January 29th, 2021
Revised February 4th, 2021

SUMMARY

This report covers all exploration activities carried out at the Atlin Goldfields Project by Brixton Metals Corporation during the 2020 field season. Exploration work took place between May and September in 2020 and included the collection of 617 soil samples and 65 rock samples. Additionally, approximately 500 boxes of historic drill core were transferred to Brixton Metals' Atlin Gold Camp for relogging in 2021.

In 2020, soil geochemical sampling focused on infilling previous geochemical grids, in hopes to constrain areas of high-grade gold mineralization. These areas included the LD, Imperial, and Fourth of July Showings. Prospecting and rock sampling was carried out at the Union Mountain Showing, as well as in structurally complex areas proximal to gold-bearing creeks. These locations were chosen to follow-up on significant historical gold occurrences and to test the precious metal potential of areas with favourable geology. The total cost of completion of all exploration work carried out in 2020 was: **$98,480.48.**

Highlights of the 2019 Exploration Program include:

- Delineated numerous, patchy gold-in-soil anomalies across the Fourth of July Showing survey grid that returned values of up to 442 ppb Au and remain open.

- Infill soil sampling at the LD Showing confirmed and constrained the existence of gold-in-soil anomalies over the central listwanite trend. At present, this moderate-to-high gold in soil anomaly measures 380-meters-long and remains open for infill soil sampling in multiple directions. The highest gold-in-soil values (761 ppb and 534 ppb Au) correlate well with the contacts of the fault-bound listwanite trend, as well as an area of intense carbonate alteration along its northeastern extension.

- Narrow pyrite-bearing quartz veins in listwanite within an area of historic trenching on the northwest-facing slope of Union Mountain assayed 53.6 ppm Au and 3.96 ppm Ag. Rock samples collected from the same area in 2019 returned values of up to 45 ppm Au.

- Prospecting and rock sampling in 2020 near the headwater of Little Spruce Creek discovered two additional areas of historic trenching, located approximately 500 meters apart. In one trench, samples of pyrite-bearing quartz veins in altered ultramafic rocks assayed up to 1.06 ppm Au and 27.9 ppm Ag. The second trenched area contains felsic intrusive rock hosting several, northwest-southeast trending molybdenite-bearing quartz veins ranging from 1 to 50 centimeters wide. Samples collected from this historic "Porphyry Showing" returned values of up to 1320 and 1490 ppm Mo.

1.0 INTRODUCTION

Brixton Metals' Atlin Goldfields Project covers an extensive area totalling 94,516 hectares (ha) of favourable geology within the Atlin Mining District of northwestern BC (Figure 1). Claims included in the Atlin Goldfields Project are 100% owned by Brixton Metals Corporation and were staked following Grey Rock Resources' discovery of visible gold in quartz-altered bedrock along Otter Creek, from which rock samples collected assayed up to 42.10 g/tonne gold (Grey Rock Resources, 2016). A complimentary study focusing on the geochemistry and age of the Otter Creek block by the British Columbia Geological Survey also determined that a close association with ultramafic-to-mafic lithologies is not necessarily required for gold deposition in the Atlin Gold Camp, as previously speculated (Mihalynuk *et al.,* 2017). These observations broaden the district-scale potential for discovery of the bedrock source of placer gold that is abundant and characteristic to the Atlin Mining District.

The focus of the 2020 exploration program was to follow up on impressive and open gold in soil and rock anomalies at the LD, Imperial, Union Mountain and Fourth of July Showings, as well as to test areas of structural complexity proximal to gold-bearing creeks. A total of 65 rock, and 617 soil samples were collected throughout the Atlin Goldfields Project during the 2020 field season. Geochemical sampling focused primarily on infill soil sampling at the LD and Fourth of July Showings.

In 2020, 196 soil samples were collected from the Fourth of July Showing, 7 from the Imperial Showing and 414 from the LD Showing. The most significant soil sample collected in 2020 assayed 761 ppb Au from the LD Showing. Infill sampling at the LD Showing constrained the existence of a 380-meter-long, moderate-to-high gold-in-soil anomaly over the central listwanite trend that remains open in multiple directions.

The best rock sample of 2020 assayed 53.6 ppm Au and was collected from a historic trench located on the northwest-facing slope of Union Mountain. Rock samples collected from the same area in 2019 returned values up to 45 ppm Au. Another area of historically trenched ultramafic rocks was discovered in 2020 near the headwater of Little Spruce Creek. Samples collected of quartz veins measuring up to 10cm wide returned values of up to 1.06 ppm Au and 27.9 ppm Ag. A series of mostly sloughed in trenches, located approximately 500 meters west of the ultramafic trenches, and historically known as the "Porphyry Showing", was also sampled in 2020. This trenched area contains felsic intrusive rock hosting several molybdenite-bearing quartz veins ranging from 1 to 50 centimeters in width. Samples collected from the Porphyry Showing assayed up to 1490 ppm Mo. All trenched areas described above are believed to be part of the historic Golden View occurrence.

Physical work completed in 2020 included the transfer of approximately 500 boxes of historic drill core to Brixton's core storage location at the Atlin Gold Camp for relogging in 2021.

2.0 PROPERTY TITLE/TENURE

The Atlin Goldfields Project claims are centered at 59° 29' N and 133° 15' W within the Atlin Mining Division in northwestern British Columbia (Figure 2). In December 2016, Brixton staked 33 contiguous mineral claims in the Atlin Camp using the Mineral Titles Online (MTO) system. In January of 2017, Brixton signed an option agreement with Brian William Scott to acquire 100% interest in 9 mineral claims covering 1,214 ha. In October of 2018, the original agreement was amended and 7 of the original 9 claims were amalgamated into one tenure (1060499*) and listed one additional mineral tenure (1057321; 65.95 ha). This agreement has since been fulfilled and Brixton has acquired 100% ownership of these claims. In February 2017, Brixton also obtained 100% ownership of 16 mineral claims totaling 745 ha over two separate purchase agreements.

From March to July of 2018, Brixton acquired 100% ownership of 18 mineral claims totaling 13,488 ha in the project area over 4 separate purchase agreements. In August of 2018, Brixton Metals Corporation purchased 51 mineral claims totaling 28,589 ha from Desert Mountain Energy Corp. (formerly African Queen Mines, Ltd.). This extensive land package includes the Yellowjacket Gold Mine and the historic Pictou Showing. Additionally, Brixton staked 4 mineral claims (2,539 ha) in September 2018 using the MTO system and purchased another 4 mineral claims (246 ha) in October of the same year. In 2019, Brixton staked an additional 5 mineral claims totaling 329 ha, and purchased 5 claims (196 ha), contiguous with the Atlin Goldfields Project land package. 3 non-contiguous claims located in the Otter Creek area (114.87 ha) were transferred to Brixton Metals in December 2019, and Brixton staked 2 contiguous mineral claims totaling 344.39 ha using the MTO system in early 2020.

Overall, this project is 100% owned by Brixton Metals Corporation. This extensive land package consists of 142 mineral claims and covers an area of 94,977 ha (949.77 km^2). The Province of British Columbia owns the surface rights to the Atlin Goldfields Project. There is overlap between these claims and pre-existing legacy claims and they have not been surveyed. The Atlin Goldfields Project mineral claim tenures are summarized below in Table 1.

3.0 LOCATION, ACCESIBILITY & CLIMATE

3.1 Location & Accessibility

The Atlin Goldfields Project lies along the eastern margin of the Coast Mountain Ranges in the Atlin Mining District of northwestern British Columbia. It consists of 142 mineral claims that cover and surround some of the major placer producing streams and creeks in the Atlin Mining District (*i.e.* Spruce, Pine, Wilson and McKinley Creeks, and the O'Donnell River). This land package is located less than two kilometers from the town of Atlin, BC; 285 kilometers north-northeast of Juneau, AK; and 175 kilometers southeast of Whitehorse, YT. There is paved highway access from Atlin to Whitehorse, YT. A gravel road network related to the historic placer mining provides access to most parts of the property. In a local geologic context, these claims extend from the historic Pictou Showing located near the Atlin airstrip, southeast to the northern margin of the McMaster Stock in the Mount McMaster/Dixie Lake area. From here, contiguous claims continue north to Surprise Lake, where they cover a portion of the Surprise Lake Batholith near Terrahina Creek.

The extensive claim area overlaps with historical mineral claims including (but not limited to): the McKee-Eldorado Creek, LP, LD and Pictou Showings, and contains the Yellowjacket Gold Mine. These areas have been previously prospected and explored for placer, lode/orogenic-type and skarn-type gold, in addition to molybdenum and uranium. All the mineral claims that constitute the Atlin Goldfields Project are accessible from Atlin via all-weather (*i.e.* Spruce Creek Road, Surprise Lake Road) and/or four-wheel drive roads, or by helicopter.

A magnetic declination of 19°21' E was used for all compass measurements. All maps and reported coordinates are referenced to 1983 North American Datum (NAD83) UTM Zone 8N.

3.2 Local Resources & Infrastructure

Atlin, Whitehorse and Juneau are the three closest towns to the Atlin Goldfields Project. Atlin has a population of approximately 500 people, whereas Juneau and Whitehorse have populations of 33,000 and 25,000, respectively. These larger cities can provide services including air support, medical clinics, small grocery stores, fuel and motels. Whitehorse, YT is the nearest fully equipped Canadian city to the Atlin Goldfields Project and has all required services and resources including an international airport with daily flights to Vancouver, Calgary and seasonal international flights.

The western-most portion of the Atlin Goldfields Project, as well as the Yellowjacket Gold Mine, can be accessed from the community of Atlin *via* Discovery Avenue. The nearest road access to the central portion of the project (specifically the LD Showing) is a four-wheel drive road that connects to the main Spruce Creek Road at the old Nolan Mine, located near the confluence of Spruce and Dominion Creeks. Multiple all weather and four-wheel drive roads allow access to the western, southern and northern portions of the property (*i.e.,* Surprise Lake Road) however, travel *via* helicopter is required for access to most of the eastern claim blocks.

3.3 Physiography and Climate

The western-most extent of the Atlin Goldfields Project is located approximately 1.5 kilometers from Atlin Lake, the largest natural lake in British Columbia, which resides at an elevation of 670 meters. The property is continuous to the east and its eastern-most margin resides approximately three kilometers west of the Gladys River. The Atlin Mining District is located immediately east of

the Coast Mountain Ranges of northwestern, BC on the Teslin Plateau. Topography of the area is generally rugged, with elevations reaching 800 meters along valleys and increasing to 1900 meters in mountainous regions. The tree line is at approximately 1370 meters on north facing slopes and 1525 meters on south facing slopes. Below 1340 meters valleys are typically forested with lodgepole pine, scrub birch, aspen and black spruce, whereas stunted black brush dominates hills above the tree line. In many cases mountain alder and willow are present near streams.

Precipitation in Atlin, BC averages 374.30 millimeters per year with average daily temperatures ranging from 10 to 13°C in the summer months, and -5 to -13°C in the winter months (Environment Canada). Moderate temperatures year-round have allowed exploration work in the Atlin Mining District to be conducted from May to November.

4.0 HISTORY & PREVIOUS WORK

4.1 Exploration & Research in the Atlin Mining District

The Atlin Gold Camp is located in northwestern British Columbia, immediately east of Atlin Lake. Here, placer gold was first discovered on Pine Creek in 1897 by Fritz Miller and Kenneth MacLaren (Mandy, 1936). Following to their discovery, and the subsequent gold rush, the historic town of Discovery (located 12 kilometers east of the community of Atlin) reached a population of approximately 10,000 (*i.e.,* Ash *et al.,* 2001 *and references therein*).

Between 1898 and 1946 (the time for which reports are available) placer gold production from creeks and drainage systems in the Atlin camp totalled 634,147 ounces (19,722 kilograms, Holland, 1950). A number of large placer deposits continued to produce significant quantities of gold well into the late 1980's (*i.e.,* Otter, Pine and Spruce Creeks) making the Atlin Camp the second largest gold producer in the province (Ash *et al.,* 2001). Most drainage systems in the area, namely Spruce, McKee, Eldorado, McKinley, Ruby, Birch and Otter Creeks, have been explored and/or mined as placer gold deposits (*i.e.,* Evans, 2003). To date, placer exploration is still on-going in the Atlin camp, including the areas near Pine Creek (Evans, 2003). Ash *et al.* (2001) estimated that the total gold production from the Atlin area from 1898 to present may exceed 1 million ounces.

In 1899, immediately following the initial discovery of placer gold, orogenic gold occurrences were reported at the Imperial Property. Here a 150-meter-long gold-bearing quartz vein was discovered and produced 268 tonnes of ore, grading 5.10 and 13.70 g/tonne gold (from lower and upper intersect levels, respectively) (Bloodgood *et al*., 1989). Samples collected from this vein from 1902 to 1933 continued to yield gold and silver values of up to 33.60 and 35.28 g/tonne (Bloodgood *et al*., 1989).

The earliest geologic work on the Atlin Gold Camp was carried out by the Geological Survey of Canada and the Bureau of Mines (*i.e.,* Gwillim, 1901; Cairnes, 1913). In 1959, Aitken produced a 1:250,000 scale geologic map of the Atlin area (NTS sheet 104N) while mapping in northwestern British Columbia under the Geological Survey of Canada. Several publications throughout the 1950's and 1960's (*i.e.,* Aitken, 1953; Gabrielse and Wheeler, 1961; Monger, 1966, 1967, 1968) as well as an accompanying memoir (Aitken, 1959) were also produced from this work. Studies focused on the stratigraphically complex Cache Creek Group (or the Atlin Terrane) have been carried out by Link (1965), Monger (1975, 1977a) and Lefebure and Gunning (1989), the latter of which produced a 1:20,000 scale geologic map of the area based largely on information obtained from exploration assessment reports (Evans, 2003). Monger (1975, 1977a) conducted detailed geologic mapping of ten specific areas within the Cache Creek Terrane and produced the first regional stratigraphic framework and tectonic evolution of the area. Regional geologic mapping and lithogeochemical studies of the Surprise Lake Batholith were carried out by Bloodgood *et al.,* (1989) and Ballantyne and Littlejohn (1982) due to the anomalous uranium contents of the intrusion. Both the Dixie Lake and Teresa Island map sheets were also mapped by Bloodgood and Bellafontaine (1990) at a 1:50,000 scale. More recently, Ash (1994, 2001) produced a detailed, 1:25,000 scale geologic map of the Atlin area while studying the tectonic significance of ophiolitic rocks, as well as their geologic relationship with gold-bearing quartz veins.

During the middle-to-late 1980's, numerous geological studies focusing on lode-gold mineralization and associated alteration assemblages were conducted in the Atlin area (*i.e.,* Newton, 1985; Lueck, 1985; Andrew, 1985; Bozek, 1989). The physical and chemical

characteristics of Atlin placer gold, and its association with proximal and potential lode-gold sources were also studied by MacKinnon (1986) and Ballantyne and Mackinnon (1986). Geologic work focusing on the surficial geology of the Atlin Camp can also be found in publications by Black (1953), Proudlock and Proudlock (1976) and Leuson and Kerr (1992).

In addition to the publications listed above, numerous publicly available assessment reports documenting placer and lode-gold exploration efforts carried out in the Atlin Gold Camp are filed by each active company with the Government of British Columbia. These reports outline and describe the physical, geological, geochemical, geophysical and drilling work conducted on each claim, or within each claim group. The historical information contained within these reports that pertain to significant orogenic gold showings and properties presently owned and operated by Brixton Metals Corporation are described below. In addition, Table 4 contains a comprehensive history of exploration work carried out in the Atlin Gold Camp.

4.2 Property Exploration History

4.2.1 Yellowjacket Property/Gold Mine

The Yellowjacket Property is located along Pine Creek Valley approximately 9 kilometers from Atlin, BC. This property contains an 80-meter-wide regional, auriferous shear zone with gold mineralization dominantly occurring as free gold grains hosted in intensely sheared and altered mafic and ultramafic lithologies. The Yellowjacket Prospect, or the Yellowjacket auriferous vein zone, was first discovered in 1899 by placer miners (BC Ministry of Energy and Mines Minfile Number 104N043) and was subsequently followed by the discovery of additional bedrock-hosted gold zones including: The Red Jacket and Rock of Ages Showings (Prior, 1903). However, it wasn't until the 1980's that modern day mineral exploration work was carried out on these orogenic gold showings, and extensive work followed in the early 2000s. Below is a summary of all exploration and mining work conducted on the Yellowjacket Property (*after* Downie, 2012 *and references therein;* Archambault and Dandy, 2017).

In 1983, Canova Resources and Tri-Pacific Resources optioned the area that is now part of the Yellowjacket Property from the title holder and carried out a small diamond drilling program that intersected high grade gold mineralization at depth.

In 1986, Homestake Mineral Development Corporation optioned the Yellowjacket Property and conducted geological, geophysical and drilling programs until 1989. From 1986 to 1988, Homestake drilled 58 holes on the Yellowjacket Zone, and in 1989 carried out a reverse circulation rotary drilling program their larger Yellowjacket Property, which identified gold mineralization within broad zones of listwanitized ultramafic rocks and adjacent silicified volcanic rocks. From this work, Homestake estimated a historical resource of 453,500 tonnes grading 10.26 g/t Au for 150,000 contained ounces of gold (BC Dept Mines Open File 2000-2 page 41). This historical estimate was prior to the implementation of NI 43-101 and does not comply with CIM reporting standards for mineral resources and should not be relied upon.

From 2003 to 2006, Muskox Minerals Corporation (later renamed Prize Mining Corporation) conducted diamond drilling programs at the Yellowjacket Property which included: 14 NQ and 50 HQ sized diamond drill holes totalling 7,797.26 meters at the Yellowjacket Zone and 10 HQ diamond drill holes totalling 1,481.28 meters at the Rock of Ages Showing. Drilling at the Yellowjacket Zone intersected gold mineralization hosted in moderately dipping structural zones

and the steeply dipping Pine Creek Fault. Muskox reported significant gold intersections from their drilling including (*Press Releases; November 15, 2004, and February 3, 2005*):

- 513.5 g/t Au over 5.6 metres in drill hole YJ03-01
- 128.2 g/t Au over 0.5 metres in drill hole YJ04-01
- 40.10 g/t Au over 6.1 metres in drill hole YJ04-07
- 142.4 g/t Au over 1.0 metres in drill hole YJ04-20
- 157.0 g/t Au over 0.5 metres in drill hole YJ04-22
- 119.6 g/t Au over 0.5 metres in drill hole YJ04-29

Between 2006 and 2008, Prize Mining Corporation carried out a bulk sampling program at surface in the area of the Yellowjacket Gold Zone (now referred to as the Pine Pit). In 2006, Prize commenced an exploration bulk sampling program, which included the diversion of Pine Creek, overburden/placer tailings excavation, bedrock mapping and channel sampling, bedrock excavation and processing. In 2007, Prize reported production of 6.43 kg (206.9 troy ounces) of gold produced from sluicing the placer-bedrock interface material excavated during bulk sample excavation. In 2008, Prize processed 4200 tonnes of material in their onsite bulk sample mill. Of this material, 2880 tonnes were considered to be taken from the main mineralized zone and returned gold ore bars totaling 18.63 kg (599 troy ounces). These gold volumes back-calculate, using a formula that allows for smelting and processing plant recoveries, to a head grade of approximately 9 g/t Au (Dandy and Price, 2010).

A Small Mines Act Permit was obtained for the Yellowjacket Property in 2009 through a joint venture agreement between Prize Mining Corporation and Eagle Plains Resources. Tailings pond construction and plant modifications were completed. Approximately 89,000 tonnes of overburden, waste rock and mineralized material were excavated. Due to the lateness of the season and continued operational difficulties, only three weeks of production were achieved. Production consisted of table concentrates and gold ore bars (Dandy and Price, 2010).

Eagle Plains resources conducted a reverse circulation drill program in 2010 totalling 2181 metres in 64 holes in the area immediately east of the Pine Pit, and Rock of Ages pit was excavated by placer operations. The Pit was progressively uncovered from west to east as overburden was stripped and the pay near bedrock was mined and processed for placer gold extraction. During the 2012 field season, Eagle Plains Resources continued its reverse circulation drill program east of Pine Pit with an additional 21 holes totalling 729 metres. They also reverse circulation drilled 15 holes totalling 716.43 metres at Rock of Ages Zone and 12-step out holes from the Yellowjacket Zone totalling 781.11 metres.

No exploration or mining activities took place at the Yellowjacket Property from 2013 to 2015 when African Queen Mines Ltd. (AQM) acquired the property from Athabasca Nuclear Corp. Athabasca obtained the property as a spin off from Eagle Plains Resources called Yellowjacket Resources Ltd., with a subsequent name change to Athabasca Nuclear Corp. Additional mineral claims were acquired by African Queen under the B.C. Mineral Tenure Act in 2015 and 2016. AQM drilled one diamond drill hole on tenure 1037086 in 2015 and four diamond drill holes totalling 635.65 meters along the Pine Creek Fault in the vicinity of the Yellowjacket Mine (Tenure 327903) in 2016. However, two of the four holes were not completed and did not reach their target. Significant intersections obtained in three holes drilled in 2016 and included: 1.5 meters of 3.2 g/tonne gold in YJ16-01; and 9.79 meters of 1.1 g/tonne gold and 11 meters of 4.1 g/tonne gold in YJ16-02 (Archambault and Dandy, 2017).

In addition to the extensive exploration work carried out at the Yellowjacket Property, historic resource estimates were reported in 2000 and 2009. After the completion of the 2000 field program, Homestake Mineral Development Corporation reported a historic (Non-43-101 compliant) resource estimate of 453,500 tonnes grading at 10.26 g/tonne gold (Schroeter and Pinsent; BC Ministry of Energy and Mines Open File 2000-2: Gold Production Resources in BC (1858-1998)). In 2009, Prize Mining Corporation and Eagle Plains Resources reported an inferred resource estimate of 133,000 tonnes grading at 5.8 g/tonne gold with a cut-off of 1.5 g/tonne, for a total of 734,000 grams of gold (Dandy and Price, 2010; *see Table 2 below*).

Table 2: 2009 Yellowjacket Inferred Resource Estimate (after Dandy and Price, 2010)

Cut-off g/tonne	Sections	Blocks	Tonnes (metric)	Grade (g/tonne)	Total Au (g/tonne)	Total Au (oz)
0.5	26	57	184000	4.4	781000	25000
1.5	20	39	133000	5.8	734000	24000

4.2.2 Pictou Showing

The Pictou Showing is located approximately two kilometers east of the town of Atlin, BC. Exploration work began in the area of the Pictou Showing (formerly the Anaconda Showing) by Lord Hamilton in 1899 and consisted of the development of 29 meters of underground workings. Hamilton discovered narrow quartz stringers associated with magnesite and carbonate altered ultramafic lenses in a dominantly serpentinized unit. A 15 to 28-centimeter-wide quartz vein containing minor pyrite, galena and mariposite was uncovered in an old cross-cut striking to the north and yielded trace amounts of gold. However, given the irregularity of the vein it could not be traced for any significant distance (Northern B.C. Mineral Inventory: Archer, Cathro and Associates Ltd. (1981)). Below is a summary of exploration work carried out at the Pictou property from 1931 to 1987 (*after* McIvor, 1988).

The first written records of mineralization observed on the Pictou Showing was reported by J.T. Mandy in 1931 who observed quartz veining and associated alteration over a width of 20 to 60 feet. This zone was sampled and returned values of 0.7 oz/ton gold and 13.2 oz/ton silver from a 2' quartz vein ("ridge pit"); 0.68 oz/ton and 7.4 oz/ton silver from a rock "dump" grab sample; and 0.03 oz/ton gold and 0.20 oz/ton silver from a 9" quartz vein sampled from the bottom of a shallow shaft. In 1933, the Pictou Showing was inspected by A.M. Richmond (Assistant Resident Mining Engineer) who reported assay values of 0.10 oz/ton gold and 0.40 oz/ton silver from a 22" quartz vein; and 0.60 oz/ton gold and 5.0 oz/ton silver from a 24" quartz vein (both samples collected from the "ridge pit").

In 1966, the Pictou Showing and adjacent claims were acquired by T. Connolly. From 1966 to 1968, Connolly reported assay values collected from trenches dug proximal to the old shaft ranging up to 2.16 oz/ton gold, 207.3 oz/ton silver and 0.63% copper. In 1967, Connolly excavated a 1-tonne bulk sample from the Pictou Showing, which returned assays of 0.295 oz/ton gold, 8.0 oz/ton silver, 0.2% lead, 0.1% zinc and 0.05% copper. In 1973, chip-channel sampling was carried out over the previously trenched mineralized exposure and returned precious metal values of up to 0.22 oz/ton gold and 6.0 oz/ton silver in the same sample.

In 1987, Homestake Mineral Development Corporation optioned the Pictou Showing and carried out ground magnetometer, VLF-EM and IP geophysical surveys, detailed geologic mapping, and geochemical sampling programs that included the collection of 225 rock samples and 492 soil samples; and stripped 400 square meters of overburden to expose the historical Au-Ag showing

("Main Showing"). The soil survey focused on areas underlain by listwanite and Homestake reported several strong Au-Ag-As-Sb anomalies throughout the property. Grab samples collected from the Main Showing returned values ranging from 15 to 60 g/tonne Au and 200 to 450 g/tonne Ag. The best channel chip sample collected from the Main Showing assayed 14.3 g/tonne over 2 meters.

In 1988, Homestake Mineral Development Corporation conducted a rotary reverse circulation drilling program at the Pictou Showing (and portions of the historic Yellowjacket Property). 45 RC drill holes were drilled totalling 2,195 meters (McIvor, 1988). During this program, 1,136 bedrock chip samples were collected, and several holes intersected favourable lithological units and alteration. 44 of the 1,136 samples returned Au values >50 ppb from 17 of the 45 RC drill holes and one ore grade intersection of 0.29 oz./ton over 1.5 meters was intersected (McIvor, 1988)

In 1991, Internova Resources optioned the property and drilled 4 diamond drill holes. All holes encountered favourable geology and alteration however, only hole #2 (drilled into the "Main Showing") returned minor and slightly anomalous Au values (Livgard, 1991).

4.2.3 McKee – Eldorado Creek Property

The McKee Creek – Eldorado Creek Property, also (partially) known as the Atlin-McKee Gold Property, the Atlin-McKee Project, the McKee Creek Property and the Sylvia Claim Group, is located approximately 14 kilometers southeast of Atlin, BC and is a past placer producer and lode-gold prospect. This property was extensively explored and mined for placer gold and produced approximately 47,000 fine ounces of gold from 1900 to 1946 (Table 3).

Table 3: Active Companies in the McKee Creek Area – 1900-1945 (*Modified after* Gonzalez, 1985)

Time Period	Company
1900-1904	Atlin Mining Co.
1904-1908	Amalgamated McKee Creek Mining Co. Ltd.
1908-1913	Pittsburgh British Gold Co. Ltd.
1913-1932	Delta Mining Co. Ltd.
1934-1937	Atlin Gold Mines Ltd.
1940-1941	Cominco Ltd.
1940-1945	Placer Gold Mining (Holland, 1950)

In 1976, Dupont of Canada Ltd. optioned the McKee – Eldorado Creek Property from John Harvey, in hopes of locating a buried placer channel in McKee Creek Valley. Dupont conducted geologic mapping, a seismic refraction survey and a small drilling program (Becker hammer) that consisted of 10 drill holes totalling 93.65 meters (Gunn, 1977). The suspected channel was determined to be shallowly buried and hosted sheared mafic-to-ultramafic lenses that contained very minor amounts of precious metals (Gunn, 1977). However, Dupont also collected and assayed pyrite from the Harvey sluice box, which returned values of 5,924.57 g/tonne Au and 1,834.97 g/tonne Ag (Gunn, 1977).

In 1984, Minerex Resources Ltd. in conjunction with Robert A. Johnson conducted a drill program along Lower McKee Creek that consisted of 15 Becker hammer drill holes totalling 349.53 meters, and an additional 7.15 meters of Jack hammer percussion drill tests (Kierans, 1984). Of the 348

drill samples collected, 17 were processed (weighed and sluiced) with fine color observed in one sample (Kierans, 1984).

In 1984, Perron Gold Mines Ltd. optioned the McKee – Eldorado Creek Property and conducted a two-phase exploration program. This consisted of geologic mapping, rock chip and soil sampling and an airborne magnetic survey to test for lode-gold mineralization potential in rock units like those observed within Standard Gold Mines Ltd. Shuksan Gold Property, located approximately two kilometers to the northeast (*see below;* Gonzalez, 1984). three rock chip and seven soil samples yielded Au values above detection (20-130 ppb) and were collected in an area adjacent to a poorly defined (~200m long), northeast-trending magnetic conductor (Gonzalez, 1984).

During the same field season, Perron carried out a small rotary drilling program along Eldorado Creek. Five holes were drilled (175.68 meters) to test the placer gold potential of a gravel-filled canyon identified during a previous seismic refraction survey (Gonzalez, 1984). However, free gold values obtained from drill holes ranged only between 1 mg/m^3 and 460 mg/m^3 of very fine-to-fine grained material (Gonzalez, 1984).

From 1985 to 1986, Perron Gold Mines Ltd. carried out back-to-back air and ground magnetic surveys that identified several magnetic anomalies, as well as a 1200-meter-long magnetic low following McKee Creek Valley (Walcott, 1985; Gonzalez, 1985). This magnetic low delineated a sheared contact between altered ultramafic rocks and cherty argillite sedimentary sequences (Gonzalez, 1985). Five diamond drill holes (NQ-size) totalling 655 meters were drilled along McKee Creek Valley and two trenches were dug (Gonzalez and Dandy, 1987). The entire length of drill core and the trench walls were sampled, all of which yielded poor results despite the presence of quartz stockwork veining and pyrite (Gonzalez and Dandy, 1987). Slightly elevated silver and base metal values were only observed in a few sludge samples collected from two drill holes (Gonzalez and Dandy, 1987).

In 1986, Nolan Mines Ltd. conducted a seismic refraction survey on a portion of Upper McKee Creek in hopes to locate a buried creek channel carrying placer gold, and to determine the depth to bedrock (Mark, 1986). It was interpreted that a buried creek channel may be located at the south and central areas of the survey line, which runs approximately perpendicular to the creek (Mark, 1986). No future work was reported.

In 2006, Saturn Minerals Inc. optioned the property from John Harvey. Saturn focused their 2007 exploration work primarily on the areas of Middle McKee and Lower Eldorado Creeks where advanced listwanite alteration and associated shear-hosted quartz-carbonate veining was prominent (Mastalerz, 2007). 122 rock samples were collected and gold in bedrock was observed in three locations within a deformed zone along the main channel of McKee Creek – termed the McKee Creek Fault Zone (Mastalerz, 2007). In these areas, gold and pyrite-bearing quartz veins are reportedly hosted in sheared and altered, cherty-to-tuffaceous sediments (Mastalerz, 2007). Samples collected at 150 meters and 600 meters northeast of the confluence between McKee and Eldorado Creeks returned Au values of 2.96 g/tonne and 7.73 g/tonne, respectively (Mastalerz, 2007). One sample collected 1300 meters downstream from this confluence yielded 1.74 g/tonne gold, and elevated copper values (up to 681 ppm) were also reported in several other samples collected in this area (Mastalerz, 2007).

In 2008, Saturn Minerals Inc. collected an additional 54 rock samples and drilled four (NQ-size) diamond drill holes totalling 694.03 meters, to re-evaluate the known locations of gold in bedrock, and to test the surrounding areas of advanced listwaenite alteration (Mastalerz, 2009). Rock samples analyzed returned lower values (45-513 ppb) than those from the previous field season

(Mastalerz, 2009). 171 drill core samples were also collected and the best intercept from that drill program was 1.12 g/tonne Au over 0.81 meters (Mastalerz, 2009).

4.2.4 LP Property (Union Mountain/Golden View)

The LP Property (also known as the Atlin Gold Prospect of Rio Alto Explorations Ltd. and the Golden View occurrence) is located approximately 8 kilometers southeast of Atlin, BC. This prospect was originally discovered in 1899 and received sporadic work until 1903. Prospecting in the Union Mountain area began in approximately 1912 to locate the source of placer gold found in Spruce Creek. Exploration work, in the form of hand trenching and driving of an exploration adit, was conducted during this initial exploration period. Trans Continental first staked this property in 1949, and from 1949 to 1951 they conducted a trenching and sampling program from which quartz veins reportedly assayed up to 17.83 g/tonne Au (*as reported in* Bankowski, 1981). Rio Alto Explorations Ltd. optioned the property from Marvin Sherman in 1980 and carried out a detailed geochemical and trenching program which focused primarily on the LP 1-4 and LS 1-3 mineral claims (Bankowski, 1981). Soil samples returned no anomalous gold values, however rock chip samples assayed up to 94.62 g/tonne Au and 94.97 g/tonne Ag (Bankowski, 1981).

Rio Alto trenched three areas during the 1980 field season, and in one case (Main Vein Trench System – Northwest) uncovered a 10-meter-long smoky quartz vein containing visible gold, pyrite, arsenopyrite and malachite that assayed up to 25.71 g/tonne Au (Bankowski, 1981). Rio Alto also reportedly observed a massive, milky quartz vein that contained thin veinlets and rosettes of molybdenite with disseminated pyrite hosted in a coarse-grained, molybdenum-bearing diorite intrusion (Bankowski, 1981).

In 1988, the LP Property was optioned by Wind River Resources Ltd. (WRR). During the 1988 field program, WRR mapped any existing trenches to locate quartz veining and associated alteration (Freeze *et al.,* 1988). They sampled quartz veins and breccia systems hosted in carbonatized ultramafic rocks that contained pyrite, minor chalcopyrite and minor visible gold (Freeze *et al.,* 1988). These veins and breccia systems were locally traceable for approximately 35 meters and reportedly returned values of up to 1.99 g/tonne Au (Freeze *et al.,* 1988). Despite promising results, no further work was reported.

4.2.5 LD Showing

The area that comprises the LD Property can be subdivided into western- and eastern-most zones of historical claim blocks that make up and/or significantly overlap with the present-day claim boundaries of the LD Property. The western-most zone coincides with the historical Shuksan 1, 2 and 3 claims (*i.e.,* Troup, 1982; Troup and Wong, 1983, 1984). Shuksan 1-3 claims formerly belonged to an extensive claim group collectively known as the “Shuksan Gold Property” that originally extended north past Spruce Creek.

In 1981, Surprise Lake Exploration Limited Partnership (Syndicate) staked the Shuksan Gold Property after Yukon Revenue Mines Ltd. reported a large, low-grade discovery at the Lakeview Property, based on similar geology and proximity to placer gold producing streams (*i.e.,* Spruce Creek) (Troup, 1982). Prospecting in the Fall of 1981 lead to the discovery of mineralized quartz veinlets containing varying amounts of pyrite, galena, chalcopyrite and mariposite hosted within gossanous zones located near the center of the Shuksan 2 claim (Troup, 1982). It was also concluded through comparison of prospecting results and regional stream sediment geochemistry

(G.S.C Open File, 1977) that increased manganese values correlate with the locations of mineralized quartz veinlets observed within the Shuksan claims (Troup, 1982).

Standard Gold Mines Ltd. (SGM) optioned the Shuksan Gold Property from Surprise Lake Exploration Limited Partnership in 1982. From 1982 to 1985, SGM focused primarily on potential zones of gold mineralization concentrated along the contacts between a carbonatized ultramafic unit and gabbroic dykes (*i.e.,* Troup and Wong, 1983, 1984). A preliminary ground VLF-EM survey showed zones of strongest conductivity adjacent to soil samples that assayed up to 440 ppb Au collected from the Shuksan 2 claim (Troup and Wong, 1983). This gently dipping conductor and corresponding soil anomalies were trenched in August of 1983. 11 trenches across the Shuksan 2 claim uncovered 12 gold-bearing quartz stockwork veins (the Discovery Zone) hosted in a carbonatized ultramafic lithology near its contact with chert (Troup and Wong, 1983). A follow-up VLF EM survey found additional conductors within the Shuksan 2 claim, the strongest of which measured approximately 600 meters along strike and extended south-west past the Discovery Zone (Troup and Wong, 1983). During this time, SGM collected 185 rock samples and 1,281 rock chip samples from a combination of outcrops (*i.e.,* representative lithologies), veins, wall rock, gossanous zones, rusted boulders and mariposite-stained, carbonatized rock, as well as 152 bulk (15 kg) vein samples and 402 soil samples (Troup and Wong, 1983). Most of these samples were collected from the Discovery Zone and reportedly yielded values of 330.34 and 518.27 g/tonne Au (Troup and Wong, 1983).

In 1984, SGM dug an additional 25 trenches within and proximal to the Discovery Zone and carried out a diamond drilling program across the Shuksan Gold Property (Troup and Wong, 1984). 11 out of 17 holes totalling 678 meters were drilled within the Shuksan 2 and 3 claims to test the 1983 Discovery showing; test visible gold-bearing quartz veins exposed by trenching during the same field season; test other quartz veins and soil geochemical anomalies and; to test several strong airborne electromagnetic conductors (Troup and Wong, 1984; Walcott, 1984). Visible gold was observed in drill holes 1, 2, 3 and 8, with the highest assay recorded at 16.87 g/tonne Au over 1.5 feet (0.46 meters) in DDH-1 (SDA-DDH-84-1) (Troup and Wong, 1984). Additionally, bulk samples collected from trenches during this field season assayed up to 90.48 g/tonne Au (Troup and Wong, 1984). SGM also conducted a regional geochemical survey over the Atlin Gold Camp in 1984 (Troup and Wong, 1984). One hundred and thirty-seven heavy mineral concentrate and 135 stream sediment samples were collected from creeks and stream confluences throughout the area (Troup and Wong, 1984). All samples yielded anomalous Mn, Fe and Cr values, whereas only a small percentage of samples were anomalous (> 25 ppb) in Au (Troup and Wong, 1984).

The eastern-most zone of claim blocks that coincide and/or overlap with the LD Property are the GV-15, GV-23, GV-24 and GV-26 claims. Collectively these claims make up the historical GV Property. During the 1982 and 1983 field seasons, owner John McFarland carried out back to back rock and soil geochemical sampling programs, most of which focused on the areas included within the GV-23, GV-24 and GV-26 claim blocks (Kerr, 1982; Wallis, 1984). One sample of a magnetite vein collected on Gold Hill (GV-23) reportedly returned a value of 5.56 g/tonne Au (Kerr, 1982).

In 1984, Claymore Resources Ltd. optioned the GV Property (GV-15, GV-23 and GV-24 claims) from John McFarland. Claymore Resources carried out two VLF-EM geophysical surveys, a detailed geochemical sampling program and a 16-hole diamond drilling program (Rich, 1985). In addition, two trenches were dug, one of which uncovered quartz tension gash veins hosted in a rhyolite dyke that was emplaced along a shear zone (Trench 1) (Rich, 1985). These veins are located in the northeast corner of the GV-23 claim block and reportedly returned values of 10.97

g/tonne Au (Rich, 1985). Claymore also reported that quartz veinlets hosted in argillite from DDH #1 yielded 9.39 g/tonne Au over 3.05 meters (Rich, 1985).

In 1986, Placer Dome Inc. (*i.e.,* Placer Development Ltd.) optioned a large area that contained the LD Property from Surprise Lake Exploration Partnership Ltd. however, no exploration work was carried out in the immediate area of the LD Claims (Boyce, 1986).

In 2005, Prize Mining Corporation optioned the LD Property from Robert Hamel and Ronald Berdahl. In 2006, Prize Mining Corp. carried out a soil sampling survey across most of the property (Dandy, 2007). Two notable gold-in-soil anomalies were delineated: Anomaly A, located in the western portion of the property and covers an area of 600 x 200 meters with 502 ppb Au near its center and Anomaly B, located in the southeast area of the property with 670 ppb Au near its center and covers an area of 800 x 200 meters (Dandy, 2007). Despite promising results and plans for a future two-phase exploration program, no further work was reported.

4.2.6 Atlin Goldfields Project

In 2017, Brixton Metals Corporation conducted a two-phase exploration program over a significant portion of the Atlin Goldfields Project. This program included: 4,571 kilometers of a high-sensitivity aeromagnetic spectrometric survey over 8 separate lines, and the collection of 119 soil samples and 200 rock samples. In 2017, rock and soil sampling at the Atlin Goldfields Project was focused on the historical LD and LP Properties, as well as areas along and proximal to drainages of the O'Donnel River, past placer producing creeks, the margins of the Surprise Lake Batholith and the McMaster Stock, and the Sentinel Mountain area. Brixton was successful in delineating numerous magnetic highs and lineaments in the western and eastern portions of the property, respectively. Historical trench sites known to host orogenic gold mineralization at the LD Showing were also located. Here, rock samples of listwanite altered ultramafic lithologies and fragmented quartz veins returned values of 88.1 ppm Au (with 5.19 ppm Ag) and 293 ppm Au (with 26.5 ppm Ag). A strong gold anomaly was also delineated along the south-central portion of the LD Showing, and correlates with the area of historical trenching. Soil and rock samples collected within and proximal to the Surprise Lake Batholith in 2017 returned an intrusion-related gold signature, dominated by Bi, W, Sn ± Ag, As, Sb, Pb and Zn values, which increase to the west along successive ridgeline contour soil lines in the Terrahina Creek area.

Exploration work carried out by Brixton Metals in 2018 included: reprocessing of a high-sensitivity aeromagnetic survey conducted in 2017 in order to accommodate the extensive Atlin Goldfields Project land package; the collection of 2,731 soil samples, 178 rock samples, 22 stream silt and associated bulk leach extractable gold samples; the collection of 122 diamond drill core samples from the Yellowjacket Property for future lithogeochemical analysis; detailed geological mapping of structurally complex and historically worked areas within the Atlin Goldfields Project including: the Pictou and LD Showings and Union and Sentinel Mountain; and small biogeochemical surveys over the Pictou and LD Showings. This work successfully located historic orogenic gold occurrences at the Pictou Showing, from which rock samples of listwanite altered ultramafic lithologies containing mineralized quartz stockwork assayed up to 11.75 ppm Au (with 114 ppm Ag) and 4.48 ppm Au (with 160 ppm Ag). Soils collected along the listwanite trend at the Pictou showing assayed up to 552 ppb Au (with 2,830 ppb Ag) and defined a 150-meter gold in soils and rocks anomaly across the trend. Additionally, a northeast-southwest trending, approximately 1750 by 700-meter, gold in soil anomaly along the eastern portion of the LD Showing dominantly underlain by the Kedhada Formation sedimentary package was also delineated; as well as

multiple, patchy and isolated moderate-to-high gold in soil anomalies along ridgeline contours in the eastern portion of the project area. Gold values range up to 511 ppb locally and all anomalies remain open.

In 2019, exploration activities incluced a 1992-line kilometer, helicopter-borne high-resolution aeromagnetic geophysical survey over a 40 km^2 portion of the Atlin Goldfields Project that hosts the historic Pictou and Imperial Showings. Interpretation of the high-resolution, aeromagnetic geophysical data delineated large-scale structures and numerous magnetic lineaments in the areas of the Yellowjacket Gold Mine and the Imperial and Pictou Showings. Additionally, 1,227 soil samples, 110 rock samples and 1 stream silt sample were collected, and a 1,599.24-meter, shallow diamond drilling program was carried out that included 4 NQ-sized holes drilled at the Pictou Showing and 18 NQ-sized holes drilled at the LD Showing.

Soil and rock sampling extended the northeast-southwest trending gold in soil anomaly outlined in 2018 at the LD Showing and identified multiple, patchy and isolated, moderate-to-high gold in soil and rock anomalies in the western portion of the project area including areas of Union Mountain and proximal to the historic Imperial Showing. Gold values in rocks range up to 45 g/tonne along the north slope of Union Mountain and 8.75 g/tonne at the Imperial Showing. The 2019 diamond drilling campaign intersected numerous, narrow and shallow (<80 meters depth) gold zones at the LD and Pictou Showings in 13 out of 22 diamond drill holes. The most significant intercept drilled at the Pictou Showing (BBB-19-04) returned 3.60 g/tonne Au sampled in basalt containing a minor network of sulphide-bearing quartz+/-carbonate+/-talc veinlets between 52.00 and 53.00m; whereas the best intercept drilled at the LD Showing (BBB-19-12) yielded 2.00 meters of 8.53 g/tonne Au from gouged, foliated and talc-clay±carbonate-silica altered ultramafic rocks from 40.00 to 42.00 meters.

Table 4: Exploration History of the Atlin Gold Camp in the Area of the Atlin Goldfields Project					
Company (Operator)	**Property/Claim Group**	**Geochemistry**	**Geophysics**	**Drilling/Physical**	**Reference**

5.0 GEOLOGIC SETTTING

5.1 Regional Geology of the Atlin Mining Camp

The Atlin Mining Camp is located on the northwestern most extension of the Cache Creek Terrane of the Intermontane Belt in the Canadian Cordillera (Figure 3; *i.e.,,* Mihalynuk *et al.,* 1994; Ash *et al.,* 2001). The Cache Creek Terrane represents an imbricated fore-arc accretionary complex of Tethyan origin that was thrust over the Stikinia-Quesnelia and Yukon-Tanana Terranes and rocks of the Whitehorse Trough during the Early-to-Middle Jurassic (Mihalynuk *et al.,* 1994).

Ash *et al.,* (2001) divided the geology of the Atlin area into two, structurally complex lithotectonic elements: the "*Atlin Ophiolitic Assemblage*" and the "*Atlin Accretionary Complex*". The ophiolitic assemblage consists of an imbricated package of oceanic and upper mantle lithologies, compositionally dominated by harzburgite with dunite and minor pyroxenite dykes, metabasaltic rocks, peridotite, diabase and gabbro (Ash *et al.,* 2001,). Collectively, these lithologies form a relatively flat-laying series of thrust slices that have been obducted over the structurally lower, and younger Atlin Accretionary Complex (Ash *et al.,* 2001). The accretionary complex is defined by Ash *et al.,* (2001) as a lithologically diverse, moderate-to-steeply dipping and intercalated package of dominantly metapelitic sedimentary rocks containing discontinuous lenses and pods of greywacke, limestone and metabasalt. Thick limestone successions associated with alkali basalts are also abundant on the western margin of the ophiolitic terrane and have been interpreted by Monger (1977b) to represent carbonate banks deposited on oceanic island arcs within the ancient Cache Creek ocean basin.

Locally, these tectonic elements are intruded by Middle Jurassic-to-Cretaceous, late syn-to-post-tectonic felsic intrusions (*i.e.,,* the Fourth of July Batholith, Surprise Lake Batholith, *i.e.,,* Mihalynuk, 1999). An undeformed suite of feldspar-quartz porphyritic dykes, associated with these large felsic intrusions, also cross-cut regional deformation fabrics observed in meta-sediments and ultramafic rocks of the Cache Creek Terrane (Ash *et al.,* 2001).

5.2 Local Geology & Tectonic Significance

All lithologies of the Cache Creek Terrane described below are present within the Atlin Goldfields Project (Figure 4). The western-most claims, located proximal to Atlin Lake, are underlain by a fault-bound and locally intercalated package of Nahlin ultramafic rocks, mafic-to-intermediate volcanic rocks of the Nakina Formation and thick pelagic-to-locally hemipelagic sedimentary sequences, dominated by fossiliferous carbonate rocks of the Horsefeed Formation, and massive chert and cherty argillite of the Kedahda Formation (*i.e.,* Mihalynuk, 1999). These carbonate rocks represent the thick, shallow marine Early Mississippian limestone successions that were originally deposited on top of ocean islands or seamounts (*i.e.,* Nakina Formation Basalt; *i.e.,* Mihalynuk, 1999). Locally, molybdenum and pyrite-bearing diorite intrusions of unknown age have also been reported in this area (Bankowski, 1981).

To the east, the area is predominantly underlain by limestone and chert-to-cherty argillite of the Early Mississippian to Late Triassic Kedahda Formation (*i.e.,* Mihalynuk, 1999). These lithologies are locally folded and intercalated with earlier carbonate successions of the Horsefeed

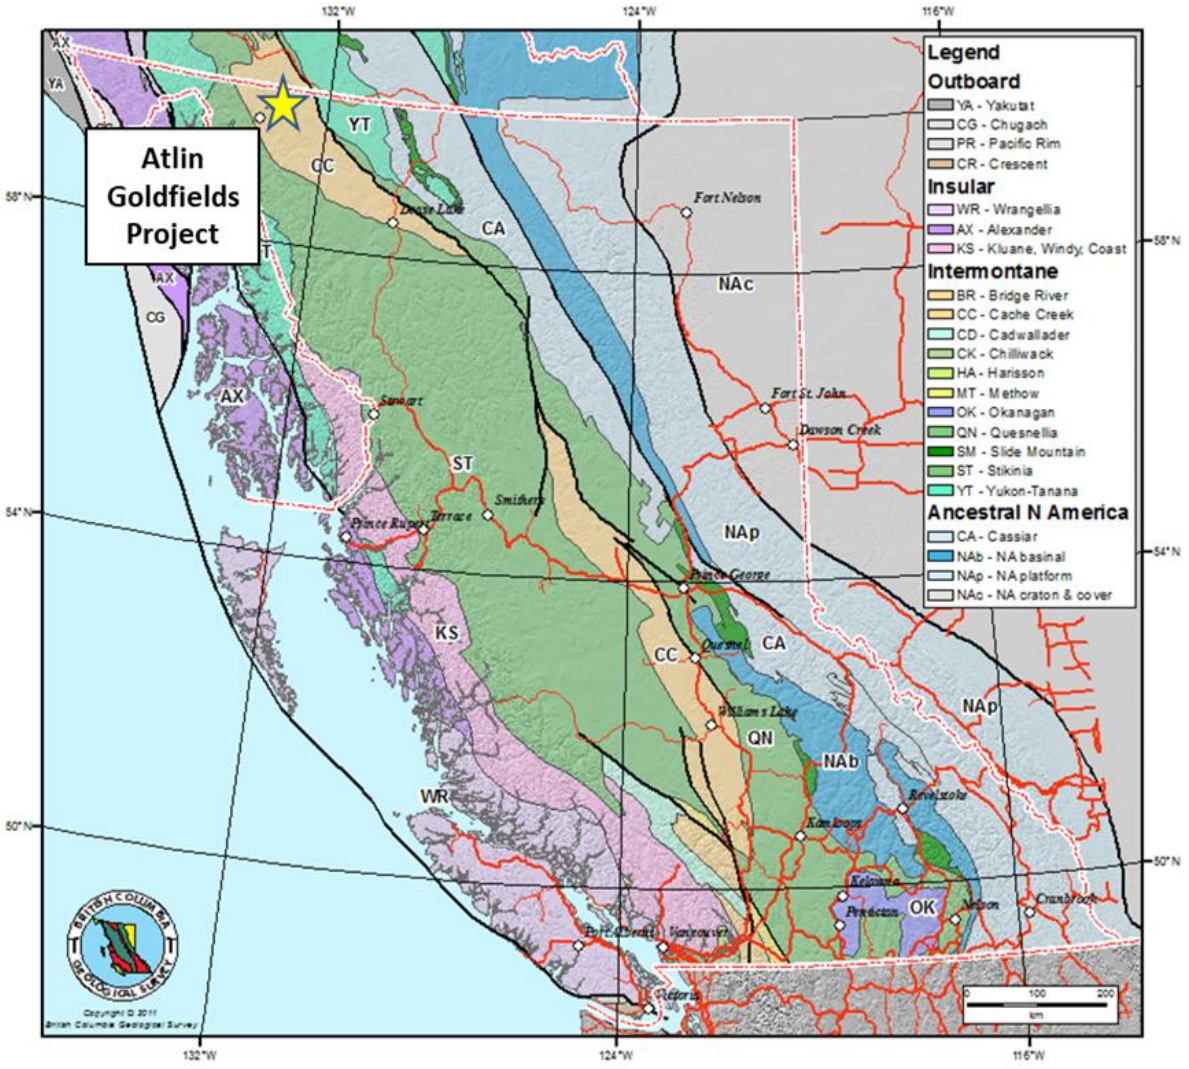

Figure 3: Atlin Goldfields Project in the Context of the Canadian Cordillera.

Formation, as well as basaltic rocks and mafic tuffs of the Nakina Formation (*i.e.,* Mihalynuk, 1999). Kedahda clastic sedimentary sequences are abundant and include chert, siliceous argillite and wacke that locally contain angular fragments of chert, quartz grains and felsic plutonic rocks. Lesser sandstone and siltstone successions are also present, and are intercalated with wake, argillite and chert (*i.e.,* Mihalynuk, 1999). The presence of clastic sedimentary units marks the Late Triassic transition from pelagic-to-dominantly hemipelagic sedimentation that was coeval with continual closure of the Cache Creek Ocean *via* subduction below the western Cordilleran margin (*i.e.,* Mihalynuk, 1999).

Continual destruction of the Cache Creek ocean basin resulted in the formation of the Atlin Accretionary Complex – a disrupted and intercalated tectonic mélange comprising a variety of Cache Creek lithologies and blocks or thrust-slices of lithologies, now embedded in a foliated, fine-grained argillaceous matrix (*i.e.,* Ash, 1994; Mihalynuk, 1999). Mélange is now concentrated along the probable contacts of most tectonically imbricated sedimentary and volcanic sequences

as a result of emplacement of the Cache Creek Terrane over the eastern margin of the Stikine arc (*i.e.,* Mihalynuk, 1999). Middle Jurassic closure of the Cache Creek ocean basin also resulted in the dismemberment and obduction of ophiolite assemblages, which collectively consist of the Nahlin Ultramafic Suite (upper mantle), the Nakina Formation basalt and shallow marine pelagic sedimentary sequences of the Horsefeed and Kedahda formations, over equivalent and younger rocks of the Kedahda and Nakina formations (*i.e.,* Mihalynuk, 1999).

The northern and southern-most project areas are dominated by extensive late-syn to-post accretionary felsic intrusions, namely the Late Cretaceous Surprise Lake Batholith and the Middle Jurassic Mount McMaster Stock – a member of the Three Sisters Suite that is texturally and geochemically similar to the Fourth of July Batholith (Mihalynuk *et al.,* 1992). These felsic plutons intrude tectonic mélange and sedimentary-dominated sequences of the Cache Creek Terrane, are non-foliated and therefore post-date ductile deformation and the regional penetrative foliation observed throughout the Cache Creek Terrane (*i.e.,* Mihalynuk, 1999).

5.2.1 Lithological Units Present in the Atlin Goldfields Project

Table 5: Lithological Descriptions (*after Mihalynuk, 1999 and references therein)*.

LATE CRETACEOUS *(ca. 84 Ma)*

IKW – Windy Table Intrusive Suite – High level plutons and coeval volcanic rocks.

LSKL – Surprise Lake Batholith – Mariolitic-to-porphyritic quartz monzonite and alaskite, elevated in U, Th, Sn, Rb, Zn, W, Mo and B; potential intrusive equivalent to the Windy Table volcanics.

MIDDLE TO LATE JURASSIC *(ca. 173-166 Ma)*

Three Sisters Suite – Syn-to-late post-accretionary calc-alkaline intrusions.

mJTg – Fourth of July Batholith (*Mount McMaster Stock*) – Pink granodiorite, granite and monzonite, and quartz-diorite; locally lamprophyric; non-foliated and texturally zoned with respect to biotite, hornblende and potassium feldspar abundance.

EARLY TO MIDDLE JURASSIC *(ca. 241-178 Ma)*

TRJW – Cache Creek Complex – argillite, wacke, greywacke and conglomerate turbidites.

LATE PERMIAN TO LATE JURASSIC *(ca. 255-145.6 Ma)*

PJS – Cache Creek Complex – mudstone/laminate, fine grained and clastic sedimentary rocks.

EARLY MISSISSIPPIAN TO LATE TRIASSIC *(ca. 350-208 Ma)*

CPac – Accretionary Complex – (prior to 173 Ma) – Tectonic mélange constituting all lithological elements present within the Atlin Complex; dominantly fine-to-medium grained, dark grey-to-green volcanic wake and argillite, chert, cherty mudstone and basalt with local dioritic and ultramafic lenses; highly strained.

Kedahda Formation Chert and Clastics – Tan, black and locally white, red and green chert (**CPk**); massive-to-well-bedded; and fossiliferous limestone (**CPkl**) (Permian to Triassic radiolaria); brecciated, folded and locally interlayered with brown-to-rusty, well-laminated argillite (**CPk; CPac**) and/or medium-to-coarse grained, dark grey wake, locally containing angular fragments of chert, quartz and felsic plutonic rocks; local sandtone-to-siltsone interlayers.

EARLY PENNSLYVANIAN TO LATE PERMIAN *(ca. 323-255 Ma)*

CPh – Horsefeed Formation Carbonate – Massive, grey-to-orange fossiliferous carbonate (Tethyan fauna); rare bedding; locally brecciated with coarse-grained, crystalline calcite veinlets.

EARLY MISSISSIPPIAN TO PENNSYLVANIAN *(ca. 359-245 Ma)*

CPn – Nakina Formation Basalt – Fine grained, massive basaltic-to-andesitic flows, mafic tuff, tuffaceous sediments and amygdaloidal pillows; Local gabbroic interiors of flows and pillows with networks of feldspar veinlets; sheared and metamorphosed to prehnite-pumpellyite-to-lower greenschist facies.

CPu – Nahlin Ultramafic Suite – Fine-to-medium grained harzburgite-to-dunite with serpentinized and listwanitized equivalents; weathers orange-to-dark red; purple-to-black on fresh surfaces; sheared and locally recrystallized.

5.2.2 Structure

The Cache Creek Terrane represents an extensive Middle Jurassic fold and thrust belt. Regional structures in the Atlin Complex are dominated by southwest-west verging folds and thrust faults that shortened and stacked the Cache Creek Terrane during accretion (*i.e.,* Mihalynuk, 1999). Thrust faulting, consanguineous with clastic sedimentation, originated during accretionary prism development and was accompanied by large-scale folding during emplacement of the Cache Creek Terrane over the Stikine arc and during subsequent ophiolite obduction (*i.e.,* Mihalynuk, 1999). Extensive Middle Jurassic deformation resulted in the stratigraphic complexity of the Cache Creek Terrane (Monger, 1975, 1977a). Lithologies in the Atlin Mining District are structurally intercalated on all levels and locally resemble chaotic tectonic mélange and polymictic breccias (Monger 1975, 1977a). Most units are highly fractured, and a regional penetrative and steep, northwest-trending deformation fabric can be observed throughout the region. Randomly oriented shear fabrics can also be seen within the Nakina basalt as well as the argillic matrix of the Accretionary Complex (*i.e.,* Mihalynuk, 1999).

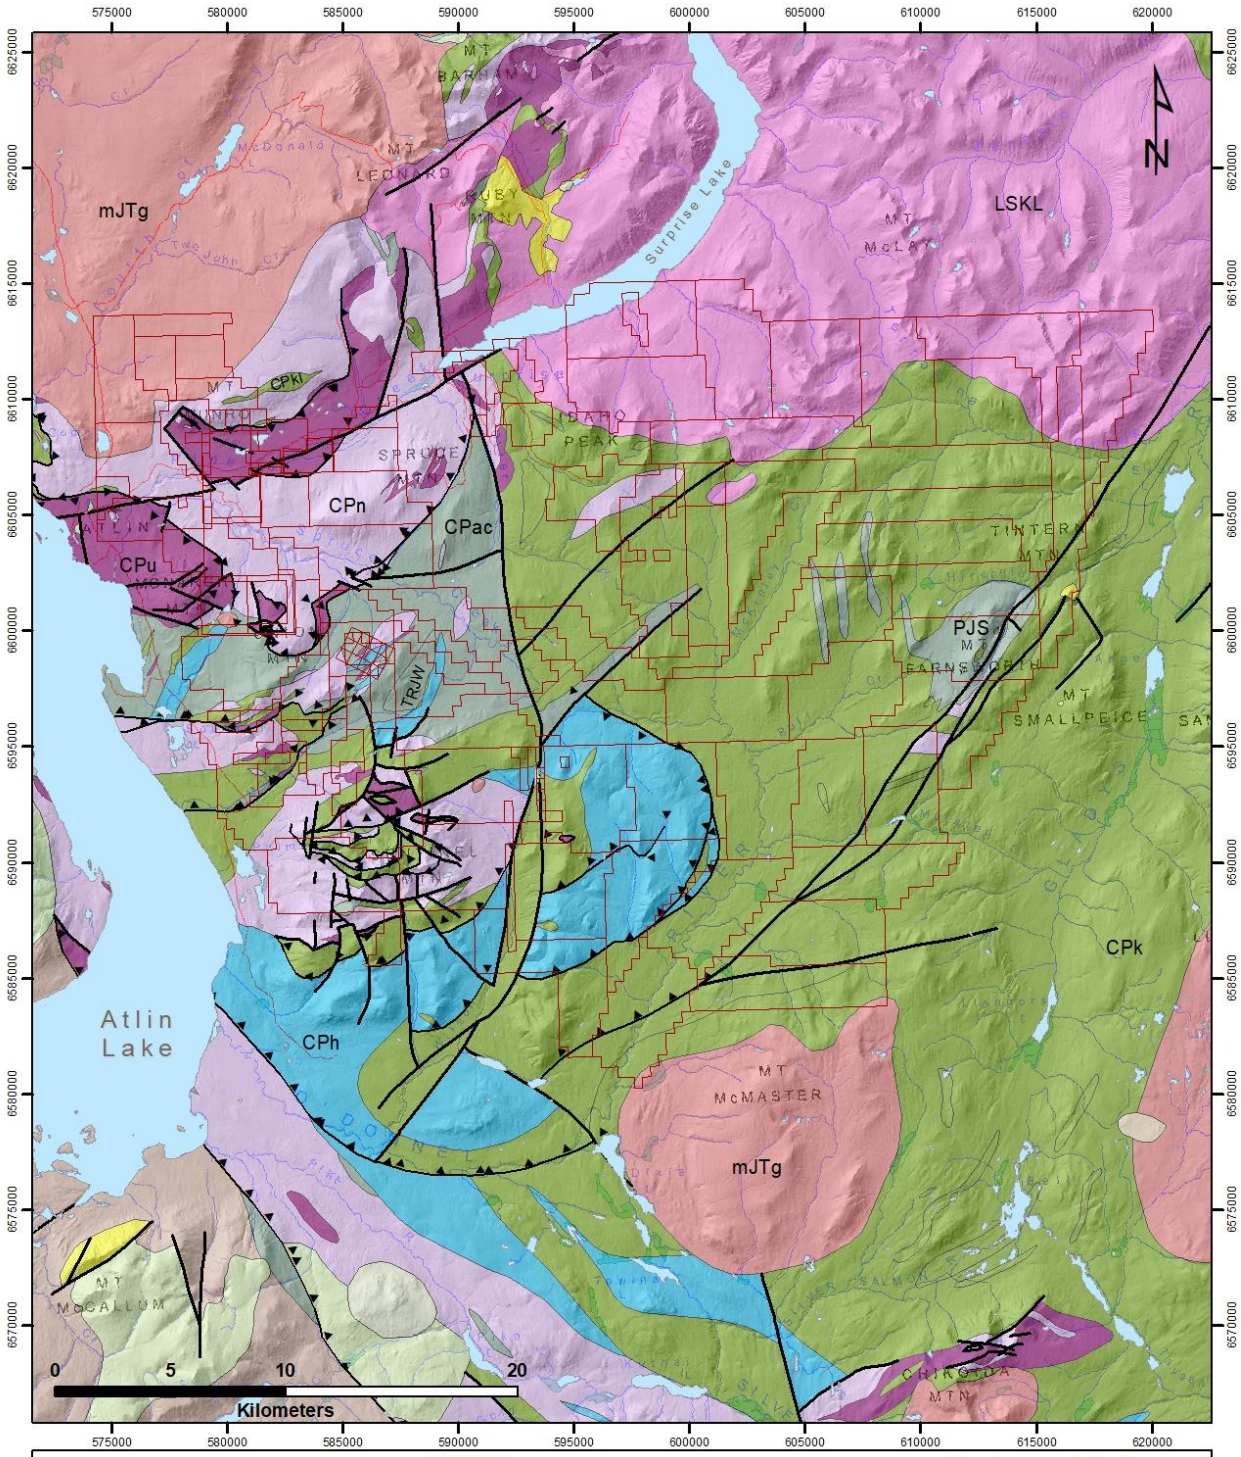

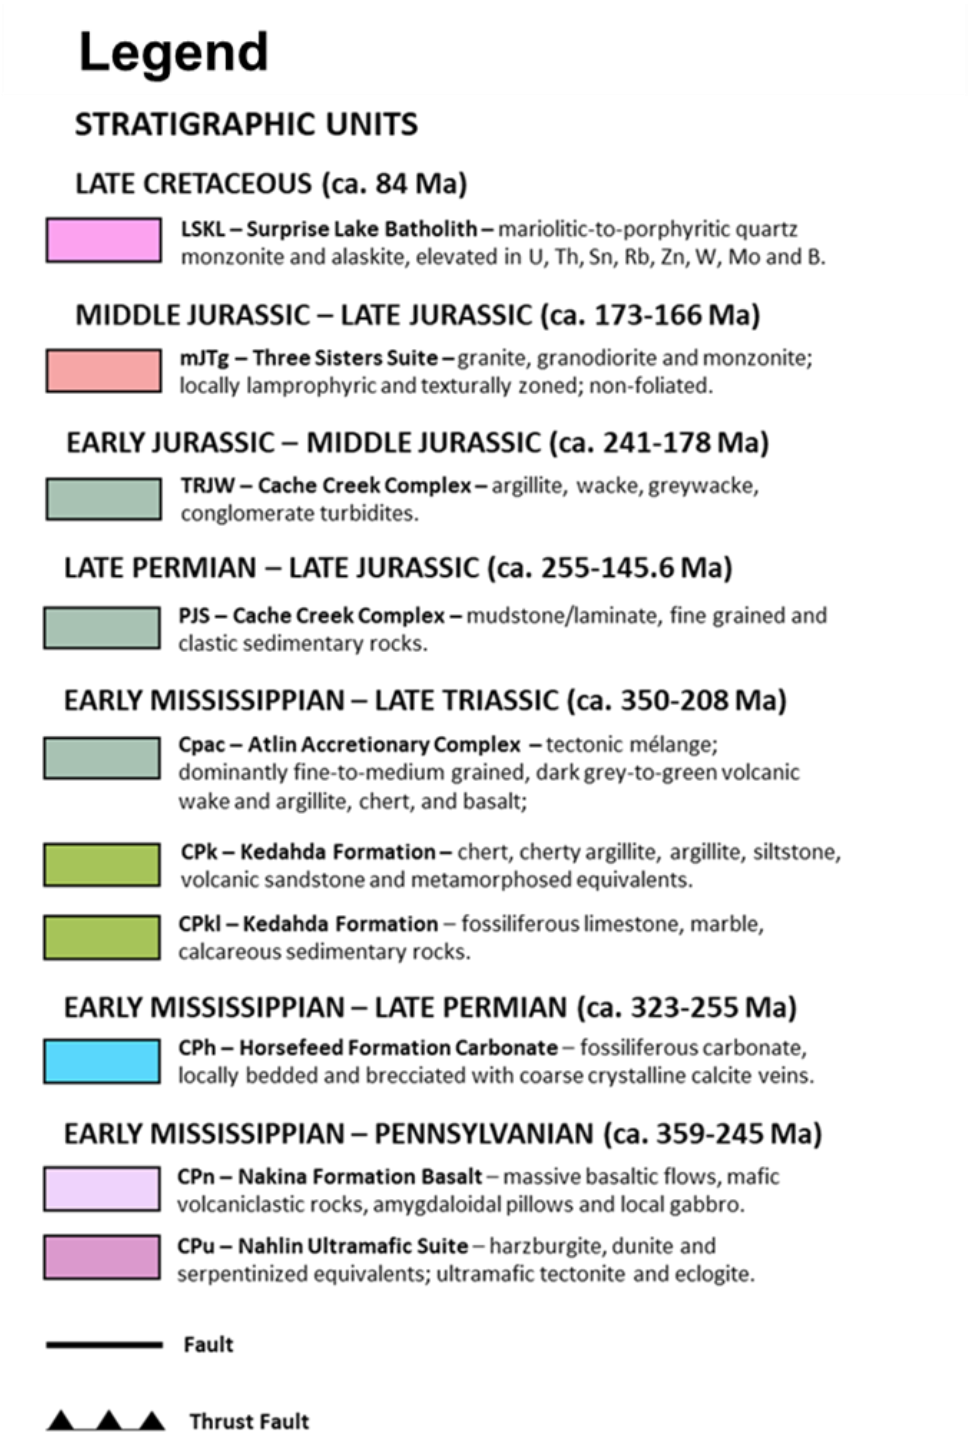

Figure 4: Local Geology

Location: 104N/12, 104N/11, 104N/10, 104N/7, 104N/6, 104N/5
Atlin Mining District; NW, BC
Scale: 1:250,000; January, 2021
NAD83 UTM Zone 8N

Reactivation of crustal-scale faults and secondary fault-splays is evident throughout the district by the presence of high-angle, dextral strike-slip faults and shear zones reported in rocks as young as Eocene (*i.e.,* Mihalynuk, 1999). Fault reactivation likely aided in the emplacement of voluminous felsic plutons throughout the Cache Creek Terrane (*i.e.,* Mihalynuk, 1999).

Due to the structural intricacy and lack of exposure throughout the Atlin area, true stratigraphy within individual properties is rarely established (Monger, 1975, 1977a). Depositional contacts are rarely observed, and many units are fault-bound, therefore most lithological boundaries are interpreted as tectonic (*i.e.,* Mihalynuk, 1999).

5.2.3 Alteration

Metamorphic alteration observed throughout the Cache Creek Terrane is dominated by prehnite-pumpellyite and lower-greenschist metamorphic assemblages (*i.e.,* Mihalynuk, 1999; Mihalynuk *et al.,* 2017). Basaltic rocks of the Nakina Formation, and cherty argillite-to-argillite of the Kedahda Formation and the Atlin Accretionary Complex exhibit a pervasive secondary mineral assemblage consisting of prehnite-epidote-chlorite (*i.e.,* Mihalynuk, 1999; Mihalynuk et al., 2017). The Nahlin Ultramafic Suite exhibits extensive serpentinization and locally intense magnetite replacement, attributed to the dehydration of olivine (Bloodgood *et al.,* 1989).

Alteration associated with lode-gold mineralization in the Atlin Mining District is generally confined to faults, proximal shear zones and faulted contacts between ultramafic and adjacent mafic-to-intermediate volcanic rocks and clastic sedimentary lithologies (*i.e.,* Ash, 1994). Throughout the Cache Creek Terrane, intense listwanite alteration (carbonate-silica-fuchsite) associated with gold-bearing quartz-carbonate±mariposite veining overprints ductile deformation fabrics and concentrates along the margins of sheared, dominantly ultramafic lithologies (Ash, 1994). This alteration is locally intense and characteristic of lode-gold mineralization in the Atlin area; and indicates the presence of gold-bearing CO_2-rich fluids that are characteristic to lode-gold deposits (*i.e.,* Ash, 1994).

6.0 MINERALIZATION

Orogenic gold deposits are characterized by the presence of complex and structurally controlled networks of gold-bearing, quartz-carbonate fault-fill veins (Dubé and Gosselin, 2007) (Figure 5a/b). These veins concentrate along moderate-to-steeply dipping, brittle-ductile shear zones and faults residing near major compressional-to-transtensional crustal-scale fault zones in deformed greenstone terranes (Dubé and Gosselin, 2007). Veins are generally hosted in mafic lithologies and exhibit a close spatial association with tectonic mélange or conglomerates distributed along major crustal fault zones (Dubé and Gosselin, 2007). Extensive carbonate alteration is usually observed associated with gold-bearing veins, in addition to more minor sericitization and sulphidation of the adjacent wall rock (Dubé and Gosselin, 2007). Further from veining, an alteration assemblage of chlorite-carbonate-magnetite is sometimes observed (Dubé and Gosselin, 2007). In addition to quartz and carbonate, other silicate minerals associated with veining may include: mica, chlorite, tourmaline and scheelite (Dubé and Gosselin, 2007). The dominant metallic signature observed within these deposits consists of Au, Ag, As, W, B, Sb, Te and Mo, with sometimes anomalous Cu, Zn and Pb (Dubé and Gosselin, 2007). This signature reflects the presence of pyrite with more minor pyrrhotite, chalcopyrite, molybdenum and telluride minerals. In amphibolite-facies terranes, gold-bearing silicate veins may be associated with an arsenopyrite-rich alteration halo (Dubé and Gosselin, 2007).

Lode-gold mineralization throughout the Atlin Mining District is generally defined as shear zone-hosted, quartz-carbonate-gold-mariposite-bearing veins and breccias containing varying amounts of disseminated pyrite and other base metal-sulphides including: arsenopyrite, chalcopyrite and galena (*i.e.* Ash 1994; Ash *et al.,* 2001). These veins are typically hosted in carbonate-talc-fuchsite-silica (listwanite) altered mafic and ultramafic lithologies and/or cherty-argillite to phyllitic metasedimentary sequences of the Cache Creek Terrane and are generally concentrated in areas proximal to faults and deformed lithological contacts (*i.e.* Ash 1994; Ash *et al.,* 2001). Lode-gold veins have been considered the source for many of the placer gold deposits discovered throughout the Atlin Gold Camp (Aitken, 1959; Ballantyne and MacKinnon, 1986; Lefebure and Gunning, 1988; Rees, 1989; Ash and Arksey, 1990a, b). Structurally controlled, orogenic gold veins with similar host-rock associations have been observed within historical properties and claims now part of Brixton's Atlin Goldfields Project including: the Yellowjacket Property, the Pictou Showing and the LD Showing (historical Shuksan and GV Properties), some of which have reported exceptional gold grades. Specifically, at the LD Showing (Shuksan 2 Claim), gold-bearing quartz veins and veinlets locally containing pyrite, galena, chalcopyrite and mariposite concentrate along, or proximal to, contacts between carbonatized ultramafic and cherty/cherty argillite and along contacts with cross-cutting mafic-to-intermediate dykes (*i.e.* Troup and Wong, 1984). Significant bulk samples collected during Standard Gold Mines 1983 and 1984 exploration programs at the LD Showing returned values of up to 518.27 g/tonne Au. In the eastern-most areas of the LD Property, Claymore Resources also reportedly observed a rhyolite dyke hosting auriferous quartz tension gash-style veining. Additionally, at the Yellowjacket Property gold is typically observed in listwanitized ultramafic lithologies as free gold grains (*i.e.* Dandy and Price, 2010).

Other notable mineralization styles documented within the boundaries of the Atlin Goldfields Project include a molybdenum and pyrite-bearing, coarse-grained diorite intrusion present at the historic LP Property (Bankowski, 1981). Here, lode-gold mineralization hosted within smoky quartz veins was also observed with minor arsenopyrite (Bankowski, 1981). Further east, anomalous Ag values have also been documented in diorite dykes observed near the divide between Union and Eagle Creeks, and a nearby limestone skarn lens reportedly assayed up to 875 ppb Au (Aspinall, 2006).

In 2016, lode-gold veins containing quartz-albite-pyrite-muscovite-graphite±rutile were discovered in quartz-rich phyllic bedrock along middle Otter Creek (Mihalynuk *et al.,* 2017). The presence of these veins and their location demonstrates that a close association with mafic-to-ultramafic lithologies may not be necessary for orogenic gold deposition in this area (Mihalynuk *et al.,* 2017). This observation is further supported by the presence of gold nuggets intergrown with cassiterite (SnO_2) and thorite ($ThSiO_4$) reportedly collected from placer producing streams proximal to the Surprise Lake Batholith (Mihalynuk *et al.,* 2017). The Surprise Lake Batholith is enriched in U, Th, Sn, Mo, W and F, whereas ultramafic rocks lack these elements (Mihalynuk *et al.,* 2017). This observation suggests that there is potential for discovery of intrusion-related gold-bearing silicate veins in the Atlin Mining District and that multiple generations of gold veins are contributing to the abundance of placer gold characteristic to the area.

7.0 2020 EXPLORATION PROGRAM OVERVIEW

The 2020 Exploration Program took place between May 21st and September 30th and consisted of approximately **133.5-man days** of combined planning, field work, support staff, reporting and physical work. This program included infill soil geochemical surveys at the LD, Imperial, and Fourth of July Showings, as well as prospecting of various areas throughout the property. All work was staged out of the community of Atlin, BC. Many access and ATV roads are present throughout the Atlin Gold Camp; therefore personnel, supplies and samples were transported by ground vehicle to and from camp to Whitehorse, YT. Air support during this exploration program was required to prospect the most north eastern and eastern claims and was provided by Tundra Helicopters *via* a Bell 206 Jet Ranger.

A total of 65 rock samples and 617 soil samples were collected from historically worked areas throughout the property, namely the LD, Imperial, Fourth of July, and Union Showings, as well as areas of structural complexity proximal to gold-bearing creeks, including: Spruce, Little Spruce, Rant, Feather and McKinley Creeks. During the soil geochemical survey, all Atlin Goldfields Project claims were accessed by 4x4 vehicles. Samples were collected at 20-meter sample spacing or less and location data was recorded using a Garmin® GPSMAP 64s, before being bagged and tagged on-site and sent to ALS Minerals preparation laboratory in Whitehorse, YT.

In 2020, 196 soil samples were collected from the Fourth of July Showing, 7 from the Imperial Showing and 414 from the LD Showing. Rock and soil geochemical sampling were successful in confirming and constraining localized high grade gold zones in historically trenched areas (i.e., the LD and Union Mountain Showings). Prospecting efforts also uncovered two additional historically trenched areas near the headwater of Little Spruce Creek. These trenches are located approximately 500 meters apart and contain ultramafic-hosted orogenic gold-style and porphyry-Mo-related veining and mineralization. The Union Mountain Showing, in addition to the additional trenched areas sampled in 2020 are believed to be part of the historic Golden View occurrence.

Physical work in 2020 included the transfer of approximately 500 boxes of historic core to storage located at Brixton Metals Corporation’s Atlin Gold Camp.

The total cost of the 2020 exploration program was $98,480.48.

8.0 SOIL GEOCHEMISTRY

8.1 Sampling, Preparation & Analysis

In 2020, infill soil geochemical surveys were conducted at the Imperial, LD and Fourth of July Showing. 617 Soil samples were collected at sample spacing of 20 meters or less, and a line spacing of 50m or less. All samples collected were photographed and described at sample collection sites noting the soil horizon and depth of the sample collected, type of surrounding landscape, contamination (i.e., road, placer workings), slope steepness, color, moisture and percent rock, clay, organics, and sand present in the sample.

Soil samples were collected from various horizons including the upper B and C horizons. Talus fines were also sampled in areas of poor soil development. All soil samples were sent to ALS Minerals preparation facility in Whitehorse, YT which is ISO9001:2008 certified. Soil samples were dried and sieved to 180 microns (-80 mesh) and both fractions were retained. Each sample was analysed for Au and 50 elements using aqua regia extraction with an ICP-MS finish.

8.2 Results

The max-min values for all 617 soil samples collected in 2020 for Au are 761 ppb and 0.5 ppb. The median value for gold is 10 ppb and 1 ppb. Two soil samples returned Au values greater than 500 ppb, 11 greater than 250 ppb, 36 greater than 100 ppb and 128 greater than 30 ppb. The most anomalous soil sample (B0055005) of 2020 was collected from the area of historic trenching and 2019 drilling at the LD Showing and yielded a value of 761 ppb Au.

A summary of the most significant soil samples collected in 2020 and their general map locations are presented in Table 6, and certificates of analysis for all soil sample assays are available in **Appendix A1**. Soil sample descriptions and location data for each sample collected are available in **Appendix A2**, whereas maps illustrating location data and gold assay values can be found in **Appendix A3**. For samples that returned values below detection, a value of half the detection limit for gold was used for labelling and plotting purposes.

Table 6: Significant Soil Samples of 2020

Sample ID	Location	Soil Horizon	Au (ppb)	Ag (ppm)	As (ppm)	Cu (ppm)
B0055005	LD Showing	C	761	0.2	60.2	34.3
B0055597	LD Showing	C	534	0.3	84	107
B0055443	Fourth of July	C	442	0.19	5.9	15.4
B0055416	Fourth of July	C	409	0.09	4.7	17.8

9.0 ROCK GEOCHEMISTRY

9.1 Sampling, Preparation & Analysis

In 2020, 65 rock samples were collected for assay from areas of the Atlin Goldfields Project including: The LD and Union Mountain Showings, the Surprise Lake Batholith, and areas near various known gold-bearing creeks. Rock samples consisted of quartz vein, vein breccia and quartz vein fragments, mineralized host rock selvedges and listwanite, as well as talus and boulders of various compositions in areas of poor exposure. All samples collected in 2020 were described at sample collection sites based on location, type of sample collected, lithology, alteration as well as mineralization type, abundance, and style where appropriate.

All rock samples were sent to the ALS Minerals preparation facility in Whitehorse, YT which is ISO9001:2008 certified. Rock samples were finely crushed to 70% nominal passing 2 mm. They were then split using a riffle splitter into a 250-gram sample and pulverized to 85% passing 75 microns. Each sample was analyzed for Au by fire assay and ICP-AES as well as 48 elements by ICP-MS after four acid digestion.

9.2 Results

For the 65 rock samples collected in 2020, Au values ranged from 0.0005 ppm to 53.6 ppm, whereas Ag values ranged from 0.01 ppm to 27.9 ppm. One sample returned Au values greater than 10,000 ppb, two greater than 1,000 ppb, two greater than 400 ppb, seven greater than 100 ppb and 13 greater than 30 ppb. The best rock sample of 2020 (A0576655) assayed 53.6 ppm Au and 3.96 ppm Ag. This sample was collected from narrow quartz veins in listwanite within an area of historic trenching on Union Mountain. Additional rock samples collected from the same area in 2019 returned values of up to 45 ppm Au. A summary of the most notable rock samples collected in 2019 and their locations is presented in Table 7, and certificates of analyses for all rock sample assays are available in **Appendix B1**. A list of rock sample locations and field descriptions can be found in **Appendix B2** and maps illustrating sample locations and gold assay values are also presented in **Appendix B3**. For assay results that returned values below detection, a value of half the detection limit for that specific element was used for map labelling and plotting purposes.

Table 7: Significant Rock Samples of 2019

Sample ID	Location	Sample Type	Au (ppm)	Ag (ppm)	As (ppm)	Cu (ppm)
A0576655	Union Mountain	Outcrop	53.6	3.96	108.5	37.7
A0576623	Little Spruce	Outcrop	1.06	27.9	28.3	12.5
A0576552	LD Showing	Outcrop	0.234	1.77	11.0	17.9

10.0 PHYSICAL WORK

In 2019, physical work completed included the transfer of approximately 500 boxes of historic core to Brixton Metals Corporation's Atlin Gold Camp for relogging in 2021.

11.0 DISCUSSION

11.1 2020 Geochemical Sampling

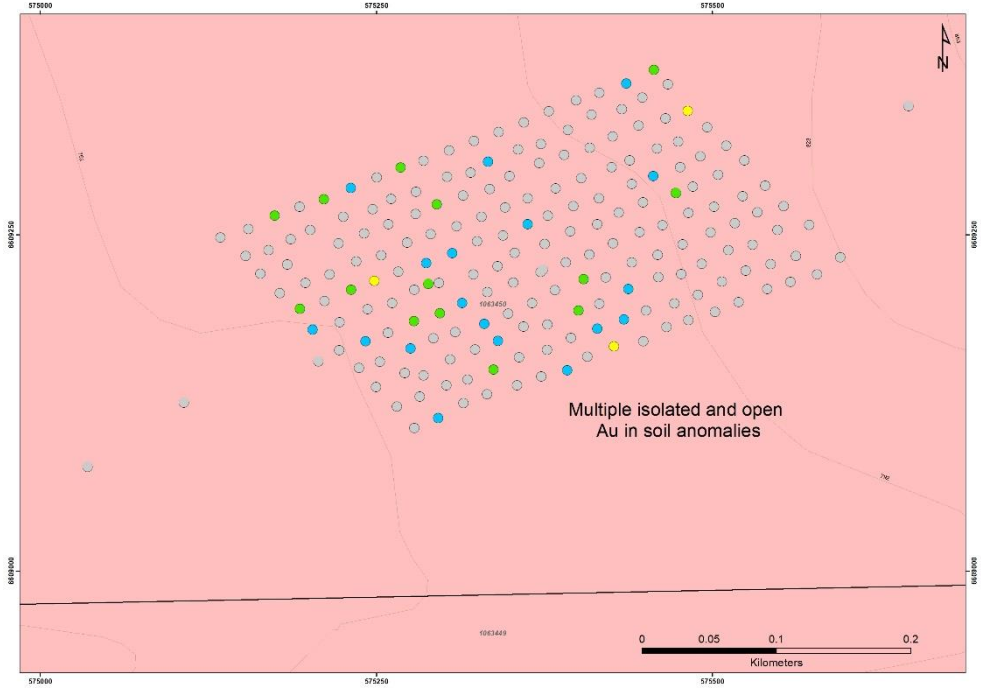

In 2020, 617 soil and 65 rock samples were collected at the Atlin Goldfields Project from areas including the historic Imperial Fourth of July, Union Mountain and the LD Showing. Soil sampling focused mainly on the LD and Fourth of July Showings, whereas rock sampling was carried out in the Union Mountain and Surprise Lake Batholith areas, as well as areas of structural complexity proximal to known gold-bearing creeks. Gold geochemical values for the 617 soil samples collected in 2020 ranged from 0.5 ppb to 761 ppb. The most anomalous soil sample (B0055005) of 2020 was collected from the area of historic trenching and 2019 drilling at the LD Showing and yielded a value of 761 ppb Au.

At the Fourth of July Showing, infill soil sampling was focused on an area of anomalous and isolated Au-in-soils collected in 2019. Soil samples collected in 2020 returned values of up to 442 ppb Au and delineated numerous and patchy, moderate-to-high gold-in-soil anomalies across the survey grid that remain open (Figure 6a).

Soil sampling at the LD Showing in 2020 infilled the 2018 and 2019 soil geochemical grids confirming and constraining the existence of gold-in-soil anomalies over the central listwanite trend. A 380-meter-long, moderate-to-high gold-in-soil anomaly shows good correlation along mapped NE-SW trending, structural contacts between mafic volcanic units, mafic volcanic and ultramafic rocks and ultramafic rocks and limestone. This anomaly remains open for infill soil sampling in multiple directions. The highest gold-in-soil values (761 ppb and 534 ppb Au), and the most consistent anomalous zone, correlate well with the contacts of the fault-bound central listwanite trend, as well as an area of intense carbonate alteration that dominates the tectonic contact between basalt and listwanitized ultramafic rocks (Figure 6b).

Gold values for the 65 rock samples collected ranged from 0.0005 ppm to 53.6 ppm. One sample returned Au values greater than 10,000 ppb, two greater than 1,000 ppb, two greater than 400 ppb, seven greater than 100 ppb and 13 greater than 30 ppb. The best rock sample of 2020 (A0576655) assayed 53.6 ppm Au and 3.96 ppm Ag (Figure 7a). This sample was collected from narrow pyrite-bearing quartz veins in listwanite within an area of trenching on the northwest-facing slope of Union Mountain, known historically as the Golden View occurrence. Additional rock samples collected from the same area returned values of up to 45ppm Au in 2019.

Prospecting and rock sampling in 2020 near the headwater of Little Spruce Creek discovered two additional areas of historic trenching. In one trench, samples of pyrite-bearing quartz veins measuring up to 10cm in width and hosted in silica and carbonate altered ultramafic rocks assayed up to 1.06 ppm Au and 27.9 ppm Ag (A0576623). A series of mostly sloughed in trenches, located approximately 500m from sample A0576623 and historically known as the “Porphyry Showing” on the past Golden View property, was also sampled in 2020. This trenched area contains felsic intrusive rock hosting several, northwest-southeast trending quartz veins ranging from 1 to 50 cm wide. Molybdenite is visible as small clusters in some of the veins, notably near their margins. Four selective grab samples were taken from the larger veins to test for gold mineralization associated with the molybdenite. Samples A0576620 and A0576621 returned values of 1320 and 1490 ppm Mo, respectively. No significant gold or copper values were associated (Figure 7b/c).

12.0 CONCLUSIONS & RECOMMENDATIONS

12.1 Conclusions

Brixton Metals Corporation's 2020 exploration program was successful in constraining and identifying new, significant, and historical areas of gold mineralization at the LD, Union Mountain (Golden View) and Little Spruce Showings. Results obtained from infill soil sampling in 2020 at the LD Showing constrained anomalous gold zones within the area of the soil geochemical grid. Infill sampling delineated a 380-meter-long, moderate-to-high gold-in-soil anomaly that dominates in areas of intense carbonate alteration of ultramafic and mafic lithologies, as well as their structural contacts along the extent of the central listwanite trend. This anomaly remains open for infill soil sampling in multiple directions. Numerous, patchy, and open moderate-to-high gold-in-soil anomalies were also identified within the Fourth of July Showing survey grid.

Follow-up rock sampling of pyrite-bearing quartz veins in listwanite from a historic trench located along the northwest-facing slope of Union Mountain assayed 53.6 ppm Au (A0576655). This sample was collected from a quartz-veined area sampled in 2019 that returned low grade gold values. Approximately 7 meters to the west of this sample, a sample of listwanite (Q026063) returned a value of 45 ppm Au in 2019. Prospecting and rock sampling in 2020 near the headwater of Little Spruce Creek discovered two additional areas of historic trenching. In one trench, samples of pyrite-bearing quartz veins measuring up to 10cm in width and hosted in silica and carbonate altered ultramafic rocks assayed up to 1.06 ppm Au and 27.9 ppm Ag. 500 meters west, a trenched area historically known as the "Porphyry Showing" was also sampled to test the intrusion-related mineralization potential. This trenched area contains felsic intrusive rock hosting several, northwest-southeast trending, molybdenite-bearing quartz veins ranging from 1 to 50 cm wide. Samples returned values of up to 1320 and 1490 ppm Mo. Collectively, these series of trenches, located in the hanging wall of the Monarch Mountain thrust fault, are believed to be part of the historic Golden View occurrence.

The Atlin Goldfields Project continues to immense potential for uncovering the lode gold sources of the numerous placer gold deposits throughout the local mining camp. The results of the 2020 exploration program (and past programs) indicate that due to the coarse and intermittent style of orogenic gold mineralization observed, infill soil sampling at tight spacing and systematic rock sampling is necessary to further characterize and constrain the orogenic and/or intrusion-related gold showings throughout the project area.

12.2 2021 Recommendations

The Atlin Goldfields Project is a property of merit and warrants further exploration to investigate the possible lode gold sources of the placer gold mining camp. Prospects such as the Union Mountain/Golden View, LD, and Imperial Showings should continue to be tested through infill geochemical surveys and prospecting in 2021, to possibly expand the known mineralized zones and to better understand the geologic controls on mineralization.

Relogging, re-assaying for total Au and systematic lithogeochemical sampling of historic drill core is also necessary to further characterize these zones, and to determine the structural controls of gold mineralization throughout the property, for future exploratory diamond drilling.

Geochemical Surveying	**Number of Samples**	**No.**	**Rate**	**Subtotal**	
Soil	*617 soil samples*	617.0	$25.20	$15,549.07	
Rock	*65 Rock Samples*	65.0	$40.91	$2,659.35	
				$18,208.42	**$18,208.42**
Transportation		**No.**	**Rate**	**Subtotal**	
Airfare (Commercial)	Air North; Air Canada; WestJet		Various Rates	$362.95	
Taxi	To/From YVR (Uber)		Various Rates	$24.85	
Kilometers	RJ Smallwood Car Use $0.54/KM	1029.10	$0.54	$550.57	
Fuel (Litres)	Gas for ATV	81.70	$1.009	$82.40	
Helicopter (Hours)	Bell 206 - Tundra Helicopters (Hourly)	3.10	$1,200.00	$3,720.00	
Fuel (Litres)	Jet A/L	3.10	$250.00	$775.00	
				$5,515.77	**$5,515.77**
Accommodation & Food		**No.**	**Rate**	**Subtotal**	
Accommodations	Atlin Cabins (Nightly Rental)	17.00	$132.85	$2,258.46	
Food	Groceries - Superstore, Save On Foods, etc.			$636.70	
				$2,895.16	**$2,895.16**
Miscellaneous		**No.**	**Rate**	**Subtotal**	
Field and Camp Supplies	Bear Horn, Mace, Sample Bags, GPS, etc.			$5,842.30	
Expediting/Hr - Annuk	Field Supplies/Sample Shipment (Hourly)		Various Rates	$760.00	
Fulcrum Software - Geochem Sampling	Activation, Memberships, etc.			$428.76	
				$7,031.06	**$7,031.06**
Equipment Rentals		**No.**	**Rate**	**Subtotal**	
Bob's Contracting	Flatbed - Transport ATV's to Atlin Camp (Hourly)	0.80	$125.00	$100.00	
Bob's Contracting	Flatbed - ATV's to Tent for Storage (Hourly)	1.00	$135.00	$135.00	
Bob's Contracting	ATV Storage Fee (/Months)	8.00	$21.40	$171.20	
				$406.20	**$406.20**
Contracting (Other)		**No.**	**Rate**	**Subtotal**	
Bob's Contracting	Core and Core Racks Transferred to Atlin Camp	6.00		$4,794.00	
Full Force Diamond Drilling	2019 Drill Rig De-Mob (Completed in 2020)			$7,500.00	
				$12,294.00	**$12,294.00**
				TOTAL Expenditures	**$98,480.48**

STATEMENT OF QUALIFICATIONS

I, Monica Barrington of 89 Discovery Avenue, Atlin, BC do hereby declare:

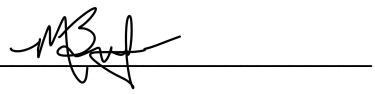

THAT I am a Geologist in the mineral exploration industry, employed by Brixton Metals Corporation with offices at 551-409 Granville Street, Vancouver, BC.

THAT this report is based on Atlin Goldfields Project work that I participated in from May to September of 2020.

THAT I am a co-author of the assessment report titled “2020 Geological & Geochemical Report on the Atlin Goldfields Project”

THAT I hold a Bachelor of Science (Honours) degree in Earth Sciences (2013) from Memorial University of Newfoundland.

THAT my work with respect to this project and report has been supervised and approved by a P.Geo in good standing with the Association of Professional Engineers and Geoscientists of British Columbia.

Monica Barrington, B.Sc. (Hons)
Project Geologist
Brixton Metals Corporation

STATEMENT OF QUALIFICATIONS

I, Christina Anstey of 3060 Attree Rd, Terrace, B.C do hereby declare:

THAT I am a Geologist in the mineral exploration industry, employed by Brixton Metals Corporation with offices at 551-409 Granville Street, Vancouver, BC.

THAT I am a co-author of the assessment report titled “2020 Geological & Geochemical Report on the Atlin Goldfields Project”

THAT I hold a Bachelor of Science degree in Earth Sciences (2012) from Memorial University of Newfoundland.

THAT I have been active in the mineral exploration industry in Canada for the past 9 years

THAT my work with respect to this project and report has been supervised and approved by a P.Geo in good standing with the Association of Professional Engineers and Geoscientists of British Columbia.

Christina Anstey, B.Sc.
V.P, Exploration
Brixton Metals Corporation

GEOLOGIST'S CERTIFICATE

I, Gary Robert Thompson of 3086 Alberta Street, Vancouver, BC do hereby certify:

THAT I am a Geologist in the mineral exploration industry, engaged by Brixton Metals Corporation with offices at 551-409 Granville Street, Vancouver, BC.

THAT this report is based on Atlin Goldfields Project work that I participated in from May to September of 2020.

THAT I am a co-author of the assessment report titled "2020 Geological & Geochemical Report on the Atlin Goldfields Project".

THAT I am a member in good standing (#29553) of the Association of Professional Engineers and Geoscientists of British Columbia since May of 2005.

THAT I hold a Bachelor of Science degree (Honours) in Geology (2000) from the University of British Columbia.

THAT I have practiced my profession with various exploration and mining companies throughout Canada and the United States of America.

THAT I am the President, Chairman, CEO, Director, and shareholder of the company and have interest in the property herein.

Dated at Vancouver, British Columbia this 28th day of January 2021.

Gary Robert Thompson, P.Geo.

Finalized Date: 14-JUN-2020
Account: BRIXMET

CERTIFICATE WH20115022

Project: Atlin Gold

P.O. No.: Atlin-2020-S001

This report is for 196 Soil samples submitted to our lab in Whitehorse, YT, Canada on 1-JUN-2020.

The following have access to data associated with this certificate:

MONICA BARRINGTON KYO YAMAGATA	SORIN POSESCU	GARY THOMPSON

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION
AuME-TL43	25g Trace Au + Multi Element PKG

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE WH20120265

Project: Atlin Gold

P.O. No.: Atlin-2020-S002

This report is for 379 Soil samples submitted to our lab in Whitehorse, YT, Canada on 8-JUN-2020.

The following have access to data associated with this certificate:

MONICA BARRINGTON	GARY THOMPSON	KYO YAMAGATA

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION
AuME-TL43	25g Trace Au + Multi Element PKG

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE WH20120267

Project: Atlin Gold

P.O. No.: Atlin-2020-S003

This report is for 42 Soil samples submitted to our lab in Whitehorse, YT, Canada on 8-JUN-2020.

The following have access to data associated with this certificate:

MONICA BARRINGTON	SORIN POSESCU	KYO YAMAGATA

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION
AuME-TL43	25g Trace Au + Multi Element PKG

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

NSS is non-sufficient sample.

Applies to Method: ALL METHODS

LABORATORY ADDRESSES

Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

Applies to Method: LOG-21 SCR-41 WEI-21

Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Applies to Method: AuME-TL43

Appendix A2: Soil Sample Descriptions 2020

CERTIFICATE WH20120264

Project: Atlin Gold

P.O. No.: Atlin-2020-R001

This report is for 5 Rock samples submitted to our lab in Whitehorse, YT, Canada on 8-JUN-2020.

The following have access to data associated with this certificate:

MONICA BARRINGTON	SORIN POSESCU	KYO YAMAGATA

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize up to 250g 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-MS61	48 element four acid ICP-MS	

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REEs may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

CRU-31	CRU-QC	LOG-21	PUL-31
PUL-QC	SPL-21	WEI-21	

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Au-ICP21	ME-MS61

CERTIFICATE WH20165289

Project: Atlin Gold

P.O. No.: Atlin-2020-R002

This report is for 24 Rock samples submitted to our lab in Whitehorse, YT, Canada on 3-AUG-2020.

The following have access to data associated with this certificate:

MONICA BARRINGTON KYO YAMAGATA	MEGAN BINNER	GARY THOMPSON

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize up to 250g 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-MS61	48 element four acid ICP-MS	

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REEs may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

CRU-31	CRU-QC	LOG-21	PUL-31
PUL-QC	SPL-21	WEI-21	

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Au-ICP21	ME-MS61

CERTIFICATE WH20222752

Project: Atlin Gold

P.O. No.: Atlin-2020-R003

This report is for 40 Rock samples submitted to our lab in Whitehorse, YT, Canada on 2-OCT-2020.

The following have access to data associated with this certificate:

MONICA BARRINGTON GARY THOMPSON	MEGAN BINNER KYO YAMAGATA	MATT KRUKOWSKI

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize up to 250g 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
Au-GRA21	Au 30g FA-GRAV finish	WST-SIM
ME-MS61	48 element four acid ICP-MS	

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE OF ANALYSIS WH20222752

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REEs may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

CRU-31	CRU-QC	LOG-21	PUL-31
PUL-QC	SPL-21	WEI-21	

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

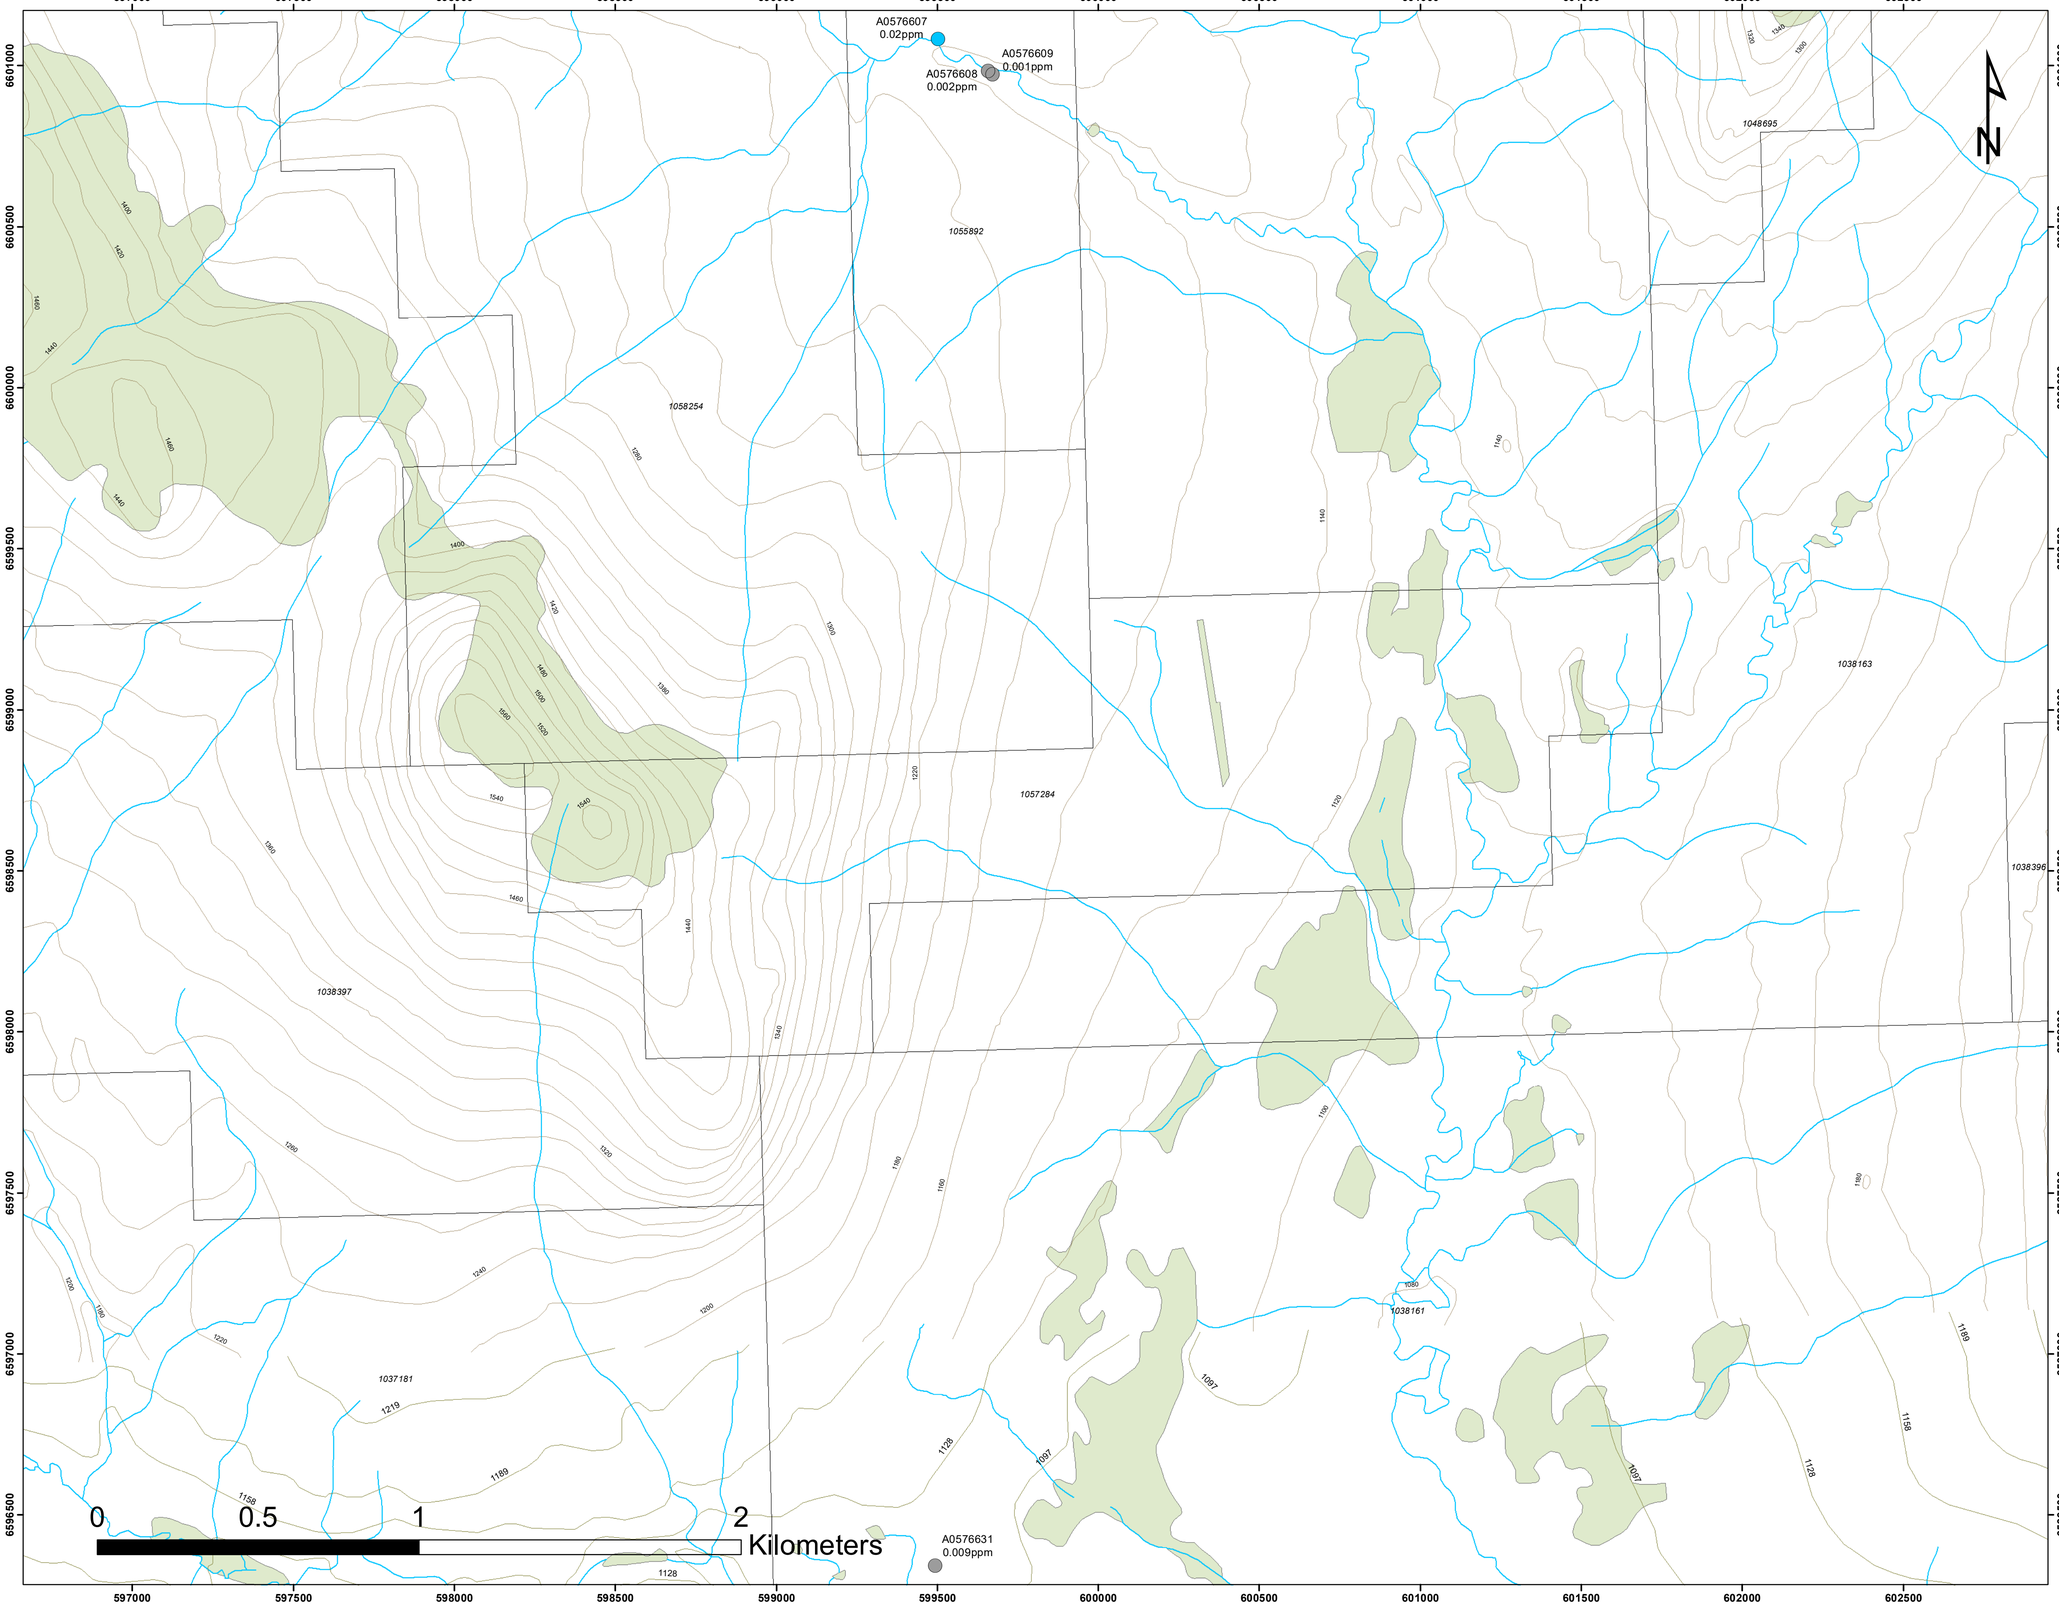

Au-GRA21	Au-ICP21	ME-MS61

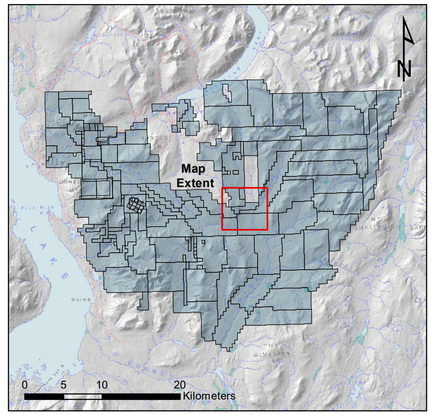

Appendix B2: Rock Sample Descriptions 2020

Sample ID	Northing (m)	Easting (m)	Sample Description
A0576552	6598877	585590	Cg quartz-carb-pyrite veining in M-IV. 0.5-1% ox py. Outcrop
A0576553	6598863	585592	Fine-cg quartz-carb-py vein breccia in float. Carb host rock
A0576554	6598958	585752	Minorly oxidized/carb altered and intensely sheared/graphitic Atlin Accretionary Complex (AAT). Minor, thin carbonate veinlets subparallel to foliation
A0576555	6599005	585670	Coarse quartz-py-carb-mariposite veining in Float with clasts of carbonatized host rock
A0576556	6599016	585547	Silicified, carbonatized and veined agrillite with minor, thin (~1cm) qtz-carb-pyrite veins in subcrop.
A0576601	6604031	587781	float - qtz in alt um
A0576602	6603530	587533	placer pit - rusty and w 2% diss py
A0576603	6603572	587491	float - angular qtz
A0576605	6600583	590257	o/c - brxx ch/argl w 50% qtz stwk
A0576607	6601084	599502	o/c - minor qtz stwk in cherty seds
A0576608	6600985	599658	o/c - 2.5cm qv
A0576609	6600975	599672	o/c - 2cm qv
A0576612	6607730	603321	o/c - rusty ch/argl with py bxwks
A0576613	6586338	591681	brxx lst, no silica or py
A0576614	6590395	590675	ands/finely lam volc seds, tr py
A0576615	6607177	602207	talus, qv in fg seds
A0576616	6607161	602153	talus, brxx seds with FeOx matrix
A0576617	6607409	602152	o/c rusty SLB chill margin
A0576618	6600632	579715	selective grab, o/c, 40cm qv with MoS2
A0576619	6606382	602308	20cm qv pieces in SLB talus
A0576620	6600627	579708	o/c broken 30cm qv with minor MoS2
A0576621	6600613	579709	selective grab, o/c, 50cm splayed qv with MoS2
A0576622	6600604	579697	o/c 30 and 50cm qvs
A0576623	6600538	580221	trenched o/c - 10cm qv w tr py in sil-cb um
A0576624	6600526	580213	o/c 1-2m wide aplite dyke with minor py
A0576625	6596096	602916	o/c 1-3cm qvs in rusty brxx seds
A0576626	6596429	603517	o/c 2cm qv in cherty rusty seds
A0576627	6596785	603685	o/c 5cm qv w minor py in cherty seds
A0576628	6596351	603570	rubbly o/c - qv pieces in chert
A0576629	6598154	604229	o/c 15cm qv w minor py in rusty chert/argl
A0576630	6597285	603871	rubbly o/c - 10cm qv with minor py
A0576631	6596342	599493	sub-crop, rusty brxx chert with ferricrete matrix
A0576632	6605652	594652	30cm qtz float pieces
A0576633	6606060	594321	Soil location - rusty argl with weather sus patches
A0576634	6606077	594283	talus - brxx seds with qtz matrix and tr py
A0576635	6606028	594180	talus - rusty argl with py bxwks
A0576636	6605061	594338	quartz float

A0576637	6605375	595052	rusty seds, minor bxwks, py and qvs
A0576638	6605290	595942	lg blocks (upto 1 metre) of qtz in talus
A0576639	6605063	596425	narrow band of sil um with silvery sus in talus
A0576640	6606510	595305	4cm qv in graph argl and mixed sed in rubbly o/c
A0576641	6606510	595155	rusty blk argl w py and bxwk in o/c
A0576642	6606385	595132	graph fault with rusty brxx layer in o/c
A0576643	6606569	594777	o/c very rusty argl with shiny py patches and bands
A0576644	6598917	605662	15 cm qv in o/c in road cut - prev sample BBR-03
A0576645	6596168	605544	qv dug up in placer bedrock
A0576646	6608854	603124	o/c - orange weathered SLB
A0576647	6608732	602690	talus/scree - orange weathered SLB w 1-3cm qvs
A0576648	6608225	602463	rusty, blk graph argl w py smears and vugs
A0576649	6608133	603630	very rusty blk argl w py bxwks, and patches to 0.5%
A0576650	6608052	604567	very rusty blk argl talus, fg tr diss py
A0576651	6611434	610741	o/c - hf seds beside SLB contact, with several 2-20cm intr dykes
A0576652	6611429	610728	Rusty hf seds, adjacent to SLB contact
A0576653	6611362	610758	fg, white aplite dykes to 20cm in seds near SLB contact
A0576654	6601262	581433	From old trench - 30cm qv
A0576655	6601262	581433	From old trench - list um w narrow qvs
A0576656	6601262	581433	From old trench - sil um w 1% diss py
A0576657	6601278	581419	From old trench - mp rich um w qtz stwk
A0576658	6601263	581410	From old trench - cb-sil ands w minor qv and py
A0576659	6601236	581487	Sil-cb alt um w qtz flooding and stwk
A0576660	6600221	581019	Golden View tunnel - o/c - 1-10cm qvs
A0576661	6600254	581006	50cm rusty qtz vein pieces outside GV adit
A0576662	6600171	581063	Shear in list um w qtz stwk and strong mp
A0576663	6600202	581065	2 m qtz veined and stwked o/c in pit above adit
A0576664	6601173	579373	fg, dk grn mafic intr w silvery sus (aspy?) - rubble from old trench
