium feldspar megacrystic biotite monzogranite, hornblende-biotite monzodiorite and coarse pegmatite segregations; **KBBgd** is comprised of coarse potassium feldspar megacrystic hornblende-biotite granite to granodiorite, coarse equigranular biotite monzogranite (**KBBg**) and medium-grained aplite dykes.

#### **3.1.2 Honeymoon Bay Stock: Mid-Jurassic**

**mJNHqd** consists of coarse equigranular biotite-epidote-hornblende quartz monzodiorite, rare potassium megacrystic phases and monzodiorite phases (**mJNHmd**).

#### **3.1.3 Eagle Bay Formation: Lower Cambrian to Mississippian**

**EBF**: Devonian and/or Mississippian, light to medium grey, rusty weathering feldspathic phyllite, schist and fragmental schist derived from intermediate tuff and volcanic breccia; minor amounts of dark grey phyllite and siltstone.

**EBA**: Devonian, light silvery grey to medium greenish grey sericite-quartz phyllite and sericite-chlorite-quartz phyllite derived from felsic to intermediate volcanic and volcanoclastic rocks, including pyritic, feldspathic and coarsely fragmental varieties; lesser amounts of dark grey phyllite and siltstone, green chloritic phyllite, sericitic quartzite and pyritic chert (exhalite?).

**EBG**: Lower Cambrian (may include younger and or older rocks), medium to dark green calcareous chlorite schist, fragmental schist and greenstone derived largely from mafic to

intermediate volcanic and volcanoclastic rocks; lesser amounts of limestone and dolostone; minor amounts of quartzite grit and light to dark grey phyllite.

- EBGp: dark grey phyllite, calcareous phyllite and limestone; minor amounts of rusty weathering carbonate-sericite-quartz phyllite (metatuff?).
- EBGq: light to medium grey quartzite.
- EBGt: Tshinakin limestone member, massive light grey finely crystalline limestone and dolostone.

**EBP:** Mississippian, dark grey phyllite and slate with interbedded siltstone, sandstone and grit; lesser amounts of conglomerate, limestone, dolostone, chlorite-sericite quartz schist, quartzite and metatuff.

- EBPv: meta-volcanic breccia and tuff.

**EBQ:** Lower Cambrian and Hadrynian, light to dark grey quartzite, micaceous quartzite, chlorite-muscovite-quartz schist and phyllite; lesser amounts of calcareous phyllite, calc-silicate schist, carbonate and green chlorite schist; eastern exposures include staurolite-garnet-mica schist and amphibolite.

#### **3.1.4 Fennell Formation: Devonian to Permian**

**Dgn:** Late Devonian, granite and granodiorite orthogneiss; includes some sillimanite-bearing paragneiss (**Dgnp**). The dominant lithologies are medium grey biotite-hornblende-plagioclase-quartz gneiss and light grey muscovite-biotite-orthoclase-plagioclase-quartz gneiss. Epidote, chlorite and sphene are common additional components of the more mafic gneiss and small grains of zircon and apatite occur as accessories in both types. Generally, both varieties are medium grained and monotonously uniform over fairly large areas (Schiarizza, 1987).

**Qp:** Cretaceous or Tertiary, late dykes and rare sills of unfoliated, light grey, white-weathering quartz feldspar porphyry are common in the vicinity of Adams Plateau. They consist of quartz, potassium feldspar and rare plagioclase phenocrysts within an aphanitic to very fine-grained quartzofeldspathic matrix. The dykes typically trend in a northerly direction and dip steeply.

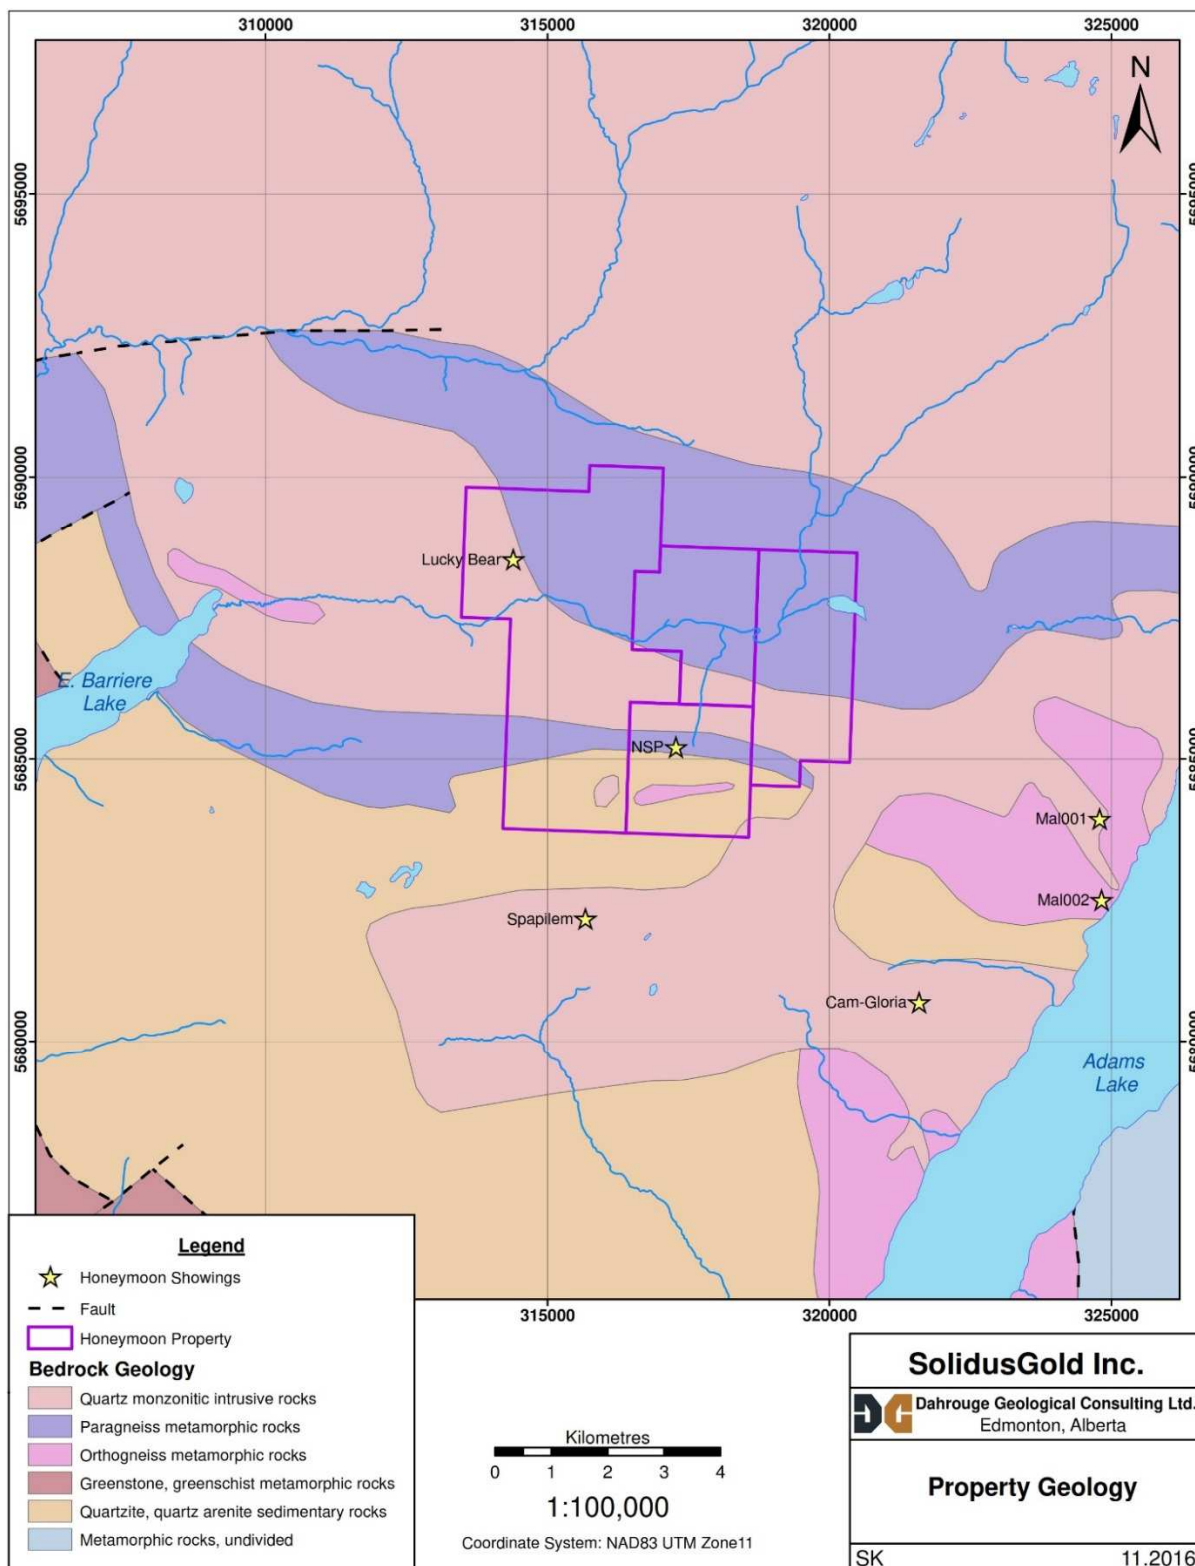

Figure 5. Property Geology

### **3.2 STRUCTURE**

The dominant structures on the Property are pre-metamorphic, easterly directed thrust faults which imbricate the Fennell Formation and separate it from Unit EBP and later syn-metamorphic southwesterly overturned folds and associated thrust faults. These structures are cut by post-metamorphic, northwest-trending mesoscopic folds and by later west-trending macroscopic and mesoscopic folds which are synchronous with intrusions of the mid-Cretaceous Raft and Baldy batholiths. The youngest structures recognized are northeast-trending strike-slip faults and later northerly trending faults and associated folds which are Eocene in age.

### **3.3 MINERALIZATION**

Historic surface rock samples on the Honeymoon Property reach up to 32.76 g/t Au and up to 280 g/t Ag. The majority of the rocks with over 1 g/t Au occur within the quartz vein system at the Cam-Gloria prospect (Figure 5). There are sample locations at each of the Honeymoon Creek, Spapilem Creek, and Lucky Bear prospects with at least 1 g/t Au each.

Drilling by Teck Corp. at the Cam-Gloria prospect intersected 1 m of 9.57 g/t Au, 128.4 g/t Ag, 160 ppm Bi, and 1896 ppm Pb. Unfortunately, drill core was not sampled throughout the drill hole, so numerous gaps in the sampling exist. Sampling appears to have focused on the occurrence of quartz veins, although this is not completely clear from the drill logs; therefore, attention should be paid to alteration zones in the wall rocks during future drilling programs.

The historic grades of copper identified to date reach up to 0.8% in surface samples. All rock samples in excess of 0.25% Cu come from the Honeymoon Creek prospect area, specifically near the Baldy-Eagle Bay orthogneiss contact. Some of these (MAL001 and MAL002) are fine-grained sulphides disseminated in meta-sediments which bear similarities to strata-bound mineralization. The molybdenum grades observed in soil samples at the Spapilem Creek prospect locally approach what would be considered ore grade (>0.1% Mo) at known and developed molybdenum deposits.

#### 4.

### RESULTS OF 2017 EXPLORATION

The 2017 exploration program of the Honeymoon Property was undertaken to support future drilling plans surrounding historic showings, as well as to identify potential new showings and mineralization on the Property by ground magnetic surveying. Survey areas included the Lucky Bear showing, near the NSP showing and geophysical targets generated by a 2011 airborne magnetometer-EM survey flown by Fugro and SolidusGold's 2014 and 2016 exploration programs.

From August 23<sup>rd</sup> to 28<sup>th</sup>, 2017, Dahrouge Geological Consulting Ltd. (Dahrouge) conducted a ground magnetic survey program on the northwest and central portions of the Honeymoon Property. The main historic showings were visited and access was evaluated for future proposed drill programs. A four-person crew surveyed a total of 26.8 line-km over 16 traverse lines (Fig.'s 6-9; Appendix 4). Traverse lines H-1 to H-14 were oriented at a SW-NE azimuth, with traverse lines H-15 to H-16 in a NW-SE azimuth. The traverse lines were spaced approximately 200 m apart.

During the 2017 magnetic survey program, several relatively strong magnetic anomalies were confirmed in the Lucky Bear showing area (Figure 6). Traverse line H-1 had a somewhat elevated magnetic signature along the first 260 m, followed by significant anomalies at approximately 350 m and 570 m. These anomalies correlate with the strongly magnetic zones identified by Astral Mining Corp. from their airborne EM and magnetic surveys (Fugro, 2012). Traverse line H-3 exhibited a notable magnetic anomaly that was approximately 45 m in length. An approximate 130 m interval in the centre of traverse line H-4 overlies the Lucky Bear showing and exhibited a significant magnetic high. Portions of H-5 and NW-SE trending H-16 traverse lines also cover the showing and show similar anomalies. Magnetic anomalies on traverse lines H-9, H-10, H-11 and H-12 were fairly continuous for approximately 90 m, 150 m, 40 m and 325 m, respectively. Of these, portions of traverse lines H-11 and H-12 historically overlaid highly magnetic conductive zones.

**TABLE 4. SUMMARY OF 2017 MAGNETIC SURVEY LINES**

<b>Traverse Line</b>	<b>Orientation</b>	<b>Approximate Length (m)</b>	<b># of Magnetic Anomalies</b>
H-1	63°	777	3
H-2	64°	869	1
H-3	61°	1100	3
H-4	64°	1176	3
H-5	62°	1331	4
H-6	61°	1495	2
H-7	64°	1088	0
H-8	65°	1135	5
H-9	65°	1335	7
H-10	65°	1442	5
H-11	66°	2603	14
H-12	65°	2432	17
H-13	64°	2277	11
H-14	65°	1907	6
H-15	175°	1442	2
H-16	171°	1437	2

\* magnetic anomalies of greater than 70 nT

## **5. DISCUSSION AND RECOMMENDATIONS**

The Honeymoon Property is located along the periphery of the Baldy Batholith (Jurassic to mid-Cretaceous), where it is in contact with Devonian orthogneisses and the Eagle Bay Assemblage (Devono-Mississippian meta-sediments and meta-volcanics). Regional geologic maps suggest a significant NE oriented structure highlighted and covered by Adams Lake, where it juxtaposes the Shuswap assemblage next to the Eagle Bay Assemblage and Baldy Batholith.

It is unclear if there is a single model that fits all the showings in the Honeymoon Property area. Teck thought the Cam/Gloria area was an intrusion-related gold system (IRGS), analogous to those found in the Tintina Gold Belt. The Bi and Ag association with gold anomalies elsewhere on the Property may support this deposit model. Gold mineralization is associated with veins that appear to be mainly quartz. Interestingly, there is very little arsenic associated with gold mineralization or elsewhere on the Property. At the Lucky Bear and to some degree the Spapilem Creek prospect, there have been some anomalous tungsten results. Historically, there are no recorded tungsten anomalies of significance at the Cam-Gloria prospect. Some of the historic surface data include UV light prospecting for scheelite in the Lucky Bear area.

Geochemistry from other parts of the Property may suggest that there are VMS influences, as seen at Harper Creek. There is some evidence of semi-massive, perhaps VMS-style mineralization at Honeymoon Creek. Surface samples with K analyses do not show any obvious porphyry-style large-scale zonation, but the sample coverage in the context of the geologic contacts makes identifying zonation patterns difficult.

The 2017 magnetic survey identified several areas where metalliferous veins may exist. Not surprisingly, traverse lines intersecting and in close proximity to the Lucky Bear showing exhibit significant magnetic anomalies, which further confirmed their extent. Several anomalies identified historically through airborne EM and magnetic surveys were also verified. In addition, several previously unidentified areas exhibited magnetic anomalies. These include along traverse lines H-1 (at approximately 570 m from start), H-3 (at approximately 180 m from start) and H-11 (at approximately 1300 m and 1600 m from start). These three previously unidentified magnetic anomalies, in particular, warrant further investigation.

Future exploration should include expansion of the magnetic surveys in close proximity to the Lucky Bear and NSP gold/copper showings to narrow down conductive/mineralized zones as well as infill soil sampling between the 2014 and 2016 soil grids to follow-up on high copper values. Further soil sampling to the east of the Lucky Bear grid is suggested to confirm whether a trend of high silver and copper values exists in that direction. Identified anomalies that were previously unknown should be “ground truthed” via trenching to access the underlying outcrop for verification of whether metalliferous veins are present.

## Introduction

This report covers the quality assessment and quality control (QA/QC) of the Honeymoon ground magnetic data from the SE British Columbia region. The data was collected by Dahrouge Consulting during August 24-27 2017.

Base station and field rover data was provided for all days. The Oasis Montaj<sup>1</sup> software was used to process the data. The data was collected with Gem Systems GSM 19 magnetometers, both as base stations to collect diurnal data and field rovers in walkmag mode. All data is projected using the NAD83 UTM zone 11 North coordinates.

## Magnetic Survey Data QA/QC and Processing

The magnetic data was processed using Gemlink<sup>2</sup> and Oasis Montaj. The data was in generally good condition as delivered for processing with generally straight survey lines (Figure 1). Magnetic reading signal quality numbers ranged from 9 to 99 with 99 being the highest quality. Areas of high magnetic gradient though, can cause magnetic signal drop outs, and return lower signal quality numbers. Some but not all of the lower signal drop outs were deleted from the raw merged database. Some were retained, though, when the readings were in proximity to higher signal quality readings with similar signature amplitudes. Obvious spurious field rover readings were deleted from the database; most of these were random spikes with unreasonable magnetic readings, some possibly due to culture. The edited database has 52418 readings over approximately 26.8 line km of surveying.

## Diurnal Corrections

The raw base and rover files were run through GEMLINK to create diurnally corrected magnetic files. After the base station diurnal corrections, the base data was further assessed using profile views. Spurious base station readings caused some spurious diurnal corrected magnetic readings, these base readings were manually removed by visual inspection of profile plots, one example is seen in Figure 2. The cleaned up base station diurnal curves used for field station corrections are shown in Figures 3-6 below.

---

<sup>1</sup> Oasis Montaj is a product of Geosoft Inc. Toronto, Ontario.

<sup>2</sup> GEMLINK is a product of GEM Systems Markham, Ontario.

Figure 1. Honeymoon ground magnetic survey sample lines the white traces, with 26.8 line km surveyed.

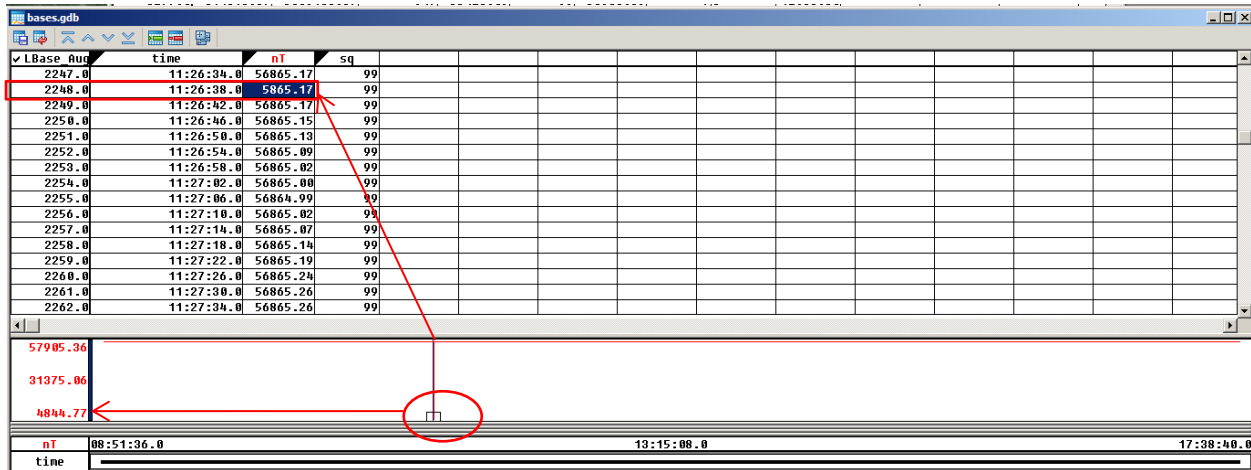

Figure 2. One example of a spurious base reading, identified by viewing the base station diurnal curves. There were a few points like these deleted after visual inspection of the profiles.

Figure 3. August 24 base station diurnal with larger spikes removed.

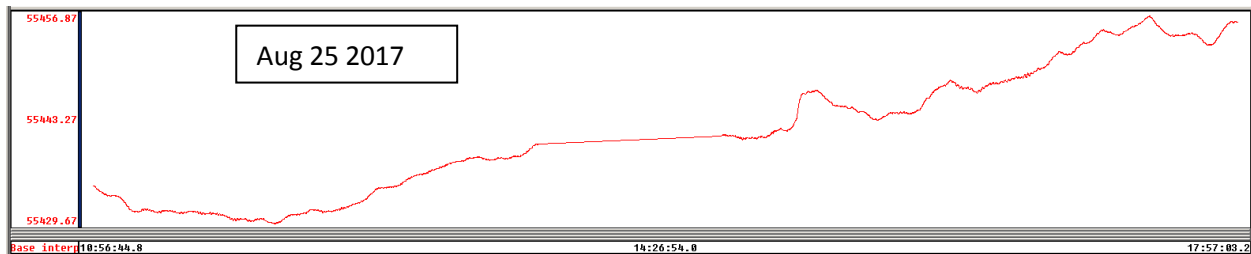

Figure 4. August 25 base station diurnal with larger spikes removed.

Figure 5. August 26 base station diurnal with larger spikes removed.

Figure 6. August 27 base station diurnal with larger spikes removed.

There are some small amplitude spikes of one to a few nT left in the base station data, these are possibly due to metal on one's person when walking past the base station, wind abruptly shaking the sensor, or small scale solar phenomena affects on the magnetic field. All GEMLINK diurnal corrections used the base station background magnetic value of 54000.

## GPS Locations

There were several GPS readings with low satellite numbers, even zero (0), but these GPS locations all appear to be in sequence up lines with adjacent points, so the satellite drop-outs do not seem to have adversely affected these GPS positional readings, and are retained.

## IGRF Corrections

After the data was diurnal corrected, the International Geomagnetic Reference Field (IGRF) correction was applied to the data. This accounts for temporal changes in the earth's background magnetic field that also varies by location and elevation. For example, for some large regional aeromagnetic surveys the IGRF corrections can be hundreds of nT over a survey area. Removal of the IGRF affects from the diurnal corrected total magnetic intensity (TMI) data results in residual TMI data that ideally has a mean of zero over a survey area with the positive and negative residual TMI only reflecting magnetic variations due to local ground changes in susceptibility. The IGRF (Figure 7) has a 13 nT range across the survey grid.

Table 1 below Figure 7 shows the IGRF values and corrections used for the Honeymoon data. The first column in the table is the survey year. The second column (A) is the mean IGRF for the survey grid during the survey period. The third column (B) is the survey datum used by Dahrouge as the background magnetization. Column C is the mean IGRF for the survey subtracted from the datum. Column D is the mean IGRF subtracted from the mean of the corrected magnetic readings for the survey period. This is a

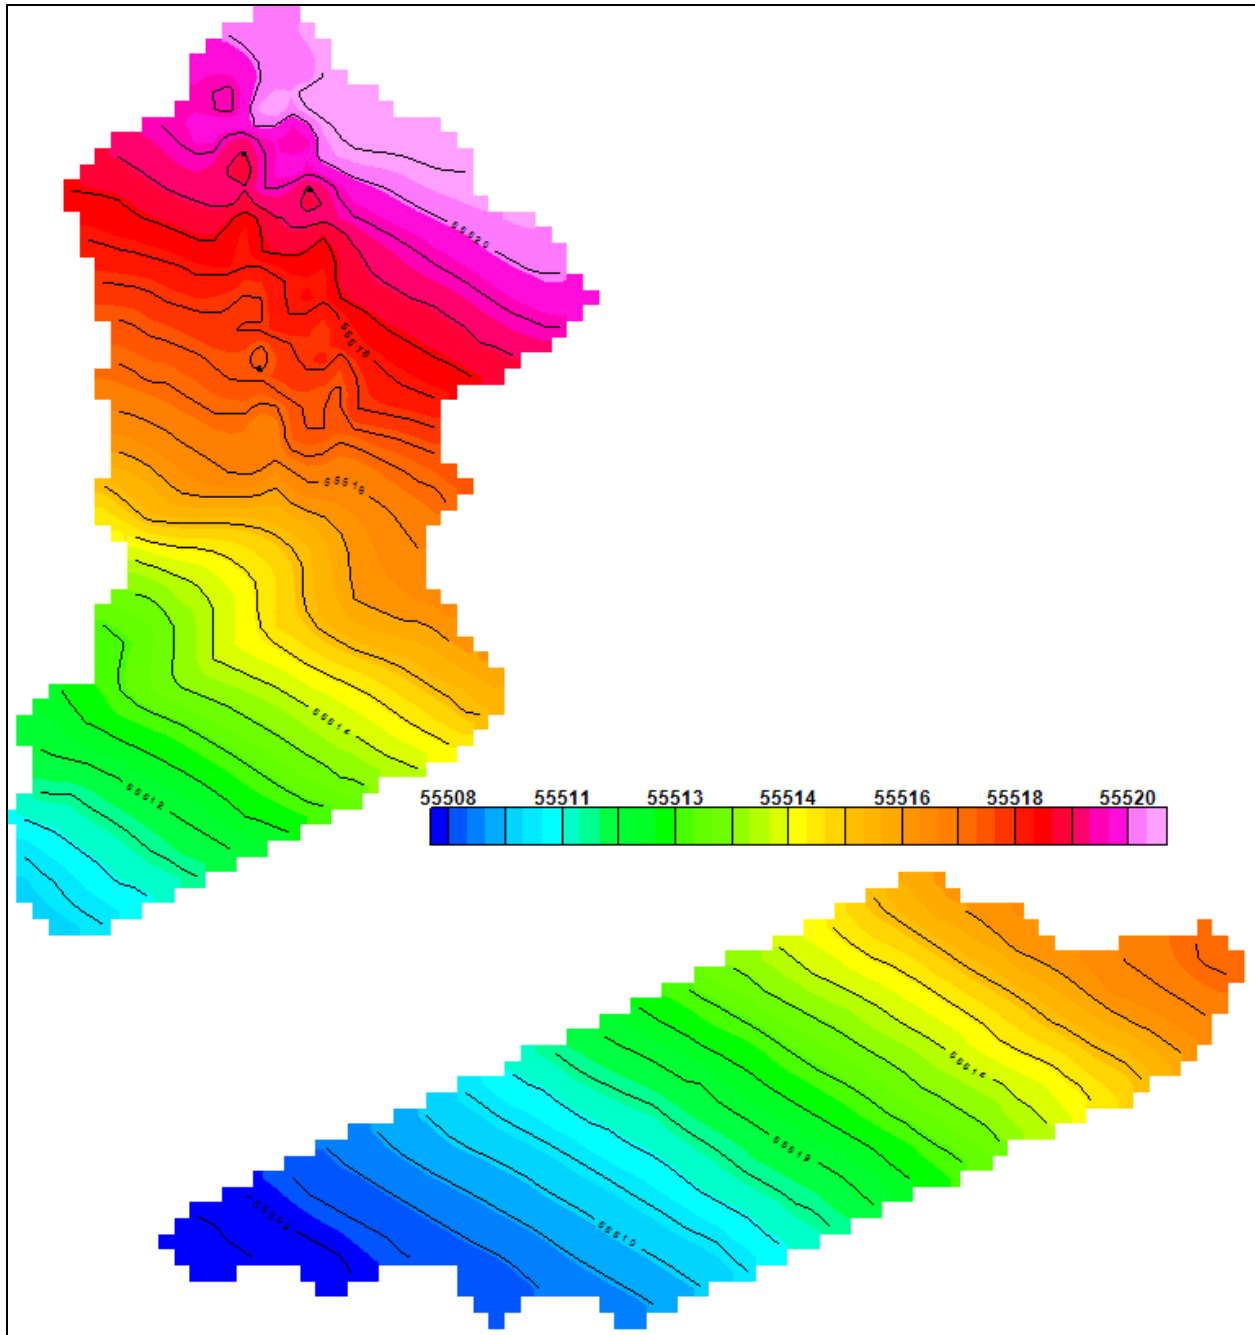

Figure 7. IGRF correction values across the Honeymoon grid.

correction factor that is subtracted from each datum corrected reading to push each reading in line with the mean survey IGRF. Column E is the mean corrected magnetic reading for a given years survey using the datum in column B. Column F is the IGRF corrected residual for each reading that has a mean of zero as it is adjusted to the mean IGRF for each survey. The math is (column E – column D) – column A. This is equal to each IGRF + diurnal corrected reading - value D (-1562.89). The result of the above IGRF

calculation is residual TMI values that are +/- the zero mean of the survey area and that can be merged with future years data, to block level the annual data.

**Table 1 Honeymoon IGRF Corrections**

Survey Year	Survey Mean IGRF	Survey Datum Used	Difference Datum-Mean IGRF	Mean corrected magnetic-mean IGRF	Mean Datum Corrected Mag for year	Survey Res_Mag Mean = 0 Col(E-D) - A
2017	55515.38	54000	-1515.38	-1562.89	53952.49	0.00
Column	A	B	C	D	E	F

## Magnetic Products

The magnetic data in Excel spreadsheet format and magnetic images in Geotiff format are the delivered products. One spreadsheet is provided with the QA/QC edits mentioned above. The Honeymoon spreadsheet and images provided are listed in the Appendix. The general magnetic character of the gridded data is discussed for Figure 8 below, the residual magnetic image. There is no identifiable magnetic grain to the grid, but there are identifiable discrete signatures. Signature A is a discrete magnetic high that has a NNW-SSE striking 400 m long axis that is enclosed by a ring of lower amplitude magnetic response. Signature B is a large NE-SW striking higher amplitude magnetic signature, a dipole, with a truncated southern negative response. Like Signature A it the northern positive response is ringed by magnetic low responses. Signature C is a complex irregular signature with adjacent magnetic lows, Signature D is a discrete magnetic high response, and Signature E another irregular complex high.

## Conclusions

The Honeymoon July 2017 magnetic data was QA/QC edited, diurnal and IGRF corrected and converted to residual TMI with a zero mean. There is significant magnetic relief on the survey grid with a total ungridded residual TMI range of ~ 7000 nT for the 54000+ stations. When gridded, the data is smoothed and the color bar shows about 700 nT of magnetic relief (Figure 8).

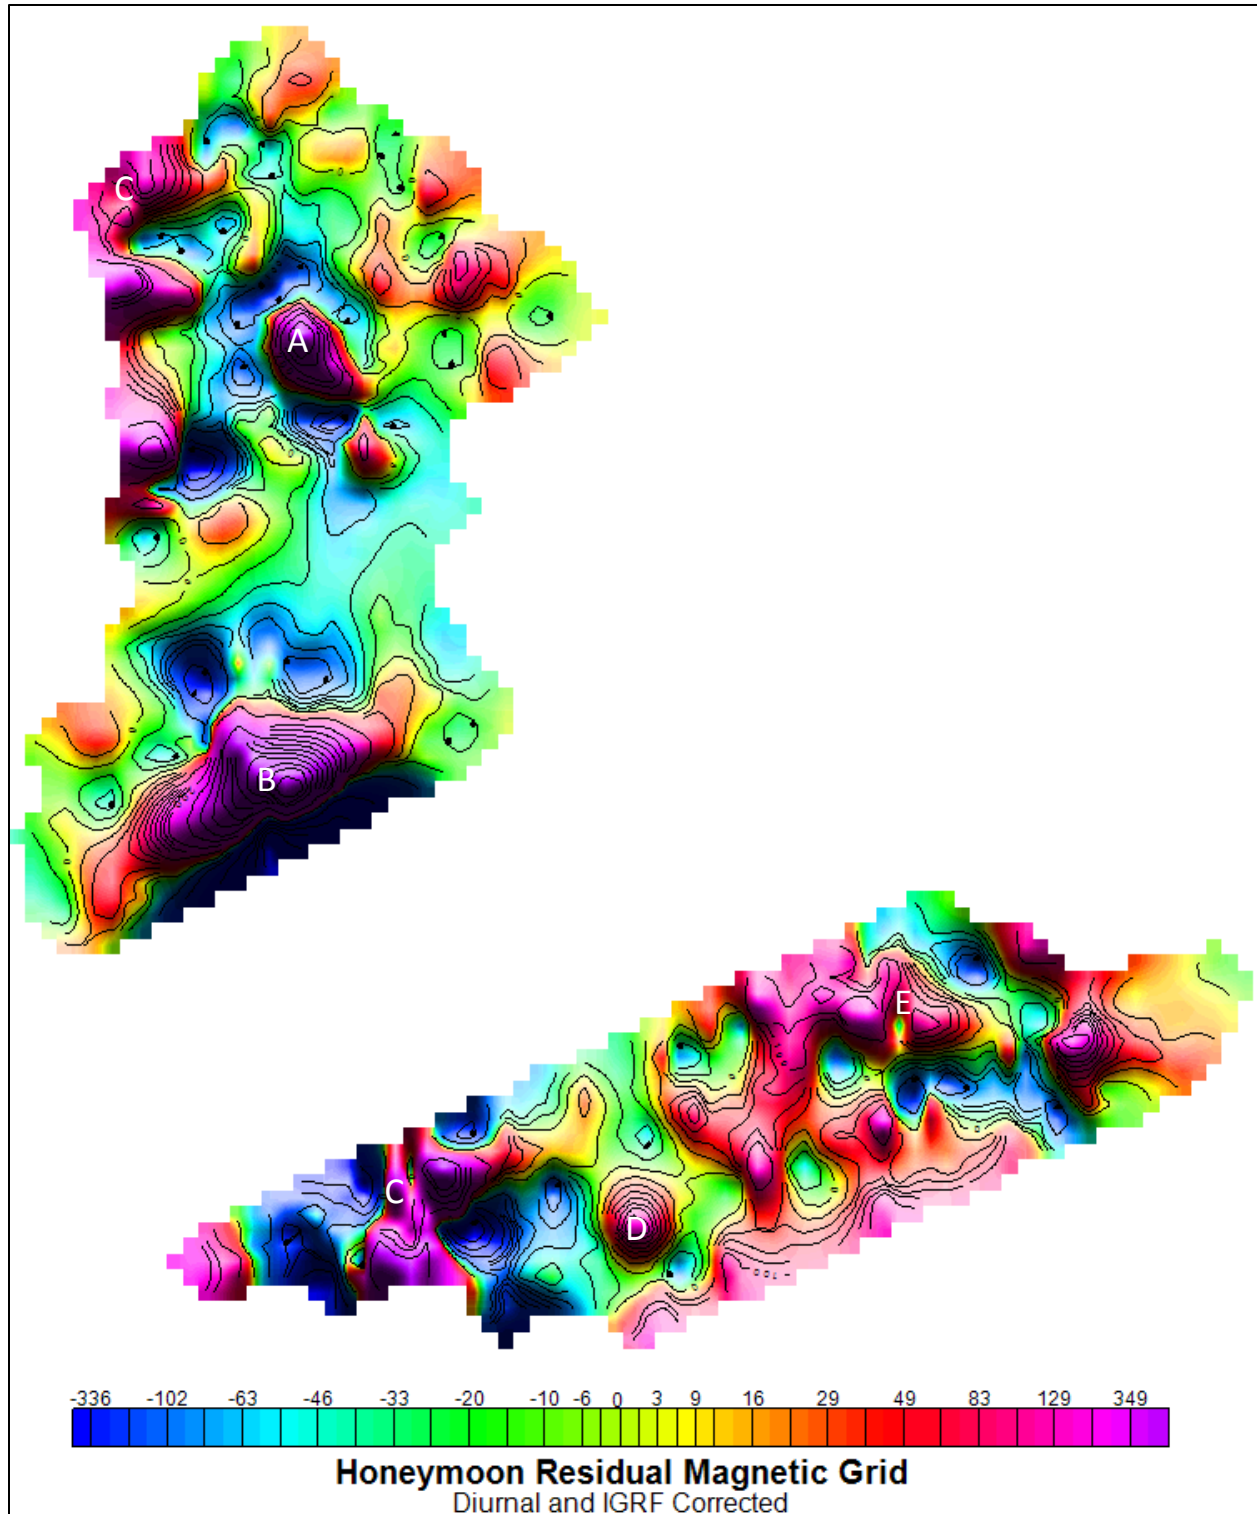

Figure 8. The sun shaded residual TMI image with contours. The raw data range is  $\sim 7250$  nT, the 50 m cell gridded range is  $\sim 700$  nT.

## Appendix 2

### Magnetic database data columns explanation

X & Y = NAD83 UTM 11 N coordinates

Longitude & Latitude = NAD83 geographic coordinates

Elevation = Metres above the NAD83 ellipsoid

raw\_NT = Field rover magnetometer reading

corrected\_nT = diurnal corrected magnetic reading (using 54000 nT background)

date = day of reading dd/mm/yyyy

time = reading time 24 hour clock

IGRF = calculated IGRF regional background using 2015 model for July 2017 survey days

inclination = IGRF magnetic field inclination

declination = IGRF magnetic field declination

IGRF\_corrected = corrected\_nT - IGRF regional this is all negative due to the 54000 background used for the corrected\_nT

Res\_mag = residual TMI magnetic with a zero mean, this is the IGRF\_corrected reading minus the mean of the IGRF\_corrected population (-1562.89)

sig-qual = the magnetic signal quality, 9 is the lowest and 99 the highest quality. Low quality numbers can indicate strong magnetic gradients associated with metallic culture, AC power sources or more magnetite rich rocks and do not mean a faulty magnetic unit.

The data was gridded on 50 m cell sizes. Gridding the corrected\_nT, IGRF\_corrected and Res\_mag channels produce almost exactly the same map, just they are all DC shifted from one another. The exception to this is the corrected\_nT channel, that is diurnal corrected, but that still retains the ~ 13 nT range IGRF surface that covers the grid, whereas the IGRF\_corrected and Res\_mag data have had the IGRF surface removed.

The IGRF\_corrected and Res\_mag images are the same grid image, just being offset from each other by the -1562.89 nT value. Both are fully corrected. The Res\_mag is just centered on a zero mean value.
