Introduction

Location, Access and Physiography

The property is about 30 km southeast of Merritt in south-central British Columbia (Figure 1). It is accessed by taking highway 97C southeast to the Loon Lake Road Exit, which connects to the logging road network which crisscrosses the property. The property is centred at approximately 685000E, 5535000N (Zone 10).

The topography is moderate and is characterized by rolling hills. It ranges in elevation from 1520 m in the southeast part of the property to 1100 m in the Quilchena Creek valley in the northwest corner of the property. Most of the property is covered by second growth forest, and cut blocks at various stages of regrowth are common. Summers are generally hot and dry and snow can be expected from November to March.

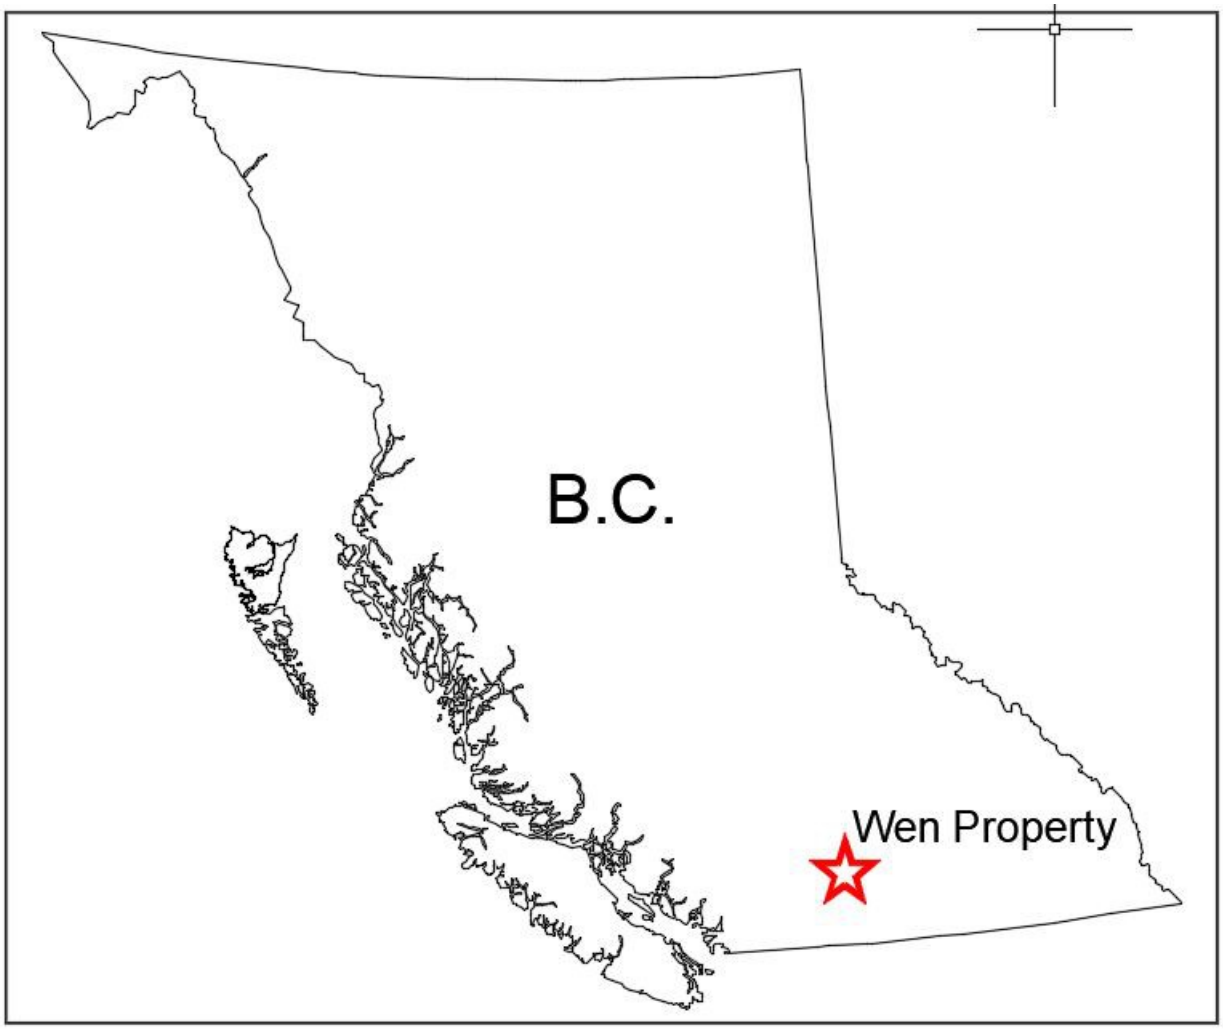

Figure 1 : Location Map

Property Definition

The Mal-Wen Property consists of 6 mineral claims with a total area of 1143.58 hectares (Figure 2). The claim details are given in Table 1. The claims are 100% owned by Victory Resources Corporation. Two statements of work were filed for the work described in this report. The first (EV#5748605) was applied to the original claim block on July 19, 2019. The second (EV#5756196) was applied on September 20, 2019 to part of that block, after the claims had been subdivided.

Claim #	Good to Date	Area (ha.)
1071189	2020/JUL/24	145.56
1071190	2021/JAN/15	519.85
1071192	2021/JAN/15	311.79
1071195	2021/JAN/15	62.37
1071197	2021/JAN/15	62.41

Table 1: Claim details.

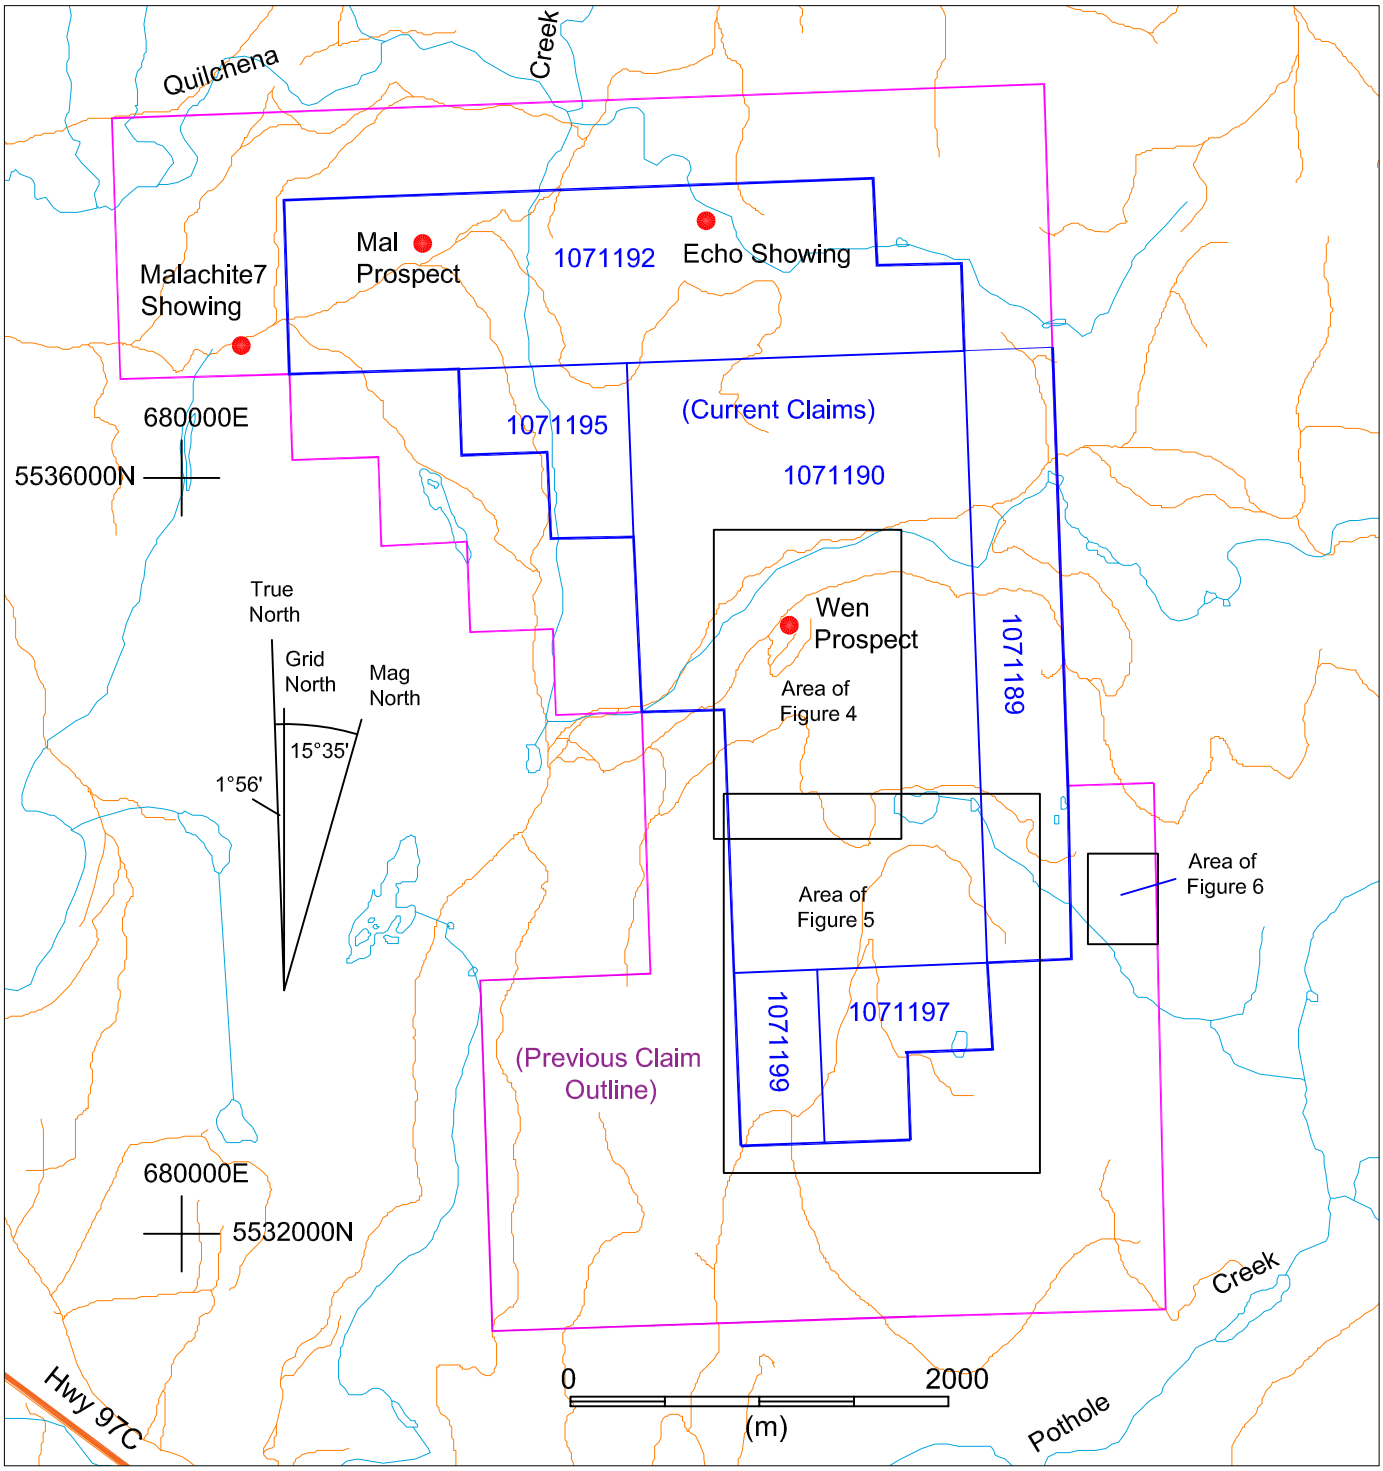

Figure 2: Claim and Index Map

Scale = 1:40 000

Previous Work

Old adits at the Wen Prospect and the Echo zone attest to exploration on the property possibly dating back to the early 1900's or earlier. Recorded work on the property begins in 1961 and is summarized in Table 2. Three Minfiles are on the property. Their locations are shown on Figure 2

Wen-Toe Property Minfiles:

HN-Wen (092HNE058) - A Cu+/-Au quartz vein and stockwork mineralization.
Echo (092HNE059) – A number of minor chalcopyrite showings.
Mal (092HNE002) – A Cu skarn prospect.

Work Program Summary

Thirteen days of fieldwork were done from May 30 to August 24. 16 rock samples were submitted, along with 4 QA/QC samples. Lithogeochemical analysis was done on 14 samples. Geochemical analysis was done 14 samples. 14 soil samples were submitted for analysis. 5 samples were submitted for petrography. About 142 hectares were mapped at a 1:2000 scale.

Table 2: Property History

Regional Geology

The property is located within the Quesnel Terrane, which is composed of Paleozoic and Mesozoic arcs and is an important metallogenic belt hosting numerous porphyry Cu-Au-Mo deposits. The property is within the eastern Belt of the late Triassic Nicola Group, which is composed of basaltic volcanic rocks and fine grained sediments. The Nicola Group rocks are intruded by granodiorites and quartz diorites of the early Jurassic Pennask Batholith (Preto, 1979; Monger, 1989). Major north-south trending faults, such as the Kentucky-Alleyne Fault immediately west of the property, are the dominant structural feature in the area. The metamorphic grade of the Nicola group rocks is commonly prehnite-pumpellyite.

The Dillard Creek Property, about 20 km to the south, hosts an alkalic porphyry system in the same (eastern) belt of the Nicola Group (Mihalynuk & Logan, 2013) as the property. The alkalic porphyry deposits of the Iron Mask Batholith also occur within Nicola Group volcanics, about 75 km to the north (Logan & Mihalynuk, 2006). In addition, Logan et al (2011) consider the Pennask Batholith to be part of the Takomkane/Wildhorse Suite, one of the three main Mesozoic magmatic suites that displays Cu Porphyry mineralization. The Brenda Deposit, about 20 km to the east is an example of a porphyry deposit associated with this suite.

Property Geology

Recent mapping by the BC Geological Survey (Mihalynuk et al, 2015) and Victory Resources (Sigurgeirson, 2018a, b & e, 2018e) shows the property to be underlain by 5 units (Figure 3), 3 of which are part of the eastern belt of the Nicola Group. The central part of the property is dominated by augite phyric mafic volcanic rocks and related intrusive rocks. Both the Mal and Wen prospects are within this unit. The southern part of the property is partly underlain by Paradise conglomerate. It is composed of medium grained pyroxene-phyric mafic volcanic rocks interfingering with conglomerate derived from augite-feldspar-rich mafic volcanic porphyries, and lesser monzonite sourced conglomerate. The western part of the property is mainly underlain by mudstone, siltstone and sandstone. The rocks are generally unfoliated. Bedding is commonly west dipping. The Pennask Batholith occurs along the northern edge of the property. This appears to be mainly a white, hornblende granodiorite in those exposures east of the property seen by the author.

Mineralization

Four main types of mineralization have been identified on the property. The Wen Prospect vein is a chalcopyrite bearing quartz vein with erratic, locally high gold values up to 16.6 g/t (Verley, 1997). It is usually about 1 m thick, and grades between 0.5% and 1% Cu and under 1 g/t Au. A crude stockwork of quartz-carbonate veins occurs to the east of the Wen Vein. These veins locally feature specular hematite and/or chalcopyrite. They are hosted by fine grained, porphyritic gabbro. South of the stockwork zone is a epidote-carbonate matrix hydrothermal breccia featuring spotty Cu mineralization in the form of chalcopyrite. The clasts are usually basalt, though gabbro clasts have also been noted. The breccia has been mapped at a number of locations to the south and north of the Wen Prospect area. The stockwork zone and the higher grade part of the breccia body together form a poorly defined zone of alteration and erratic mineralization at least 70 m wide and over 400 m in length (Kierans, 1972 & Verley, 1996). The final type of mineralization, occuring at the Mal Prospect, is chalcopyrite bearing epidote-garnet-magnetite skarn.

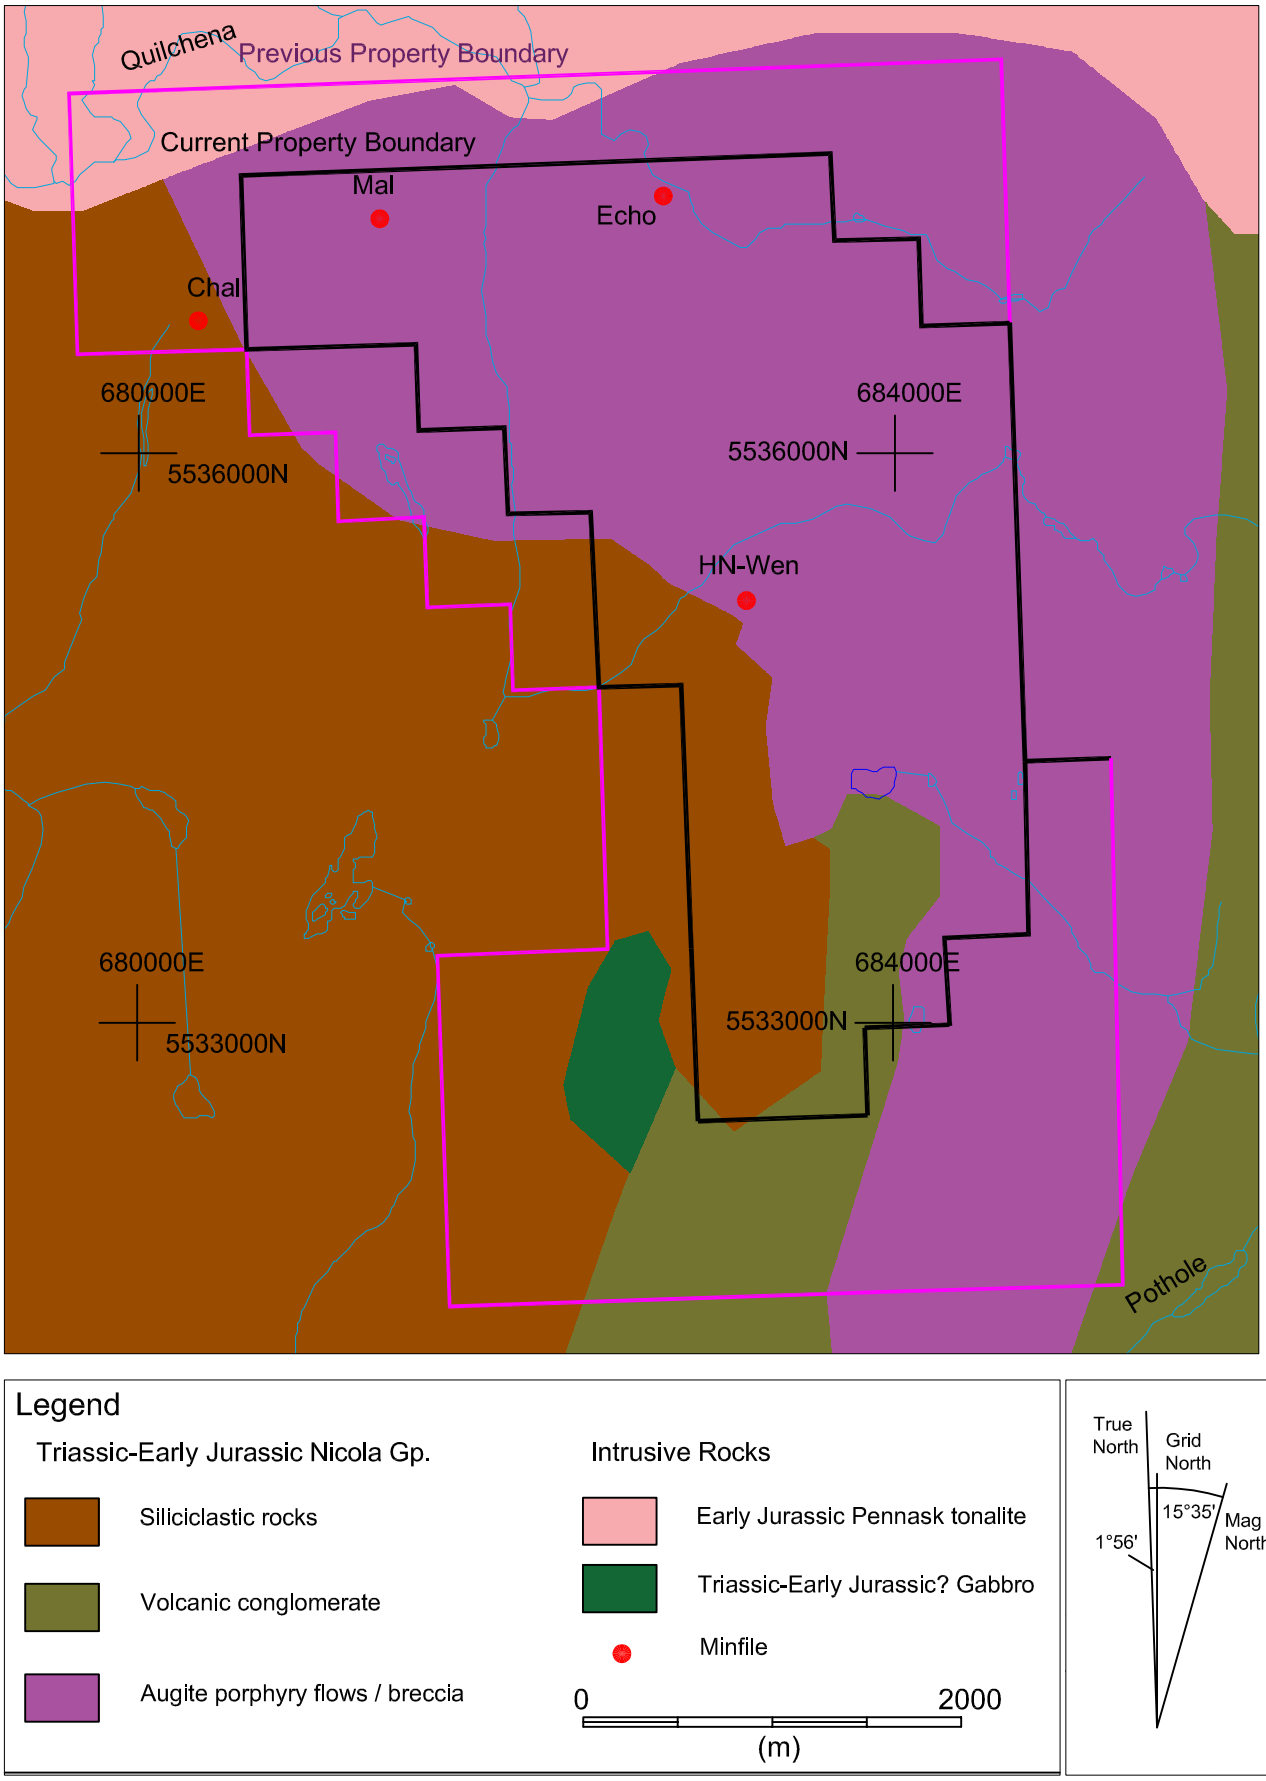

Figure 3: Property Geology Map

Scale = 1:40 000

Geological Mapping

The purpose of the mapping was to locate more of the type of mineralization found in the Wen Prospect area, and to determine whether the mineralization was associated with the hydrothermal breccia, alkalic intrusives, or the contact between the volcanic and sedimentary units. The area of the contact between the volcanics and sediments was mapped at a 1:2000 scale from the area of the Wen Prospect to about 3 km to the south (Figures 4 & 5). In addition, a small area along the east edge of the property (Figure 6) was mapped at 1:2000 while following up on a soil anomaly documented by Sharp (1968).

The best mineralization mapped during the program was encountered about 300 m southeast of the Wen Adit (Figure 4). A poorly exposed outcrop of quartz-calcite altered basalt featured about 0.5% disseminated pyrite and chalcopyrite (sample 21631). The outcrop is near the volcanic sedimentary contact and is similar in style of alteration, mineralization and location to an altered and mineralized basalt float sample (sample 21637(8) and 21630) taken about 1.3 km to the south. This area is labelled the “Road Showing” on Figure 5. Sample 21631 and 21637(8) may may be the same type of alteration as at the stockwork zone east of the Wen adit
.
The epidote-carbonate matrix hydrothermal breccia body about 200 m southeast of the Wen Adit was extended to the northeast and southeast, though no significant mineralization was encountered away from the stripped area. The northern and eastern boundaries of the breccia body are still to be mapped. More breccia of this type was found over a kilometer to the south of the Wen Prospect, to the south and west of the Lake. Poorly exposed, often weakly mineralized, subcrop of breccia occur on either side of an inferred northeast trending fault. Historic trenching (labelled the “Southern Trenches” on Figure 5) in this area had limited success reaching bedrock, but exposed breccia at one location.
Epidote-carbonate matrix breccia was also found within the volcanic conglomerate unit about 600 m northwest of the Wen Adit and about 400 m south of the Road Showing. These breccias were generally unmineralized or at best weakly mineralized. Epidote and/or carbonate alteration, as veinlets, replacement and breccia matrix is the most common kind of alteration (or infill) on the property. However, this type of alteration on it's own is not very indicative of an alkalic porphyry system.

Considerable attention has been paid during recent programs to determining whether any of the intrusives in the Wen Prospect area could be shown to be spatially associated with mineralization, and whether they could be alkalic porphyries similar to those found at Dillard Creek (Mihalynuk & Logan, 2013). Mapping to date has identified two types of intrusive. Fine grained pyroxene (+/- plagioclase &/or hornblende) gabbros occur throughout the volcanic unit, and appear to be subvolcanic equivilents to the extrusive rocks. There is a large body of gabbro in the area of the Wen Prospect, but it's eastern boundaries are not defined. A second type of intrusive is found at scattered locations within the volcanics and the sediments. It is a fine grained, hornblende phyric intrusive, which was given the field label quartz monzodiorite. It is often pyritic, but otherwise generally unaltered, with the possible exception of sample 21639. Sample 21639 occurs in the area of the road showing, and may be a Quartz/calcite/k-spar/chlorite altered quartz monzodiorite intrusive within the sediments (near the contact).

The contact between basaltic volcanics and related intrusives to the east and sediments to the west has been mapped over several kilometers. The contact has been placed at the change from flows and course clastics (ie. volcanic conglomerate) to mudstone and sandstone. Minor tuffs occur within the sedimentary unit, often at or near the contact. Most bedding measurements dip moderately or steeply to the west, which agrees with historic drill results (Kierans, 1973), which indicate an westward dip to the contact. All significant mineralization discovered to date occurs within the volcanics and related

intrusives and within a few hundred meters of the contact.
The small area mapped along the east edge of the property (Figure 6) encountered epidote altered gabbros, but no significant mineralization.

Conclusions of the 2019 mapping

The quartz monzonites cross cut the sediments as well as the volcanics, unlike the mineralization, which appears confined to the volcanics. They are unmineralized and not particularly alkaline. These factors argue against the quartz monzonites being a candidate for an alkalic porphyry. Sampling during previous programs (Sigurgeirson, 2018e) indicates that the gabbros are somewhat alkaline compared to the volcanics. The quartz-carbonate stockwork mineralization at the Wen Prospect occurs within rocks mapped as gabbro suggests a relationship between the gabbro and the Wen Prospect mineralization. However, unmineralized gabbros are common on the property, so a spatial association may be coincidence,
The quartz-carbonate hydrothermal breccias occur at a number of locations on the property, usually within a few hundred meters of the volcanic sediment contact. They are often weakly mineralized, but outside of the Wen Prospect area, no significant Cu grades have been encountered. The observation that the largest breccia body mapped to date contains the southern portion of the relatively large, low grade Wen mineralized zone suggests that the breccia is related to the mineralization and may be a guide to prospective areas.
The occurrence of mineralized, quartz-carbonate altered rocks at two locations south of the Wen Prospect suggest that the stockwork style mineralization seen to the east of the Wen Prospect may occur elsewhere on the property, especially in the vicinity of the contact.

Legend

Large outcrop (>2.5 m across)
Small outcrop (<2.5 m across)
Subcrop

(Lithology indicated by colour)

Quartz Monzodiorite - fine grained, medium grey, weakly hornebelende porphyritic.
Gabbro - fine grained, dark grey-green, weakly Px (+/- Hb, Pl) porphyritic.
Sandstone - medium to dark grey, very fine grained to fine grained, locally laminated.
Mudstone - aphanitic, dark grey to black, locally with medium grey laminae.
Basaltic Tuff - very fine grained, dark greenish grey, massive.
Basaltic volcanic conglomerate - matrix supported with sub-round basalt &/or gabbro clasts up to boulder size, medium to dark green-grey.
Basalt Flows - very fine grained, dark green-grey, weakly Px (+/- Pl) phyric, locally with Px phenocrysts up to 5 mm.
Epidote &/or Carbonate Matrix Breccia - clast supported with subangular to angular basalt &/or gabbro clasts up to cobble size, medium to dark green grey.
Altered Volcanic &/or Vein - strongly Qz-Lm-Cb altered volcanic &/or Qz-Cb vein, +/- Ma.

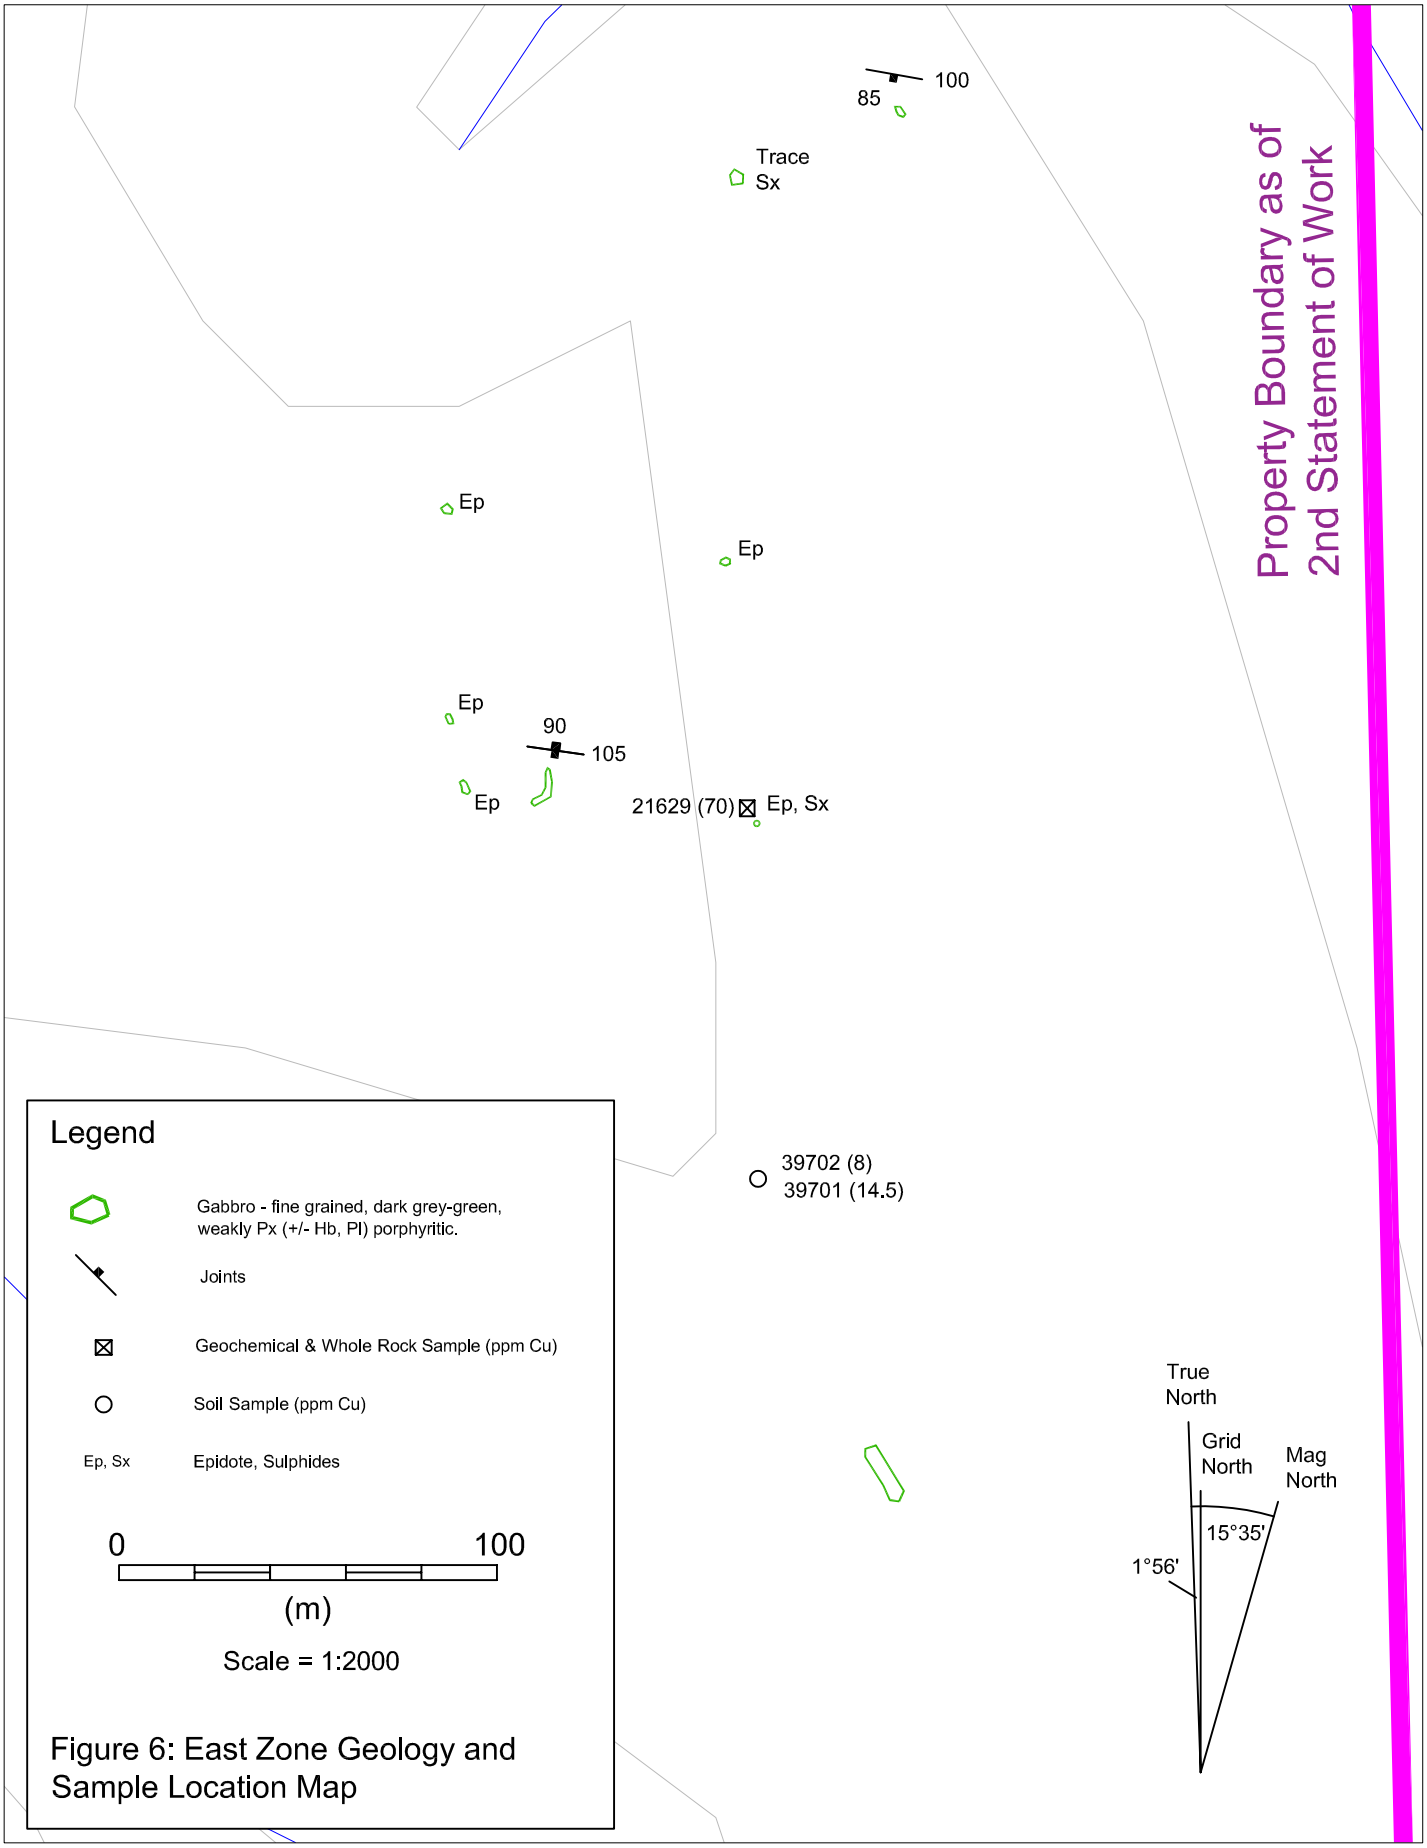

Figure 6: East Zone Geology and Sample Location Map

Geochemical Sampling

Lithogeochemical Sampling

14 samples were submitted for lithogeochemical analysis. The main purpose of the sampling was to determine whether there were alkalic porphyries associated with the Wen Prospect mineralization. Rock samples were collected for lithogeochemical analysis from float and outcrop at the locations shown on Figures 4, 5 & 6. Samples were crushed to 70% less than 2 mm, 250 g were split off and pulverized to 85% passing 75 microns. The samples were subjected to a lithium borate fusion followed by ICP-AES and ICP-MS analysis for major and trace elements. Sample descriptions are given in Table 3. Appendix I contains the assay and QA/QC certificates.

An REE plot (Sun & McDonough, 1989) of the 2019 whole rock samples (with the blank, standards and tuffs removed) shows the rocks falling into two main groups (Note that sample 21637 was removed from the plot, as it appears it was switched with the blank. See QA/QC section for discussion). The main group is composed of the green triangles and red circles shown on Figure 7. These are the basaltic to andesitic flows, coarse clastics and related gabbros which comprise the volcanic units. The second group have higher LREE abundances and steeper profiles. Two of these were mapped as quartz monzodiorites, while the third appears to be an altered equivilent (from the road showing area). Rocks with similar profiles from the 2018 program were labelled diorites, but have been reclassified as quartz monzodiorites on the 2019 map.

A Zr/Ti vs Nb/Y plot (Pearce, 1996) follows the REE groupings (Figure 8). The basalts and gabbros fall in a cluster that is mainly within the basalt field. The quartz monzodiorites form a separate group that is more evolved and alkaline, falling along the lower boundary of the andesite + basaltic andesite field. Sample 21629 was collected along the eastern edge of the property from within a group of rocks that were called diorites in the field, though they have been plotted as gabbros on the map.

These patterns hold on the TAS plot (LeMaitre,1989), with the two quartz monzonites falling in the andesite to trachyandesite field and most of the basalts and gabbros falling in the basalt to trachybasalt field. Again, sample 21629 is separate from the basaltic rocks, suggesting it may in fact be a diorite. The red circles represent samples 21630 and 21631 which are the altered and mineralized basalts? found near the contact. They are higher silica relative to the basalts, which may be a result of silicification, though the petrography indicates that they are andesites. Sample 21639 plots as more siliceous that the quartz monzonites (well into the dacite field), which again may indicate silicification or simply a compositional difference (or both).

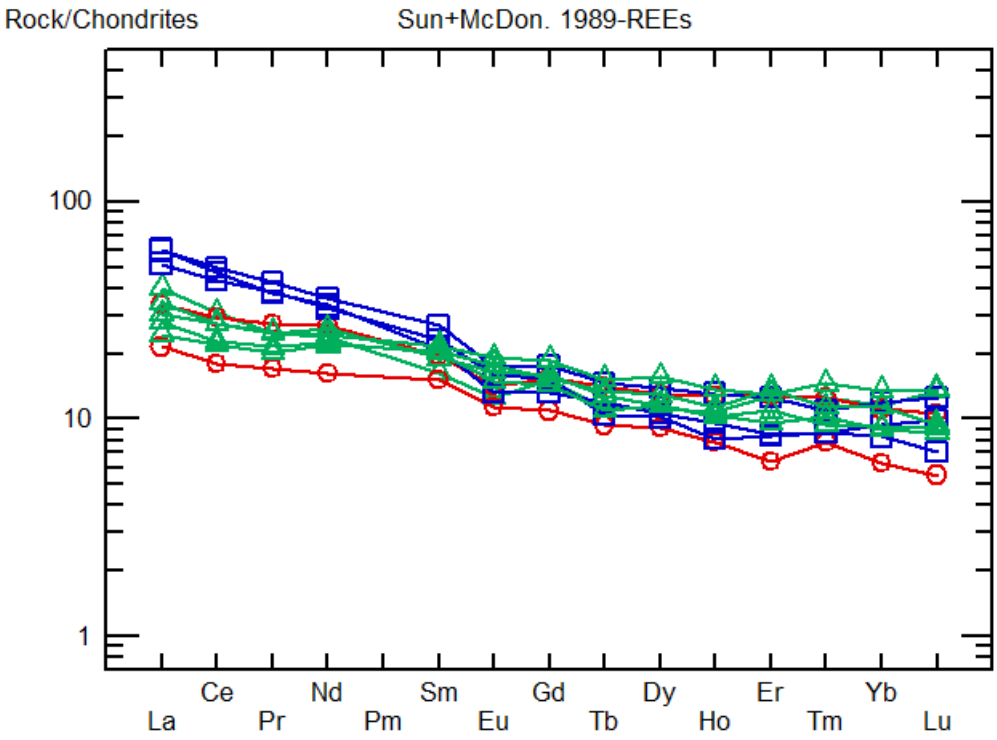

Figure 7: REE plot of samples (blue squares = quartz monzonites; green triangles = basalts and gabbros, red circles = altered basaltic andesites?)

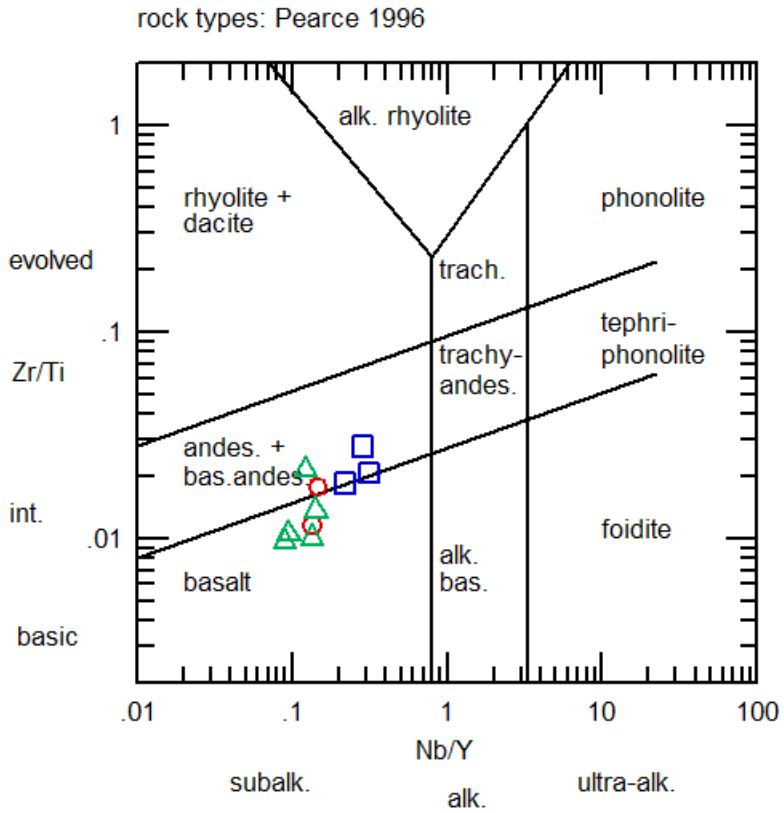

Figure 8: Zr/Ti vs Nb/Y plot of samples (blue squares = quartz monzonites; green triangles = basalts and gabbros, red circles = altered basaltic andesites?)

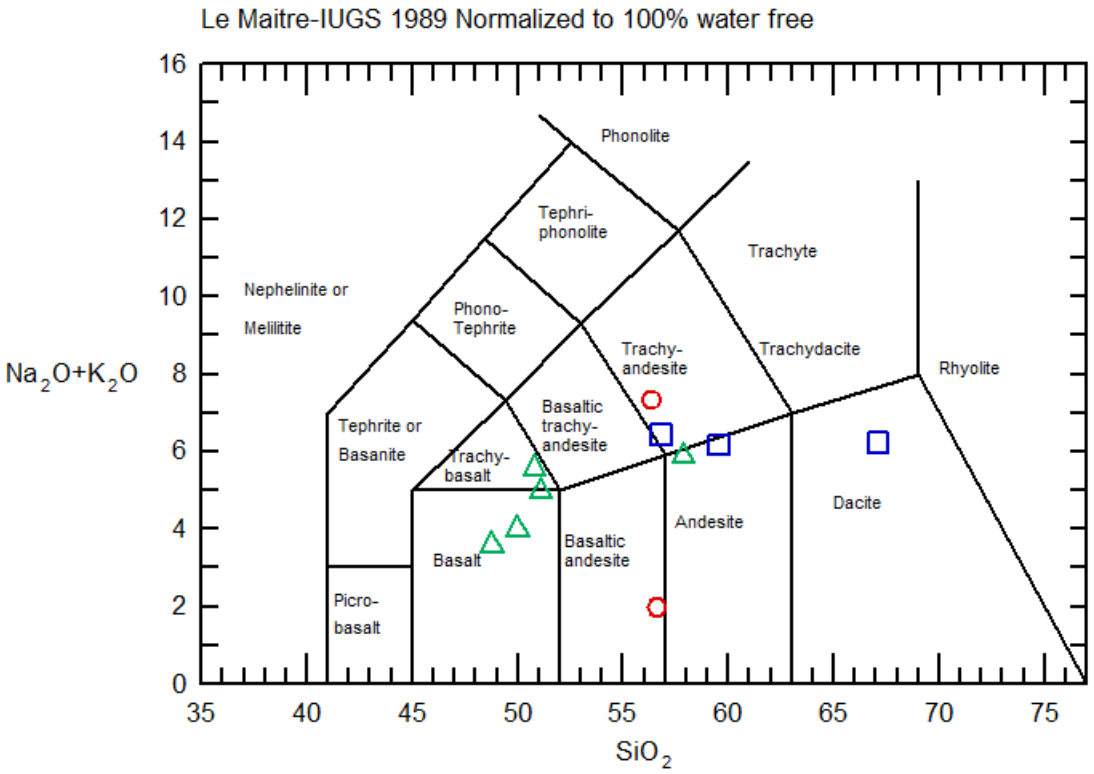

Figure 9: TAS plot of samples (blue squares = quartz monzonites; green triangles = basalts and gabbros, red circles = altered basaltic andesites?)

Geochemical Sampling

Fourteen rock samples and a blank were submitted for geochemical analysis.
Rock samples were collected from float and outcrop at the locations shown on Figures 4, 5 & 6.
Samples were crushed to 70% less than 2 mm, 250 g were split off and pulverized to 85% passing 75 microns. 30 gram samples were subjected to fire assay for Au with ICP-AES finish. They were also subjected to aqua regia digestion and ICP-AES analysis. Sample descriptions are given in Table 4.
Appendix I contains the assay and QA/QC certificates.
The highest Cu values taken during the 2019 season was from quartz-carbonate altered basalts, though even the best of these was an unexciting 540 ppm. However, the similarity in alteration style of these samples (21631, 21630 & 21638(7)) with the quartz-carbonate stockwork east of the Wen adit suggests that this style of mineralization may be more widespread.
Epidote-carbonate matrix breccia samples generally had elevated, but unexceptional Cu values.

Table 3: Rock Samples

Sample ID	Easting	Northing	Description	Lithology	Thin Section	Whole Rock	Geochem	ppm Cu
21629	684998	5533805	Dark greenish grey, feldspar phyric, fine grained diorite? Frequent Ep+/-Qz+/-Ch veinlets. Trace Sx.	Gabbro		x	x	70
21630	683654	5533559	Reanalysis of 2018 sample J488640. Same subcrop or float as sample 21638(7)* below.	Basaltic Andesite		x	x	402 (2018 analysis = 396)
21631	683342	5534853	Medium grey, very fine grained, limonitic basalt? Frequent carbonate veinlets. About 0.5% disseminated Sx (Cp & Py).	Basalt?	x	x	x	540
21632	683331	5534652	Medium grey, very fine grained quartz monzodiorite? Fl & Hb phyric (fine crowded phenocrystss). Lm'tc fractures. Patchily pyritic (up to 5% Py).	Quartz-monzodiorite		x	x	65
21633	683428	5534780	Breccia with basalt clasts & Qz-Cb-Ep matrix. Trace Cp in matrix.	Breccia			x	160
21634	683450	5534877	Very limonitic quartz vein material.	Vein			x	85
21635	682828	5534045	Breccia with basalt &/or gabbro clasts & Qz-Cb-Ep matrix. Trace Sx.	Breccia			x	111
21636	683872	5534053	Breccia with basalt &/or gabbro clasts & Qz-Cb-Ep matrix. Trace Sx.	Breccia			x	115
21637(8)*	683654	5533559	Float. Medium grey, fine grained, mafic volcanic? Orange brown weathering. ~1% disseminated Py & Cp. Frequent Qz-Cb veinlets. (resample of 2018 sample #488640).	Andesite	x	x	x	12
21638(7)*			BLANK	Rhyolite			x	256
21639	683642	5533516	Orange weathering, medium greenish grey, Hb? phyric diorite? Brecciated by Cb veinlets.	Andesite?	x	x	x	53
21640	683671	5533466	Medium purple grey, fine grained intrusive or crystal tuff. Frequent Cb veining. Limonitic fracture.	Basaltic Tuff	x	x	x	35
21641	683671	5533466	Same as 21640, but more veining.	Basaltic Tuff			x	5
21642	683259	5534745	Fine grained, medium grey, weakly Hb porphyritic, Quartz Monzodiorite. Trace pyrite.	Quartz Monzodiorite		x		
21643			Basalt standard (OREAS 24c)	Basalt		x		
21644	683483	5533962	Reanalysis of 2018 sample J488643. Basalt brecciated by Ep-Cb veinlets.	Basalt		x		
21645	684321	5533168	Dark grey, very fine grained basalt with about 15% large (up to 8 mm) Px phenocrysts.	Basalt		x		
21646	683494	5534587	Medium grey, fine grained, crowded Fl>Px>Hb porphyritic gabbro. Pale green (Ep alteration) patches.	Gabbro		x		
21647	683561	5533072	Dark grey, very fine grained sandstone or basaltic tuff.	Basaltic Tuff	x	x		
39715	683207	5535606	Medium to Dark Green Grey, variably Ep and Cb brecciated, volcanic conglomerate.	(Basaltic) volcanic conglomerate		x	x	167

***Sample 21637 and 21638 appear to have been switched. See text for discussion.**

Ep (epidote), Qz (quartz), Ch (chlorite), Sx (sulphides), Fl (feldspar), Hb (hornblende), Py (pyrite), Cp (chalcopyrite), Cb (carbonate)

Soil Sampling

Fourteen soil samples were collected and submitted for analysis. One of these was a duplicate sample. Samples were taken from roadcuts to see if deeper samples of possible basal till would be more effective in areas of thicker overburden than standard soil sampling. Considerable area of the property feature thick overburden with few outcrops.

The soil samples were taken at the locations shown on Figure 4, 5 & 6. The samples were screened to -80 mesh. A 25 gram split was then subjected to aqua regia digestion followed by ICP-MS analysis for 51 elements including Au. Sample descriptions are given in Table 4. Appendix I contains the assay and QA/QC certificates.

Samples were taken from a depth 30 cm to 1.7 m from roadcuts in till. Most samples showed little difference with depth and were not anomalous, either by regional till sampling thresholds (Jackman, 2010) or historical Wen soil surveys (Kierans, 1973). However, the site with the deepest sample (samples 39708-39710) show a clear increase with depth from not anomalous to weakly anomalous relative to the 1972 sampling thresholds.

QA/QC

Two pulps from the 2018 lithogeochemical survey were submitted for reanalysis, a standard from OREAS certified reference materials (OREAS24c – Appendix 2) and a dacite blank were included with the rock samples. A field duplicate was submitted with one of the soil samples.

It appears that the dacite blank and the preceeding sample were switched. The dacite blank reported a high Cu value (256 ppm), while the preceeding sample (21637), which had chalcopyrite reported in handsample and in the petrographic report, returned a Cu value of 12 ppm. In addition, the major and trace element plots of sample 21637 were unlike any on the property to date, and specifically unlike the plots for 21630. Sample 21637 was essentially a field duplicate of sample 21630 (which was a reanalysis of a sample taken from the same buried subcrop/float in 2018).

Sample 21630 was a reanalysis of 2018 sample 488640. It returned Cu values of 396 ppm Cu, which is acceptable compared to the 2018 result of 402 ppm. The results for major and trace elements were plotted on the three discriminant plots used in the Lithogeochemical Sampling section above. The plots are included in Appendix 2. The REE and TAS plots had acceptable agreement between the 2018 and 2019 analysis, but there was significant scatter in the Zr/Ti vs Nb/Y plot.

The certified element values for the standard were directly compared to the ALS analysis in Table 5. Several elements had differences between 5 and 10%. Two elements had differences of over 30%, though one of these is likely due to round off error.

Table 4: Comparison of sample 21643 analysis with certified values for OREAS 24c

Sample	Na2O	K2O	TiO2	Ba	Cr	Hf	Nb	Rb	Sn	Sr	Ta	Th	U	Y	Zr
21643	3.12	0.84	1.84	277	270	3.8	21.7	21	2	428	1.4	2.96	0.79	22.1	152
Standard	3.26	0.885	1.77	269	193	3.75	23.8	21.9	1.51	442	1.48	3.08	0.76	22.3	143
Difference	-0.1	0.0	0.1	8.0	77.0	0.0	-2.1	-0.9	0.5	-14.0	-0.1	-0.1	0.0	-0.2	9.0
% difference	-4.3%	-5.1%	4.0%	3.0%	39.9%	1.3%	-8.8%	-4.1%	32.5%	-3.2%	-5.4%	-3.9%	3.9%	-0.9%	6.3%

The duplicate soil samples had Cu values which were well within 10% of each other, which the GSC considers acceptable for field duplicates.

Table 5: Soil Samples descriptions

Sample ID	**Easting**	**Northing**	**Depth**	**Description**	**ppm Cu**
39701	685002	5533704	40 cm	Dense, light brownish grey, gritty silt. Frequent subangular to subround polymictic pebbles	14.5
39702	685002	5533704	20 cm	Loose, light brownish grey silt. Frequent cobbles.	8
39703	683521	5532847	1.5 m	Moderately dense, tan sand=silt>clay. Matrix supported, subround to subangular, polymictic. pebbles & cobbles	54.6
39704	683521	5532847	1.5 m	**Duplicate of 39703**	57.2
39705	683519	5532847	40 cm	Moderately dense, tan sand=silt+clay. Matrix supported, subround to subangular, polymictic. pebbles & cobbles	57.4
39706	683674	5533523	60 cm	Weakly compact, medium brown clay=sand. Polymictic angular to rounded pebbles & cobbles. Matrix dominant.	70.6
39707	683674	5533523	30 cm	Loose, medium reddish brown silt>clay>sand. Polymictic, angular to rounded (dominant) pebbles to boulders. Clast supported.	77.8
39708	683197	5535598	1.7 m	Moderately compact, pale tan silt. Frequent subround to subangular volcanic pebbles to cobbles.	90.5
39709	683197	5535598	1.3 m	Dense, light brown sand>pebbles>silt. Polymictic subangular to subround pebbles.	68.2
39710	683197	5535598	30 cm	Moderately compact, light tan silt>sand>clay. Matrix supported, polymictic pebbles to boulders.	32.7
39711	682941	5535422	1.5 m	Moderately compact, pale tan silt. Frequent subround to angular volcanic pebbles to cobbles.	62.4
39712	682941	5535422	30 cm	moderately compact, light brown silt>pebbles>sand. Polymictic, angular to subround pebbles.	54.7
39713	683378	5535654	1.5 m	Moderately compact, pale tan sand>silt>pebbbles. Angular to subround pebbles.	51.4
39714	683378	5535654	30 cm	moderately compact, light brown silt>pebbles>sand. Polymictic, angular to subround pebbles.	42.2

Petrography

Five samples were submitted for petrographic examination. Sample details are given in Table 3. The locations of the samples are shown on Figures 4 and 5. The petrographic report is in Appendix 3. The purpose of the sampling was to determine the lithology and/or alteration of a number of rocks that could not be confidently identified in the field or by slabbing.
Petrographic examination indicated that the two most mineralized samples collected in the 2019 season were both quartz-carbonate altered andesites. Two samples were confirmed to be tuffs. A second sample taken from the road showing also featured quartz-carbonate (+k-spar?) alteration.

Conclusions and Recommendations

Overall, little mineralization of note was encountered during the 2019 field season. The mineralization of note that was encountered was associated with the volcanic-sediment contact. Neither of the intrusive rocks mapped to date appears to be an alkalic porphyry. Most of the hydrothermal breccia examined is either low grade or unmineralized. However, much of the property remains unmapped and barely examined. Mapping is also still incomplete in the area of the Wen Showing and along portions of the volcanic-sediment contact.
The contact should be mapped to the north, and chalcopyrite occurrences associated with the Echo showing should be followed up on as well as the historic soil anomalies in this area.
The area to the east of the Wen showing should be mapped to constrain the limits of the quartz-carbonate stockwork and the Wen breccia body. The area north of the Southern Trenches should be mapped to cover this area of the contact.
Consideration should be given to trenching in the area of the South Trenches and the Road Showing.

Statement of Qualifications

I certify the following:

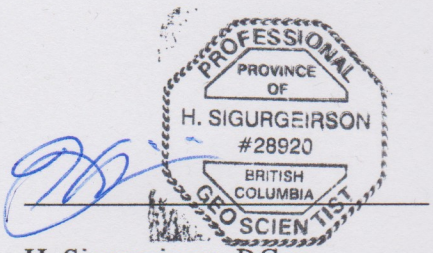
1. I graduated in 1995 from the University of British Columbia with a B.Sc. in the Geological Sciences.

2. I have worked in mining and mineral exploration continuously since graduation.

3. I have worked on VMS, porphyry, epithermal and mesothermal Au vein, anorthosite hosted Ti, nephrite and other exploration programs in Canada, Mexico and China. I have developed and operated 3 dimension stone quarries on the BC coast.

4. I am a professional geoscientist in the Association of Professional Engineers and Geoscientists of British Columbia, and have been a member in good standing (member #28920) since 2004.

5. I carried out the work program described herein and wrote this report.



H. Sigurgeirson, P.Geo

Project: Mal-Wen

This report is for 7 Rock samples submitted to our lab in Vancouver, BC, Canada on 3-SEP-2019.

The following have access to data associated with this certificate:

VICTORY RESOURCES		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
DISP-01	Disposal of all sample fractions
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION
AuME-TL43	25g Trace Au + Multi Element PKG

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

***** See Appendix Page for comments regarding this certificate *****

Project: Mal-Wen

This report is for 19 Rock samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2019.

The following have access to data associated with this certificate:

VICTORY RESOURCES		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-23	Pulp Login - Rcvd with Barcode
DISP-01	Disposal of all sample fractions
CRU-QC	Crushing QC Test
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
ME-ICP06	Whole Rock Package - ICP-AES	ICP-AES
OA-GRA05	Loss on Ignition at 1000C	WST-SEQ
ME-MS81	Lithium Borate Fusion ICP-MS	ICP-MS
TOT-ICP06	Total Calculation for ICP06	
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

Account: VIRELIT

VA19204072

Project: Mal-Wen

This report is for 19 Rock samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2019.

The following have access to data associated with this certificate:

VICTORY RESOURCES		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-23	Pulp Login - Rcvd with Barcode
DISP-01	Disposal of all sample fractions
CRU-QC	Crushing QC Test
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
ME-ICP06	Whole Rock Package - ICP-AES	ICP-AES
OA-GRA05	Loss on Ignition at 1000C	WST-SEQ
ME-MS81	Lithium Borate Fusion ICP-MS	ICP-MS
TOT-ICP06	Total Calculation for ICP06	
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

Project: Mal-Wen

This report is for 7 Soil samples submitted to our lab in Vancouver, BC, Canada on 16-AUG-2019.

The following have access to data associated with this certificate:

VICTORY RESOURCES		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
SCR-41	Screen to -180um and save both
DISP-01	Disposal of all sample fractions

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION
AuME-TL43	25g Trace Au + Multi Element PKG

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

This report is for 7 Soil samples submitted to our lab in Vancouver, BC, Canada on 16-AUG-2019.

The following have access to data associated with this certificate:

VICTORY RESOURCES		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
SCR-41	Screen to -180um and save both
DISP-01	Disposal of all sample fractions

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION
AuME-TL43	25g Trace Au + Multi Element PKG

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

This report is for 1 Rock sample submitted to our lab in Vancouver, BC, Canada on 3-SEP-2019.

The following have access to data associated with this certificate:

VICTORY RESOURCES		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
DISP-01	Disposal of all sample fractions

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
ME-ICP06	Whole Rock Package - ICP-AES	ICP-AES
OA-GRA05	Loss on Ignition at 1000C	WST-SEQ
ME-MS81	Lithium Borate Fusion ICP-MS	ICP-MS
TOT-ICP06	Total Calculation for ICP06	
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

VA19220856

Project: Mal-Wen

This report is for 1 Rock sample submitted to our lab in Vancouver, BC, Canada on 3-SEP-2019.

The following have access to data associated with this certificate:

VICTORY RESOURCES		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
DISP-01	Disposal of all sample fractions

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
ME-ICP06	Whole Rock Package - ICP-AES	ICP-AES
OA-GRA05	Loss on Ignition at 1000C	WST-SEQ
ME-MS81	Lithium Borate Fusion ICP-MS	ICP-MS
TOT-ICP06	Total Calculation for ICP06	
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

Note: intervals may appear asymmetric due to rounding.

INTRODUCTION

OREAS reference materials are intended to provide a low cost method of evaluating and improving the quality of analysis of geological samples. To the geologist they provide a means of implementing quality control in analytical data sets generated in exploration from the grass roots level through to prospect evaluation, and in grade control at mining operations. To the analyst they provide an effective means of calibrating analytical equipment, assessing new techniques and routinely monitoring in-house procedures.

SOURCE MATERIALS

OREAS 24c was prepared from olivine tholeiitic basalt from the Quaternary Newer Volcanics Province in Victoria, Australia. It is characterised by very low background gold of less than 1 parts per billion.

COMMINUTION AND HOMOGENISATION PROCEDURES

The material constituting OREAS 24c was prepared in the following manner:

- drying to constant mass at 105°C;
- multi stage crushing and milling to approximately 99% minus 75 microns;
- homogenisation;
- packaging into 10 and 60g units sealed in laminated foil pouches and 1kg units in plastic jars.

ANALYTICAL PROGRAM

Seven commercial analytical laboratories participated in the program to characterise gold by fire assay with ICP-OES (4 labs), ICP-MS (1 lab), AAS (1 lab) or SXAAS (1 lab) finish. Elements certified via 4-acid digestion include Ag, Al, As, Ba, Be, Bi, Ca, Cd, Co, Cr, Cu, Fe, Hf, K, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, Sb, Sc, Sn, Sr, Ta, Th, Ti, U, V, W, Y, Zn and Zr with ICP-OES or ICP-MS finish.

For the round robin program ten 500g test units were taken at predetermined intervals during the bagging stage, immediately following homogenisation and are considered representative of the entire batch. The six samples received by each laboratory were obtained by taking two 100g scoop splits from each of three separate 500g test units. This format enabled nested ANOVA treatment of the results to evaluate homogeneity, i.e. to ascertain whether between-unit variance is greater than within-unit variance. Table 1 (above) presents the certified values together with their associated 1SD's, 95% confidence and tolerance limits and Table 2 shows indicative values. Indicative values are provided for the major and trace elements determined by borate fusion XRF (Al_2O_3 to Zn) and laser ablation with ICP-MS (Ag to Zr) and are the means of duplicate assays from Bureau Veritas, Perth. Additional indicative values by other analytical methods are present where; i) the number of laboratories reporting a particular analyte is insufficient (< 5) to support certification; ii) inter-laboratory consensus is poor; or iii) a significant proportion of results are outlying or reported as less than detection limits.

Table 3 provides performance gate intervals for the certified values based on their associated standard deviations. Tabulated results of all elements together with analytical method codes, uncorrected means, medians, standard deviations, relative standard deviations and per cent deviation of lab means from the corrected mean of means (PDM[3]) are presented in the detailed certification data for this CRM (**OREAS 24c Datapack.xlsx**).

Note: the number of significant figures reported is not a reflection of the level of certainty of stated values. They are instead an artefact of ORE's in-house CRM-specific LIMS.

STATISTICAL ANALYSIS

Certified Values, Standard Deviations, Confidence and Tolerance Limits have been determined for each analytical method following removal of individual and laboratory outliers (Table 1). Certified Values are the mean of means after outlier filtering. The 95% Confidence Limit is a measure of the reliability of the certified value, i.e. the narrower the Confidence Interval the greater the certainty in the Certified Value. It should not be used as a control limit for laboratory performance.

Standard Deviation values (1SDs) are reported in Table 1 and provide an indication of a level of performance that might reasonably be expected from a laboratory being monitored by this CRM in a QA/QC program. They take into account errors attributable to measurement uncertainty and CRM variability. For an effective CRM the contribution of the latter should be negligible in comparison to measurement errors. The Standard Deviation values include all sources of measurement uncertainty: between-lab variance, within-run variance (precision errors) and CRM variability. The SD for each analyte's certified value is calculated from the same filtered data set used to determine the certified value, i.e. after removal of all individual, lab dataset (batch) and 3SD outliers (single iteration). These outliers can only be removed after the absolute homogeneity of the CRM has been independently established, i.e. the outliers must be confidently deemed to be analytical rather than arising from inhomogeneity of the CRM. The standard deviation is then calculated for each analyte from the pooled accepted analyses generated from the certification program.

Performance Gates (Table 3) are calculated for two and three standard deviations. As a guide these intervals may be regarded as warning or rejection for multiple 2SD outliers, or rejection for individual 3SD outliers in QC monitoring, although their precise application should be at the discretion of the QC manager concerned.

A second method utilises a 5% window calculated directly from the certified value. Standard deviation is also shown in relative per cent for one, two and three relative standard deviations (1RSD, 2RSD and 3RSD) to facilitate an appreciation of the magnitude of these numbers and a comparison with the 5% window. Caution should be exercised when concentration levels approach lower limits of detection of the analytical methods employed as performance gates calculated from standard deviations tend to be excessively wide whereas those determined by the 5% method are too narrow.

Table 3. Performance Gates for OREAS 24c.

Note: intervals may appear asymmetric due to rounding

Tolerance Limits (ISO Guide 3207) were determined using an analysis of precision errors method and are considered a conservative estimate of true homogeneity. The meaning of tolerance limits may be illustrated for copper (Cu), where 99% of the time (1-α=0.99) at least 95% of subsamples (ρ=0.95) will have concentrations lying between 45.9 and 51.4ppm. Put more precisely, this means that if the same number of subsamples were taken and analysed in the same manner repeatedly, 99% of the tolerance intervals so constructed would cover at least 95% of the total population, and 1% of the tolerance intervals would cover less than 95% of the total population (IS0 Guide 35).

The homogeneity of OREAS 24c has also been evaluated in an ANOVA study for all certified analytes. This study tests the null hypothesis that no statistically significant difference exists between the *between-unit variance* and the *within-unit variance* (i.e. p-values <0.05 indicate rejection of the null hypothesis). Of the 38 certified values, no failures were observed indicating no evidence to reject the null hypothesis.

Based on the statistical analysis of the results of the inter-laboratory certification program it can be concluded that OREAS 24c is fit-for-purpose as a certified reference material (see 'Intended Use' below).

PARTICIPATING LABORATORIES

1. Acme, Vancouver, BC, Canada
2. ALS, Brisbane, QLD, Australia
3. ALS, Vancouver, BC, Canada
4. Amdel (BV), Adelaide, SA, Australia
5. Intertek Genalysis, Perth, WA, Australia
6. SGS, Perth, WA, Australia
7. Ultra Trace (BV), Perth, WA, Australia

PREPARER AND SUPPLIER

Certified reference material OREAS 24c is prepared, certified and supplied by:

ORE RESEARCH & EXPLORATION

ORE Research & Exploration Pty Ltd
37A Hosie Street
Bayswater North VIC 3153
AUSTRALIA

Tel: +613-9729 0333
Fax: +613-9729 8338
Web: www.ore.com.au
Email: info@ore.com.au

It is available in unit sizes of 10 and 60g (single-use laminated foil pouches) and 1kg (plastic jars).

INTENDED USE

OREAS 24c is intended for the following uses:

- for the monitoring of laboratory performance in the analysis of Ag, Al, As, Au, Ba, Be, Bi, Ca, Cd, Co, Cr, Cu, Fe, Hf, K, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, Sb, Sc, Sn, Sr, Ta, Th, Ti, U, V, W, Y, Zn and Zr in geological samples;
- for the verification of analytical methods for Ag, Al, As, Au, Ba, Be, Bi, Ca, Cd, Co, Cr, Cu, Fe, Hf, K, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, Sb, Sc, Sn, Sr, Ta, Th, Ti, U, V, W, Y, Zn and Zr;
- for the calibration of instruments used in the determination of the concentration of Ag, Al, As, Au, Ba, Be, Bi, Ca, Cd, Co, Cr, Cu, Fe, Hf, K, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, Sb, Sc, Sn, Sr, Ta, Th, Ti, U, V, W, Y, Zn and Zr.

STABILITY AND STORAGE INSTRUCTIONS

OREAS 24c has been prepared from a barren basalt sample. In its unopened state under normal conditions of storage it has a shelf life beyond ten years.

INSTRUCTIONS FOR CORRECT USE

The certified values for OREAS 24c refer to the concentration level in its packaged state. It should not be dried prior to weighing and analysis.

HANDLING INSTRUCTIONS

Fine powders pose a risk to eyes and lungs and therefore standard precautions such as the use of safety glasses and dust masks are advised.

TRACEABILITY

The analytical samples were selected in a manner to represent the entire batch of prepared CRM. This 'representivity' was maintained in each submitted laboratory sample batch and ensures the user that the data is traceable from sample selection through to the analytical results that underlie the consensus values. Each analytical data set has been validated by its assayer through the inclusion of internal reference materials and QC checks during analysis. The laboratories were chosen on the basis of their competence (from past performance in inter-laboratory programs) for a particular analytical method, analyte or analyte suite, and sample matrix. Most of these laboratories have and maintain ISO 17025 accreditation. The certified and non-certified (indicative) values presented in this report are calculated from the means of accepted data following robust statistical treatment as detailed in this report.

LEGAL NOTICE

Ore Research & Exploration Pty Ltd has prepared and statistically evaluated the property values of this reference material to the best of its ability. The Purchaser by receipt hereof releases and indemnifies Ore Research & Exploration Pty Ltd from and against all liability and costs arising from the use of this material and information.

QMS ACCREDITED

ORE Pty Ltd is accredited to ISO 9001:2008 by Lloyd's Register Quality Assurance Ltd for its quality management system including development, manufacturing, certification and supply of CRMs.

CERTIFYING OFFICER

Craig Hamlyn (B.Sc. Hons - Geology), Technical Manager - ORE P/L

September 2019

Project: Victory

Samples: MW19: 12.15, 16.16, 16.17, 714.10, 714.14a

Summary:

Sample MW19 12.15 is of altered andesite(?) that contains scattered clusters of very fine grained plagioclase (possibly after plagioclase phenocrysts); these are set in a groundmass containing scattered lathy plagioclase grains in an aphanitic matrix of plagioclase (altered slightly to sericite in patches) and limonite/hematite, with disseminated grains of pyrite (altered strongly to completely to hematite). Replacement patches and veins are dominated by calcite and/or quartz, with locally abundant pyrite (altered moderately to hematite) and elsewhere minor to accessory sericite.

Sample MW19 16.16 is of altered andesite/latite(?). Minor plagioclase phenocrysts (?; altered completely to sericite) are set in a groundmass of plagioclase (altered strongly to completely to sericite) with scattered patches of ilmenite (altered completely to leucoxene). Early, commonly diffuse replacement patches are of quartz with much less abundant calcite, and with diffuse patches of extremely fine grained quartz and sericite. Later replacement patches and veinlets are dominated by calcite and/or quartz. Chalcopyrite and pyrite commonly occur separately in replacement patches and veins and in the altered host rock.

Sample MW19 16.17 is of slightly porphyritic latite/andesite that contains scattered phenocrysts of plagioclase (altered slightly to moderately to sericite) and of hornblende (altered completely to chlorite); these are set in a groundmass dominated by plagioclase with lesser K-feldspar. Abundant discontinuous veinlets are of quartz with minor to accessory calcite.

Sample MW19 714.10 is of andesite crystal tuff that contains abundant subhedral to euhedral crystal of plagioclase (altered slightly to moderately to sericite) and much less abundant ones of hornblende (altered completely to tremolite/actinolite-calcite-epidote); these are set in a sparse groundmass dominated by granular plagioclase/K-feldspar(?) with accessory disseminated ilmenite (altered completely to leucoxene). Replacement patches, mainly in the groundmass, are of epidote and locally abundant quartz. A few veinlets are of epidote and of calcite-epidote.

Sample MW19 714.14 is of altered andesite crystal tuff that contains abundant subhedral to euhedral crystals of plagioclase (altered completely to sericite) and lesser ones of hornblende (altered completely to calcite-hematite), as well as disseminated grains of ilmenite in a groundmass of extremely fine grained plagioclase/sericite that was variably replaced by hematite. Several replacement patches are of calcite-(hematite) and two are of plagioclase. A veinlet of calcite has selvages along its margin of hematite; in the adjacent host rock an envelope up to 1 mm wide contains disseminated patches of calcite in sericite-altered plagioclase crystals.

Photographic Notes:

The scanned section shows the gross textural features of the sections; these features are seen much better on the digital image than on the printed image. For the photographs, sample numbers are shown in the upper left corner, photo numbers are shown in the lower left corner, and the letter in the lower right corner indicates the lighting conditions: incident light in crossed nicols (= X); reflected light (= R); reflected light in nearly crossed nicols and incident light in crossed nicols (= ~RX). Locations of photographs are shown on the scanned section. Descriptions of the photographs are at the end of the report.

Sample MW19 12.15 Altered Andesite(?)
Veins/Replacement: Calcite-Quartz-(Pyrite-Sericite)

Scattered clusters of very fine grained plagioclase (possibly after plagioclase phenocrysts) are set in a groundmass containing scattered lathy plagioclase grains in an aphanitic matrix of plagioclase (altered slightly to sericite in patches) and limonite/hematite, with disseminated grains of pyrite (altered strongly to completely to hematite). Replacement patches and veins are dominated by calcite and/or quartz, with locally abundant pyrite (altered moderately to hematite) and elsewhere minor to accessory sericite.

mineral	**percentage**	**main grain size range (mm)**
phenocrysts(?)		
plagioclase	3- 4%	0.5-0.7
groundmass		
plagioclase (lathy)	1- 2	0.07-0.15
plagioclase	50-55	0.005-0.02
limonite/hematite	2- 3	dusty-0.02
sericite	2- 3	0.01-0.03
pyrite	1- 2	0.05-0.2
veins, replacement		
1) calcite-quartz-(sericite-pyrite)	30-35	0.1-1.5 (ct), 0.1-0.3 (qz, py), 0.01-0.03 (se)

Scattered patches up to 0.7 mm across of very fine grained plagioclase may be secondary after plagioclase phenocrysts.

The groundmass is dominated by equant plagioclase and possibly lesser other minerals, but much of it is too fine grained for minerals to be identified optically. Plagioclase also forms unoriented, disseminated elongate prismatic to lathy grains. In places the groundmass contains accessory to modestly abundant sericite.

Pyrite is concentrated moderately locally as disseminated subhedral to euhedral cubic grains that were altered strongly to completely to pseudomorphic red-brown hematite.

Limonite and hematite form disseminated spots, lenses, and wispy veinlets up to 0.02 mm wide.

Veins, veinlets, and replacement patches up to several mm across are dominated by calcite and/or quartz. A few veinlets also contain minor to accessory sericite, in part stained orange by limonite). A few patches, including one up to a few mm across are of pyrite (altered moderately to deep red-brown hematite).

Sample MW19 16.16 **Altered Andesite/Latite(?); Alteration: Sericite-K-feldspar(?) Replacement, Veins: Calcite-Quartz-(Chalcopyrite)**

Minor plagioclase phenocrysts(?; altered completely to sericite) are set in a groundmass of plagioclase (altered strongly to completely to sericite) with scattered patches of ilmenite (altered completely to leucoxene). Early, commonly diffuse replacement patches are of quartz with much less abundant calcite, and with diffuse patches of extremely fine grained quartz and sericite. Later replacement patches and veinlets are dominated by calcite and/or quartz. Chalcopyrite and pyrite commonly occur separately in replacement patches and veins and in the altered host rock.

mineral	percentage	main grain size range (mm)	
phenocrysts(?)			
plagioclase	minor	0.2-0.3	
groundmass			
plagioclase/sericite	60-70%	0.01-0.03	
ilmenite/Ti-oxide	1- 2	0.05-0.25	
apatite	trace	0.05-0.07	
replacement			
quartz-calcite	12-15	0.03-0.07	(locally up to 0.5 mm)
veinlets, replacement			
calcite-quartz	15-17	0.05-0.3	
pyrite	0.3	0.05-0.3	
chalcopyrite	0.3	0.03-0.15	(locally up to 1 mm)

A few sericite-rich patches with vague subhedral outlines may represent original plagioclase phenocrysts.

Much of the sample consists of groundmass feldspar (probably plagioclase that was altered strongly to sericite). The bright yellow stain on the offcut block suggests the presence of abundant K-feldspar; however, feldspar grains intergrown with sericite are too fine grained to be identified optically as either plagioclase or K-feldspar. Feldspar is moderately well preserved in one corner of the section; it appears to be mainly plagioclase altered slightly to moderately to micritic calcite and sericite.

Ilmenite (altered completely to leucoxene) forms irregular equant patches in the host rock and locally in the veins/replacement patches.

Apatite forms scattered subhedral grains.

Irregular, diffuse replacement patches are of intergrowths of quartz and generally lesser calcite. A few coarser grained patches contain moderately abundant subhedral prismatic quartz grains up to 0.7 mm long.

Chalcopyrite forms disseminated anhedral equant patches, mainly associated with quartz.

Pyrite forms disseminated, commonly subhedral grains, locally associated with chalcopyrite.

Veinlets up to 2 mm wide are of calcite and quartz, in which quartz commonly forms elongate prismatic crystals. One calcite-quartz veinlet contains a large grain of chalcopyrite and several patches of leucoxene (after ilmenite).

A few veinlets up to 1 mm wide are dominated by calcite with no to accessory quartz. One calcite-rich veinlet is rimmed by thin selvages of limonite.

A wispy seam is of limonite.**Sample MW19 16.17 Slightly Porphyritic Latite/Andesite**

Veinlets/Replacement: Quartz-(Calcite); Limonite

Scattered phenocrysts of plagioclase (altered slightly to moderately to sericite) and of hornblende (altered completely to chlorite) are set in a groundmass dominated by plagioclase with lesser K-feldspar. Abundant discontinuous veinlets are of quartz with minor to accessory calcite and minor K-feldspar. Late stringers are of limonite.

mineral	**percentage**	**main grain size range (mm)**
phenocrysts		
plagioclase	3- 4%	0.5-1
hornblende	4- 5	0.7-1 (one 1.7 mm long)
groundmass		
plagioclase	45-50(?)	0.02-0.04
K-feldspar	30-35(?)	0.02-0.04
chlorite	2- 3	0.01-0.03
veinlets, replacement		
1) quartz-(calcite-K-feldspar)	4- 5	0.03-0.1
2) limonite	2- 3	cryptocrystalline

Plagioclase forms subhedral to euhedral equant phenocrysts that were altered slightly to moderately to sericite. Some phenocrysts were cut by veinlets of K-feldspar, which in the groundmass beyond the phenocrysts are of quartz.

Hornblende (altered completely to chlorite and minor calcite) forms disseminated anhedral phenocrysts and a few clusters up to 2 mm across of several phenocrysts.

The groundmass consists of an intergrowth of unoriented plagioclase and K-feldspar; the strong yellow stain on the offcut block suggests the presence of abundant K-feldspar. Chlorite forms disseminated flakes and minor patches.

Wispy veinlets mainly from 0.03-0.08 mm wide are of quartz with generally lesser calcite. Where a few quartz-rich veinlets cut plagioclase phenocrysts they consist of K-feldspar. Several irregular replacement patches are dominated by quartz.

Numerous late fracture-filling seams are of limonite.

Sample MW19 714.10 Andesite Crystal Tuff
Replacement: Epidote-Calcite-K-feldspar

Abundant subhedral to euhedral crystal of plagioclase (altered slightly to moderately to sericite) and much less abundant ones of hornblende (altered completely to tremolite/actinolite-calcite-epidote) are set in a sparse groundmass dominated by granular plagioclase/K-feldspar(?) with accessory disseminated ilmenite (altered completely to leucoxene). Replacement patches, mainly in the groundmass, are of epidote and locally abundant quartz. A few veinlets are of epidote and of calcite-epidote.

mineral	percentage	main grain size range (mm)
phenocrysts		
plagioclase	40-45%	0.5-1 (a few up to 1.5 mm long)
tremolite/actinolite	7- 8	0.5-1 (a few up to 1.5 mm long)
groundmass		
plagioclase-(K-feldspar)	25-30	0.02-0.05
leucoxene	2- 3	0.1-0.3
magnetite	0.3	0.2-0.25
chlorite	minor	0.01-0.02
chalcopyrite	minor	0.02-0.05
apatite	trace	0.05-0.1
pyrite	trace	0.02-0.03
replacement, veinlets		
epidote	4- 5	0.05-0.3 (locally up to 0.4 mm long)
calcite	1- 2	0.05-0.2
quartz	0.5	0.05-0.2; one grain 1 mm long
K-feldspar	minor	0.05-0.1

Plagioclase forms subhedral to euhedral, unzoned prismatic grains that were altered slightly to locally moderately to sericite.

Tremolite/actinolite forms subhedral to euhedral prismatic grains that are secondary after hornblende. They commonly contain patches of calcite and less commonly epidote and/or leucoxene.

In the groundmass, plagioclase and lesser K-feldspar form aggregates of granular grains. The yellow stain on the offcut block is unusual, indicating that K-feldspar is concentrated along the margins of the section; because of this unusual distribution, and the inability to identify K-feldspar optically, its distribution is uncertain. A few patches up to 1 mm long are of very fine igneous plagioclase altered in part to epidote.

Leucoxene (after ilmenite) forms disseminated irregular equant patches up to 0.25 mm across.

Magnetite forms disseminated equant grains.

Chlorite forms a few patches up to 0.15 mm across.

Apatite forms scattered anhedral to subhedral, equant to stubby prismatic grains.

Chalcopyrite and pyrite form disseminated anhedral grains, commonly associated with epidote.

Epidote forms irregular replacement patches up to 0.7 mm across and discontinuous veinlets up to 0.2 mm wide.

Quartz forms one large interstitial grain and also occurs with epidote in a few replacement patches up to 1 mm across.

Calcite and epidote occur together and locally separately in discontinuous veinlets up to 0.3 mm wide. One veinlet is of calcite-K-feldspar.

Sample MW19 714.14 Altered Andesite Crystal Tuff

Alteration: Sericite-Calcite-Hematite
Replacement: Calcite, Plagioclase
Veinlet: Calcite-Hematite

The sample contains abundant subhedral to euhedral crystals of plagioclase (altered completely to sericite) and lesser ones of hornblende (altered completely to calcite-hematite), as well as disseminated grains of ilmenite in a groundmass of extremely fine grained plagioclase/sericite that was variably replaced by hematite. Several replacement patches are of calcite-(hematite) and two are of plagioclase. A veinlet of calcite has selvages along its margin of hematite; in the adjacent host rock an envelope up to 1 mm wide contains disseminated patches of calcite in sericite-altered plagioclase crystals.

mineral	**percentage**	**main grain size range (mm)**	
phenocrysts			
plagioclase	40-45%	0.2-0.7	(a few up to 1.0 mm)
hornblende(?)	10-12	0.4-0.7	(a few up to 2 mm)
groundmass			
plagioclase(?)	25-30	0.01-0.03	
hematite/limonite	7- 8	cryptocrystalline	
ilmenite	2- 3	0.05-0.3	(a few up to 0.4 mm)
kaolinite(?)	minor	0.005-0.01	
replacement			
calcite	2- 3	0.03-0.07	
plagioclase	0.3	0.02-0.07	
veinlets			
1) calcite-hematite	0.5	0.03-0.07 (ct), 0.01-0.015 (qz)	

Plagioclase forms subhedral to euhedral crystals that were altered strongly to completely to sericite. Along the side of the section with strong hematite alteration, some sericite is stained yellow by limonite.

Hornblende forms subhedral equant crystals that were altered completely to calcite and minor to moderately abundant hematite. In the more strongly hematite-altered zone, hematite is abundant in hornblende crystals and obscures the optical properties of any calcite that is present.

The groundmass is mainly of extremely fine grained plagioclase/sericite(?) with moderately abundant to abundant dusty hematite, which increases in intensity towards one side of the section.

Locally calcite forms replacement patches up to 0.8 mm in size in the groundmass of equant, unoriented grains.

A few interstitial patches up to 0.7 mm across are of slightly coarser grained replacement(?) plagioclase that is at most only slightly altered to sericite.

Kaolinite(?) forms a few patches up to 0.15 mm in size.

A veinlet 0.2-0.3 mm wide along one end of the section is of calcite with seams of hematite along its margins and with a few inclusions(?) of groundmass plagioclase(?). Near the veinlet, a few plagioclase crystals were altered completely to sericite with accessory patches of calcite.

List of Photographs

Photo	Section	Description
01	MW19 12.15	patch of very fine grained plagioclase (possibly after a plagioclase phenocryst) in a matrix of aphanitic plagioclase(?) with scattered elongate laths of plagioclase, minor dusty Ti-oxide(?), and disseminated patches and veinlets of limonite/hematite.
02	MW19 12.15	groundmass of plagioclase (altered slightly to moderately to sericite), disseminated, cubic pyrite grains (altered completely to red-brown hematite), and replacement patches of calcite.
03	MW19 12.15	upper left: patches of very fine grained plagioclase (possibly secondary after plagioclase phenocrysts) in a groundmass of much finer grained plagioclase and disseminated limonite; lower right: calcite-rich replacement patch with an inclusion of plagioclase-limonite.
04	MW19 12.15	replacement patch/vein of pyrite (altered moderately inwards from grain borders to hematite), calcite (poorly preserved) and quartz.
05	MW19 16.16	to the left: possible plagioclase phenocryst (altered completely to sericite) in a groundmass of plagioclase (altered completely to sericite with disseminated patches of ilmenite (altered strongly to completely to Ti-oxide) and minor replacement grains of quartz and of calcite; to the right: diffuse replacement patch of secondary quartz and minor calcite with relic patches of sericite (after plagioclase); cutting both is a veinlet of calcite.
06	MW19 16.16	scattered subhedral plagioclase grains can be identified intergrown with anhedral plagioclase (all altered slightly to locally moderately to sericite and calcite; one grain of apatite, one of quartz, one of pyrite, and a few of calcite.
07	MW19 16.16	host rock: plagioclase (altered completely to sericite); vein/replacement: quartz-calcite with a large patch of chalcopyrite and a few patches of leucoxene (after ilmenite).
08	MW19 16.17	cluster of hornblende phenocrysts (altered completely to chlorite and minor calcite) enclosed in a groundmass of plagioclase-K-feldspar; minor discontinuous veinlets of quartz and of calcite-(limonite).
09	MW19 16.17	plagioclase phenocryst (altered strongly to sericite) in a groundmass of plagioclase-K-feldspar-(sericite-limonite); veinlet of quartz-K-feldspar (in plagioclase phenocryst)-calcite; late veinlets and spots of limonite.
10	MW19 16.17	hornblende phenocrysts (altered completely to chlorite-[limonite]) and one plagioclase phenocryst (altered strongly to sericite) in a groundmass of plagioclase-K-feldspar; a veinlet of calcite-quartz and a few irregular veinlets/replacement patches of quartz.

List of Photographs

Photo	Section	Description
11	MW19 714.10	plagioclase crystals (altered slightly to moderately to sericite) and a few of tremolite/actinolite-(calcite-magnetite) that probably are secondary after hornblende or diopside; sparse groundmass of extremely fine grained granular plagioclase with minor magnetite; replacement patches in the groundmass of epidote.
12	MW19 714.10	large subhedral tremolite/actinolite-(epidote-calcite) grain (probably after hornblende) and euhedral plagioclase crystals (altered slightly to moderately to sericite) in a sparse groundmass of plagioclase with disseminated patches of leucoxene (after ilmenite) and replacement patches of epidote.
13	MW19 714.10	subhedral to euhedral plagioclase (altered slightly to moderately to sericite), minor tremolite/actinolite-calcite (after hornblende) in a sparse groundmass dominated by plagioclase with a few patches of leucoxene (after ilmenite); replacement patches of epidote-quartz.
14	MW19 714.14	larger euhedral hornblende crystals (altered completely to calcite-sericite[?]-ilmenite and smaller subhedral to euhedral plagioclase crystals and crystal fragments (altered completely to sericite) in a sparse groundmass of plagioclase/sericite(?)-(hematite) with disseminated grains of ilmenite.
15	MW19 714.14	subhedral to anhedral plagioclase crystals (altered completely to sericite) in a groundmass of extremely fine grained plagioclase/sericite(?)-hematite, with abundant replacement patches in the groundmass of calcite.
16	MW19 714.14	many subhedral to euhedral plagioclase crystals (altered completely to sericite), two subhedral hornblende crystals (altered completely to calcite-hematite) and a cluster of ilmenite in a sparse groundmass of plagioclase/ sericite(?)-hematite; replacement patches of calcite (in part with rims of hematite) and of plagioclase.
17	MW19 714.14	above: calcite veinlet with selvages of hematite along its margins, scattered patches of hematite in the interior, and a few lensy inclusions of groundmass plagioclase(?) parallel to its margins; below: subhedral to euhedral plagioclase crystals (altered completely to sericite-calcite near the vein and to sericite-(calcite) or sericite further away from the veinlet; one subhedral grain of hornblende (altered completely to calcite-hematite) and one patch of ilmenite; sparse groundmass of plagioclase-(sericite) with patches of calcite adjacent to ilmenite.
