ASSESSMENT REPORT TITLE PAGE AND SUMMARY

TITLE OF REPORT: 2017 Diamond Drilling Report on the Baker Gold Project

TOTAL COST: \$362,664.48

AUTHOR(S): Joel Gillham
SIGNATURE(S):

NOTICE OF WORK PERMIT NUMBER(S)/DATE(S): 17-1300245-1006

STATEMENT OF WORK EVENT NUMBER(S)/DATE(S): 5713264

YEAR OF WORK: 2017

PROPERTY NAME: Baker

CLAIM NAME(S) (on which work was done): 505647; 505482; 505643; 505639

COMMODITIES SOUGHT: Au, Cu

MINERAL INVENTORY MINFILE NUMBER(S),IF KNOWN: 094E 026; 094E 302

MINING DIVISION: Omineca

NTS / BCGS: 94E6E / 094E025

LATITUDE: $57^{\circ} 17' 00''$ N

LONGITUDE: $126^{\circ} 06' 30''$ W (at centre of work)

UTM Zone: 614130 EASTING: 6351300

NORTHING:

OWNER(S): Sable Resources Ltd

MAILING ADDRESS: Suite 900 – 999 West Hastings, Vancouver BC

OPERATOR(S) [who paid for the work]: Sable Resources Ltd

MAILING ADDRESS: Suite 900 – 999 West Hastings, Vancouver BC

REPORT KEYWORDS (lithology, age, stratigraphy, structure, alteration, mineralization, size and attitude. **Do not use abbreviations or codes**)

Takla, Hazelton, Toodoggone, Jurassic, Stikine, Volcanic, Porphyry, Copper, Gold, Quartz, Magnetite, Pyrite

1) INTRODUCTION

The Baker Gold Project (the "Baker Project" or "Property") is located in the Toodoggone region of the Omineca Mining Division, 430 km northwest of Prince George, British Columbia. The Property is situated 35 km northwest of the former Kemess South open pit gold-copper mine. The Baker Project consists of 54 mineral claims, and 2 mining leases, all 100%-owned by Multinational Mining Inc., a 100% owned subsidiary of Sable Resources Ltd. The claims cover 6,601 hectares of land that encompass the Baker Gold Project which includes the past-producing Dupont-Baker 'A' and Multinational 'B' underground gold-silver mine, and the past-producing Shasta open pit/underground gold-silver mine, as well as multiple gold, silver, and copper showings.

The 2017 diamond drill program on the Baker Project consisted of 5 NQ (1 partial HQ) diameter holes totalling 1,811.9 meters. Drilling took place between October 5 and October 24, 2017. Drilling was carried out by Radius Drilling of Prince George using 2 modified skid mounted drills, with a D6 dozer for pad construction and drill moves. A table of drill holes is provided below in Table 4-1, a drill collar map is presented in Figure 4-1 (a to-scale version of the map is contained in Appendix I) and the drill collar's approximate locations are marked on plate 4-1. Drill holes were surveyed by the contractor using a downhole Reflex survey tool. Drill hole collar locations and elevations were obtained in the field by a handheld garmin GPS tool. Selected cross-sections are shown in Figures 4-2 through 4-6.

The 2017 drilling program designed to test for shallow porphyry mineralization within the gossanous alteration zone present around the Baker mine and Black Gossan minfile. Drill targeting primarily utilized results from the 2017 geophysical and geochemical surveys, along with historic drill information and geochemical and geological surveys conducted in 2015 and 2016 respectively. Based on the results of the work contained in this report and previous geophysical, geochemical and geological reports, additional work is recommended.

Total costs filed for assessment in this report are \$336,664.48.

1.1) LOCATION AND ACCESS

The Baker Project is located approximately 450 km north-northwest of Prince George in the Omineca Mining Division of north-central British Columbia (Figure 4.1). The Project is situated 45 km northwest of the past-producing Kemess South open pit copper-gold mine ("Kemess South"). It is centered at Latitude 57.285° N and Longitude 127.111° W or, in NAD 83 (Zone 9) UTM co-ordinates, 6350723 N and 613892 E, and covers parts of two BCGS mapsheets: 094E.025 and 094E.026.

Access to the Project is provided by a series of branching gravel roads, including the Finlay Forest Service Road ("Finlay FSR"), that begin south of Mackenzie, a small forestry town located about 180 km north of, and about a two-hour drive from, Prince George. The Finlay FSR forms the southern part of the Omineca Resource Access Road ("ORAR"), an industrial road that provides access to the past producing Kemess South mine/Kemess Underground development project, and beyond to the Baker Project. Driving time from the Kemess South turn-off on the ORAR to the project is about 60 minutes. Current seasonal road access to the Project is only during the late spring, summer and early fall seasons when the road conditions are snow-free.

Total driving distance from Prince George to the Project is 520 km, and total driving time is about 9 hours. There are no fueling stations once one leaves paved Highway 97; therefore fuel for the return trip to the Project area must be carried. At the Project, numerous mine and exploration roads remain in good condition and provide access to many of the previously drilled areas.

Year round helicopter access is via Smithers, a distance of 300 km south of the Project. Alternative helicopter access during summer months may be from the Kemess South mine site if it is under active exploration. Fixed-wing air service departing from Smithers or Prince George to it can be contracted to Black Lake located approximately 2 km southeast of the Project (floatplane in ice-free conditions or skis in winter-ice conditions), or the Sturdee valley airstrip located approximately 15 km south of the project.

1.2) PROPERTY TITLE

The Baker Project consists of 54 contiguous British Columbia Mineral Titles Online (MTO) claims, and 2 British Columbia Mineral Titles Online (MTO) mining leases 100%-owned Sable Resources Ltd. and shown in Fig 1-2. A claim map at a 1:40,000 scale is contained in Appendix I. The mineral claims are in good standing until October 30, 2022, and are as described in Table 1-1. The mining leases are 40-year term leases, due for renewal on June 13, 2020 and September 10, 2021 for the past producing Shasta and Baker mines respectively, and with lease payments due annually. The 'Good to date' presented in Table 4-1 for Mining leases 243451 and 243454 are the dates to which the annual lease payments have been made to, and not the date for renewal of the 40-year term lease term.

The claims cover 6,601 hectares of land that encompass the Baker project which includes former Dupont-Baker 'A' and Multinational 'B' underground gold-silver mine, and the former Shasta open pit/underground gold-silver mine, as well as multiple gold, silver, and copper MINFILE occurrences as listed in Table 3-1 and shown in Figure 1-3.

Historically, and referred to in this report, the "Chappelle Group" claims encompass the past producing Dupont/Baker 'A' and Multinational 'B' and covers an extensive zone of pyrite enriched, gossanous alteration extending from the Black Gossan MINFILE showing in the center of the current property to the Western edge, while the "Shasta Group" claims, as referred to in this report, covers the former Shasta mine. Both 'groups' are informally defined and depicted In Figure 1-3.

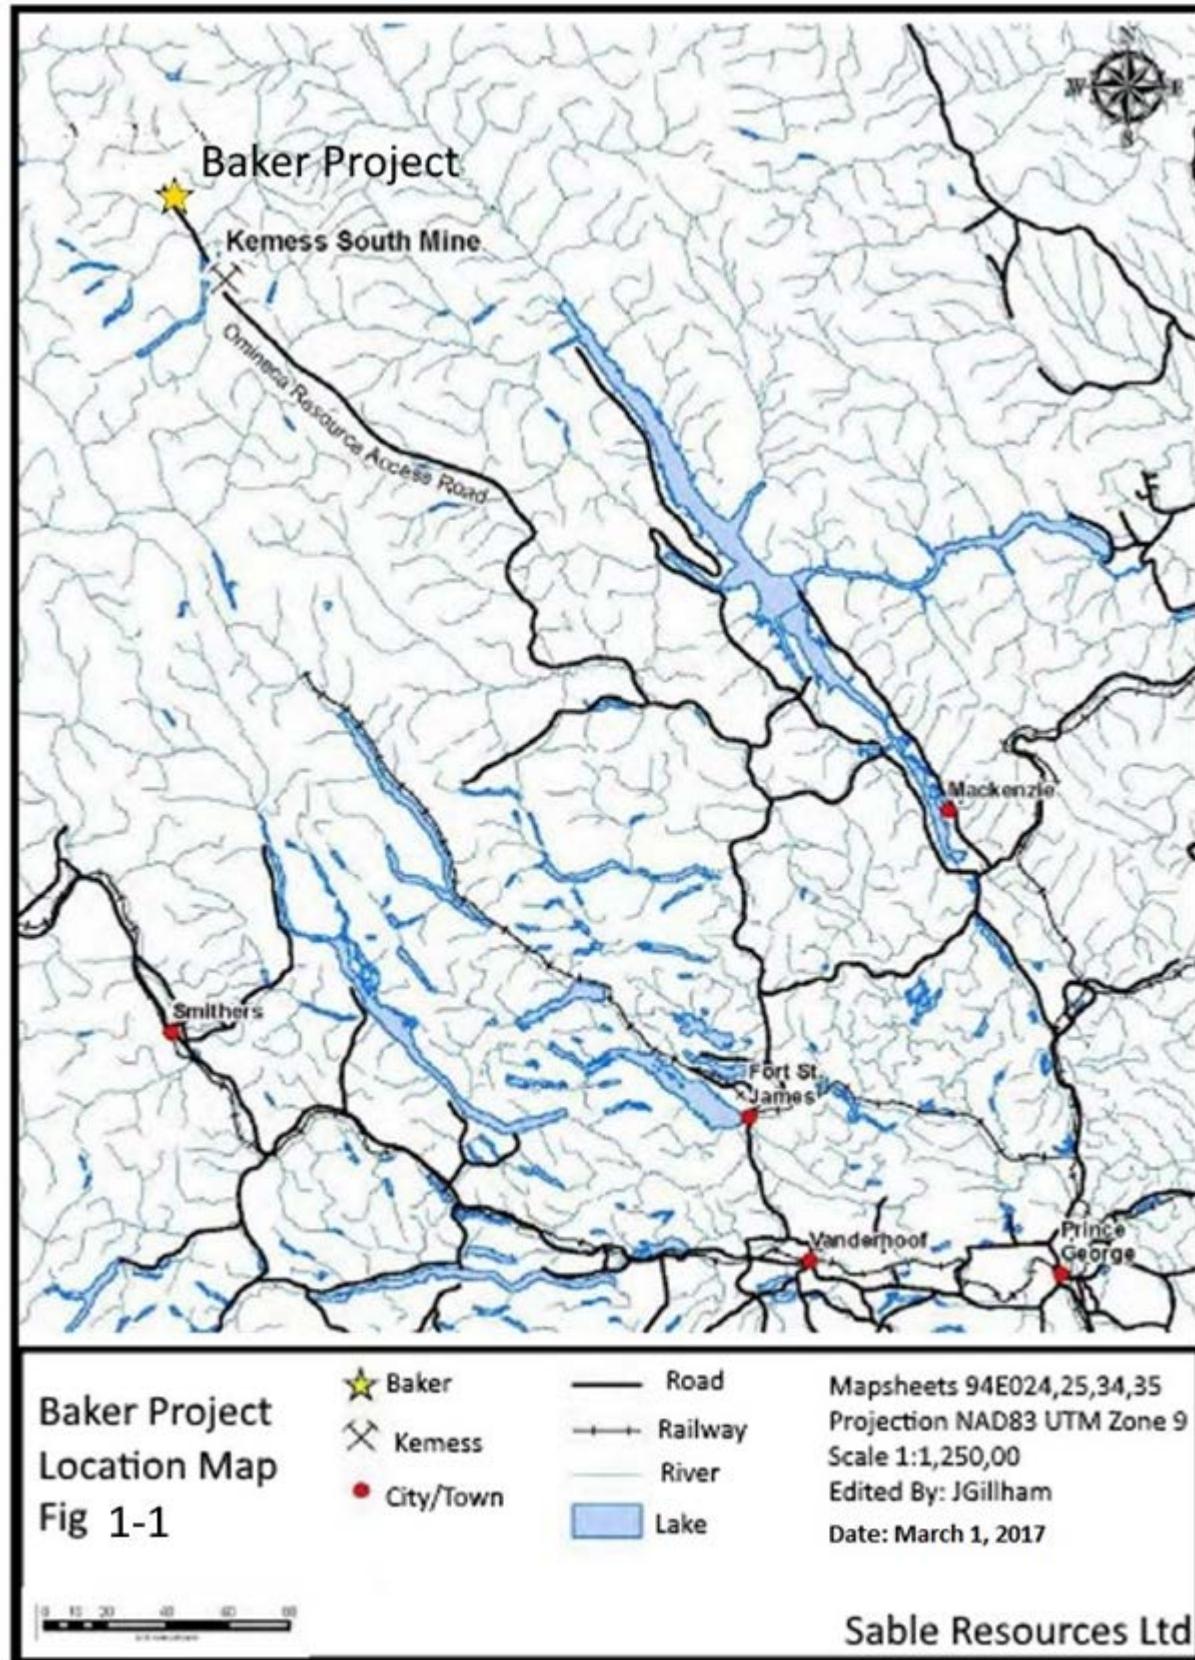

Figure 1-1: Baker Project Location Map

The 2017 diamond drill program was completed on the Baker-Black Gossan system on the Chappelle group of claims. No work was completed on the Shasta Group of claims and further discussion in this report on these claims is limited. The reader is directed to one of many other reports for a more comprehensive discussion of the geology and historical work performed on that group of claims.

To the authors' knowledge, SRL has not entered into any joint venture or option agreement with other entities on the Baker Project. SRL is the 100% owner of all of the claims that comprise the Project, free and clear of any liens and other encumbrances, but subject to a 0.5% royalty obligation on the Shasta Mining Lease (Title Number 243454), and select mineral titles of the Shasta Group claims (Title Numbers: 505435, 505436, 505432, 505431, 505434, 505430) to the beneficiary International Royalty Corporation.

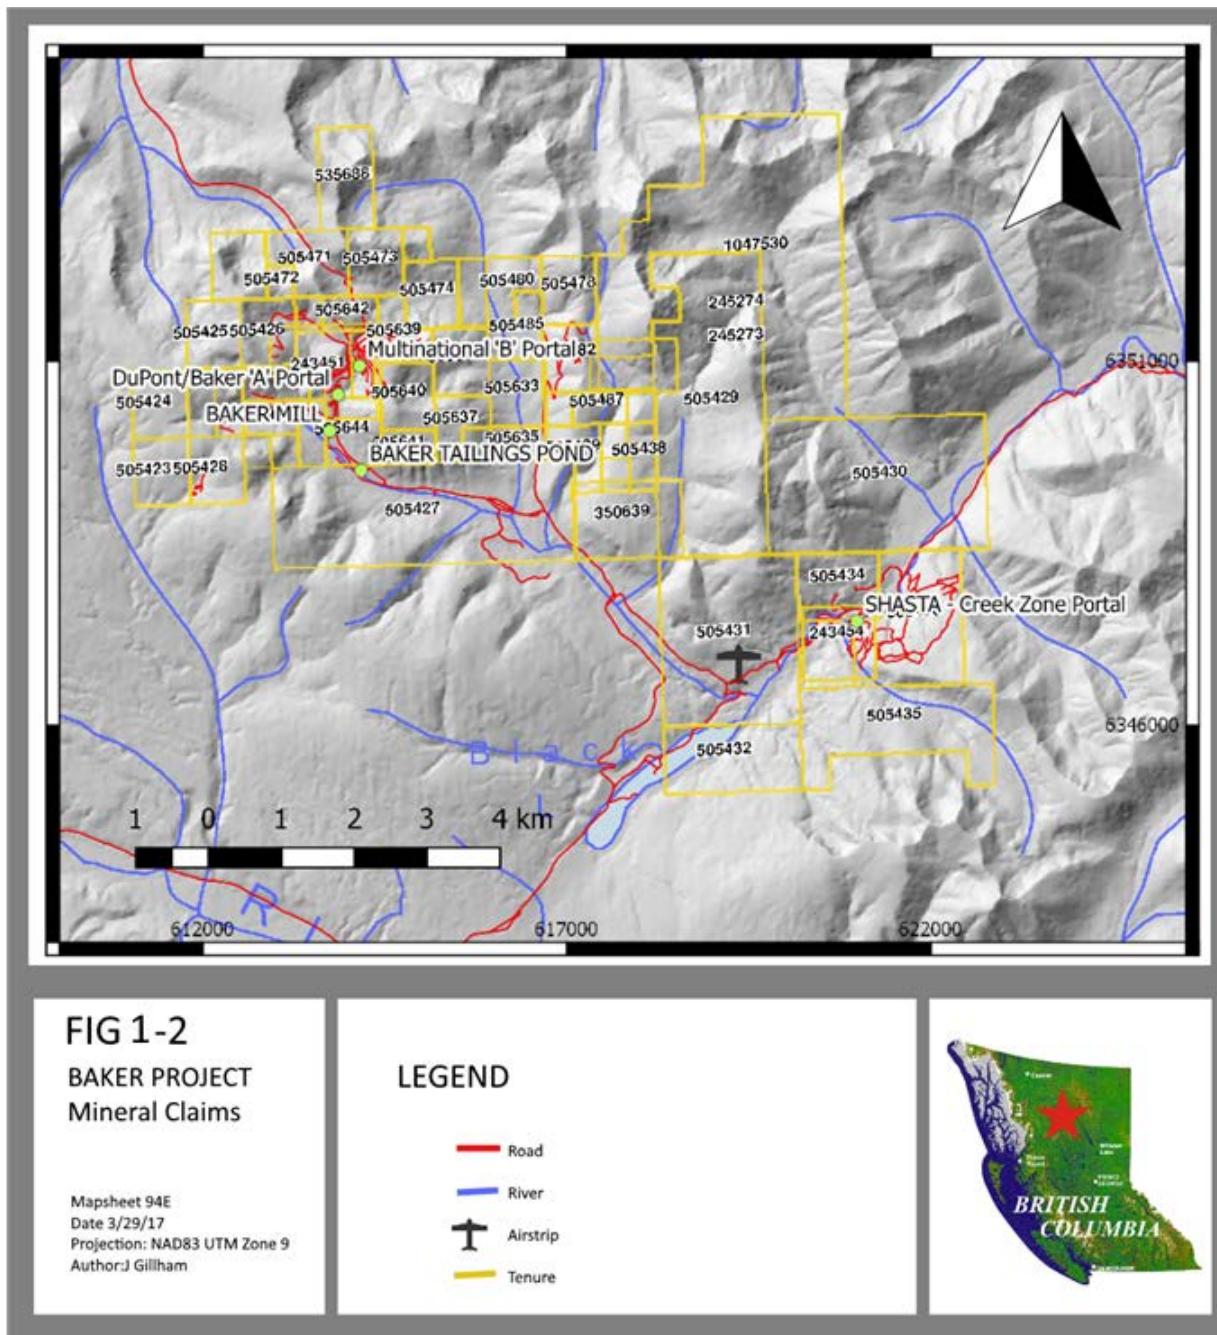

Figure 1-2: Baker Project Mineral Claims Map

1.3) PHYSIOGRAPHY

The Project is situated in moderate terrain with elevations ranging from about 1,200 metres a.s.l. along Jock Creek in the eastern part of the property to about 1,900 metres a.s.l. in the central and

west parts of the property. Most of the property is above tree line which is at an elevation of about 1,630 metres. Below tree line, sparse cover consists of birch and willow shrubs and scattered groves of white spruce and sub-alpine fir. In alpine areas, dwarf shrubs, grassy meadows, lichens and rocky tundra are common. Bedrock exposures are relatively scarce and are primarily limited to ridges and steeper creek gullies. A number of creeks are present on the property; these have been used for exploration water sources into October before freezing. Most creeks on the property appear groundwater fed.

The climate of the Project can be described as cool continental with cool summers and cold winters. The summer field season typically extends from the beginning of June to late September. The temperatures and weather can be quite erratic during this period and sporadic rain and snow showers can occur at any time. Approximate temperatures range from a minimum of -32°C in January to a maximum of +26°C in June. Snowfall accumulations can reach up to two metres over the winter months.

1.4) EXPLORATION HISTORY

The exploration history of the Project has been well documented in property reports by Carter (1988), Holbek (1991), Craft (2004), and Gillham (2016). A brief history is presented here, and for a more extensive discussion, the reader is directed to Yeomans (2019).

The Baker Project brings together the formerly separately held Chappelle and Shasta group claims which contain the past-producing Dupont/Baker 'A' and Multinational 'B', and the Shasta gold-silver mines respectively. The Chappelle group forms the western portion of the current claim block and exploration was focused on high grade veins occurring within a roughly 5 km pyrite rich gossanous zone. The Shasta group claims form the eastern portion of the current claim block where exploration was focused on a number of quart-carbonate stockworks and breccias discovered along jock creek. The exploration and development history of the Chappelle group will be discussed in this report.

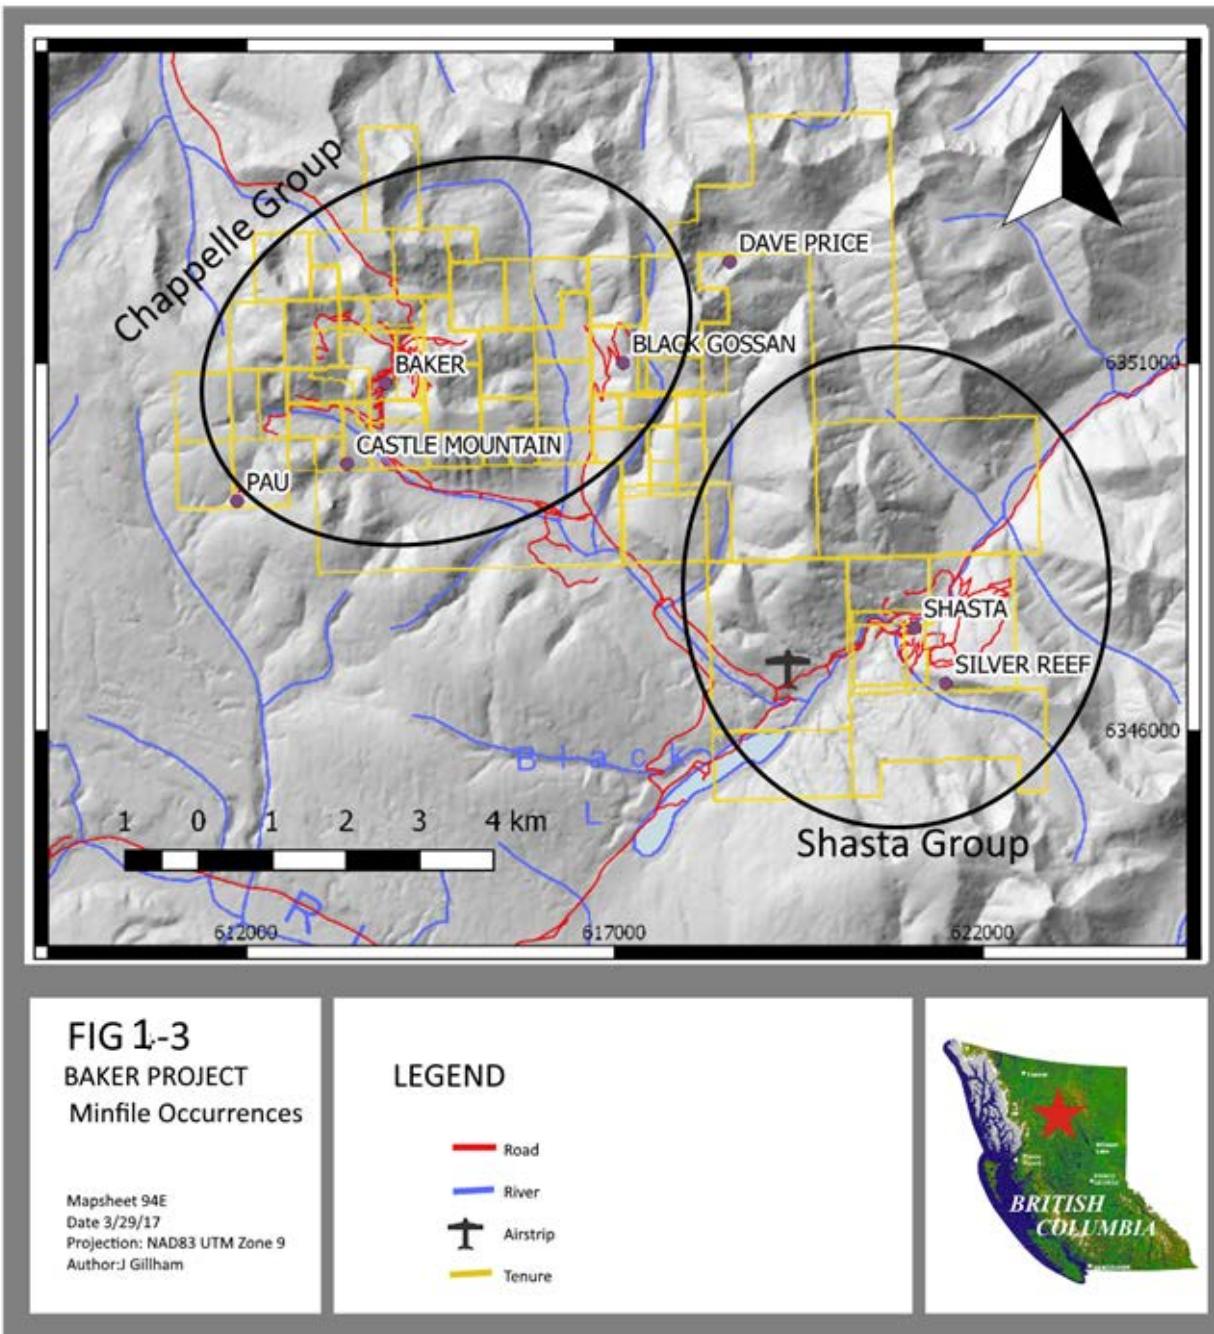

Figure 1-3: Baker Project MINFILE Occurrences

1.4.1) EARLY HISTORY OF THE TOODOGGONE REGION

In 1824, explorer Samuel Black diarized many unusually colorful gossans in the headwaters of the Findlay River system. In 1915, prospector Charles McClair mined alluvial gold from the gravels of

a creek north of Toodoggone Lake that would later bear his name. In 1929, Cominco explored several base metals showings in the region.

1.4.2) EXPLORATION AND DEVELOPMENT HISTORY

On the Chappelle group of claims, gold-silver mineralization The historic drilling information presented in this section was gathered from several sources including: (i) descriptions for all MINFILE occurrences which fall within the current claims boundary of the Project; (ii) selected B.C. Ministry of Energy and Mines assessment reports; (iii) available information sheets for B.C. Mineral Exploration Annual Reviews; and, (iv) a 2016 compilation of past drilling, prepared by SRL, consisting of: Dupont Exploration Canada Ltd drill logs dated between 1973 and 1983; Multinational Mining Inc. Exploration reports 1986 through 1988; and SRL assessment reports for the years 1994, 1997, 1998, 2000, 2004. **The total number of drill holes and the total meters given below are approximate estimates only**, based upon the various historic drill data that the author was able to compile. They are presented in this section of the Report so that the reader can appreciate the overall scope of historic surface and underground diamond drilling on the past-producing Dupont/Baker 'A' and Multinational 'B' Shasta mines, and surrounding prospects.

Surface plans with drill collar location and stems for the Dupont/Baker + Multinational deposit are presented below in Figure 1-4.

Historic drilling on the Chappelle Group of claims is summarized in Table 1-2 below.

Table 1-2: Summary of historic drilling on the Chappelle group of claims

Chappelle Group			
Period	Metres	# Holes	Description
1974-1984	12381	159	Dupont/Baker 'A' vein
1986-1988	11935	104	Multinational 'B' vein
1997-2004	3312	52	Sable drilling - peripheral targets
Total	27628	315	

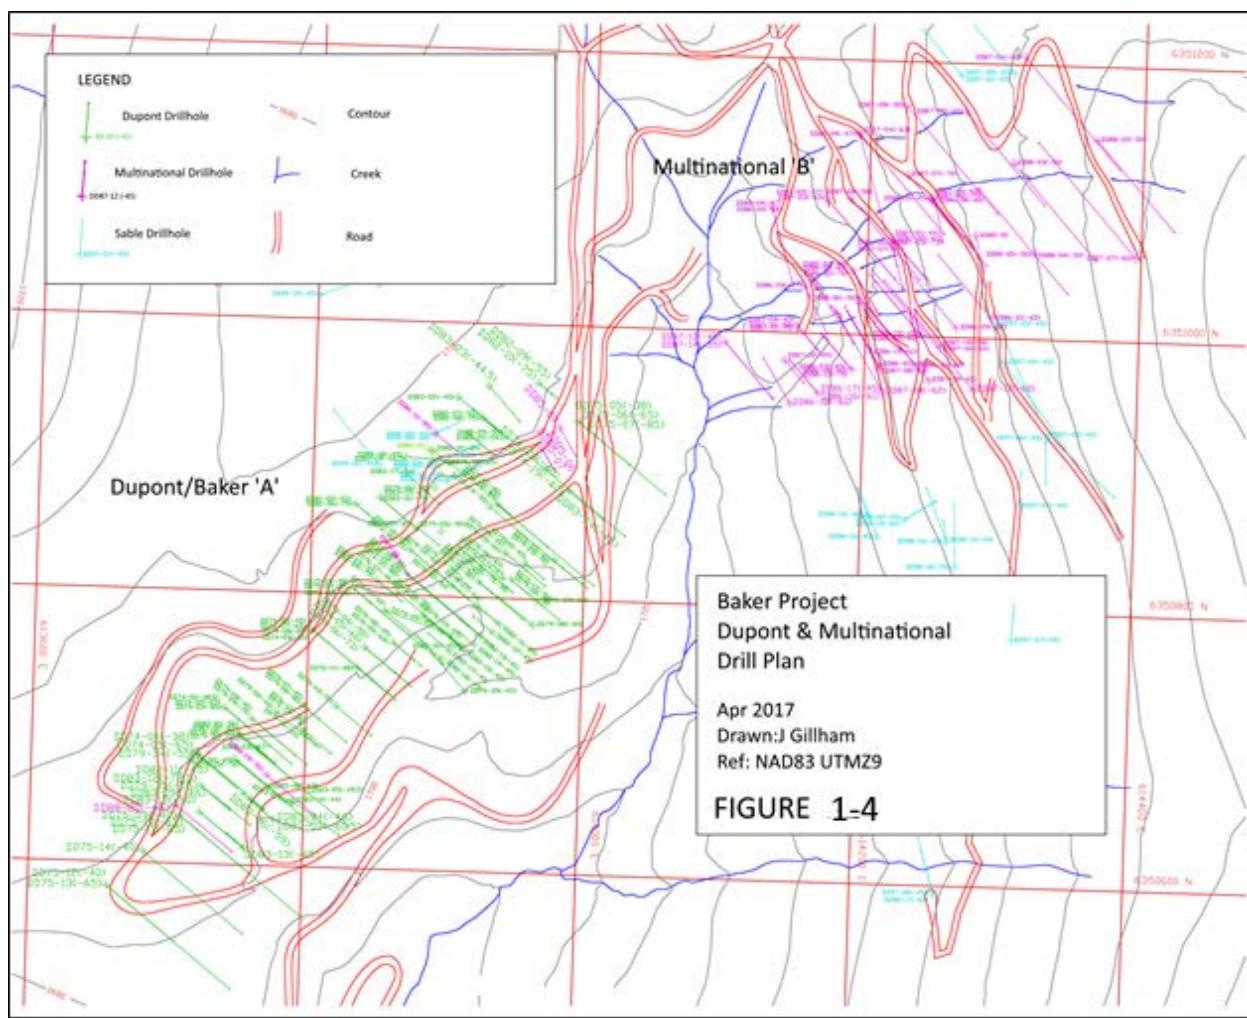

Figure 1-4: Surface and Drill Plan for the historic Dupont/Baker 'A' and Multinational 'B' mines.

On the Chappelle group of claims, gold-silver mineralization was discovered by Kennco Explorations (Western) Limited in 1969. Several quartz vein structures were identified including the 'A' Vein. Conwest Exploration Ltd. optioned the property in 1973 and constructed an airstrip at Blake Lake and a road to the property prior to driving a 200 metre adit to further explore the 'A' Vein. Underground diamond drilling was also carried but results were not encouraging and the option was terminated (Carter 1988).

DuPont of Canada Exploration Limited acquired the property in 1974 and over the next five years completed 8700 metres of diamond drilling and 460 metres of underground development on the 'A' Vein structure. A production decision was made in 1979, and the mine was put into production as the Baker mine. An airstrip was constructed in the Sturdee River Valley to facilitate air freighting of all equipment including a 90 tonnes per day mill (Carter 1988).

The Baker Mine (referred to as the Dupont/Baker 'A' deposit) was operated by Dupont Canada during the period 1981 – 83 as an underground and open pit gold - silver mine. The Dupont operation included a 90 tons per day whole ore cyanidation plant using the Merrill-Crowe process (Carter 1988). Sable Resources Ltd. acquired the Baker site including the processing facility in 1989 and subsequently modified it to a flotation circuit with optional concentrate cyanidation.

The Multinational 'B' deposit, located adjacent to Adit Creek and upstream of the 'A' deposit, was a high grade gold-silver-copper deposit from which flotation concentrates were shipped off-site. This mine was intermittently operated by Sable during 1991-1997 (Craft 2003).

No reliable historical resource or reserve estimate could be located for either the Multinational 'B' or Dupont 'A' deposits; however, Craft (2001) reports that DuPont of Canada Exploration Ltd produced 95,000 tons from the Dupont 'A' between 1981 and 1983 at an average production grade of 0.9 oz/ton gold equivalent and that Sable produced 17,500 tons from the Multinational 'B' deposit at a grade of 0.5 oz/ton gold, 5 oz/ton silver, and 1% copper.

The most recent drill programs on the Chappelle claims is detailed in assessment reports by Craft (2001), Craft (2003), and Craft (2005), where SRL conducted modest exploration programs consisting of 2,321 metres of diamond drilling on targets peripheral to the historic Dupont/Baker 'A' and Multinational 'B' zones.

Since mining of the Creek zone at the Shasta mine ceased in 2012, very limited exploration has been conducted prior to 2017. Work has focusing primarily on the former Chappelle group claims and has consisted of prospecting, geochemical surveys and mapping, and is detailed in Gillham (2016) and Gillham (2017).

2) REGIONAL GEOLOGY AND METALLOGENY

The Baker Project is situated in the Toodoggone region, an area measuring approximately 1500 square kilometres that extends from the Kemess South mine area northwestwards to the Chuckachida River. The region occurs within the Intermontane Belt and is underlain by strata of the Stikine Terrane (Figure 2-1) which consists of Paleozoic to Mesozoic island arc assemblages and overlying Mesozoic sedimentary sequences (Table 2-1). The oldest rocks exposed in the region consist of crystalline limestone of the Devonian Asitka Group. They are unconformably overlain by mafic volcanic rocks of the Upper Triassic Takla Group. Takla Group volcanic rocks are in turn overlain by bimodal volcanic and sedimentary strata of the Lower Jurassic Toodoggone Formation of the Hazelton Group (Diakow et al. 1993).

Toodoggone Formation pyroclastic and epiclastic volcanic rocks are a predominantly calcalkaline andesitic to dacitic subaerial succession. Toodoggone volcanic rocks display broad open folds with attitudes generally less than 25 degrees dipping predominantly to the west.

Potassium-argon dating of hornblende and biotite indicate that the age of Toodoggone volcanism ranges from 204 to 182 Ma. This age range appears to be divisible into two main groups: an older, lower stage of volcanism dominated by andesitic pyroclastics and flows characterized by widespread propylitic and zeolitic alteration; and a younger, upper stage of volcanism dominated by andesitic ash-flow tuffs which generally lack significant epithermal alteration (Diakow et al., 1993). All the known epithermal gold-silver deposits and occurrences are restricted to the lower Toodoggone Formation volcanics and underlying units.

Unconformably overlying volcanic strata of the Toodoggone Formation are sedimentary strata of Cretaceous age, including fine-grained clastics of the Skeena Group and chert pebble conglomerates and finer grained clastics of the Sustut Group. These sediments are structurally unaffected and are horizontal, forming cap rocks to high-standing plateaus primarily on the western edge of the Toodoggone region.

Late Triassic to Middle Cretaceous intrusions are exposed throughout the Toodoggone region. The most significant of these in terms of precious metal and porphyry mineralization are Early Jurassic granodioritic to quartz monzonitic bodies known as the Black Lake Suite of Intrusions. These intrusions host porphyry copper-gold mineralization in several localities, including the former Kemess South mine and several other deposits on the Kemess property in the southeastern part of the Toodoggone region.

A northwest-trending set of younger, steeply dipping faults and half-grabens are the principle structures found in the region. Major structural breaks are postulated to have been caused by, or be the result of, a northwest-trending line of volcanic centres (Diakow et al., 1993). Small stocks are also aligned northwesterly, suggesting they were also influenced by the same structural trend. Subsequent to volcanism and intrusion, younger faults are recognizable as northwest-trending lineaments.

The Toodoggone region is host to a number of mineral deposit types including epithermal gold-silver mineralization, calc-alkalic porphyry copper-gold mineralization, and occasional iron or copper (+/- gold-silver) skarn mineralization. All of these styles of mineralization are genetically related to Early Jurassic volcanic and intrusive activity in an extensional setting (Diakow et al, 1993). Epithermal gold-silver mineralization is hosted primarily by strata of the Toodoggone Formation, to a lesser degree by coeval intrusions, and locally within strata of the Takla Group. Epithermal mineralization is structurally controlled, and both vertical and lateral zoning in mineralization and alteration are common (Panteleyev, 1986). Porphyry copper-gold mineralization at Kemess is spatially and genetically associated with Black Lake Suite intrusions which have intruded Takla Group volcanic and sedimentary rocks. High-sulphidation epithermal mineralization systems formed at ca. 201 – 182 Ma and coincide with district wide plutonism and porphyry copper-gold±molybdenum mineralization, whereas low-sulphidation systems formed later at ca. 192 – 162 Ma, commonly coinciding with the emplacement of felsic dykes and Toodoggone Formation volcanism (Duuring et al., 2009).

Table 2-1: Regional Stratigraphy of the Toodoggone Region (after Diakow et al., 1993)

Period	Group	Formation	Lithology
Upper and Lower Cretaceous	Sustut	Brothers Peak Tango Creek	Nonmarine conglomerate, siltstone, shale, sandstone; minor ash-tuff Cassiar Intrusions: Quartz, monzonite and granodiorite
Major Unconformity			
Lower Cretaceous to Middle Jurassic	Bowser Lake		Marine and nonmarine shale, siltstone and conglomerate
Comfortable Contact			
Middle and Lower Jurassic	Spatsizi Hazelton	Toodoggone	Marine equivalent of the Hazelton Group; shale siltstone and conglomerate, subordinate fine tuffs Subaerial andesite to dacite flow and tuffs, rare basalt and rhyolite flows; subordinate volcanic siltstone to conglomerate; rare limestone lenses Black Lake Intrusive Suite: Granodiorite and quartz monzonite
Unconformity			
Upper Triassic	Takla		Submarine basalt to andesite flows and tuffs, minor limestone and argillite
Unconformity			
Lower Permian	Asikta		Limestone, chert, argillite
Major Terrane Boundary Fault			
Cambrian & Proterozoic			Siltstone, shale, sandstone, limestone; regionally metamorphosed to greenschist and amphibolite grade

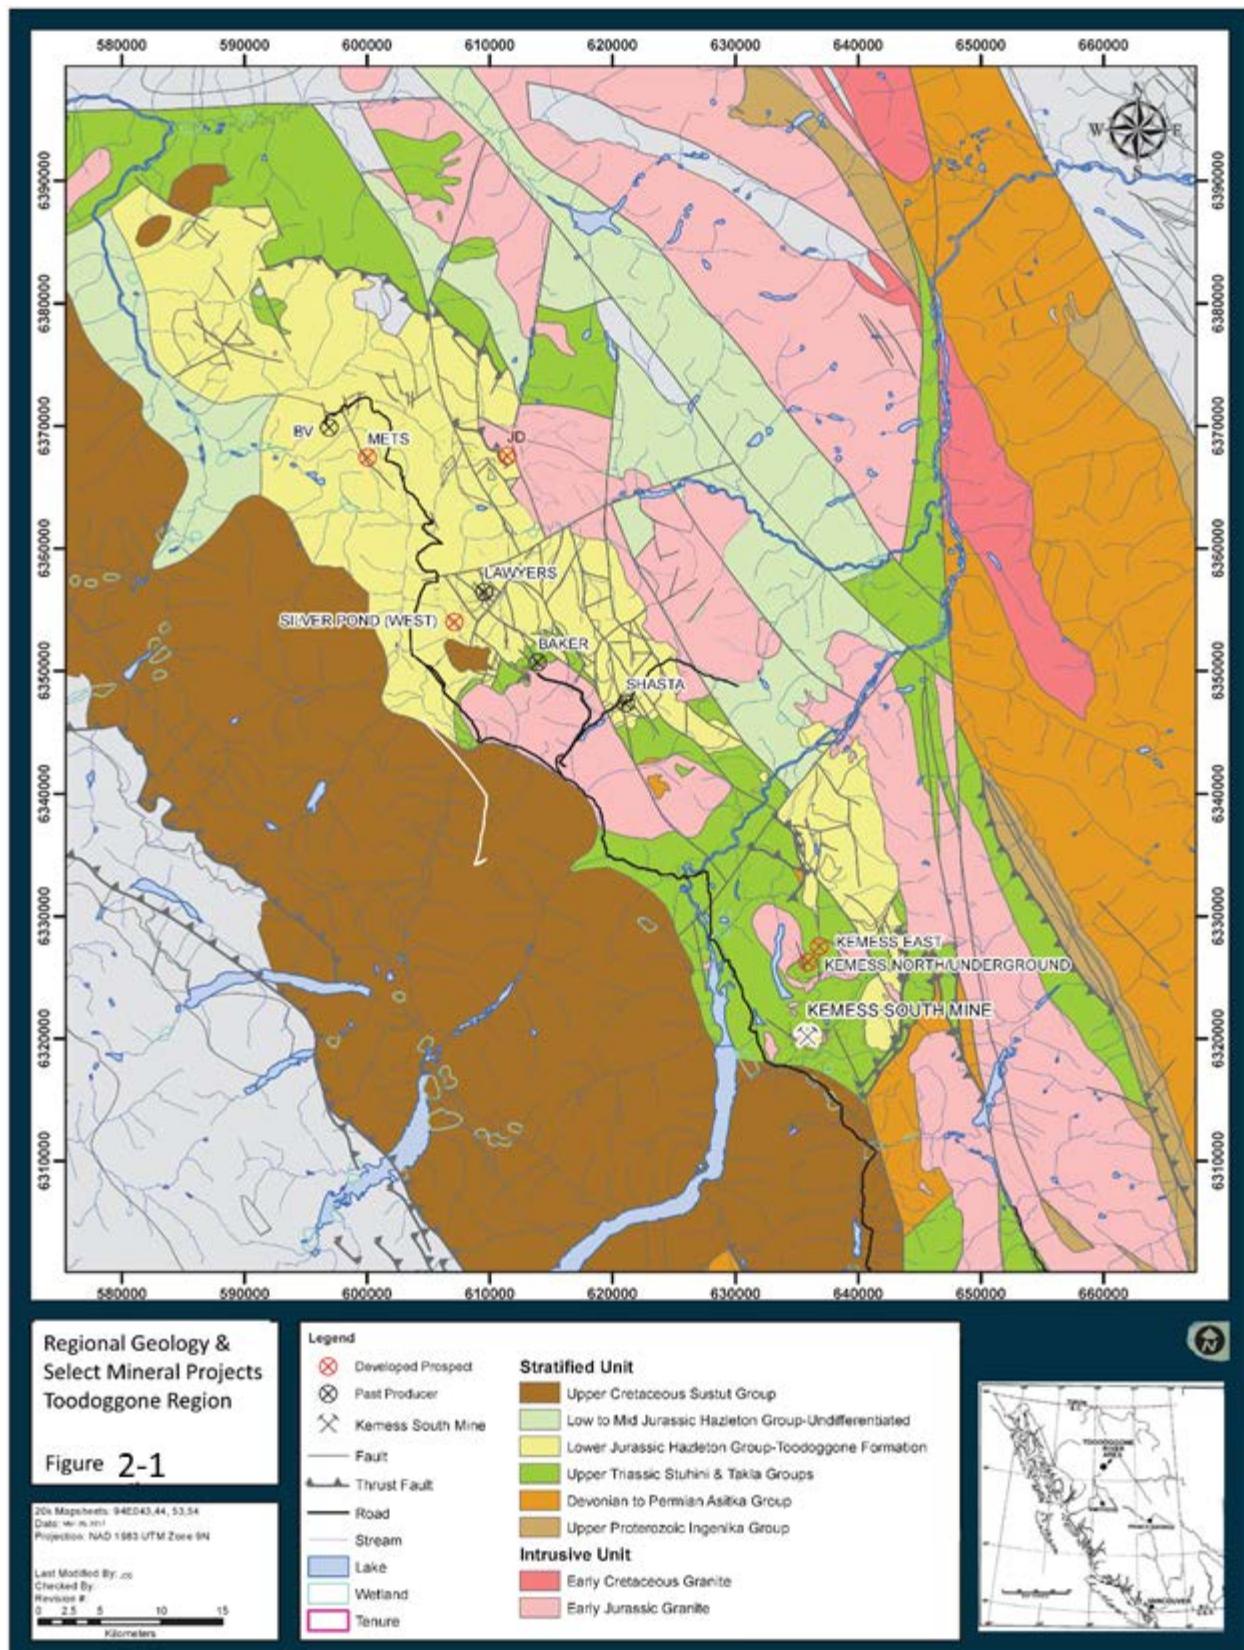

Figure 2-1: Regional Geology & Select Mineral Projects, Toodoggone Region

3) PROPERTY GEOLOGY

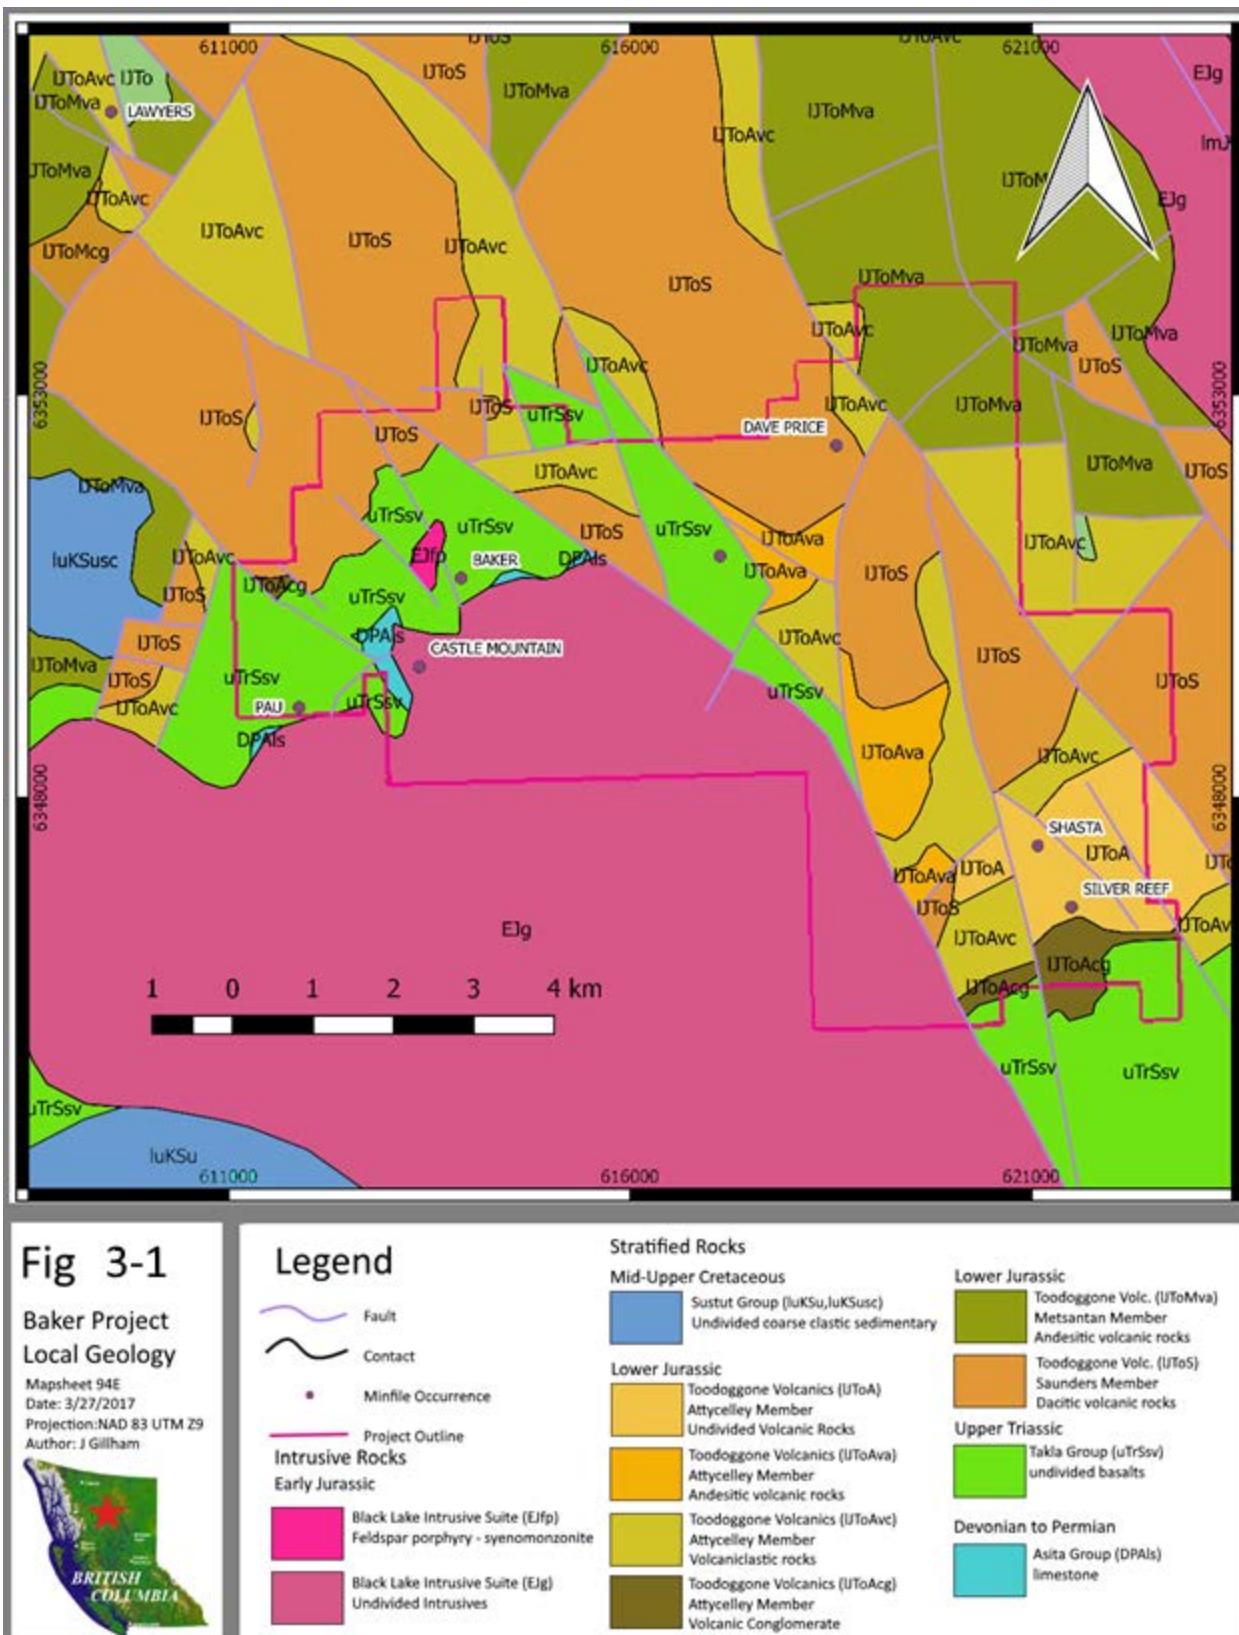

The descriptions that follow are compiled from numerous reports that have evaluated the Project area, including: assessment reports downloaded from the B.C. Ministry of Energy and Mines' ARIS (Assessment Report Indexing System) website; publications of the B.C. Geological Survey (B.C. Ministry of Energy and Mines); and hard copy reports obtained by SRL.

A map depicting the local geology and the principal mineralized zones of the Project area is shown in Figure 3-1, while a lithostratigraphic column of the Toodoggone Formation rocks is presented in Table 3-1. The geology of the Baker/Dupont 'A' mine site (Diakow et al., 1993) is shown in Figure 3-2.

The Baker property is underlain by an uplifted fault block of Takla Group volcanics in thrust contact with Asikta limestone both having been intruded by quartz monzonite of the Black Lake stock. The stock is exposed at the southern margin of the property, and has locally altered the limestone to an epidote-diopside skarn along their contact. The limestone also occurs towards the south of the property, and forms the prominent cliffs of Castle Mountain. Broken and iron-oxide stained augite phryic andesite to basalt flows of Takla Group are the dominant rock types on the property, and are the principal host of mineralization at Baker. To the north, upper cycle Toodoggone formation volcanics of Diakow (1990) are present in fault contact with Takla Group rocks.

Numerous hornblende-feldspar porphyritic apophyses of the Black Lake stock intrude and brecciate the Takla host rocks. The similar composition to the overlying Toodoggone volcanics suggests that these may be feeders for the overlying volcanism. The largest of these, intrusions, the Black Lake stock, extends 9 kilometres southeast from the Baker property. Its composition varies from granodiorite to quartz monzonite. Radiometric potassium-argon dates obtained by the Geological Survey of Canada on hornblende from this pluton indicate an emplacement age of 186 Ma. Another pair yielded ages of 189 Ma and 200 Ma on biotite and hornblende respectively (Diakow 1993). Two small syenomonzonite intrusions occur immediately to the north of the Black Lake stock near the A vein. Highly altered quartz feldspar porphyry which appears to be a late phase of the syenomonzonite intrusions, occurs immediately to the north of the A vein. The main portion of this porphyry unit lies at the fault contact between Asitka Group and Takla Group rocks near the western end of the A vein. Dike-like apophyses of this body, varying from 1 to 30 metres in thickness, subparallel and intersect the northeast extension of the A vein.

Prominent Propylitic and Sericitic alteration on the property has weathered a gossanous rust color. An assemblage of quartz-sericite-chlorite-pyrite gives way to an argillic clay assemblage proximal to veins. Milky quartz veins are the principal host to economic mineralization, and commonly exhibit polyphase breccia, and vuggy textures. Gold-silver mineralization is associated with pyrite, sphalerite, galena and chalcopyrite, with precious metal mineralization in the form of electrum and acanthite.

**Figure 3-1:** Baker Project Local Geology

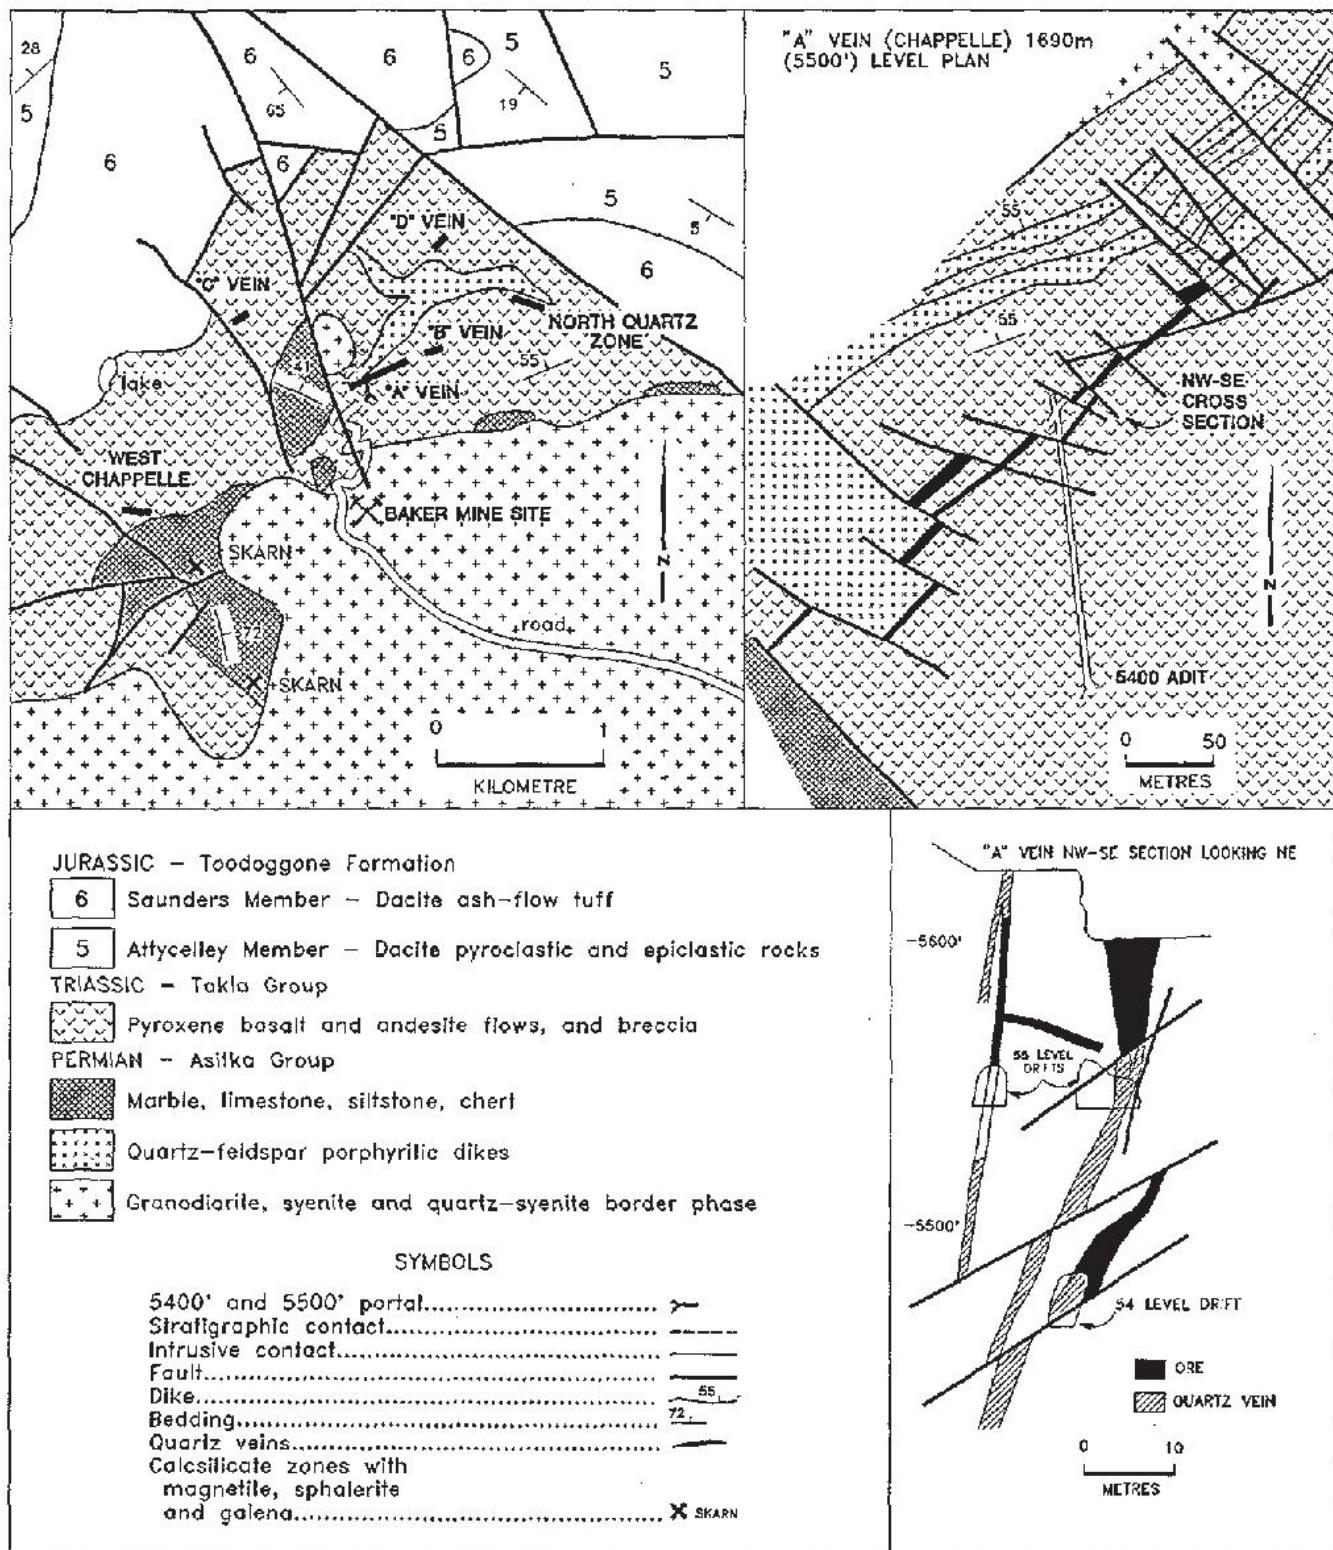

Figure 3-2: Geology and Select Mineralized Zones, Dupont/Baker 'A' Mine (after Diakow et al., 1993)

Table 3-1: Lithostratigraphic Column, Toodoggone Formation (Diakow et al., 1993)

Toodoggone Formation Member	Eruptive Cycle	Age (Ma)	Description
Saunders	Upper	192.9 to 194	Trachyandesite tuffs
Attycelley		193.8	Dacite tuffs and related feeder dykes and sub-volcanic domes
McClair			Heterogeneous lithic tuffs, andesite flows and sub-volcanic dykes and plugs
Metsantan	Lower	197 to 200	Trachyandesite latite flows and tuffs
Moyez			Well-layered crystal and ash tuffs
Adoogacho		197.6	Trachyandesite ash flows to lapilli tuffs and reworked equivalents

Mineralization occurs within steeply dipping structures on the property, commonly with a northeast strike. The hypabyssal hornblende-feldspar porphyry has exploited these structures, and silification with or without mineralization, occurs along these intrusive contacts. Wallrocks are variably silicified and altered to sericite, clay minerals and carbonate with intensity increasing with proximity to vein structures.

The main production occurring on the Chappelle Group claims was at the Dupont/Baker 'A' vein, a fault-controlled quartz vein system composed of two or more subparallel veins which strike northeast and dip from 80 degrees southeast to approximately 70 degrees northwest. The quartz vein system has been traced for a strike length of 435 metres and across a width varying from 10 to 70 metres. Individual veins within the system vary from 0.5 to 10 metres in width. Drilling indicated that the vein system persists for at least 150 metres vertically from surface. The A vein system is cut by numerous crossfaults which offset portions of individual veins, commonly for 1 to 15 metres and in one instance, for an inferred plan offset of 30 metres in a small graben structure. Most of the faults are northwest striking normal and reverse faults dipping to the northeast, and dip-slip strike faults dipping at shallow angles, generally to the southeast. Wallrocks, particularly in the hangingwall, are badly broken. The quartz vein is broken into segments less than 30 metres in length. A variety of quartz vein textures and crosscutting relationships indicate a complex history of veining with multiple depositional stages. Much of the quartz is massive and drusy, whereas a distinctive earlier ribboned variety is common, particularly near vein contacts. The quartz varies in colour from white to grey to dark grey.

Gold-silver values are generally associated with highly fractured and occasionally brecciated white to grey, vuggy quartz veins containing 1 to 10 per cent pyrite, and to a lesser extent occur in silicified wallrock. Xenoliths of altered andesite and dacite frequently occur in the veins. The only other common gangue mineral is carbonate, which fills fractures.

Higher grade mineralization is associated with grey quartz, which occasionally contains visible argentite, commonly associated with disseminated grains of pyrite, chalcopyrite and very minor sphalerite. High grade gold-silver values occasionally occur in narrow (1 to 5 centimetres) crosscutting silicified shears. Visible gold is rare. Significant precious metals were found to be contained in a flat-lying shoot 200 metres in length by 3 metres wide and extending to a depth of 40 metres below surface.

Polished section, x-ray diffraction, and electron microprobe studies indicate that pyrite is the dominant mineral, constituting about 90 per cent of sulphide mineralization. It occurs as euhedral grains and includes blebs of chalcopyrite, electrum, argentite, bornite and sphalerite. Sphalerite constitutes about 3 per cent of the sulphides and is commonly enclosed in pyrite. Argentite is commonly interstitial between pyrite, chalcopyrite and gold. Electrum is frequently associated with argentite. The form of occurrence of gold is similar to that of argentite and electrum. Bornite occurs as blebs in pyrite or with chalcopyrite. Galena occurs as rare discrete disseminated grains. Chalcocite forms thick coatings on chalcopyrite and covellite forms a thin coating on both chalcocite and chalcopyrite in the oxidized part of the A vein.

3.1) STRATIGRAPHY AND STRUCTURE

Dominant structures on the Baker Project consist of steeply dipping normal faults, and north to northwest-trending strike-slip faults. One of the latter (the Saunders fault) borders the Shasta deposit to the east (Fig 3-1), and has an estimated ~5 km right-lateral displacement (Diakow et al. 1993). Several of the Toodoggone area deposits, including Lawyers, Baker, and Shasta, lie near northwest-trending faults. Diakow (1990) proposed that these deposits lie along the margin of a fault-bounded trough which may have ponded later volcanics and localized hydrothermal fluids during extension. At Shasta, structurally controlled mineralized zones also have northwest trends, and may similarly reflect syn- to immediately post-volcanic normal fault activity. Small stocks in the area are also aligned northwesterly, suggesting they were also influenced by the same structural trend. Subsequent to volcanism and intrusions, younger faults are recognizable as northwest-trending lineaments.

3.2) ALTERATION AND MINERALIZATION

Alteration and associated mineralization on the Baker Project includes both the Dupont/Baker 'A' and Multinational 'B' vein systems on the Chappelle group of claims, and the Shasta deposit and on the Shasta claims. Alteration for the property consists of regional scale propylitic alteration of chlorite-epidote +/- calcite and pyrite. At the deposit scale, the Chappelle group of claims has undergone intense propylitic chlorite-epidote-pyrite alteration, and locally strong sericitic alteration. The lower grade regional alteration has been overprinted at Shasta by extensive potassic (quartz-adularia) alteration assemblage associated with a low-sulphidation epithermal system.

The Baker Project covers an area that includes seven (7) B.C. MINFILE mineral occurrences, including the past producing underground and open cut/pit Dupont/Baker 'A', Multinational 'B', and Shasta mines. The Dupont/Baker 'A' and Multinational 'B' deposits are not distinguished in the MINFILE reports and both occur under the 'BAKER' MINFILE. The other six (6) MINFILE occurrences along with the 'BAKER' showing are listed in Table 3-2 and are shown on Figure 1-3.

Table 3-2: List of MINFILE and Other Notable Mineral Occurrences, Baker Project

4) 2017 DIAMOND DRILLING

The 2017 diamond drill program on the Baker Project consisted of 5 NQ (1 partial HQ) diameter holes totalling 1,811.9 meters. Drilling took place between October 5 and October 24, 2017. Drilling was carried out by Radius Drilling of Prince George using 2 modified skid mounted drills, with a D6 dozer for pad construction and drill moves. A table of drill holes is provided below in Table 4-1, a drill collar map is presented in Figure 4-1 (a to-scale version of the map is contained in Appendix I) and the drill collar's approximate locations are marked on plate 4-1. Drill holes were surveyed by the contractor using a downhole Reflex survey tool. Drill hole collar locations and elevations were obtained in the field by a handheld garmin GPS tool. Selected cross-sections are shown in Figures 4-4 through 4-8.

The 2017 drilling program focused on testing for shallow porphyry mineralization within the gossanous alteration zone present around the Baker mine and Black Gossan minfile. Drill targeting

primarily utilized results from the 2017 geophysical and geochemical surveys, along with historic drill information and geochemical and geological surveys conducted in 2015 and 2016 respectively.

The drilling areas are underlain by andesitic-basaltic volcanic rocks of the Takla group, and intrusive feldspar porphyries of the Black Lake intrusive suite. A minor limestone/skarn unit assigned to the Permian Asitka Group was also encountered at the northeast end of the drill area in hole BK-17-05.

All 2017 drill core was transported from the drill site by one of the drillers or by a representative of Sable and securely stacked outside of the core logging facility until being brought inside for logging, and is now stored at the Baker camp site.

Table 4.1 – 2017 Diamond Drill Summary						Total	1811.86

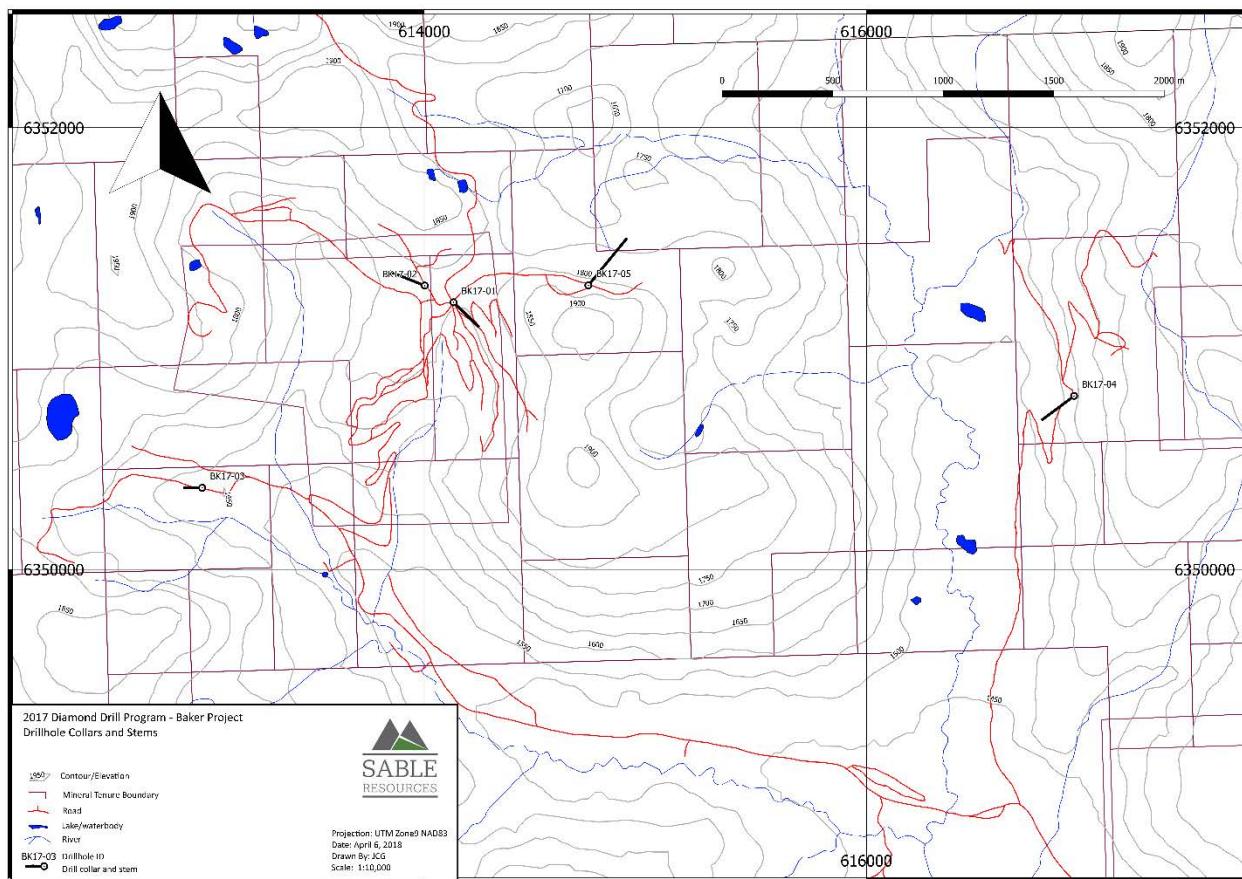

Figure 4-1: 2017 Drill collar and stem map for the Baker Project

Core recovery for the 2017 Baker Diamond Drill Program was generally good. The average total recovery of each individual core run was 88.9%, while the average of total recovery of all drill core was 89.7%. Recovery was generally poorest within the top 50 to 100 meters of the collar due to the felsenmeer texture of the oxidized(gossanous) ground. Figures 4-2 and 4-3 plot Total Core Recovery (%) as a function of depth and run length respectively. A brief interpretation of this visual data supports the notion that recovery was good to excellent at depth and poor near surface (Figure 4-2), and that poor recovery and recoveries significantly above 100% were impacted by short-core-barrel runs (less than standard 10 foot runs) indicating poor ground.

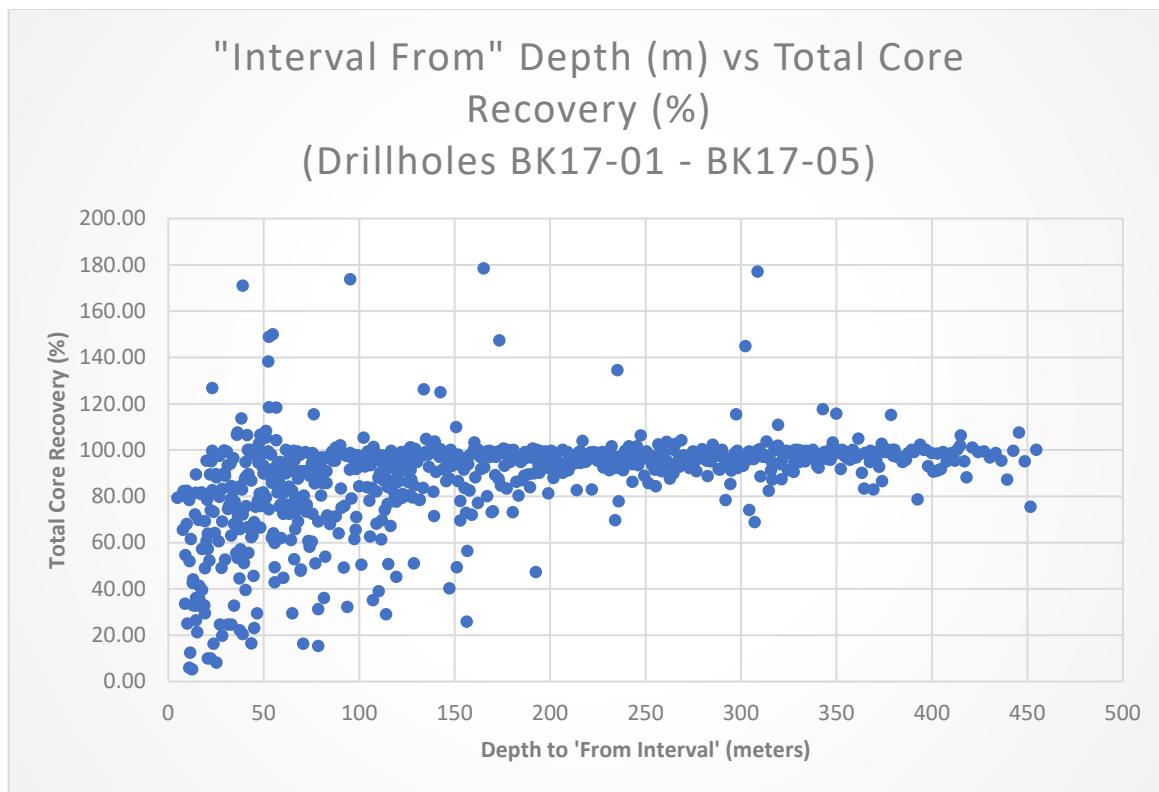

Figure 4-2: Depth to "interval from" vs total core recovery for the 2017 Drill Program

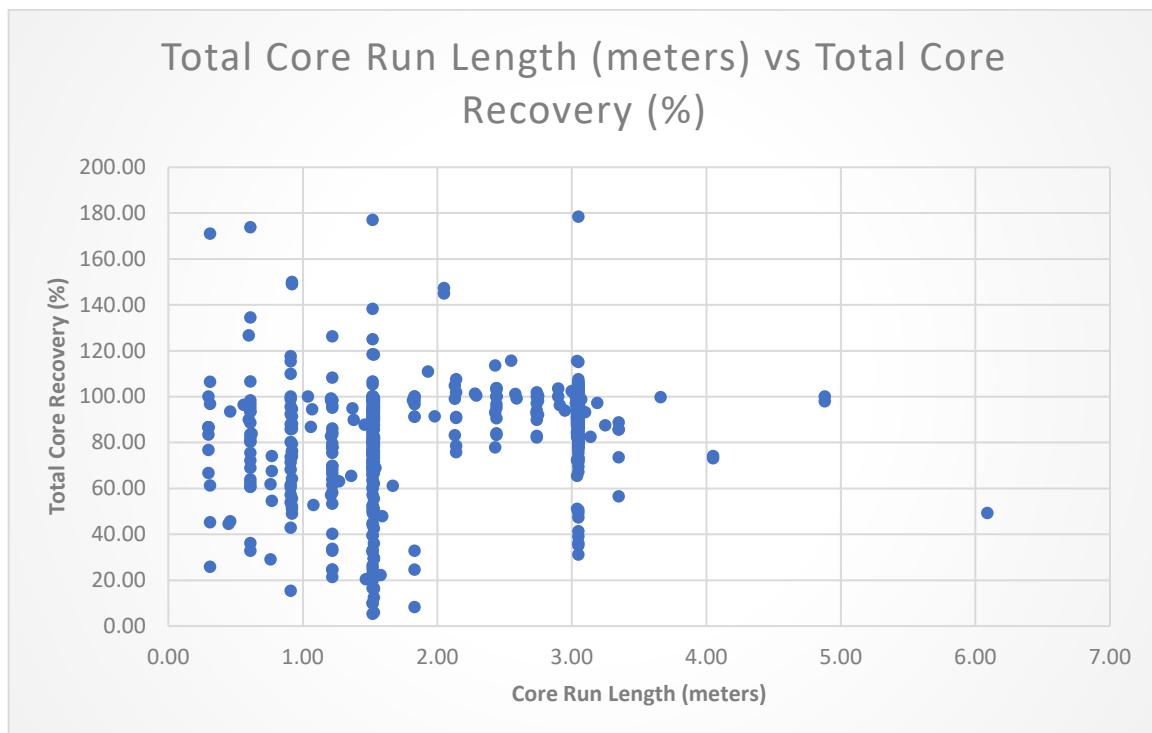

Figure 4-3: Core run length vs total core recovery for the 2017 drill program

4.1) PROCEDURE

Drill core handling procedures from drill to laboratory consisted of the following:

- Drill core was transferred from the core tube to four-foot long wooden core boxes by a member of the drill crew;
- The drillers labelled the core boxes with drill hole number and box number, and placed a wooden block marked with the depth in feet at the end of each run of core;
- At the end of each drill shift, filled core boxes were transported to the core logging facility;
- At the core logging facility, core boxes were laid out in order to ensure all boxes were present and to ensure markers were correctly located and labelled;
- A Sable technician or geologist then converted block measurements from feet to metres and core recovery measurements were determined and recorded for each run;
- Core was geologically logged using hard copy forms designed for the Project; data was later entered into an electronic database;
- The geologist determined the core to be sampled by marking it with bright coloured wax crayons to indicate the start and end of each sample interval. Each sample interval was tagged with a unique identification number, and the data was recorded on a Sample Record form.
- Core was photographed sequentially from collar to ‘End of Hole’ in wet conditions prior to being moved to an adjacent core cutting shack for halving using a water-cooled diamond saw.

Drill core sampling procedures were as follows:

- Core boxes to be sampled were laid out in numerical order and lids removed;
- Sections of competent core were halved using a diamond saw, with half of the core for each sample placed in its own pre-numbered bag with matching pre-numbered sample tag; the other half of the core was returned to the core box;
- Sections of badly fractured core and gouge were carefully halved using a square-nosed cement trowel, and bagged as per the procedure listed above;
- All bagged samples were closed tightly with zip ties and packed together with QA/QC samples (that were inserted into the core sample stream at a prescribed frequency) into large rice bags at a rate of 3-7 per rice bag; each rice bag was labelled with the project name, drill hole ID and sample number range and then sealed with a zip tie;

Sample Shipping:

- Each shipment consisted of: a) multiple packed rice bags representing one or more drill hole's worth of core samples, b) a Sample Record form, and c) a laboratory requisition form;

- Core sample shipments were made from site to a private secure location in Prince George by staff, and subsequently delivered directly to ALS Laboratories ("ALS") in North Vancouver, British Columbia, by a bonded commercial carrier; and
- ALS's receiver logged receipt of the rice bags into the company's tracking system.

It is the author's opinion that the sample preparation, security and analytical procedures were sufficient to produce the maps and interpret the qualitative results from the 2017 program.

SRL selected ALS Laboratories ("ALS") in North Vancouver British Columbia, to conduct its analysis of the rock and soil samples from the 2017 exploration program. ALS maintains ISO 9001:2015 accreditation for quality management system certification.

The samples are weighed and crushed to 70% –10 mesh (2 mm), then a 250 gram split is pulverized to 85% –200 mesh (75 microns). Samples were analyzed for gold by fire assay fusion with ICP-AES finish (30 gram sample) (ALS code: Au-ICP21), and for 48 elements including copper, molybdenum and silver by four acid digestion ICP/MS (ALS code: ME-MS61). ALS's Quality Management System is compliant with the ISO 9001 Model for Quality Assurance and ISO/IEC 17025 General Requirements for the Competence of Testing and Calibration Laboratories. Quality control at the laboratory is maintained by submitting blanks, standards and re-assaying duplicate samples from each analytical batch. In addition, Sable Resources Ltd included QA/QC samples at a rate of 1 every 15 for duplicates and 1 every 10 samples for blanks and standards.

4.2 2017 DRILLING RESULTS

The 2017 drilling encountered extensive pyrite-magnetite-quartz mineralization in all holes hosted in Takla group basalts and feldspar porphyry dikes/sills. Assay results for gold and copper were disappointing. The significant magnetite encountered in all holes explains the magnetic anomaly component targeted in all drillholes. In general, the holes all encountered pyrite-magnetite mineralization and classic porphyry propylitic, sericitic (phyllitic) and lesser potassic alteration zones indicative of an extensive magmatic-hydrothermal system.

All information, data, and maps pertaining to the 2017 diamond drilling program can be found in Appendix I.

BK17-01

Drillhole BK17-01 was collared near the historic Multinational 'B' deposit and was designed to test an intrusive body below and adjacent to the known mineralization. The drillhole was collared on a main access road and drilled to 352.96 meters depth at an azimuth of 135 degrees and a dip of -64 degrees.

The hole encountered altered Takla group basalts and an approximately 60 meter interval of intrusive feldspar porphyry. No downdip extension to the mineralized 'B' zone was encountered.

Assay results were generally disappointing. 81 unique intervals were assayed representing 129.28 meters of the core. High assay values of 0.11 ppm gold and 443 ppm copper were encountered in a 1.46 meter interval within an anomalous interval of 5.05 meter between 154.3 meters and 159.35 meters with average grades of 0.09 ppm gold and 369 ppm copper.

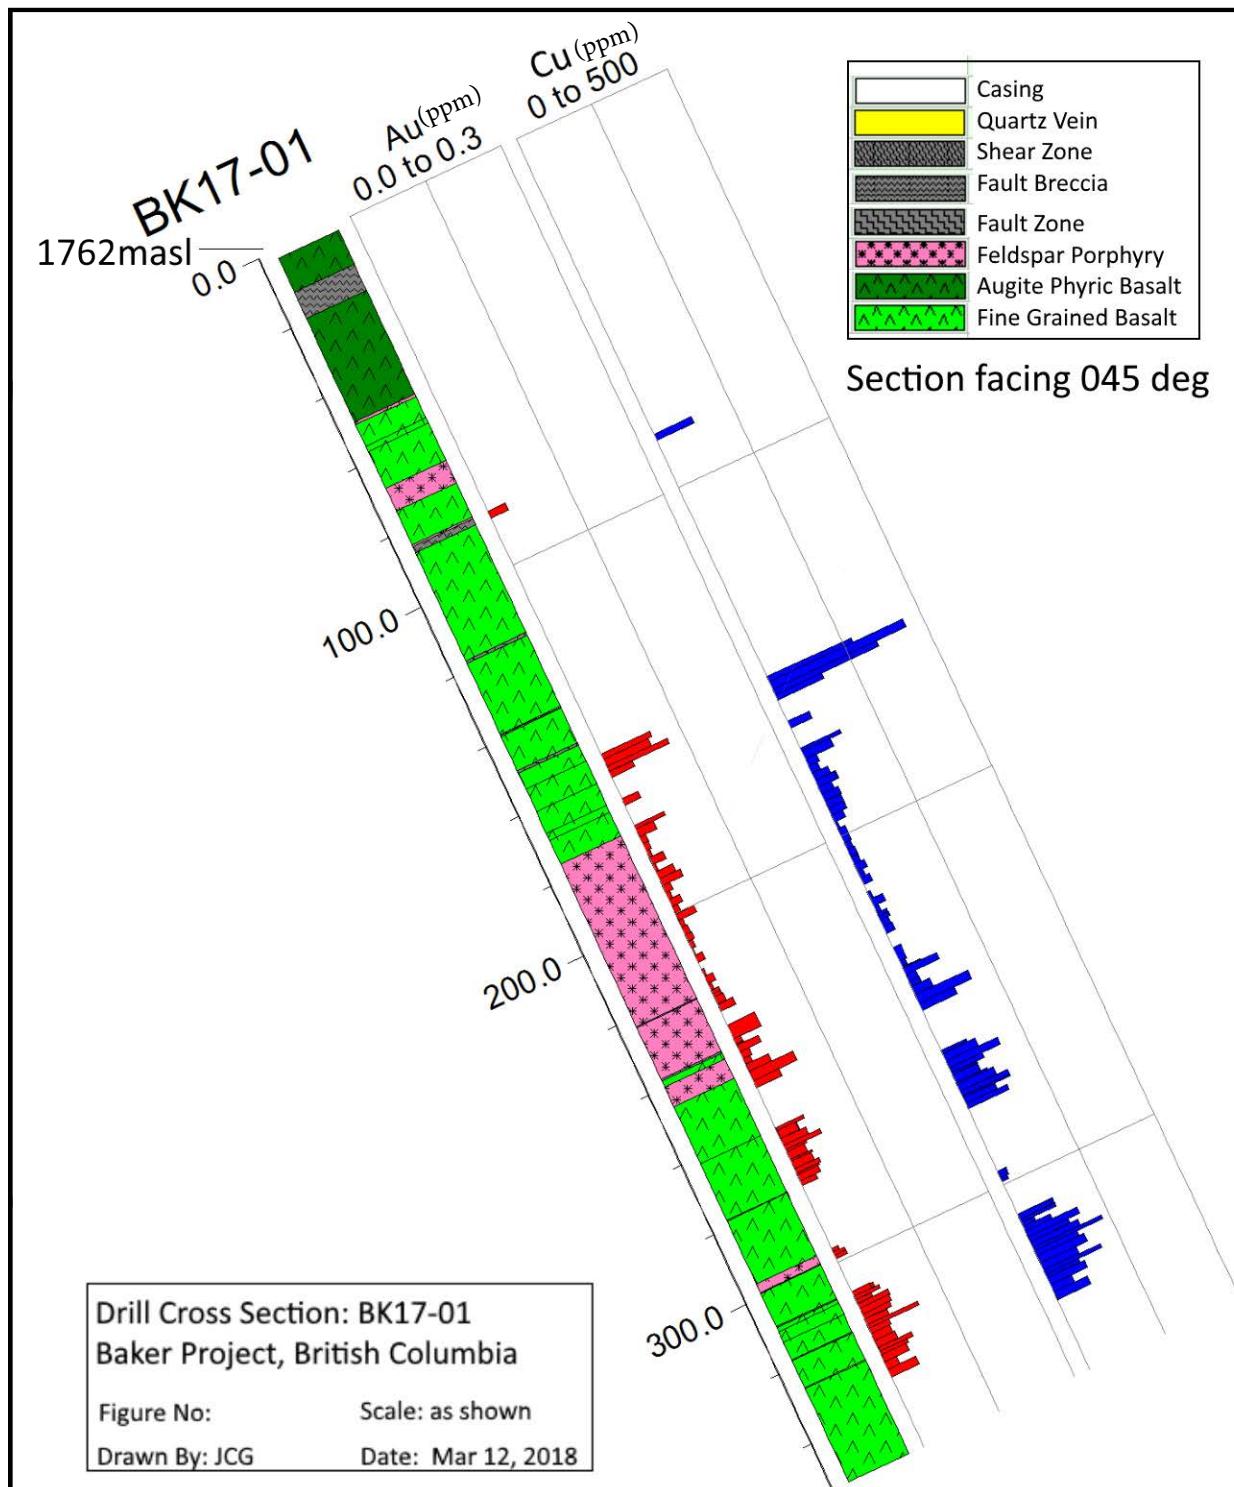

Figure 4-4: Drillhole BK17-1 Section

BK17-02

Drillhole BK17-02 was collared in the Upper Ridge zone (Craft 203) in an area which received limited diamond drilling between 1998-2000 after numerous multi-ounce gold quartz float boulders were discovered. Located approximately 500 meters north of the historically mined Dupont 'A' vein, the area is largely scree covered with limited outcrop. The diamond drillhole was drilled from a pre-existing road setup at an azimuth of 292 degrees northwest at a dip of -65 degrees, and targeted coincident interpreted structural, chargeability and magnetic anomalies.

The hole encountered Takla group fine-grained-basalt interfingered with numerous short intervals (less than 10 m core length) of intrusive feldspar porphyry (Black lake suite). Early chlorite-(epidote)-pyrite rarer K-spar alteration of all rocks is variably overprinted by a sericite-quartz-pyrite suite. Pyrite +/- Quartz +/- Magnetite stringers are relatively common throughout the entire hole. Minor biotite alteration is preserved as halos around these quartz rich stringers within basalt towards the bottom of the hole.

Assay results were generally disappointing. 127 unique intervals were assayed representing 230.88 meters of the core were sampled along with the insertion of 10 duplicate and 15 CRM's for assay. Numerous anomalous gold (to 0.128 ppm) and copper (to 251 ppm) intervals were returned throughout the length of the hole in both dominant lithologies. Grades generally appear to be more anomalous in areas where remnant Potassium-Feldspar or Biotite alteration and less late sericite (phyllitic) alteration were noted in the logs.

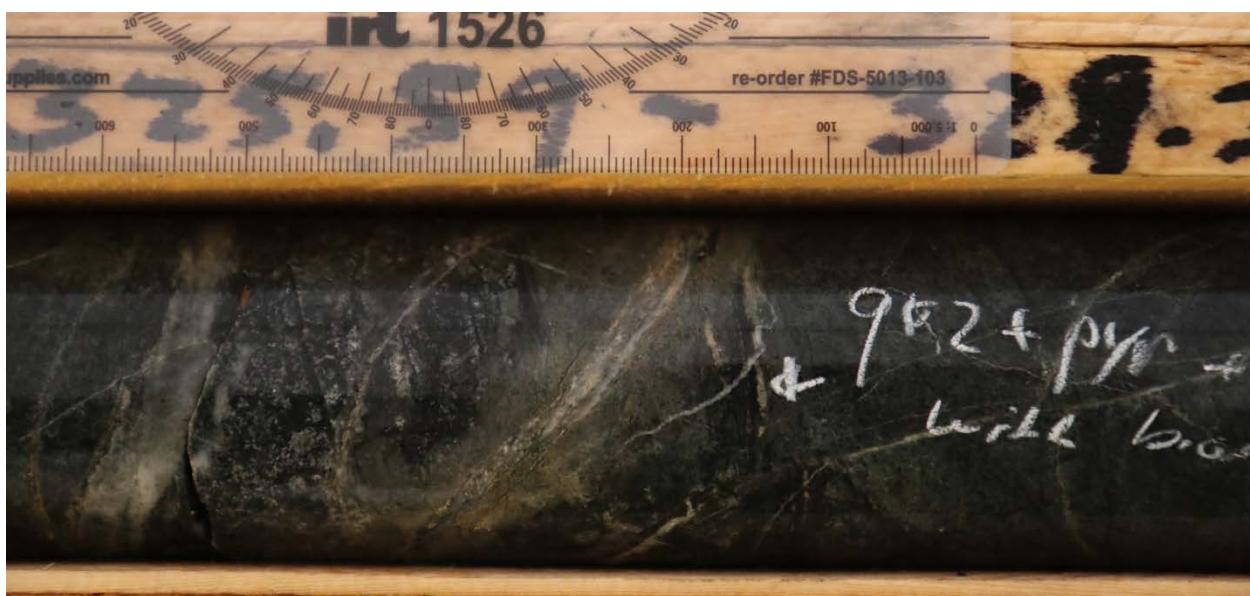

Plate 4-2: quartz-pyrite-magnetite mineralization with biotite alteration halo at 326m downhole in BK17-02

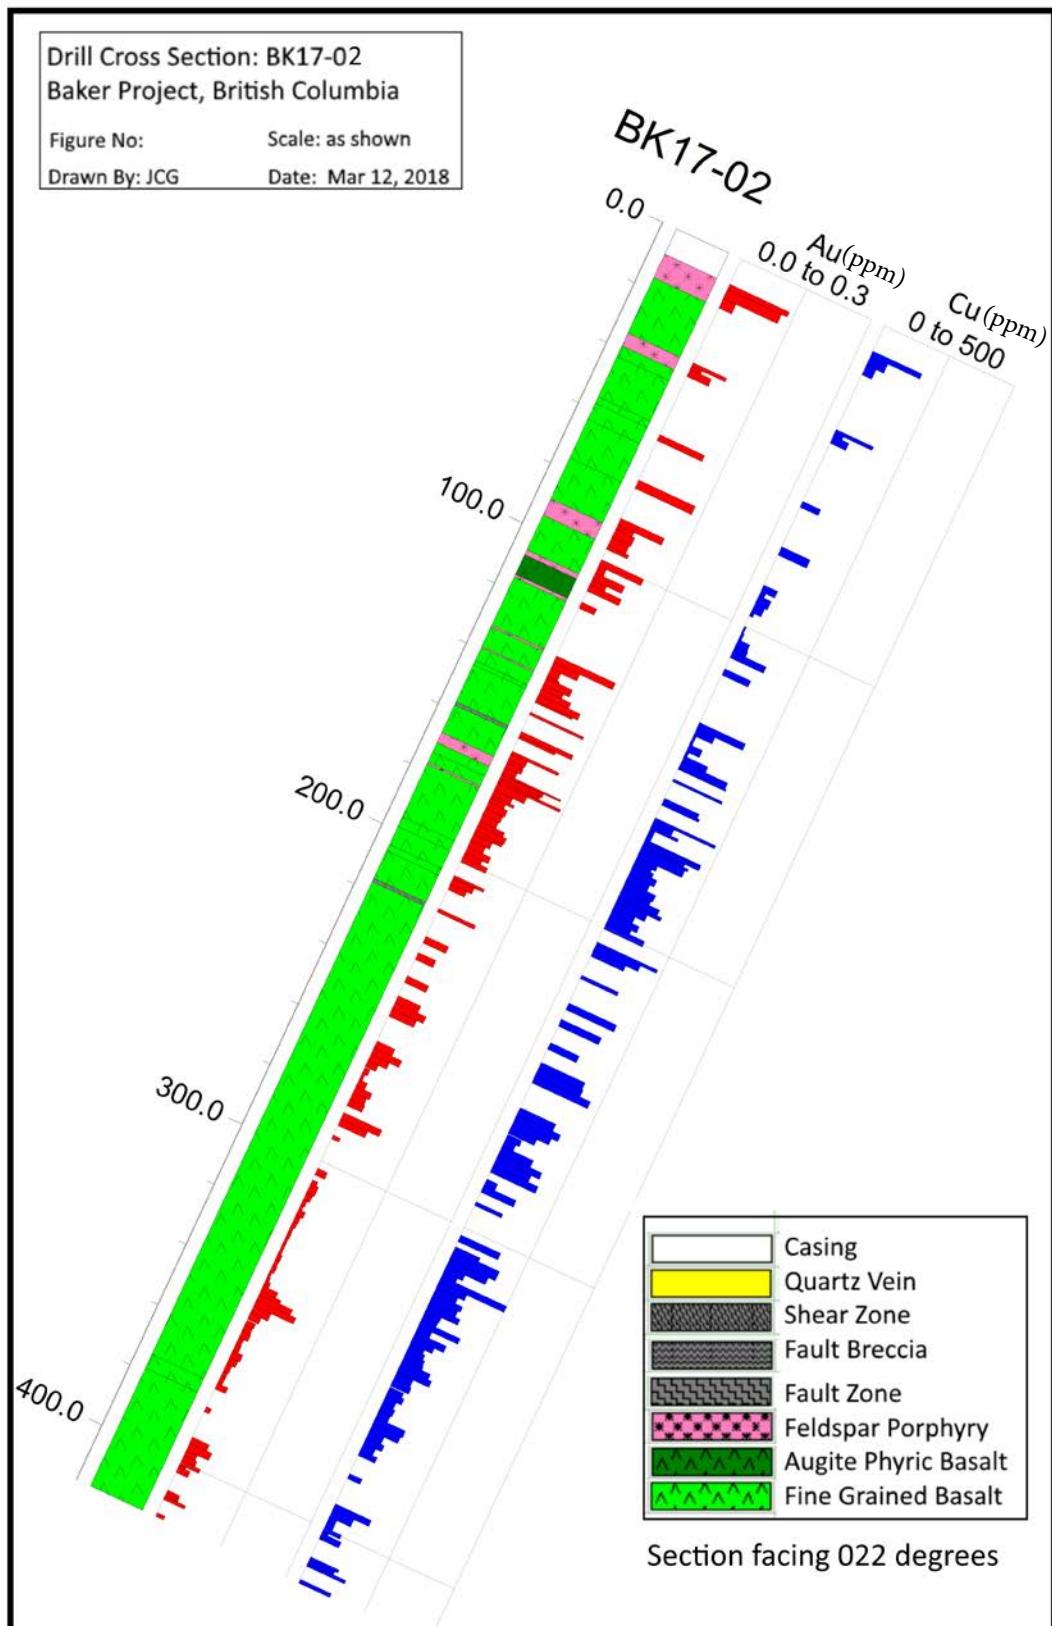

Figure 4-5: Drillhole BK17-2 Section

BK17-03

Drillhole BK17-03 was collared approximately 650 meters west of the Baker camp facilities on the 'West Chappelle' exploration access road in an area with no previously recorded exploration work prior to 2017 and no rock exposure. The hole targeted a coincident chargeability, magnetic and K radiometric anomaly and was drilled to 202.09 meters at a 270 degree west azimuth and a -65 degree dip.

The hole began in an intrusive feldspar porphyry before going through a large series of fault zones and in to Takla group basalts. Weak to moderate quartz-pyrite-sericite alteration was noted throughout the hole, and early chlorite-pyrite alteration of the Takla group basalt was present in all basalts.

Assay results were again disappointing with some anomalous values up to 0.123 pm Au over 1.88 meters and 255 ppm Cu over 1.62 meters. 48 unique intervals representing 87.17 meters were assayed in addition to 4 duplicates and 6 certified reference material samples.

Plate 4-3: sericite altered shear zone at ~27m downhole BK17-03 with gold value to 0.123 ppm

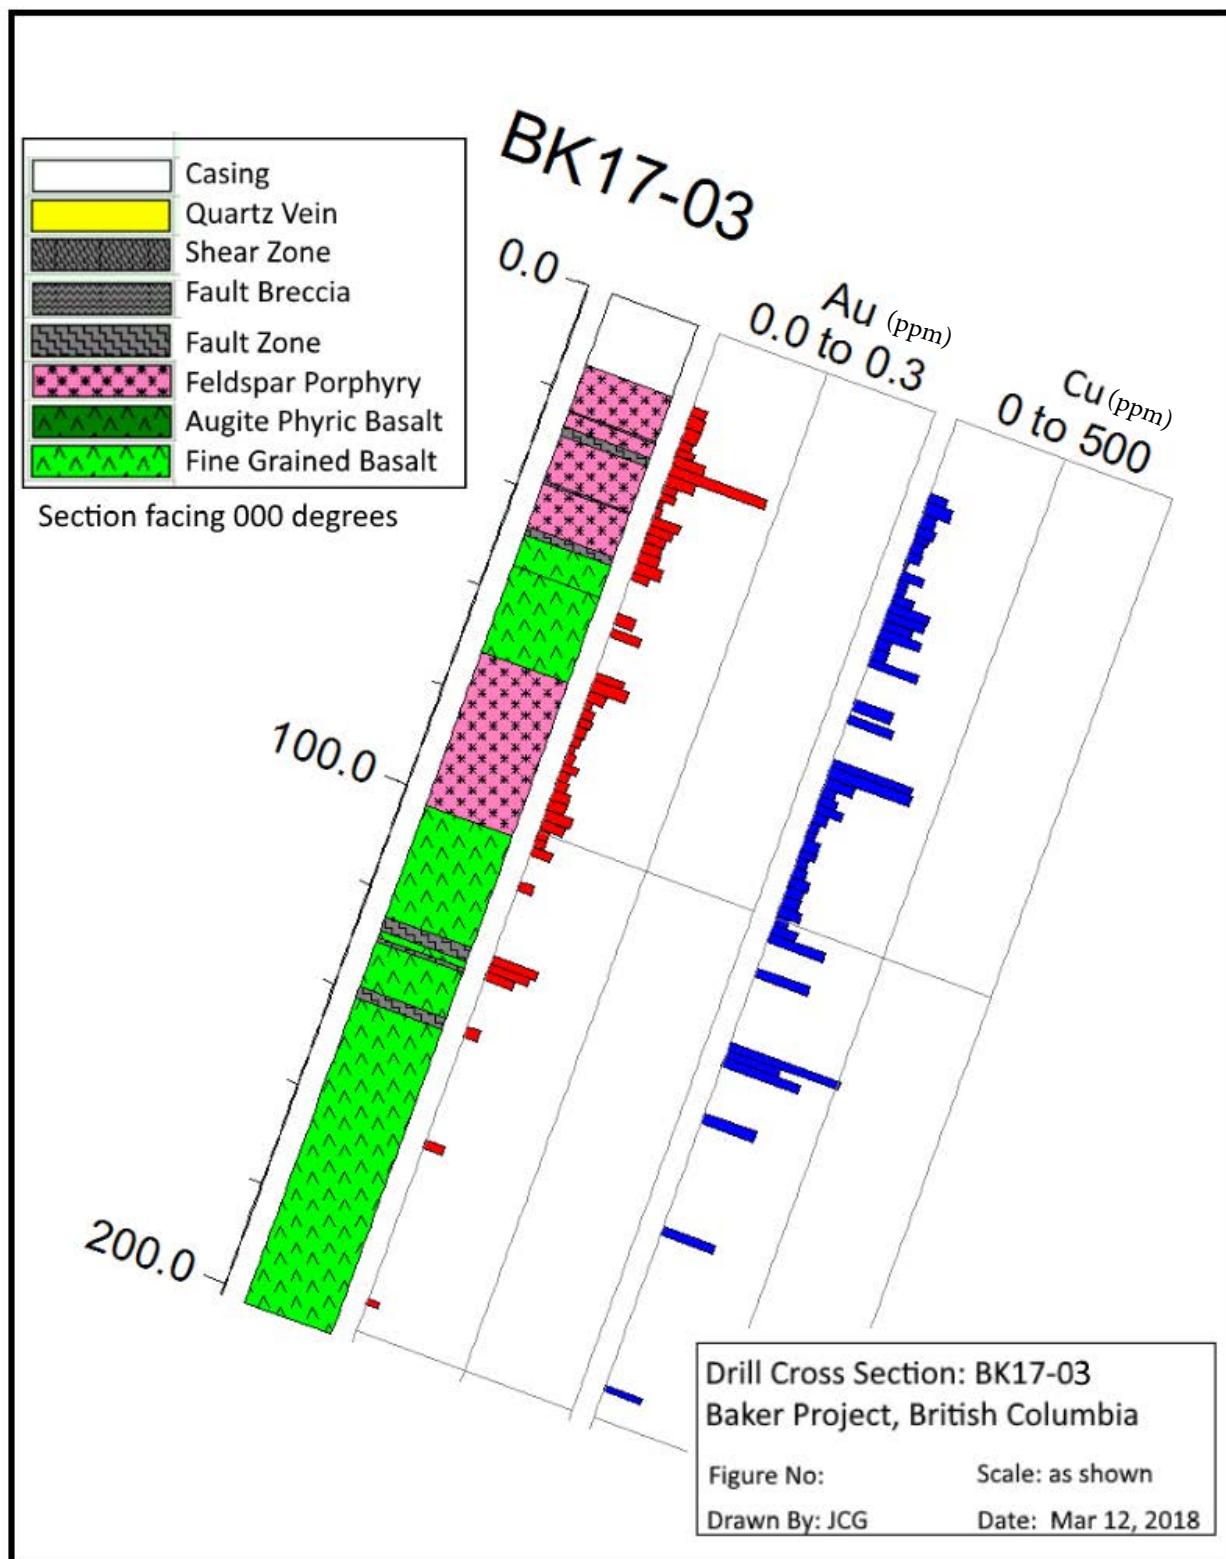

Figure 4-6: Drillhole BK17-3 Section

BK17-04

Drillhole BK17-04 was collared along the Black Gossan target exploration road approximately 3 km due east of the historic Baker/Dupont 'A' vein. The hole targeted a magnetic high under scree and valley cover adjacent to a known feldspar porphyry intrusive outcrop and near a point Au geochemical anomaly (Gillham 2015). It was drilled to a depth of 455.8 meters along an azimuth of 232 degrees southwest and a with a dip of -67 degrees.

A total of 66 unique core samples representing 129.94 meters of core were sampled and assayed, in addition to 8 CRM's and 5 duplicates.

Assay results revealed a 43.4 meter anomalous section along with numerous other narrow anomalous sections. The 43.4 meter section between downhole depths of 44.81 meter and 88.21 meters returned anomalous values of 0.12 ppm Au, 173 ppm Cu and 32 ppm Mo.

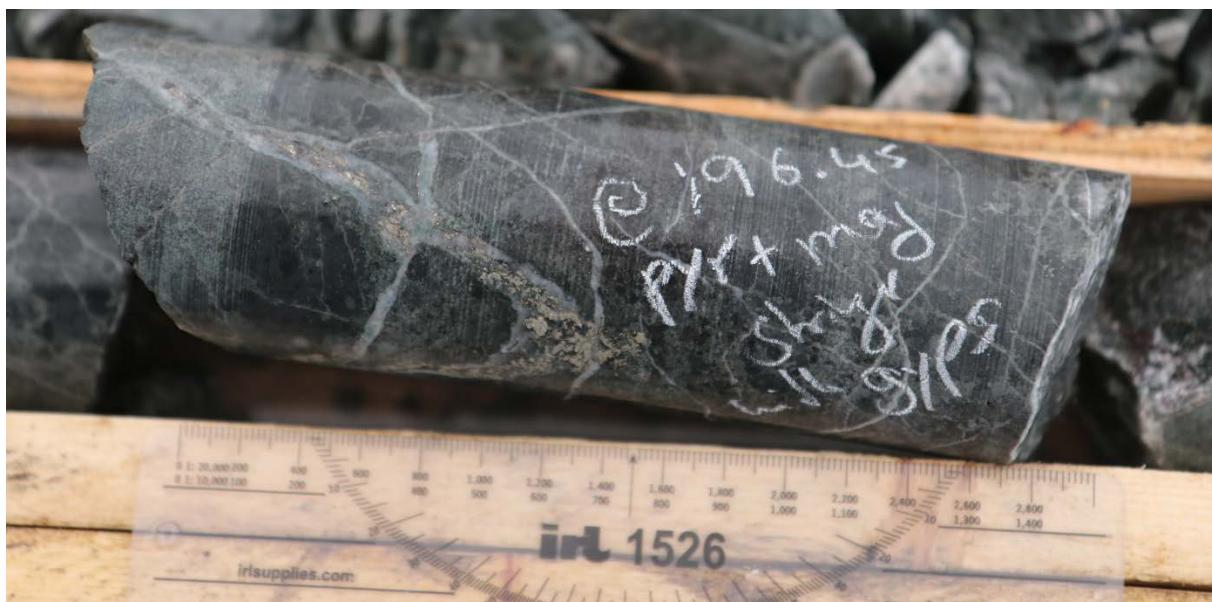

Plate 4-4: pyrite-magnetite-quartz stringer with late gypsum stringers at 196.45 meters downhole in drillhole BK17-04

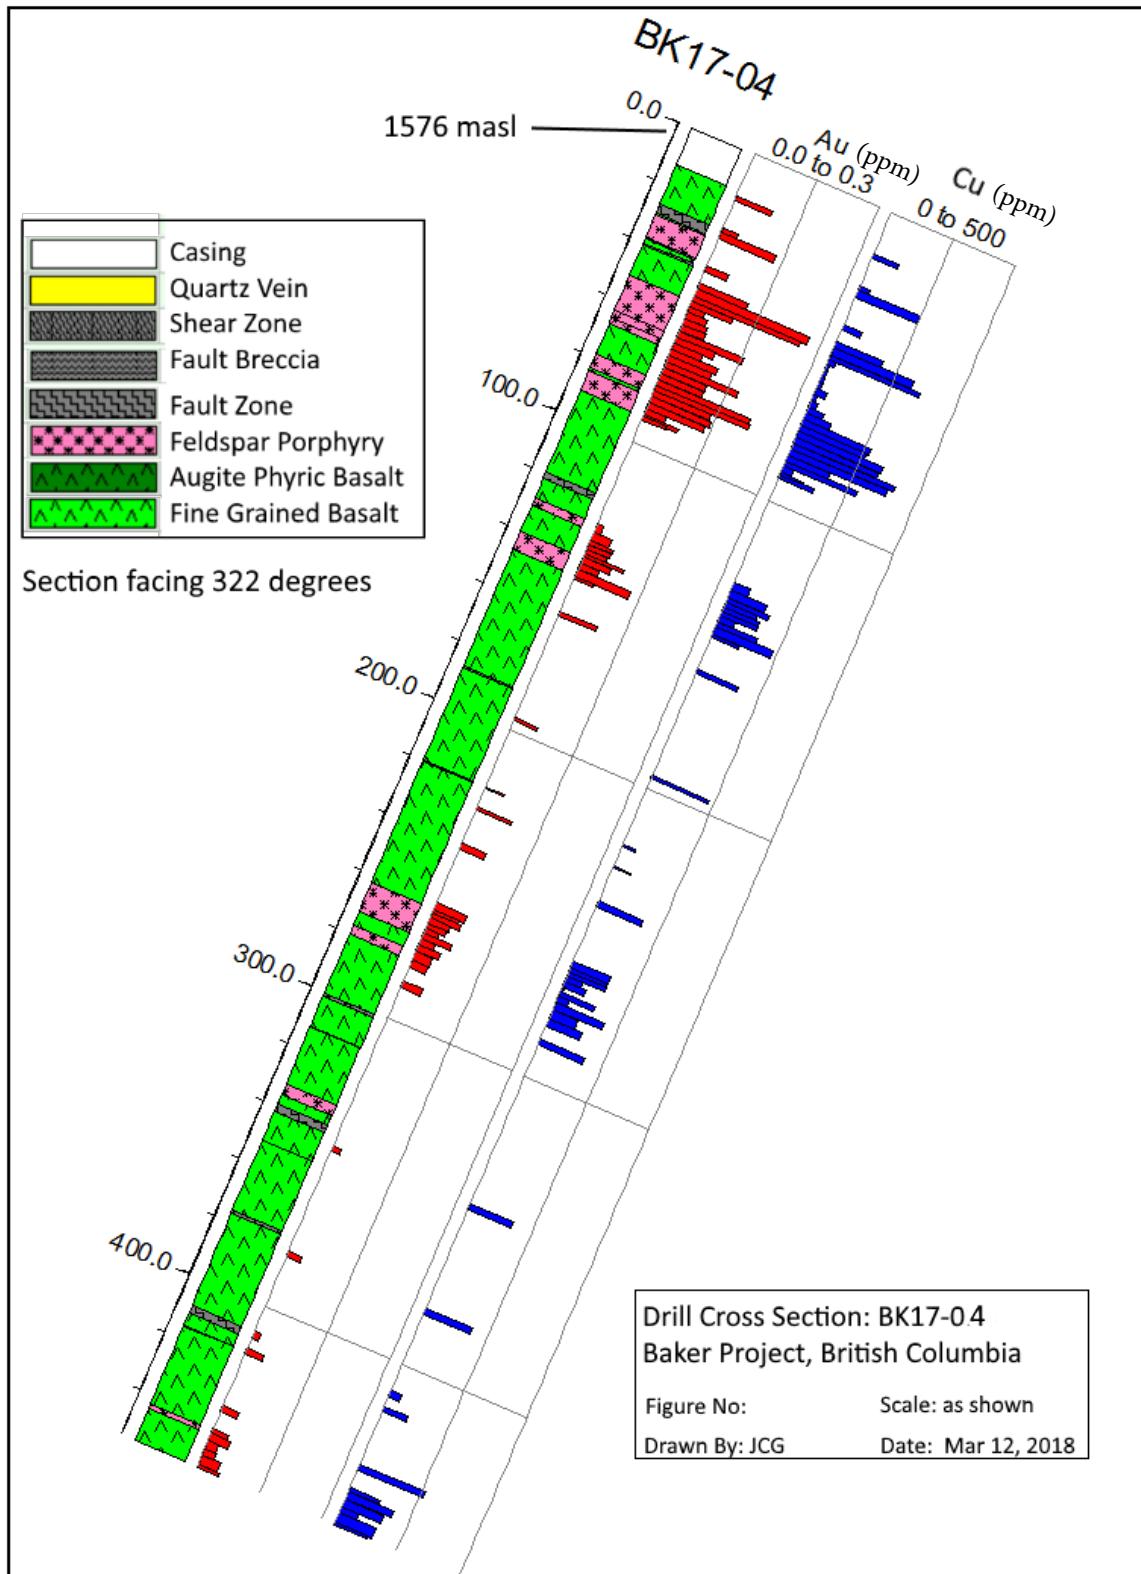

Figure 4-7: Drillhole BK17-4 Section

BK17-05

Drillhole BK17-05 was collared along the North Quartz zone access road approximately 500 meters northeast of the historic Baker mine workings. The North Quartz zone consists of a series copper bearing quartz veins. The hole targeted a magnetic anomaly immediately to the north of the North Quartz zone veins. It was drilled to a depth of 382.82 meters along an azimuth of 038 degrees and with a dip of -45 degrees.

Assay results were again generally disappointing, with the best assay 0.154 ppm Au and 1265 ppm Cu over 0.72 meters associated with a copper bearing quartz vein between 13.3 and 14.02 meters downhole. In total 34 unique intervals were assayed representing 61.43 meters of core, in addition to 2 duplicate and 4 CRM's submitted for QA/QC.

The hole encountered numerous quartz veins and stockworks throughout the top 200 meters of the hole hosted in Takla group basalt, along with numerous smaller feldspar porphyry dikes/sills. The Takla group basalts exhibited chloritic alteration with significant disseminated pyrite and pyrite-magnetite stringers as observed in other drill holes. A significant interval of skarn altered Asitka group marble was encountered between 295.8 and 315.3 meters downhole. A large shear / cataclasite zone was encountered between 323.2 and 332.9 which marked the transition from older Takla and Asitka group rocks into younger Toodoggone group feldspar crystal tuffs.

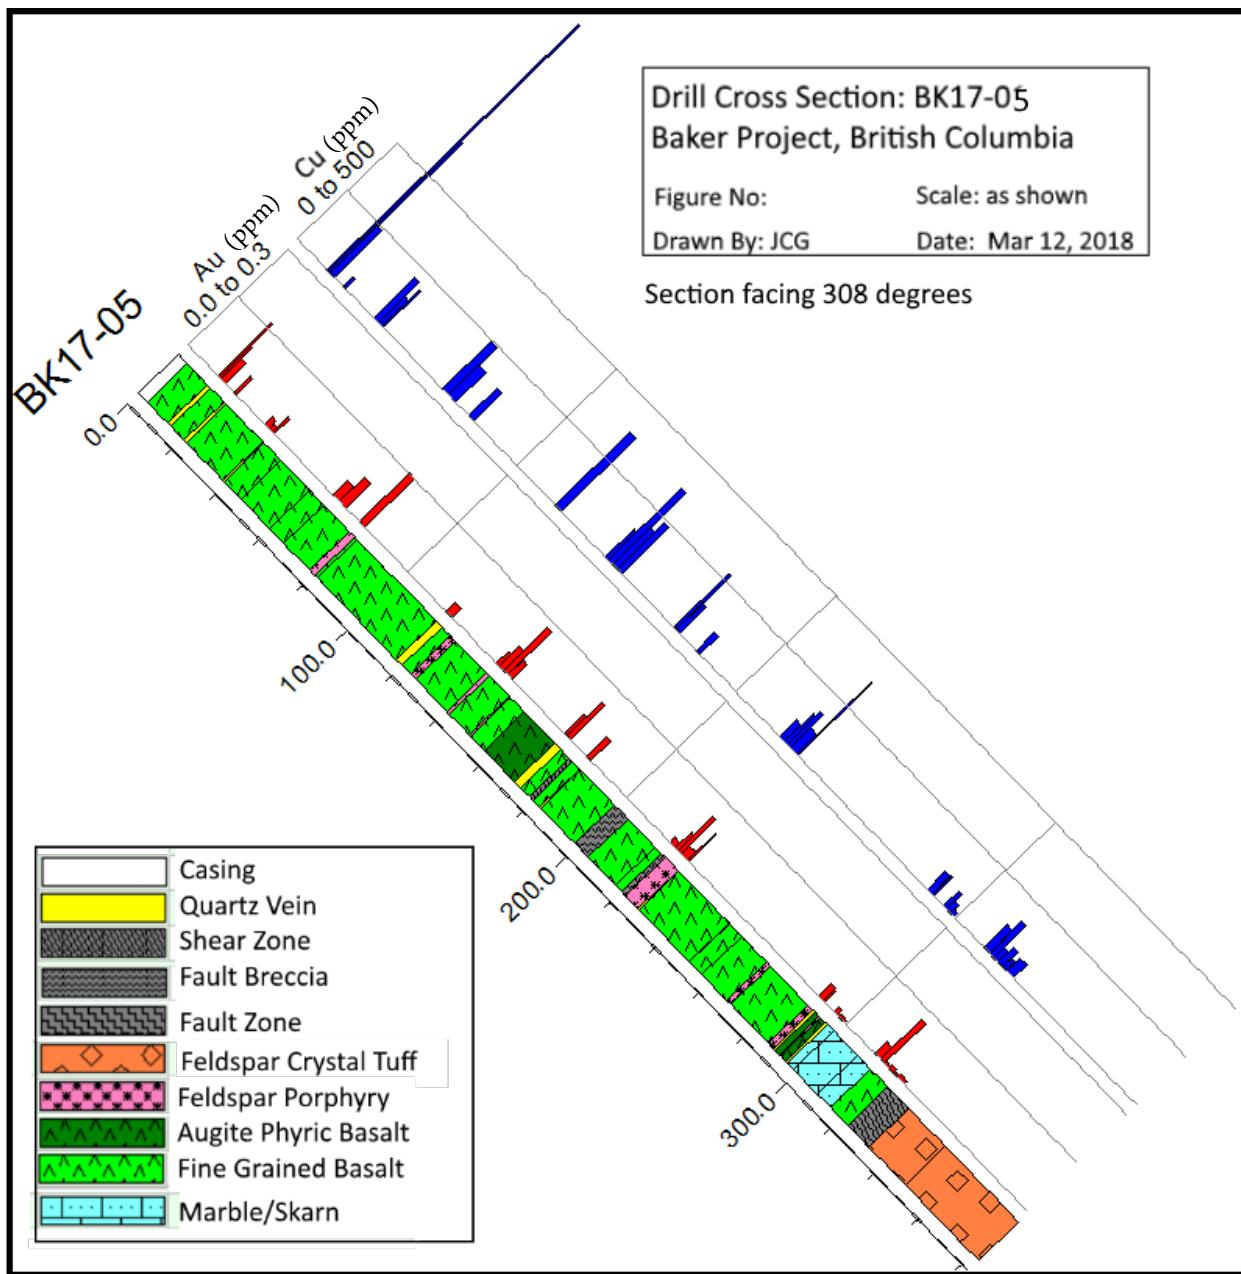

Figure 4-8: Drillhole BK17-5 Section

4.3 QUALITY ASSURANCE / QUALITY CONTROL

A systematic QA/QC program was instituted by Sable that included the insertion of blanks, standards and duplicate core samples into the regular core sample stream. A total of 356 core interval samples (excluding duplicates) were collected and a total of 66 quality control samples (40 blanks & standards certified reference materials "CRM"s and 26 core duplicates) were inserted into the sample stream.

Blank & Standard Analysis

A total of 40 blanks and standards were submitted to ALS as part of the project's total sample shipment. The material used was certified reference material "CRM" purchased from Analytical Solutions Ltd and consisted of the following: OREAS 23a, 152b, 213, 214, 217, 218, 221. Overall, the results were within reasonable tolerance of the CRM's listed value and indicate acceptable sample preparation at ALS.

Drill Core Sample Duplicates Comparison

Drill core duplicates are used to monitor sample submissions for switched samples, data variability due to laboratory error, homogeneity of sample preparation and/or natural inhomogeneity of sampled mineralization. A total of 26 core sample duplicate pairs were made by quarter-splitting the second half of the core. Duplicate samples were analyzed at the same time as the original sample. A comparison of results for the core sample duplicate pairs is shown graphically for gold and copper values in Figures 4-9 and 4-10, respectively. The results indicate that there is insignificant variance in gold or copper at all grades encountered during the 2017 drilling.

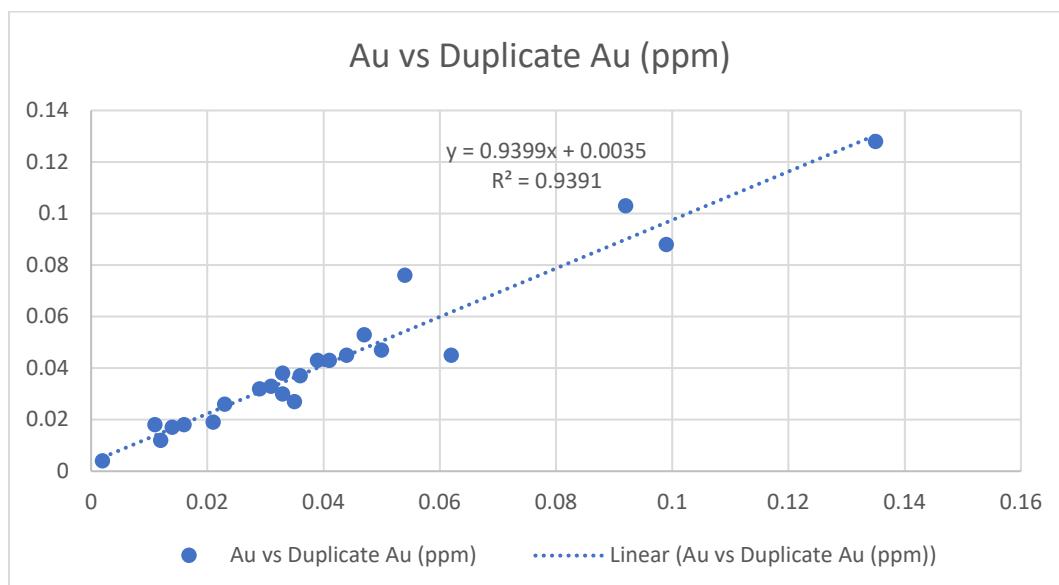

Figure 4-9: Comparison of duplicate gold assays

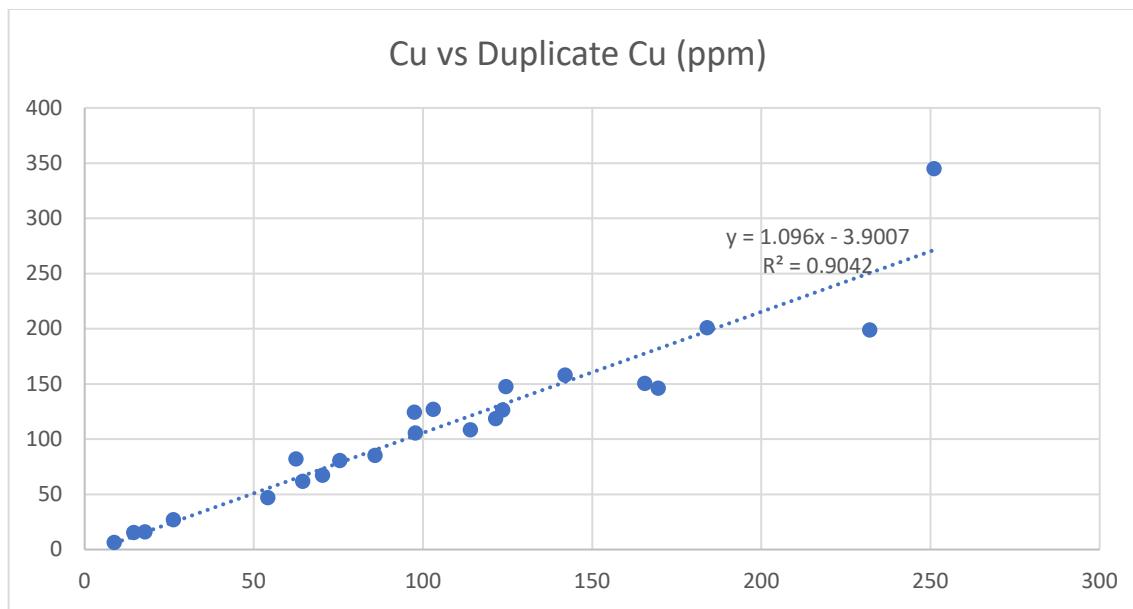

Figure 4-10: Comparison of duplicate copper assays

The authors conclude that security, sample collection, sample preparation and analytical procedures employed during the 2017 drill program meet or exceed current best management practices. Continued use of a comprehensive QA/QC program is recommended to ensure that all analytical data can be confirmed to be reliable. There were seven certified reference standards used in 2017.

Overall, adequate care and proper procedures were used to obtain reliable gold and copper results in the 2017 diamond drilling program at the Baker Project.

5) DISCUSSION AND RECOMMENDATION

All diamond drillholes from the 2017 program intersected altered Takla group basalts with significant magnetite-pyrite-quartz stockwork in addition to feldspar porphyritic intrusions. Au and Cu grades encountered fell well short of values which may under circumstances be considered economic, but did exhibit anomalous values in all holes. The alteration of sericite-quartz-pyrite overprinting either chlorite-pyrite-(epidote) or potassic feldspar/biotite is consistent with a porphyry deposit model, as is the presence of the stockwork veins and the gypsum veinlets seen at depth and previously reported. Previous fluid inclusion work by Duuring (2009) on the Baker veins are further support for this model.

Given the significant size of the pyrite enriched alteration zone over the Baker system as seen on surface, and the anomalous Cu-Au values found in the 2017 and historic drilling, continued exploration of this system seems warranted. The holes drilled in 2017 primarily targeted magnetic anomalies near known intrusive bodies away generally away from historic drillholes to further knowledge of the system.

The potential to discover more ‘Baker’ style high-grade veins remains as a viable target on the property.

Recommendations by the author include a single phase of exploration intended to assist in the vectoring fluid characteristics of the Baker hydrothermal system as follows:

Data Compilation & Modelling:

complete a modern 3D model compiling all historic surface and underground drilling data on the DuPont/Baker ‘A’ and Multinational ‘B’ veins, and historic underground workings to support geological modeling.

- i. use the geological model to identify internal grade related structural controls and zones within the historic (mined-out) resource,
- ii. project mineralized zones outside the historic mine workings to support a possible drill campaign targeting structurally controlled gold mineralization.

Resampling of historic core:

Historic drilling on the West Chappelle, Dupont ‘A’, Multinational ‘B’, and the ‘C’ and ‘D’ veins systems is stored at the Baker camp as is historic drilling from the Black Gossan. Much of the core displays sulphide stockwork and other than the Black Gossan drillholes was only ever sampled as an ‘epithermal quartz vein system’. Anomalous copper and other elements can be useful vectoring tools within such a large hydrothermal system. Where core boxes contain legible tags and hole ID and depths can be determined, core should be relogged and

resampled to add additional subsurface geochemical and geological data to the compilation model already recommended.

Surface Geochemistry and Mapping:

Extend the lithogeochemical sampling (Gillham 2016) and Mapping (Gillham 2017) surveys further east and north cover the Dave Price occurrence. Include a Terraspec survey to assist in the identification of clays as a vector for temperature, and include the stored samples from 2016 mapping.

				\$1,770.84
TOTAL Expenditures				\$362,664.48

8) CERTIFICATE OF QUALIFICATION

I, Joel Gillham, of 7676 Ontario St, Vancouver, British Columbia, Canada, hereby certify that:

I graduated from Simon Fraser University with a Bachelor of Science degree in Earth Sciences (2007) for junior exploration companies and as an independent geoscientist on numerous projects throughout the Canadian Cordillera;

I have been continuously employed as a geoscientist in the mineral exploration industry since 2005;

I have been involved in the exploration and underground development and mining of the subject property since 2006, and have completed an extensive literature search and reviewed all data available to me.

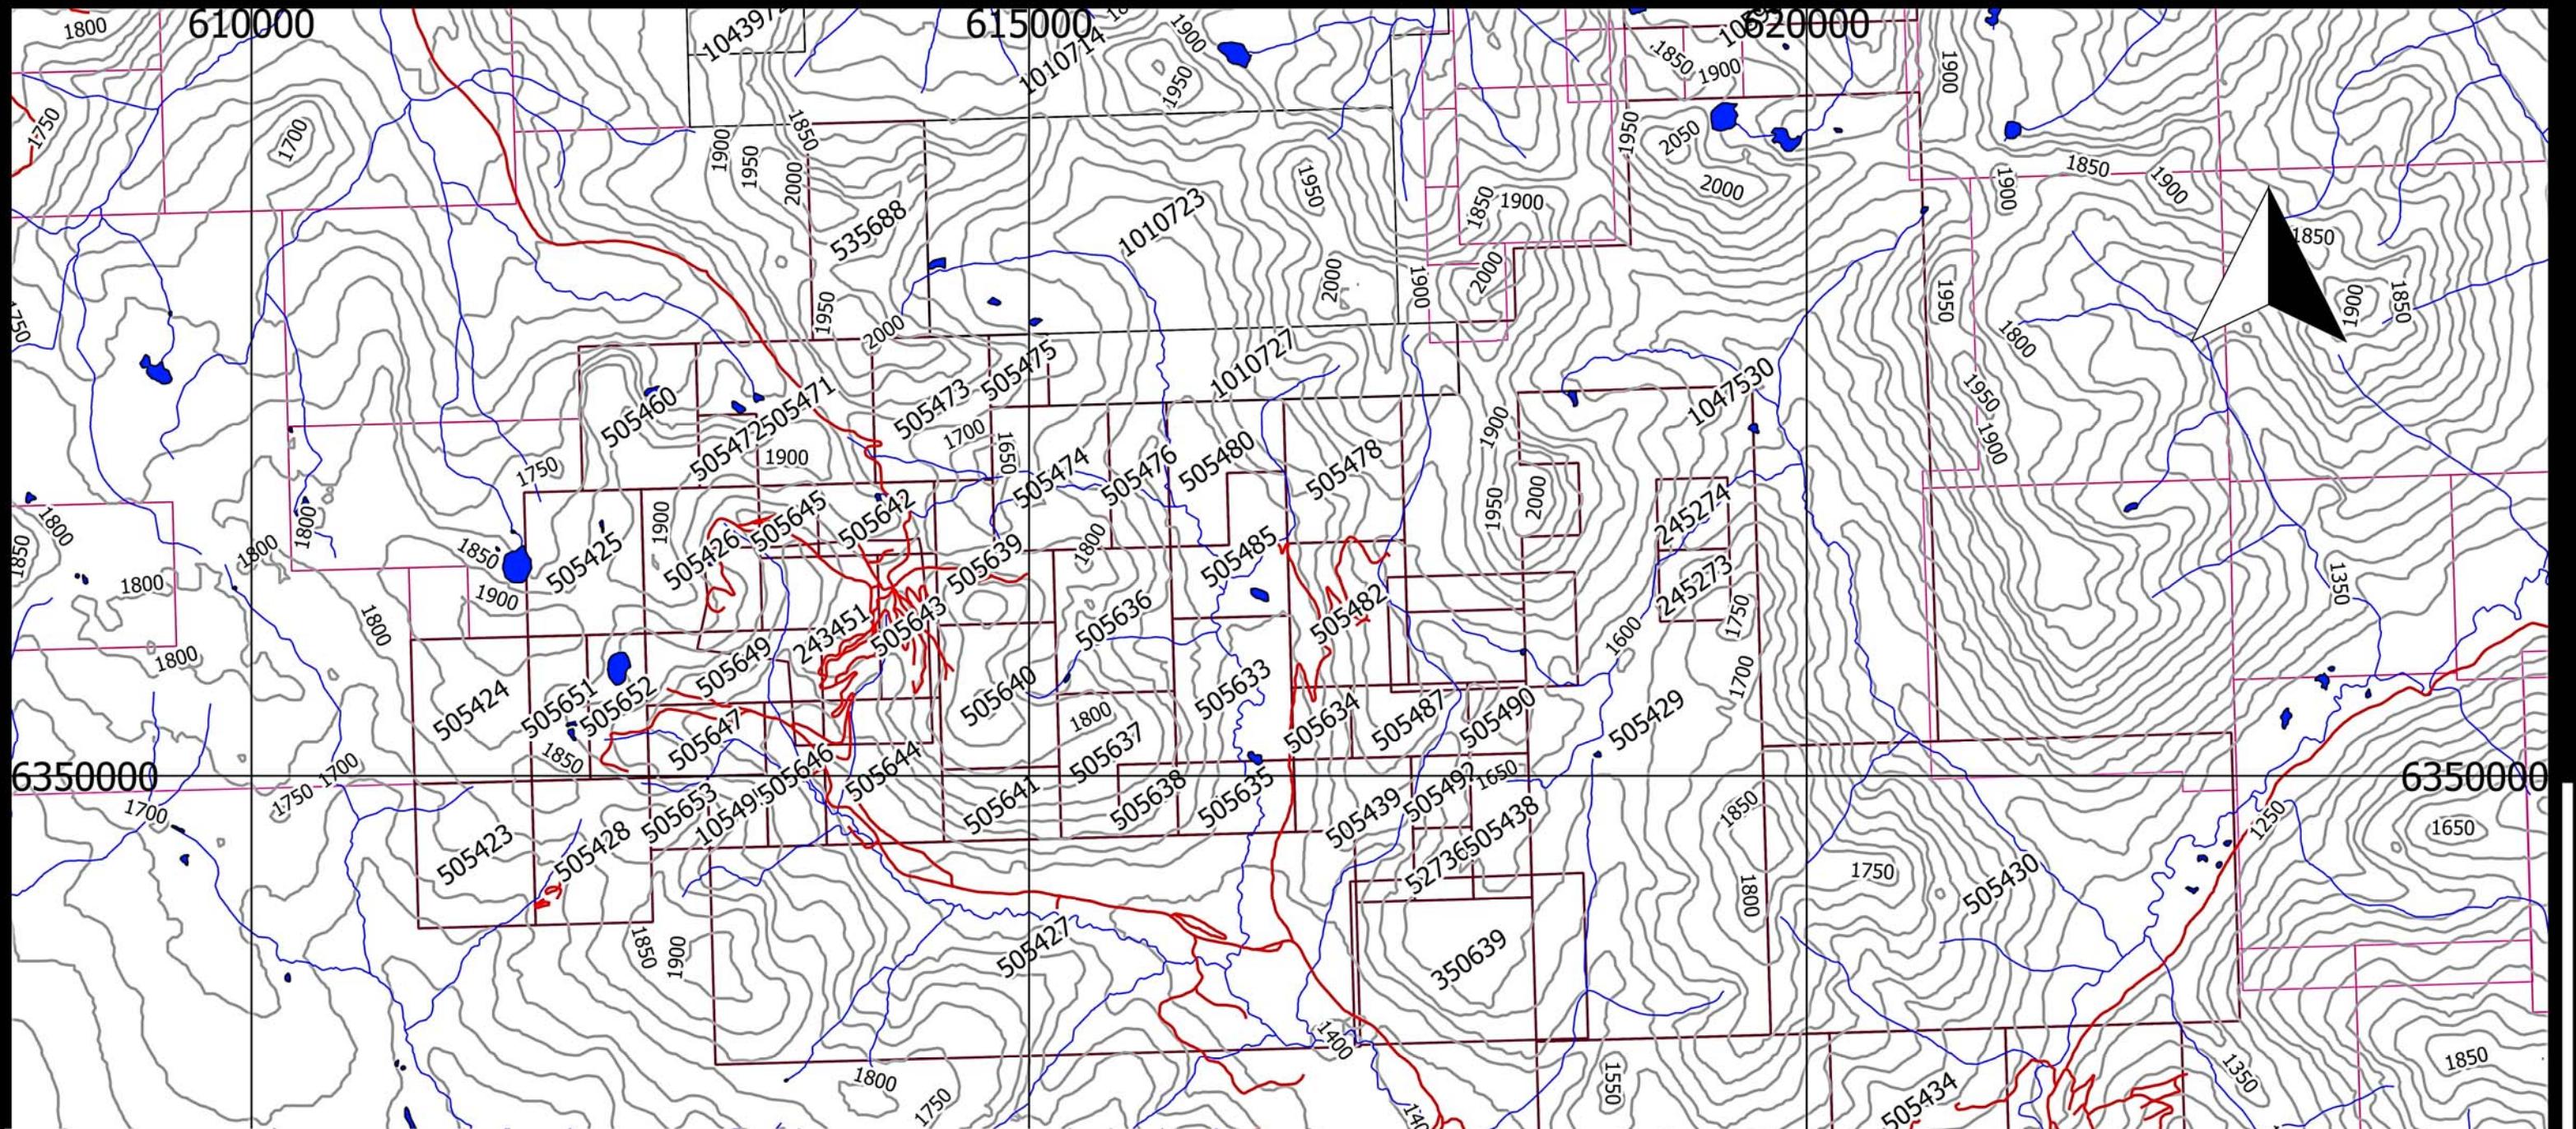

Dated at Vancouver, BC this 1st day of February 2019

Joel Gillham, B.Sc

CERTIFICATE VA17237696

Project: Baker-Bot

This report is for 49 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 30-OCT-2017.

The following have access to data associated with this certificate:

JOEL GILLHAM

WILLIAM YEOMANS

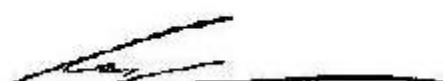

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login – Rcd w/o BarCode
LOG-24	Pulp Login – Rcd w/o Barcode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing – 70% <2mm
SPL-21	Split sample – riffle splitter
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
ME-OG62	Ore Grade Elements – Four Acid	ICP-AES
Zn-OG62	Ore Grade Zn – Four Acid	ICP-AES
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-MS61	48 element four acid ICP-MS	

To: **SABLE RESOURCES LTD.**
ATTN: JOEL GILLHAM

CERTIFICATE VA17237283

Project: Baker-Bot

This report is for 200 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 30-OCT-2017.

The following have access to data associated with this certificate:

JOEL GILLHAM

WILLIAM YEOMANS

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
LOG-24	Pulp Login - Rcd w/o Barcode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-MS61	48 element four acid ICP-MS	

To: **SABLE RESOURCES LTD.**
ATTN: JOEL GILLHAM
900-999 W. HASTINGS ST.
VANCOUVER BC V6C 2W2

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE VA17237276

Project: Baker-Bot

This report is for 200 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 30-OCT-2017.

The following have access to data associated with this certificate:

JOEL GILLHAM

WILLIAM YEOMANS

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login – Rcd w/o BarCode
LOG-24	Pulp Login – Rcd w/o Barcode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing – 70% <2mm
SPL-21	Split sample – riffle splitter
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-MS61	48 element four acid ICP-MS	

To: **SABLE RESOURCES LTD.**
ATTN: JOEL GILLHAM
900-999 W. HASTINGS ST.
VANCOUVER BC V6C 2W2

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.
