Assessment Report
Title Page and Summary

TYPE OF REPORT [type of survey(s)]: Drilling, Soil Sampling

TOTAL COST: $2,475,176.27

AUTHOR(S): Tucker, Michael J. **SIGNATURE(S):** Michael Tucker

NOTICE OF WORK PERMIT NUMBER(S)/DATE(S): MX-10-216 **YEAR OF WORK:** 2020

STATEMENT OF WORK - CASH PAYMENTS EVENT NUMBER(S)/DATE(S): 5840568, 5840575

PROPERTY NAME: Frasergold

CLAIM NAME(S) (on which the work was done): Simon Gold (1077066), Southlimb2 (1045754), 2nd Limb (1044576), Central Syncline (1044577), Imperial (517996), Kay 10 (204347), H#1(547367)

COMMODITIES SOUGHT: Au

MINERAL INVENTORY MINFILE NUMBER(S), IF KNOWN: 093A339, 093A011, 093A150, 093A061

MINING DIVISION: Cariboo **NTS/BCGS:**

LATITUDE: 52 ° 18` ' 25.80 " **LONGITUDE:** -120 ° 38 ' 41.72 " **(at centre of work)**

OWNER(S):

1) Karus Gold **2)**

MAILING ADDRESS:

1601-277 Thurlow St.
Vancouver, BC V6C0C1

OPERATOR(S) [who paid for the work]:

1) **2)**

MAILING ADDRESS:

PROPERTY GEOLOGY KEYWORDS (lithology, age, stratigraphy, structure, alteration, mineralization, size and attitude):

Kootenay, Slide Mountain, Quesnel Terranes. Omenica Belt consists of Hadrynian to Paleozoic quartz-mica schists and gneisses of Snowshoe group. Gold, Tungsten. NW trending Eureka Syncline, Perseus Anticline. Vertical extension joints. Basalt, augite porphyry flows, tuffs, volcanic breccias. Gold occurs in quratz-iron-muscovite-pyrite vein stockwork best developed in the knotted phyllite (Ribbon and dilational veins).

1.0 INTRODUCTION

During 2020, Karus Gold ("Karus" or "the Company") completed a diamond drilling program and a soil sampling program on the Frasergold Property ("The Property") located in the Cariboo Regional of Central British Columbia. The Frasergold Property is part of a larger land package held 100% by Karus Gold called the South Cariboo Property, which consists of 121 mineral claims in two nearby blocks within the Cariboo Mining Division of central British Columbia. This larger land package covers 99,778 hectares (998 km^2), centred at 52° 23'N latitude and 120° 54' W longitude. The Property's northwestern end is referred to as the Gold Creek area and the southeastern end, including the Frasergold deposit and the Nova zone, as the Frasergold area. The Frasergold Property consist of 87 contiguous claims totaling 899.56 km^2 and is the focus of this report. KORE Mining Ltd. is the recorded owner of most claims, although a few are held in the name of their optionors.

The Property includes claims acquired directly from MTO by KORE, bought by KORE under the terms of two purchase agreements (Scott and Earl) or held under the terms of four option agreements (Bullion, Hen, Hawk and Tep), one of which (Bullion) has already vested. A 1-3% NSR royalty is applicable to certain of the claims held under purchase or option agreements, subject to variable buydown terms. Pursuant to the proposed Spin-out Transaction, KORE will be granted a 1% NSR on all claims in the Property which are not subject to other royalties.

The Property lies within the traditional territory of the Northern Shuswap Tribal Council which is in active land claim negotiations with the British Columbia Treaty Commission (BCTC, 2018). Land claims have not been settled in this part of British Columbia and their future impact on the Property's access, title or the right and ability to perform work on it remains unclear.

In 2020, a drill program and a soil surveying program was performed on the Property. This exploration program and the subsequent results are the basis for this Assessment Report. The drilling campaign took place in two separate blocks, from March 24 – April 20, 2020 and from July 2 – October 19, 2020. The drill program consisted of 23 individual diamond drill holes totaling 7,412.50 meters. All drill core was logged and sampled on site, and then shipped to a secure storage facility in Horsefly, BC. 2020 drill holes FG-20-376 to FG-20-386 were drilled across four complete cross sections over a strike of ~650 m designed to cross both upper and lower zones to allow for correlation both down dip and along strike of both the "Upper and Lower Zones". Holes FG-20-387 to FG-20-390 tested for lateral and down-dip mineralization in areas below sparse historical drilling. Drilling in 2020 tests over 1,780 m of strike length below the limits of historical drilling.

2.0 PROPERTY DESCRIPTION AND LOCATION

The Frasergold Property claims are located approximately 50 kilometers east of the village of Horsefly, BC, and 100 kilometers east of the city of Williams Lake, BC located on NTS map sheets 093A11, 093A10, 093A06, 093A07, 093A08, 093A03, 093A02 and 093A01 (Figure 1). The property outlined for assessment consists of 87 mineral claims covering 899.56 km², centred near 648150 E, 5806085 N (NAD83, Zone 10). The property runs south on either side of Crooked Lake and extends NW crossing Horsefly Lake and the western arm of Quesnel Lake. Several claims are part of the Frasergold property on the north side of Quesnel Lake, extending within 7 km of the Company's other property, Gold Creek. (Table 1, Figure 1).

British Columbia law requires property expenditures to maintain tenure ownership past the current expiry dates. These required expenditures are:

- C$5.00 per hectare for anniversary years 1 and 2
- C$10.00 per hectare for anniversary years 3 and 4
- C$15.00 per hectare for anniversary years 5 and 6, and
- C$20.00 per hectare for subsequent anniversary years.

Table 1: Mineral tenure summary data for the Frasergold Property (April 15, 2021).

The main activity took place in the Wells-Barkerville, Lighting Creek, Keithley Creek, Quesnel Forks-Likely and Horsefly River regions. These areas are still being worked for placer gold, though at a much reduced scale.

In more recent times the principal exploration and economic development targets in the central Quesnel belt-Cariboo region have been for lode gold- copper type deposits. This includes: alkalic intrusion-related porphyry copper- gold deposits; gold-bearing propyllitic alteration zones formed in volcanic rocks peripheral to some of the intrusions; auriferous quartz veins in the black phyllite metasedimentary succession.

Mount Polley copper-gold porphyry deposit (formerly Cariboo-Bell) is located 56 km northeast of Williams Lake and 8 km southwest of Likely. The deposit was discovered in 1964. Initial pit reserves are stated to be 48.8 million tonnes of material with an average grade of 0.38% copper and 0.56 g/t gold. The geological resource is estimated at 230 million tones with an average grade of 0.25% copper and 0.34 g/t gold (MINFILE). Total proven and probable reserves as of September 2019 are 53.7 million tonnes of 0.34% copper, 0.30 g/t gold and 0.90 g/t silver (www.imperialmetals.com) As of 2019, the mine was put on care and maintenance status.

The Quesnel River gold deposit ("QR") is 58 km southeast of Quesnel and 10 km west of Quesnel Forks. It was discovered in 1975 by multi-element geochemical soil surveys. In 1986, mineable reserves in three zones were 1.3 million tonnes with 4.7 g/t gold (Fox and Cameron, 1995). As of 1998, 1.06 Mt of ore grading 4.1 g/t gold had been processed. Mine operations were subsequently suspended due to low gold prices. Cross Lake Minerals Ltd. drilled several holes between 2003-2005. Production was formally announced in November 2007 but initial production yielded lower than expected ore production and grade. This, with increased costs during the winter months have made operations uneconomical. On December 22, 2008, Cross Lake Minerals Ltd. announced the decision of its board of directors to temporarily shut down operations at the QR Mine and in late 2009, International Wayside Gold Mines purchased the QR mine and mill and, in January 2010, changed their name to Barkerville Gold Mines Ltd. Early in 2010, Barkerville restarted mining operations at QR and announced the production of the first gold bar weighing 9.77 kilograms in September 2010 (MINFILE).

Beginning in 1933, auriferous-bearing quartz veins hosted in metasedimentary rocks (e.g. phyllite/black shale units) have been found on Spanish Mountain 7 km southeast of Likely and Eureka 57 km east of the community of Horsefly. During the 1980's, a series of exploration programs were conducted in this area by several various mining companies, currently held by Spanish Mountain Gold. In the 1980s gold veins were discovered on Frasergold property (KORE Mining/Karus Gold). Between 1980 and 1994, exploratory drilling delineated an auriferous-bearing horizon traceable for 10 km along strike. Within this horizon, a zone 800 m to a depth of 100 m was defined containing a resource of 3.2 million tonnes grading 1.71 g/t Au (Panteleyev et al, 1997).

4.2 Property Exploration History

The first record of work on the Frasergold property is from the prospecting work of Clifford E. Gunn in the late 1970s. He staked the original claims over an area with a panned gold anomaly in Frasergold Creek. Prospecting continued through to 1982 when Keron Holdings Ltd. and NCL Resources Ltd., optioned the property. They conducted geological mapping, soil and rock geochemistry surveys which resulted in delineation of anomalous gold values over a 10 km strike length.

Eureka acquired the property in 1983 and optioned it to Amoco Canada Petroleum Co. Ltd. ('Amoco'). In 1983 and 1984, Amoco collected soil and rock samples, conducted limited electromagnetic and magnetic surveys, and drilled 14 diamond drill holes totalling 4,519 meters. Highlights from their work include visible gold in 12 of 14 drill holes and intersections ranging from 0.7 g/T Au over 7.5 meters and 10.6 g/T over 1.5 meters. Amoco terminated the option agreement and returned the property to Eureka after these programs.

In 1985 and 1986 Eureka collected additional soil and rock samples, completed targeted trenching and bulk sampling, performed an I.P. geophysical survey, reverse circulation drilling, diamond drilling and metallurgical testing. Four reverse circulation holes totalling 406.5 meters and eighteen diamond drill holes totalling 2,021 meters was completed in this time. Drilling highlights include 1.8 g/t Au over 39.0 meters and 40.8 g/t over 1.5 meters. The gold content of the bulk sample taken in 1985 was determined to be 4.26 g/t Au (Marchant 1985).

Southlands Mining Corporation ('Southlands') undertook an option on the Frasergold property in 1987 with Eureka as the operator. During this time, Southlands sampled eight trenches totalling 660 meters, and completed 21 reverse circulation drill holes totalling 1,710 meters. Southlands optioned a portion of their interest to Sirius Resources Corp. ('Sirius') in late 1987. Sirius completed 17 diamond drill holes totalling 1,536 meters, 37 reverse circulation holes totalling 2,456 meters, and excavated 524 tonnes of material from 184 meters of underground workings for bulk sampling.

In 1988 Sirius collected 478 soil samples, 27 rock chip samples and completed 6 diamond drill holes totalling 862 meters in the Eureka Peak zone. Drilling highlights included numerous 1 meter intervals with grades up to 7.93 g/t Au (Campbell, 1989).

In 1989, Eureka collected 284 underground channel samples, 74 muck samples from untested rounds and 297 drill core samples during a reclogging and geological mapping campaign of the underground workings. In 1990, Eureka and Asarco Company of Canada Ltd. (Asarco) entered into a joint venture agreement. In 1990 and 1991, Asarco drilled 25 diamond drill holes totalling 4,687.2 meters, and 156 reverse circulation holes totalling 15,720 meters. Four 1.25 ton bulk samples collected in 1990 were tested by Bacon, Donaldson and Associates Ltd. The average composite grade of these bulk samples was 2.12

g/t Au with preliminary gold recoveries ranging from 87 to 92%.

In 1991, underground workings were lengthened by 114 meters, producing 1,591 tons of material divided into nine lots for off-site milling. The average grade of this material was 0.84 g/t. A 1991 report by K.V. Campbell, W. Gruenwald, L. Walters and M. Schatten used drill hole and underground sample data to conclude that an "in-situ resource" of 3,396,970 tons with an average grade of 1.56 g/t Au was present within the Main Zone of the Frasergold property (Campbell, et al., 1991). However, the in-situ resource figure presented above does not conform to the currently accepted CIM standards or NI43-101 Standards of Disclosure for mineral projects; they are presented solely for historical context and should not be relied upon.

Asarco commissioned James Askew Associates Inc. ('Askew') to conduct a pre-feasibility study of the Frasergold project in January 1991. Askew completed "in-situ Reserves/Resources" for the projects using hand drawn polygon methods based on data collected by Asarco and other reliable historical data. A cutoff grade of 0.933 g/t Au, an upper limit of 18.66 g/t Au, and specific gravity of 2.7 was used for their calculations. The result was presented as 6,612,675 tons with an average grade of 1.71 g/t Au to represent 362,825 ounces of gold (Askew, 1991). The volume and gold contents of the Askew (1991) study do not conform to the "CIM Standards on Mineral Resource and Reserves, Definitions and Guidelines", issued in 2000 and modified with adoption of the "CIM Definitions Standards – For Mineral Resources and Mineral Reserves" in 2005. The resource estimate provided by Askew (1991) study does not use CIM compliant calculations and therefore does not fulfill NI43-101 reporting standards and should not be relied upon. The study is relevant to the current review as an indication of the depth and scope of exploration conducted on the property.

Between 1980 and 2007, it is estimated that approximately $11.26 million had been expended on exploration of the Frasergold property. 344 holes totalling 39,582 meters along with 294 meters of underground drifts were completed during this time.

In 2007, Hawthorne conducted a drill program to test four previously defined zones of interest; including the Main Zone, Grouse Creek West Zone, Grouse Creek East Zone and the Frasergold Zone. 16 HQ sized diamond drill holes were completed totalling 3,615 meters. In 2008, Hawthorne drilled an additional 58 NQ sized diamond drill holes totalling 10,414 meters. Silt, soil and rock samples were collected at locations considered distal to the Main Zone.

In 2009, Gary Giroux calculated a mineral resource for the Frasergold deposit that was then compliant with NI 43-101 reporting standards. Using a cut-off grade of 0.5 g/t Au, Campbell and Giroux (2015) reported Measured + Indicated (M+I) resources of 15.17 million tonnes at 0.776 g/t Au, and Inferred Resources of 27.49 million tonnes at 0.718 g/t Au.

In 2011, Teslin Resources conducted an 11 field exploration program and collected 565 soil, 7 rock and 6 silt samples over three areas of interest. Compilation of digital geological and geochemical data throughout the fall of 2011 led to a new geological interpretation and recommendations for future exploration programs.

A short reconnaissance program in 2015 utilized a Bell 206 helicopter from Highland Helicopters of Williams Lake B.C. The program collected 71 soil samples over 4 line kilometers as follow up to a previously defined anomalous copper and gold in soil trend. The objective of the field work was to assist in the planning of further exploration on the property later in the year. An additional 9.5 line kilometers totalling 190 soil samples was recommended for future work.

In 2016, Eureka conducted a soil sampling program immediately west of the 2015 ("northwest extension grid") soil grid in an effort to explore for gold mineralization along an interpreted geophysical trend. The objective of this program was to assist in the planning of an exploration drill program in 2017.

Since their reverse take-over of Eureka in October 2018, KORE has completed 1,077 m of drilling at the Nova zone in the FG Gold area and 5,829 m of drilling at the Frasergold deposit, also in the FG Gold area plus the drilling completed during this campaign. In November 2020, Equity Exploration Consultants Ltd. was contracted to complete an NI43-101 on the area, including the Frasergold Property. No ore production has been reported from the Property.

5.0 GEOLOGICAL SETTING

5.1 Regional Geology

The Frasergold property straddles the boundary between two major tectonic belts of the Canadian Cordillera. The Omineca Tectonic Belt lies to the east of the property and the Intermontane Belt lies on the west and central portions of the property. Three regional tectonostratigraphic Terranes are present; Kootenay, Slide Mountain and Quesnel Terranes. Slide Mountain and Quesnel Terranes form part of the Intermontane Belt which has been accreted eastward onto the Kootenay Terrane of the Omineca Belt. The tectonic boundary between these two Belts is referred to as the Eureka Thrust (Figure 3).

In the project area, the Omineca Belt is characterized by Hadrynian to early Paleozoic quartz-mica schists and gneisses of the Snowshoe Group. These rocks are considered part of the Kootenay Terrane and described as pericratonic, intensely deformed, variably metamorphosed rocks. The Omineca Tectonic Belt is known for its prevalence of gold and tungsten mineral occurrences such as those in the Barkerville mining camp north of the property. Rocks of the Quesnel Terrane are

described as metavolcanic and phyllite of Permian to Jurassic age. Imperial Metal Corporation's Mount Polley copper-gold porphyry mine 40 kilometers north of Frasergold occurs within similar Quesnel Terrane rocks.

The northwest trending, shallowly plunging, Eureka Syncline and Perseus Anticline are the dominant interpreted structures in the region. Well developed, northeast striking, vertical extension joints are manifested in the drainage pattern of the Eureka Syncline. Toward the nose of the Syncline, southeast of the project area, the Syncline becomes overturned to the southwest with axial planes dipping steeply northeast; however, the Syncline is considered upright in the area of the property. Rocks in the core of the Eureka Syncline are comprised of basalt, augite porphyry flows, tuffs and volcanic breccias metamorphosed to a low grade. The basal contact of the volcanic rocks with underlying sedimentary rocks of the Quesnel River Group is interpreted as a fault.

Regional metamorphism has affected all pre-Tertiary rocks in the project area. Lowest metamorphic grades are exposed along Horsefly River where primary sedimentary rock textures are preserved. Increasing metamorphic grade is documented towards the Perseus and Boss Mountain Anticlines; ranging from medium grade amphibolite facies up to kyanite-staurolite-fibrolite stability zones in the cores of the Anticlines.

The northwest trending MacKay River valley marks a zone of extensive vertical or near vertical fracturing. Along the valley, the upper Triassic Quesnel River Group is flanked by two or more competent units; younger intrusive and volcaniclastic rock to the south and older amphibolite, schist and gneiss to the north and east. Shearing and faulting is concentrated within the incompetent phyllites striking along the valley.

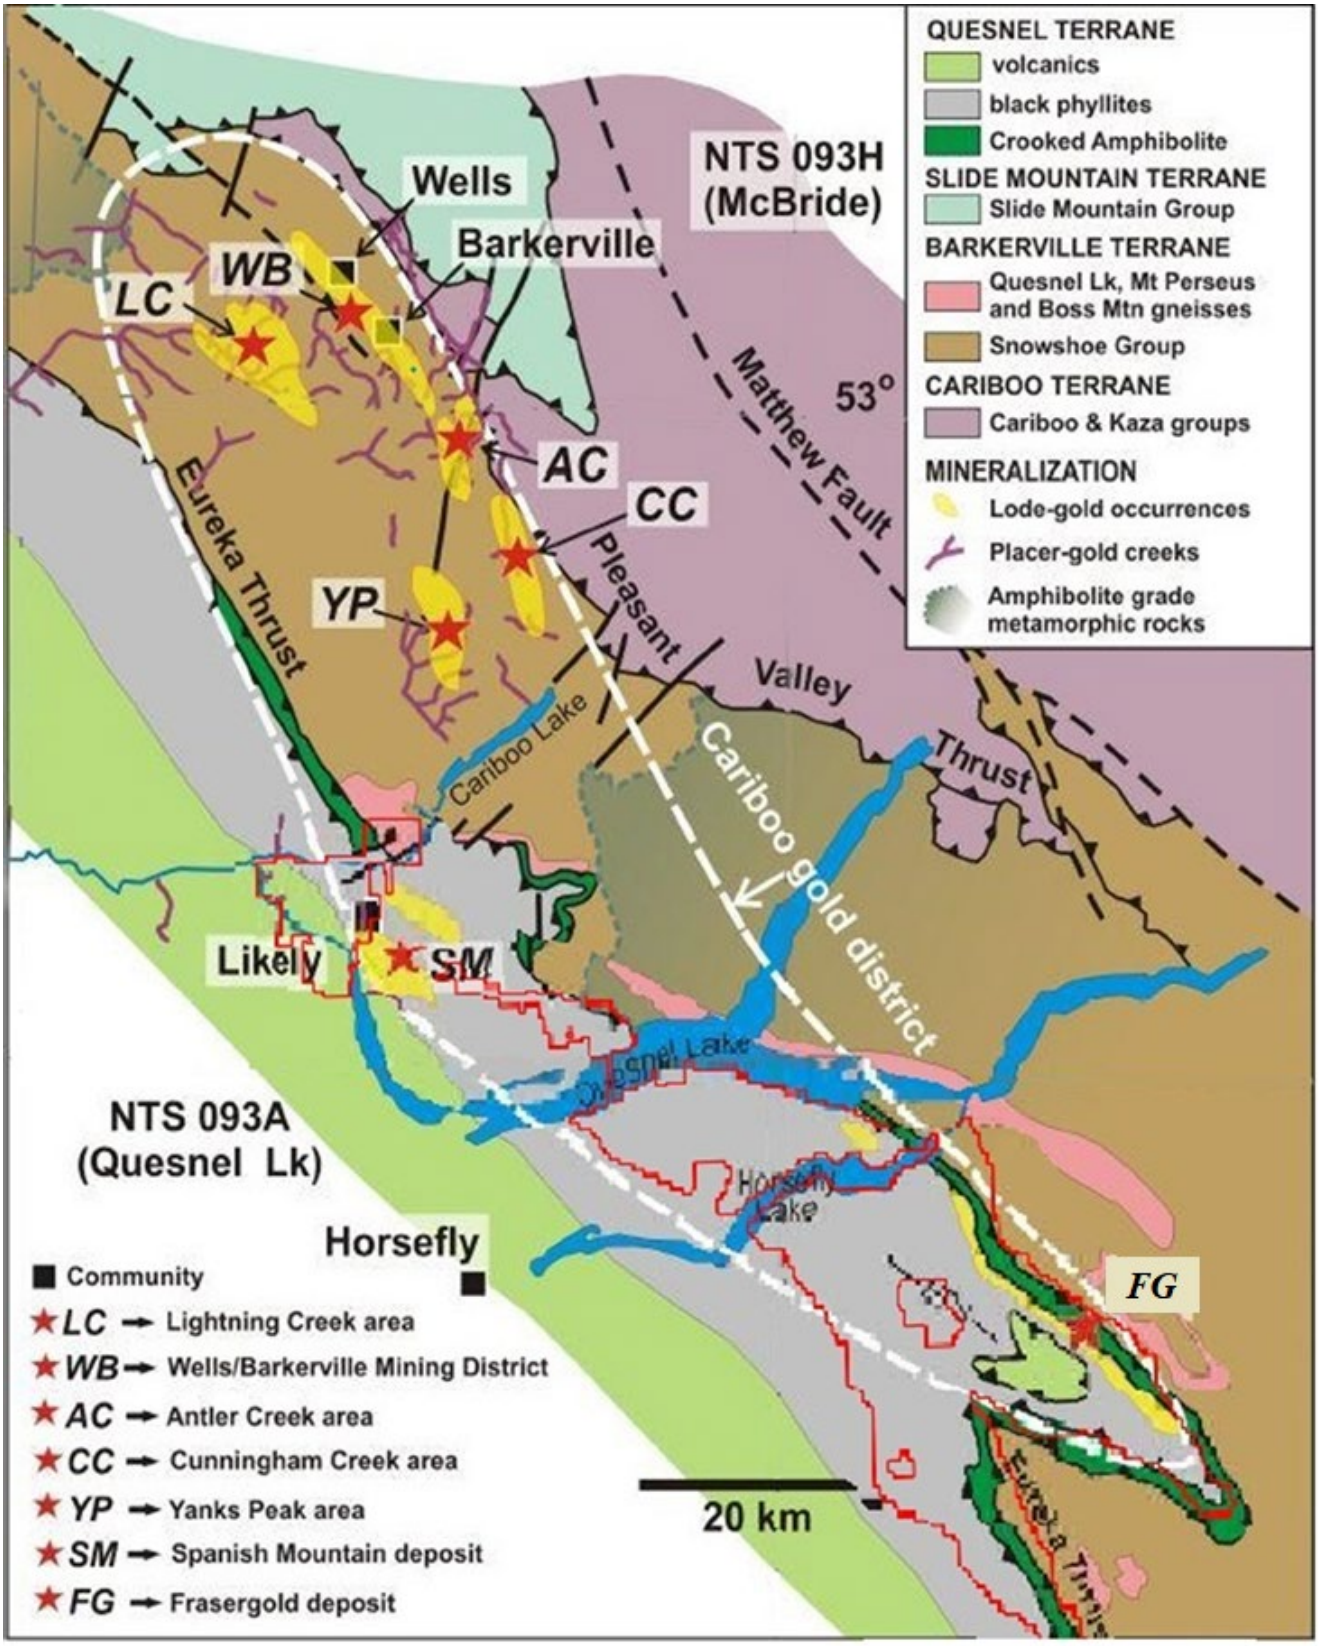

Figure 3: Regional geology map of South Cariboo (Frasergold can be seen as the SE property surrounding Likely, BC) (derived from Massey et al, 2005)

5.2 Regional Mineralization and Deposit Types

The Cariboo Gold District (Figure 3) is a part of the eastern Cordilleran gold belt (Allan et al., 2017) that encompasses a 25 x 150 km northwesterly-trending region of orogenic gold mineralization and their derived placer gold deposits. It is hosted within polydeformed, medium grade metamorphic rocks of the Barkerville Terrane's Snowshoe Group to the north in the Wells-Barkerville area and less deformed and less metamorphosed black phyllites of the Quesnel terrane to the south in the area. Cu-Au porphyry deposits occur west of the eastern Cordilleran gold belt within the Quesnel terrane. Historical work has demonstrated potential for both deposit types in the area and they are described below.

5.2.1 Orogenic Gold

Orogenic gold deposits form many of the most significant gold-producing belts in the world (e.g. Kalgoorlie in Australia, Timmins in Ontario, and Ashanti in Ghana). Their name reflects a temporal and spatial association with late stages of orogenesis (Groves et al., 1998; Goldfarb et al., 2001; Goldfarb et al., 2005; Dubé and Gosselin, 2007) with many deposits developing between 2.8 to 2.55 Ga (Archean), 2.1 to 1.8 Ga (Early Proterozoic) and 600 to 50 Ma (Phanerozoic). Orogenic-style mineralization within the eastern Cordilleran gold belt, including the Cariboo Gold District, was deposited between 180-140 Ma.

The Phanerozoic deposits include a relatively high number that are hosted in sedimentary rocks (the "sedimentary hosted vein (SHV)" deposits of Klipfel, 2005) that were developed on passive margins and then deformed and metamorphosed in regional-scale fold-and-thrust belts. Hydrothermal fluids generated during this fold-and-thrust event ascended along related faults to deposit gold. Orogenic gold systems, including SHV deposits, are typically associated with deep-crustal fault zones like those marking terrane boundaries. Large gold camps are commonly associated with curvatures, flexures and jogs along these deep fault zones, with gold typically concentrated in dilational structures, at intersections of multiple structures, and/or competent or reactive lithological units. The relative timing of mineralization is typically syn- to late-kinematic and syn- to post-peak metamorphism.

Gold in all orogenic deposits occurs in structurally controlled vein systems that include shear and related extension veins, as well as hydrothermal breccias. Individual veins range anywhere from <1 cm to 10 m in width and form sets with continuity of up to 5 km along strike, 3 km in depth, and 1 km in width. In SHV deposits, gold is sporadically associated with As, Sb, and/or W (Klipfel, 2005).

The main economic mineral is native gold, which in SHV deposits either lacks correlation with sulphide or occurs with arsenopyrite. Sulphide minerals typically comprise less than 5% of the volume of any orogenic deposit. The main gangue

minerals are quartz and carbonate with variable abundance of white mica.

The Wells-Barkerville Camp consists of quartz-carbonate-pyrite veins and pyrite replacement-style deposits hosted in more competent metasedimentary rock units. $^{40}Ar/^{39}Ar$ ages indicate emplacement of early quartz veins between 155- 147 Ma followed by Au-bearing replacement zones and extensional veins from 148-139 Ma, most likely during the waning stages of D2 (Rhys et al., 2009). Approximately 2/3 of the gold was produced from vein deposits and the remainder from replacement style (Allan et al., 2017).

The Spanish Mountain deposit occurs on the other side of the terrane boundary from Wells-Barkerville, within carbonaceous argillite, siltstone, and greywacke of the Quesnel terrane. The deposit lies 6 km east of the Gold Creek Property and is a bulk tonnage gold deposit that also includes local higher-grade gold-bearing quartz. The most economically significant gold mineralization (>1 g/t Au) occurs in wide zones (10–135 m), hosted mainly within the black argillite unit as a set of stacked and lensoidal bodies. At least two periods of mineralization are recognized within these mineralized bodies; an earlier phase of disseminated pyrite and pyrite-quartz veinlets, and a later phase of fault-related quartz veining. The highest gold grades in the Spanish Mountain deposit are typically associated with quartz veins, particularly in association with mineralized faults (Mortensen et al., 2011). Mineralization is syn- to post-D2 and likely occurred between 161-150 Ma, broadly overlapping with the onset of pre-mineral brittle deformation in the Wells-Barkerville Camp (Allan et al., 2017). The Frasergold deposit is comprised of stratabound sets of white quartz veins hosted in a distinct, "knotted", Fe-carbonate porphyroblastic, carbonaceous phyllite. The veins form complex sets that are developed in concentrated zones several metres to tens of metres wide, which collectively dip to the southwest and form a bulk tonnage low-grade gold deposit (Mortensen et al., 2011).

5.2.2 Cu-Au Porphyry Deposits

Mount Polley is an open pit and underground Cu-Au-Ag porphyry mine located 5 km southwest of the Gold Creek Property. The deposit is hosted in a high level, northwest-trending, alkalic stock ("Mount Polley Complex") that was emplaced into metasedimentary and metavolcanic rocks of the Nicola Group at c. 205 ± 3 Ma (Mortensen et al., 1995). Mineralization occurs mostly within magmatic- hydrothermal breccias, with lesser amounts hosted within veins, disseminations, and skarn (Pass et al., 2014). The silica-undersaturated nature of mineralization and associated magmatic rocks is somewhat unusual, with alteration and vein minerals consisting mostly of carbonate and garnet. The mine is currently on care-and-maintenance with reserves of 73.6 million tonnes at 0.274% Cu, 0.293 g/t Au, and 0.563 g/t Ag, as well as measured and indicated resources of 247 million tonnes at 0.2665% Cu, 0.262 g/t Au and 0.667 g/t Ag (Brown et al., 2016). The author has not verified the resources at Mount Polley and the mineralization there is not necessarily indicative of mineralization on the Gold Creek Property.

5.3 Property Geology

Geological mapping of the Frasergold property was undertaken by Kerr Dawson and Associates (1981), G. Belik & Associates (1984), Campbell (1989), Kerr and Campbell (1990) and Campbell et al (1991). Historical geological mapping campaigns were focused on specific areas of interest and no property wide compilation has been created to date. The following discussion of the property geology is based on information contained in the Historical mapping campaigns.

In the Frasergold property, the middle to upper Triassic Quesnel River Group is underlain by a thick sequence of dark grey to black, iron-carbonate porphyroblastic, lustrous phyllite, locally referred to as the "knotted phyllite". The knotted phyllite contains minor intercalations of grey phyllite, lenses and layers of light grey massive to phyllitic siltstone and lenses of grey silty limestone. Underlying this sequence is a grey, silty and locally calcareous phyllite. At the base of the knotted phyllite unit in the northwest extension area lies a unit of pale carbonate-quartz-sericite-chlorite schist.

In the vicinity of the Eureka Peak Zone and Nova Zone, upper Triassic and lower Jurassic Quesnel River Group rocks of the Quesnel Terrane consist of arc volcanics, volcaniclastics and comagmatic intrusive phases of hornblende-augite porphyritic quartz monzonite, monzonite and intrusive breccia. Quesnel River Group volcanic and intrusive rocks are overlain by Jurassic arc-derived clastic rocks (Monger et al, 1982). The Quesnel Terrane is recognized for its copper, gold and molybdenum mines and showings such as those at Highland Valley, Boss Mountain, QR and Mount Polley.

The Main Zone of known gold mineralization on the Frasergold property is hosted by a fine-grained turbiditic sequence dominated by black carbonaceous phyllite with thin interbeds and lenses of fine-grained metasandstone. This sequence is considered to form part of the middle to late Triassic Quesnel Terrane that lies directly on the Crooked Amphibolite of the Slide Mountain Terrane, which in turn is structurally emplaced on the underlying Barkerville Terrane by the Eureka Thrust (Panteleyev, 1996; Bloodgood, 1987, 1990). All of these features are affected by formation of the structurally late, regionally northwest trending Eureka Syncline; an open fold, the axis of which passes beneath Eureka Peak to the southwest of the Main Zone. The Main Zone lies on the northeast limb of the syncline.

Bedding in the Main Zone dips moderately to shallowly southwest although local variations are thought to result from structural deformation related to the formation of the Eureka Syncline (D_2 of Rhys, 2007). Regional mapping indicates the overall sequence is upright.

Two dominant phases of deformation (D_1 and D_2) are believed to affect rocks of the Quesnel Terrane exposed on the

5.4 Property Mineralization

Gold mineralization occurs in or is associated with development of quartz – Fe carbonate – muscovite – pyrite vein stockwork. The stockwork is best developed in the knotted phyllite unit. Stockwork zones locally concentrate in zones 10s of meters wide and are observed as dominantly stratabound. Fe-carbonate alteration of specific lamina and carbonate porphyroblast development within the knotted phyllite unit are observed to extent well outside immediate areas of veining.

Two styles of veining are recognized in mineralized areas of the Main Zone; ribbon veins and dilation veins (Rhys, 2007). Ribbon veins refer to bedding parallel veins and veinlets up to 30 centimeters thick. They are traceable for several meters in surface and underground exposures. They are the most abundant style of veining in the Main Zone. Dilation veins refer to 15-50 centimeter thick quartz-carbonate veins that develop at high angles to bedding. Ribbon and dilation veins, although discordant, show no crosscutting relationships, they have the same mineralogy and are equally deformed by both D_1 and D_2, suggesting they are coeval (Rhys et al., 2009).

Two styles of gold mineralization appear to be present on the Frasergold property. Gold-quartz infill vein mineralization in the Main Zone, hosted within knotted phyllite on the east limb of the Eureka Syncline is classified as an orogenic lode-gold deposit type (Goldfarb et al., 1986). Copper-gold-silver replacement style and disseminated mineralization within massive to semi-massive sulphide stringers in the Nova Zone hosted by hornblende-pyroxene porphyritic quartz monzonite and monzonite breccia is tentatively described as peripheral to a copper-gold porphyry deposit type.

Table 2. Summary of showings on the Frasergold Property.

MinFile No.	Name	Status	Commodit ies	Deposit Type
093A 339	Jolly Jack	Showing	Ag-Pb-Zn +/- Au	Polymetallic veins

093A 061	Kusk	Prospect	Au-Ag-Zn-Pb-Cu	Stratbound veins

6.0 2020 SOIL SAMPLING PROGRAM

101 soil samples were taken from several areas north of Crooked Lake, in the south of the Property. These soil surveys were undertaken on Claims # 1077066, 1045754, 1044576 and 1044577 in order to trace the south limb of the syncline to the northwest. The samples were taken using a soil auger and non-permeable sample bags, targeting the b-horizon. Samples were ideally taken in undisturbed soils, but this was not always possible with the extent of logging in the area. The soil grids also encountered outcrop so grids were amended in the field. All soils were assayed for Au, Ag, As, Cu and Zn using a method of drying samples at 60° C followed by sieving 100 g to a -80 mesh. The samples were then assayed using 1:1:1 Aqua Regia digestion ICP-MS analysis. Assaying was completed by Bureau Veritas Commodities based in Vancouver, BC. A table of sample data including coordinates and assays can be found in the Appendix. Soil assays certificates are also located in the Appendix.

The primary goal for the limited soil program in 2020 was to search for any evidence of gold mineralization on the south limb of the Eureka syncline. While the coverage of the program was limited due to access and weather issues, a small group of anomalous gold samples does appear to correlate with the hypothesized projection of the knotted phyllite unit in the area of coverage. While the results from one days samples in a limited area should be treated with some caution, samples with Au up to 105 ppb in an area where mineralization was hypothesized certainly warrants a follow up soils program to verify the initial results and expand any anomalous results to the NE and SW along the projected south limb.

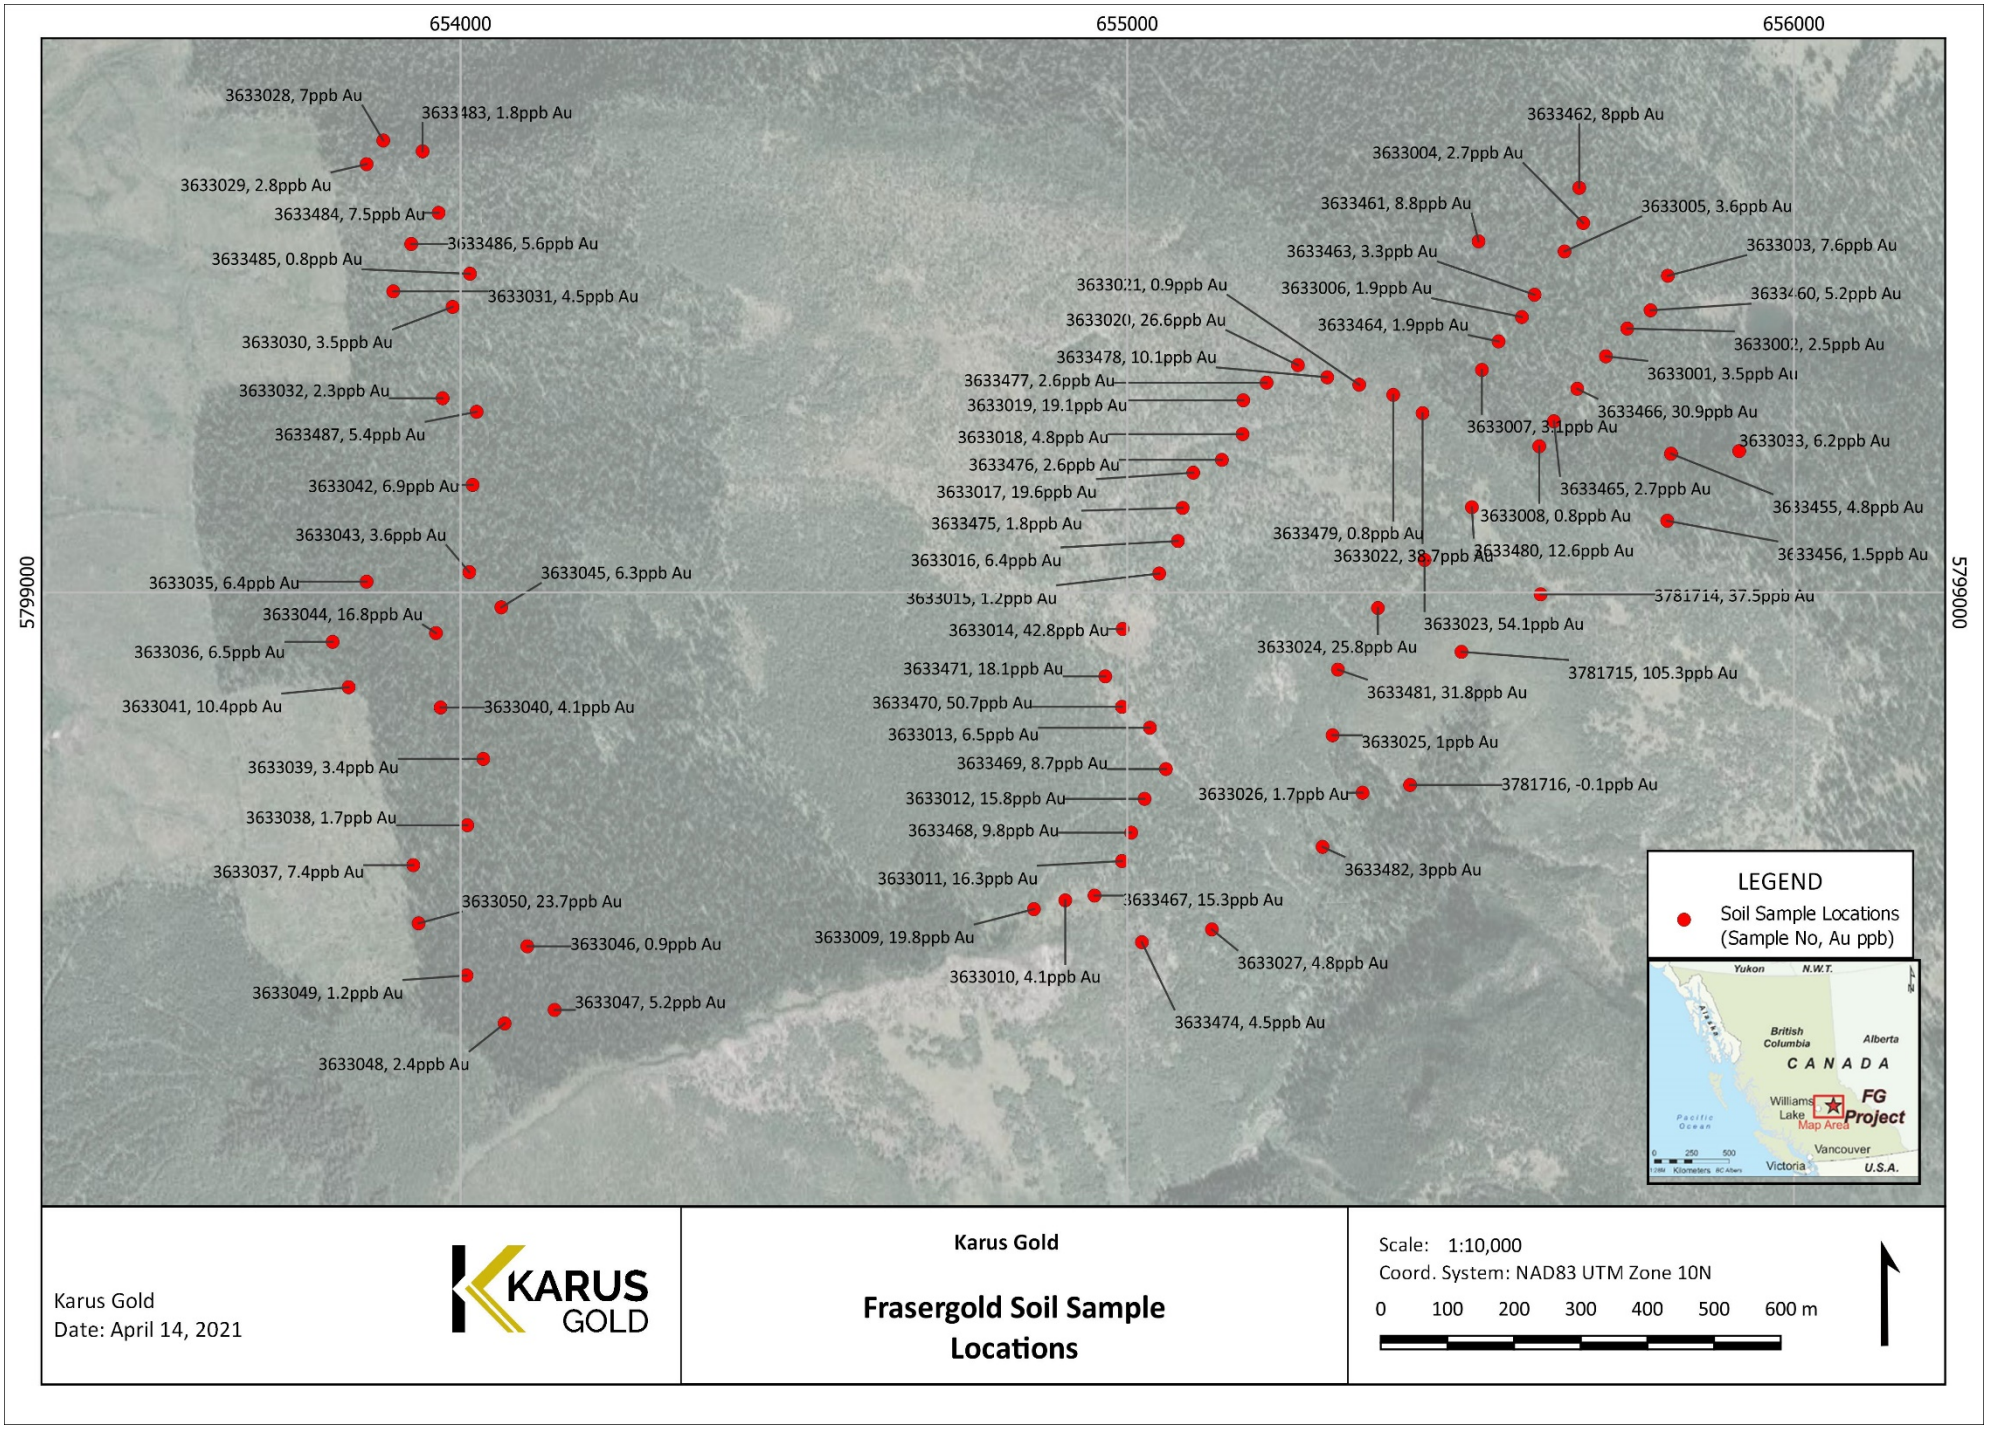

Figure 6a: Soil sample locations with values (Sample No, Au ppb)

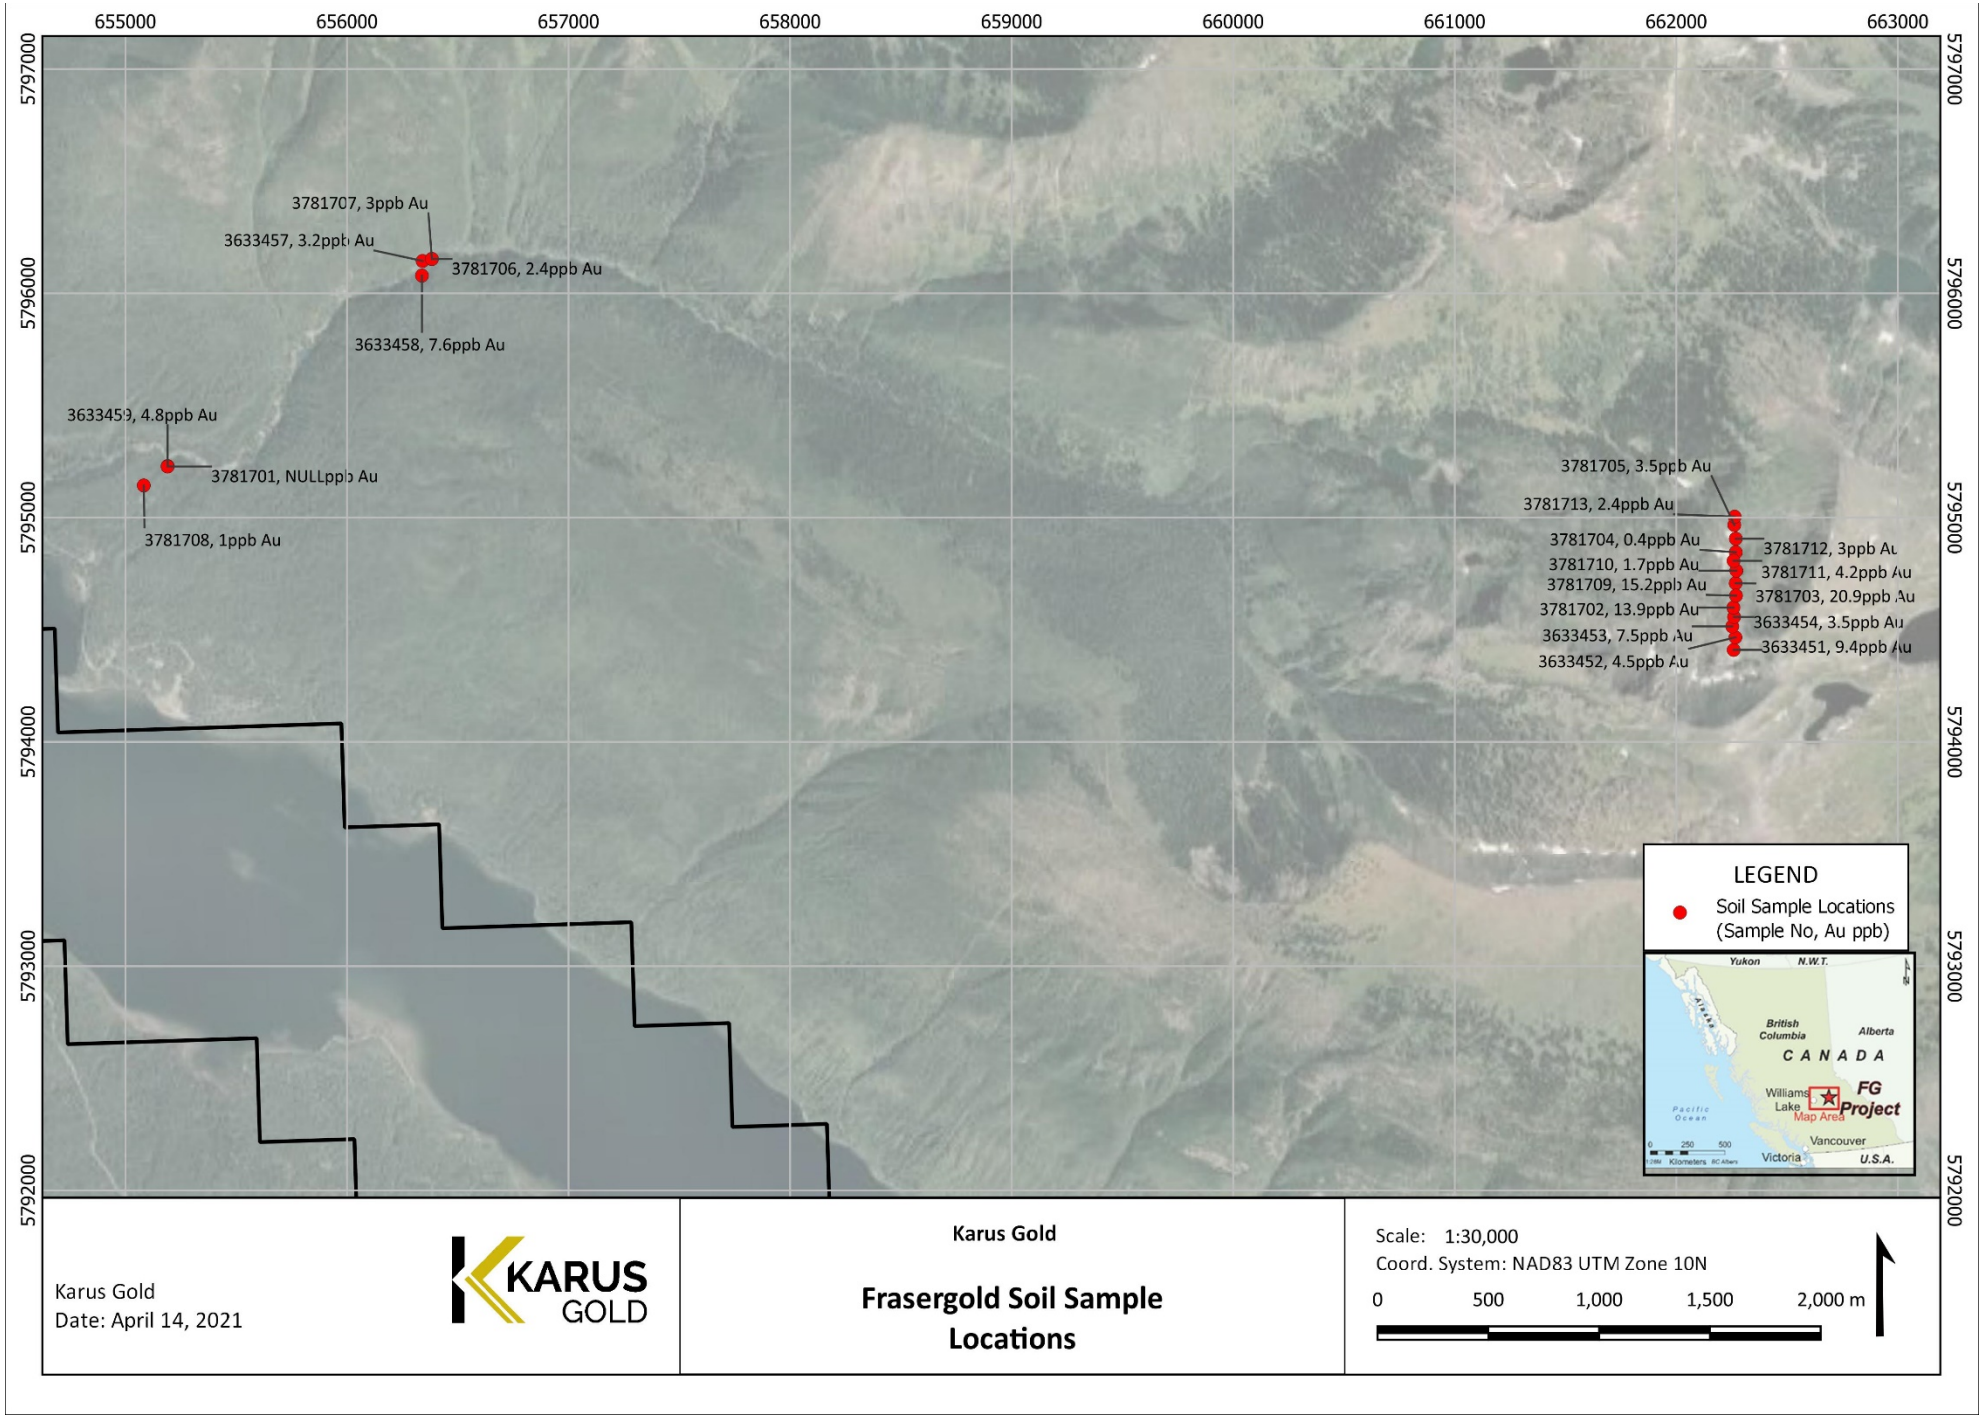

Figure 6b: Soil sample locations with values (Sample No, Au ppb)

7.0 2020 DIAMOND DRILL PROGRAM

The program took place at two separate times during 2020. The first drill campaign commenced with Paycore Drilling of Valemount, BC arriving on site March 22, 2020, with drilling commencing on March 24th. The duration of the program was a sum total of 27 days completing 8 HQ diameter diamond drillholes for a total of 1583 meters. The second part of the 2020 campaign commenced with Paycore arriving on July 1, with drilling commencing on July 2, completing on October 19, 2020. This programs duration was a total of 110 days completing 15 holes for 5829.5 m. The total drilling between the campaigns is 7412.5 m. The drill program was designed to step-out up to 200 m downdip and test nearly 2 km along strike. The program targeted the continuation of known gold-mineralized [orogenic] quartz veins further down-dip and along strike within prospective and un-tested regions of the targeted [phyllite] host rock. All dip test results are available in Appendix D and in their respective PDF log in Appendix A.

Table 3. Drill collar data from the 2020 Karus drill campaign

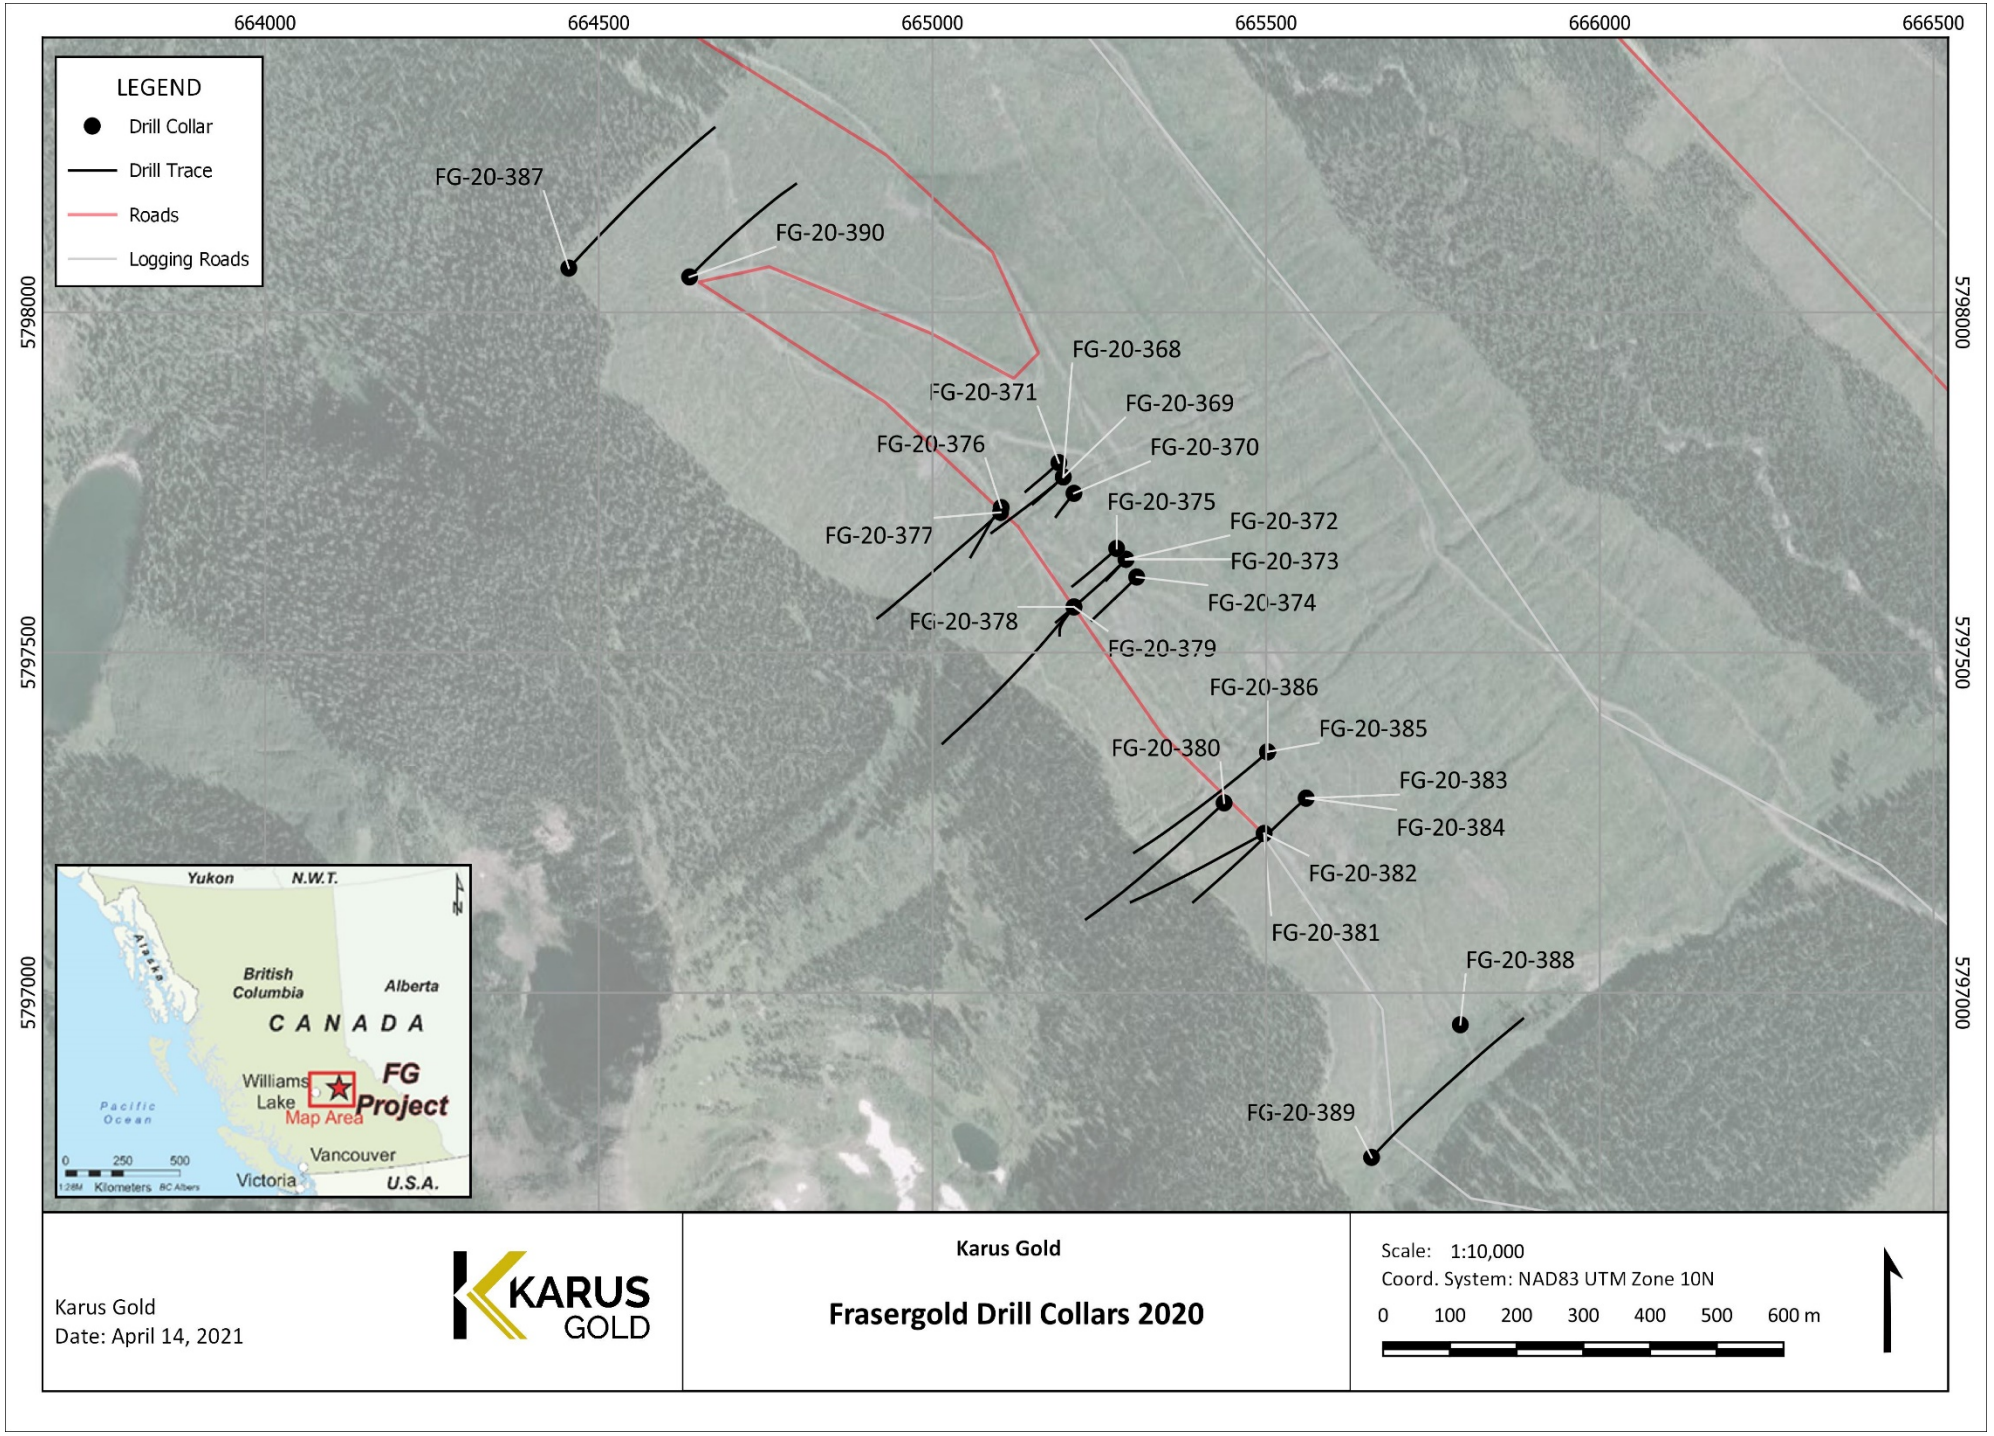

Figure 7. Frasergold Property 2020 drilling collar locations

7.1 Sample Collection and Shipping

Once the drill core was received from the drill site, individual samples were determined, logged for geological attributes, sawn in half, labelled, and bagged for assay submittal. The remaining drill core was then stored at a secure site in Horsefly, BC. The Company inserted quality control samples at regular intervals within the sample stream which included blanks, preparation duplicates, and standard reference materials with all sample shipments intended to monitor laboratory performance. Sample shipment was conducted under a chain of custody procedure.

7.2 Analytical Methods

Drill core samples were submitted to Bureau Veritas' analytical facility in Vancouver, British Columbia for preparation and analysis. Sample preparation included drying and weighing the samples, crushing the entire sample, and pulverizing 250 grams. Analysis for gold was by method FA450: 50g fire assay fusion with atomic absorption (AAS) finish with a lower limit of 0.005 ppm and upper limit of 10 ppm. Gold assays greater than 10ppm are automatically analyzed by method FA550: 50g fire assay fusion with a gravimetric fusion. Metallic screen techniques were employed to assay gold mineralized zones thought to contain coarse gold. Approximately 1,000 grams of coarse reject material are pulverized and screened. Two splits of the fine fraction are assayed, as well as all material that does not pass through the screen (the coarse fraction). The final gold assay reported is a weighted average of the coarse and fine fractions. Bureau Veritas is accredited to the ISO/IEC 17025 standard for gold assays, and all analytical methods include quality control materials at set frequencies with established data acceptance criteria. Parameters for Bureau Veritas' internal and Karus Gold's external blind quality control samples were acceptable for the analyses returned. All assays with sample data are available in the Appendix.

7.3 Sampling Discussion

Quality assurance and quality controls were thorough during the program to support the due diligence nature of the exploration work to aid in future program procedures and ensure credibility of historical works. 7306.5 m of the 7412.5 m of core received was sampled and sent for assay. A total of 6, 163 samples were collected with an average sample length of 1.19 m. QA/QC protocols included assaying 158 Blanks and 453 Standards (CDN-GS-1W, CDN-GS-1Z, CDN-GS-4E CDN-GS-P1A, CDN-ME-1308, CDN-ME-1708). 153 field duplicates and 129 prep duplicates were completed in field and sent for analysis as well. Bureau Vertitas also completed 315 pulps. Due to coarse visible gold, metallic screening assays provide a much more representative sample versus conventional fire assays. Historical drilling and assays had limited and sporadic metallic screen analyses which may have underestimated historical gold grades.

7.4 Significant Results

Table 4: Significant Results from the 2020 Frasergold Drilling Campaign

Drill Hole	Zone	From (m)	To (m)	Length (m)	Au (g/t)

7.5 Significant Results Discussion

FG-20-376, 100 m from the discovery hole FG-20-377 (14.3m of 6.4 g/t gold) returned 20.9m of 2.9 g/t gold, confirming the continuity of gold mineralization within the Lower Zone discovery and includes:

- ***12.4 m of 4.3 g/t gold at 239.4 m downhole, including:***
- ***1 m of 38.0 g/t gold at 240.3 m downhole***

FG-20-378 returning 62.3 m of 1.7 g/t gold confirms higher grades than those previously reported in FG-20-368 including:

- ***6.6 m of 9.7g/t gold at 195.9 m.***

FG-20-382 extends the continuity of Upper Zone gold mineralization a further 100m down dip of historical drilling and includes:

- ***42.2 m of 2.0 g/t gold at 122.8 m downhole, including***
- ***10 m of 5.5 g/t gold at 124 m downhole***

FG-20-383, drilled on the same section line, confirms the continuity of gold mineralization identified in hole FG-20-382 and includes:

- ***48.2 m of 2.0 g/t gold at 127.6 m downhole, including***
- ***4.5 m of 7.7 g/t gold at 150 m downhole***

FG-20-385, confirms the continuity of Upper Zone gold mineralization identified in FG-20-382 and 383 a further 50 m along strike to the northwest and includes:

- ***17.7 m of 3 g/t gold at 139 m downhole, including***
- ***5.3 m of 10.2 g/t gold at 150 m downhole***

Figure 15: Cross section of FG-20-388 and FG-20-389

7.7 Cross Sections Discussion

The cross-section in Figure 10 (Section line A to A' on Figure 9) shows the location of FG-20-376, 185 m up-dip from the 14.3 m of 6.4 g/t gold at 386 m downhole as previously reported by KORE in hole FG-20-377. The 20.9 m of 2.9 g/t gold at 239.4 m, including 12.4 m of 4.3 g/t gold at 239.4 m downhole in FG-20-367 demonstrates continuity of gold mineralization for 330m along the Lower Zone down-dip from historical drilling.

The Figure 11 (cross-section B to B' on Figure 9) shows the location of the 62.3 m of 1.7 g/t gold, including 6.6 m of 9.7 g/t gold in FG-20-378. Results from FG-20-378 improve upon the anomalous gold mineralization encountered in FG-20-373, which was terminated in gold mineralization and highlights the potential of the Upper Zone to contain broad intervals of better than predicted gold mineralization based on past drilling. FG-20-379, drilled along the same section line as FG-20-378, successfully tested both the Upper and Lower Zones down dip of previous drilling. The hole intersected 11.5 m of 2.4 g/t gold, extending Upper Zone gold mineralization a further 160 m down dip. The Lower Zone was successfully tested a further 210 m down dip where FG-20-379 intersected a 50.5 m wide interval of anomalous gold mineralization including 3 m of 5.8 g/t gold.

FG-20-380 (located in Figure 14) is located 300 m southeast of Section B to B' (Figure 12) encountered both Upper and Lower Zone mineralization. The Lower Zone returned a broad interval of anomalous gold mineralization beginning at 346.7 m of 1.1 g/t gold over 49.9 m, including 15.5 m of 1.9 g/t gold 330m down dip of historical drilling.
FG-20-381 (located in Figure 13) is located 100 m southeast of FG-20-280 and was drilled along the fourth section line to test the continuity of gold mineralization down dip of historical drilling. The 24 m of 1.3 g/t gold, including 7 m of 3.1 g/t gold in FG-20-381 successfully extends the Lower Zone for 330 m down dip of historical drilling.

8.0 CONCLUSIONS AND RECOMMENDATIONS

2020 drilling by KORE was largely a success in finding new gold mineralization outside of known mineralized areas. Significant intersections well down-dip from historic drilling open new areas for expansion of the Frasergold deposit. Further, results appear to indicate that higher grade portions of intersections may trace well to the NW and SE, highlighting a potential NW structural control to higher grade plunge lines that may be parallel to the axial trace of the Eureka Syncline.

To verify this potential structural control, it is recommended that a series of tightly spaces holes flanking higher grade zones to test for a NW control on higher grade plunge lines. Holes such as FG-20-385, FG-20-382/383 are candidates to test for this trend. It is also recommended that a more detailed structural mapping program be completed in the rocks at FG to search for concrete data to validate this hypothesis. Fold closures and plunge lines on surface should be

mapped in detail to investigate any similarities to the orientations of higher grade gold zones projected through higher density drilling. There is a structural control on higher grade ore shoots in the Frasergold deposit that needs to be fully realized in order to maximize the potential of this deposit.

The primary goal for the limited soil program in 2020 was to search for any evidence of gold mineralization on the south limb of the Eureka syncline. While the coverage of the program was limited due to access and weather issues, a small group of anomalous gold samples does appear to correlate with the hypothesized projection of the knotted phyllite unit in the area of coverage. While the results from one days samples in a limited area should be treated with some caution, samples with Au up to 105 ppb in an area where mineralization was hypothesized certainly warrants a follow up soils program to verify the initial results and expand any anomalous results to the NE and SW along the projected south limb.

9.0 EXPLORATION EXPENDITURES

Detailed expenditures listed in Appendix F.

Exploration Work type	Totals
Personnel	**$331,355.00**
Office Studies	**$21,062.92**
Geochemical Surveying .	**$377,625.12**
Drilling	**$1,347,482.13**
Reclamation	**$152.15**
Transportation	**$65,820.12**
Accommodation & Food	**$240,520.56**
Miscellaneous	**$51,996.27**
Equipment Rentals	**$36,295.83**
Freight, rock samples	**$2,866.17**
TOTAL Expenditures	**$2,475,176.27**

GeoSpark: Drill Hole Report

KARUS GOLD

Project: FG
Hole: FG-20-373

From (m)	To (m)		Rock Type & Description			
188.60	**190.80**	**BP**	**Black Phyllite**	**black**		
Graphitic phyllite, 25% bx QV w/ blebby sulfide margins. Possible VG at 188.53 Lith2: QVV						
<<Vein: 188.6 - 190.8 25% Quartz-Visible Gold>>						
<<Struct: 190.12 - 190.12: vein>> upper contact						
<<Struct: 190.7 - 190.7: shear>>						
190.80	**213.00**	**SST**	**Sandstone**	**grey**	**Silt**	
Siltstone, rare graphitic fractures. <5% ribbon and discrete brecciated veins. trace sulfieds with local areas of >1% Lith2:						
<<Min: 190.8 - 235 0.3% Pyrite>>						
<<Vein: 190.8 - 235 5% Quartz>>						
<<Struct: 190.8 - 190.8: shear>>						
<<Struct: 193 - 193: primary foliation>>

Project: FG
Hole: FG-20-377

From (m)	To (m)	Rock Type & Description
		<<Struct: 18.5 - 18.51: primary foliation>> low quality ori mark, S1 parallel to core axis
		<<Struct: 18.7 - 18.71: bedding>> low quality ori mark, 12 degree angle of intersection betweren S0 and S1
22.85	**43.40**	**SIS Interbedded silt Sandstone/Siltstone**
		interbedded arkosic f-g sandstone and siltstone(phyllite), and knotted phyllite. Knotted phyllite layers have significantly less quartz vein/brx than the silt-mudstone. Quartz veins show no systematic pattern of orientation. QV ~40% averaged over entire i Lith minor: QVV
		<<Min: 22.85 - 43.4 1% Pyrite>> pyrite-pyrrhotite infilling fractures and margins of qz veins, locally up to 2-3% over intervals less than a meter. Sulphides are a consistent component of the qz veining through the interval.
		<<Min: 22.85 - 43.4 0.1% Pyrrhotite>>
		<<Alt: 22.85 - 43.4 strong Sericite-Carbonate-Pyrite>> also graphite alteration is strong. Chlorite alteration on the margins of qz viens.
		<<Alt: 22.85 - 43.4 weak Chlorite>>
		<<Vein: 22.85 - 27.8 65% Quartz-Carbonate-Pyrite>> strong veining through this interval, no systematic orientation (i.e. stockwork appearance), Vein composition Q:95, C:4, Sulphides:0.5, chlorite 0.5.
		<<Vein: 27.8 - 29.57 15% Quartz-Carbonate-Pyrite>> same veins as above interval, less abundant through this interval, hosted in short interval of knotted phyllite. Fewer veins appear in the knotted phyllite relative to the silt/mudstone

Project: FG

Hole: FG-20-377

From (m)	To (m)	Rock Type & Description
		<<Vein: 29.57 - 32 45% Quartz-Carbonate-Pyrite>> same veins as above, convoluted and deformed frags of hostrock are caught up in the qz veins, chlorite content of the veins is higher in the silt/mudstone relative to the knotted
		<<Vein: 32 - 33.56 2% Quartz-Carbonate-Pyrite>> interval dominated by bedded arkosic sandstone and knotted phyllite, only trace veinlets. Interestingly this lithological horizon appears to resist replacement and/or infiltration by qz veins.
		<<Vein: 33.56 - 40.4 65% Quartz-Carbonate-Pyrite>> same qz veins as described, additions to the description include: patchy chlorite on margins of veins, remobilized/deformed country rock fragments are highly strained, buff ankerite forms microbreccias supported by a qz-chl-py-po cement near QV margins
		<<Vein: 40.4 - 43.4 30% Quartz-Carbonate-Pyrite>> same qz veins as described, additions to the description include: deformed stockwork veins within highly convoluted foliation and bedding.
		<<Struct: 22.85 - 22.86: vein>> low quality ori mark, measured as the contact of ~50cm of oxidized rock, curious.
		<<Struct: 28.05 - 28.06: bedding>> laminated deformed bedding within silt-mud-sandstone interbeds.
		<<Struct: 28.75 - 28.76: primary foliation>> well foliated, decent ori mark (2 marks lined up)
		<<Struct: 31.05 - 31.06: bedding>> this zone around 30 - 31m is a fold nose, S1 cleavages are perpendicular to bedding and there are numerous qz-veins around the hinge!
		<<Struct: 33.25 - 33.26: bedding>> interbedded light and dark bands (0.5-3cm thick) of silt and sandstone.
		<<Struct: 33.27 - 33.28: primary foliation>> S1 is along the core axis here.
		<<Struct: 38 - 38.01: bedding>> fractured and brecciated bedding
		<<Struct: 38.4 - 38.65: vein>> good oir mark, thick vein hosted in black phyllite
		<<Struct: 38.9 - 38.91: primary foliation>> good ori mark, well developed foliation within graphitic black phyllite, two strong foliations intersect at a high angle throughout the black phyllite/siltstone, typically only one well developed foliation is present in the knotted phyllite.
		<<Struct: 41.65 - 41.66: primary foliation>> good ori mark, well developed foliation within knotted phyllite
43.40	**60.45 MKP**	**Knotted Phyllite** **f-sand**
		well foliated knotted phyllite, black phyllite with 50%QV between 48.12 - 48.73m, interbedded light and dark grey sandstone and siltone layers are wiggly and continuous i.e. they are not brecciated. S1 intersection angle is 0-10 degrees indicating this ho Lith minor:
		<<Min: 48.12 - 48.73 0.5% Pyrrhotite>>
		<<Min: 48.12 - 48.73 1% Pyrite>> sulphides py-po contained in microfractures within margins of QV and proximal country rock

From (m)	To (m)	Rock Type & Description
68.40	**71.50 BP**	**Black Phyllite** **silt**
graphitic black phllite interbedded with fg sandstone nad knotted phyllite, convolute S1 and S0, ~60% QV replacement of host rock, strongly deformed interval, QVs are deformed as well and have an inconsistent orientation, Lith minor: QVV		
<<Min: 68.4 - 71.5 1% Pyrrhotite>> trace dissem py in host rock, fracture controlled po and py within QV, QV account for up to 60% of interval, QVs have a random pod-like oritentation, convoluted S1 and QV deformation suggests this is a high strain area(i.e. hinge)		
<<Min: 68.4 - 71.5 0.25% Pyrite>>		
<<Alt: 68.4 - 71.5 strong Graphite>> locally texture destructive graphite replacement of hostrock matrix, ~60% QV through inerval, brilliant vitreous greenish sericite development is very strong along foliation planes		
<<Alt: 68.4 - 71.5 strong Quartz-Clay-Pyrite>>		
<<Vein: 68.4 - 71.5 60% Quartz-Carbonate-Pyrite>> pod-like stockwork of >5cm thick QV with composition: Qz(95), ank(4), po-py(0.5), chl(0.5), no systematic orientation, high strain zone,		
<<Struct: 68.4 - 68.41: bedding>> good ori mark, contact between knotted phyllite and laminated siltstones. The siltstones have been replaced by ~50% quartz. This measurement can be taken as a qz-vein measurement as well		
<<Struct: 69.05 - 69.2: vein>> good ori mark, QV within a high strain zone		
<<Struct: 69.5 - 69.51: primary foliation>> good ori mark, well developed highly strained foliation		
71.50	**93.69 MKP**	**Knotted Phyllite** **f-sand**
well foliated knotted phyllite interbedded with lesser thinly bedded fg arkosic sandstone and lesser black phyllite. Black phyllite is associated with relatively more quartz veining, Lith minor:		
<<Min: 71.5 - 83.8 1.5% Pyrite>>		
<<Min: 71.5 - 83.8 1.5% Pyrrhotite>> both py and po are have a patchy dissemation along S1 and form clots and blebs within vein margins and ankerite breccia matrix		
<<Min: 83.8 - 93.69 0.1% Pyrite>> trace disseminated py controlled along foliation, trace py-po in margins and fractures of QVs		
<<Alt: 71.5 - 83.8 moderate Clay>>		
<<Alt: 71.5 - 83.8 moderate Graphite>> clay = sericite, graphite-sericite replacement of matrix, disseminated py and foliation controlled py up to 2 modal % of the knotted phyllite. QV have relatively higher sulphide content than when hosted in pyrite-bearing knotted phyllite		
<<Alt: 83.8 - 93.69 moderate Clay>> clay = sericite, this interval broken out from above interval due to low py content - trace if any. QV through this interval are more chloreite-rich and suphide-poor		
<<Alt: 83.8 - 93.69 moderate Graphite>>

From (m)	To (m)	Rock Type & Description
		<<Struct: 90 - 90.2: vein>> good ori mark, ~10cm thick QV, conformable to S0, sheeted quartz veins around this interval.
		<<Struct: 90.6 - 90.61: bedding>> good ori mark, measured from an ~5cm thick bed of silt/mudtsone with well developed internal S2 cleavage, QV and dissem pyrite are conformable to S0
		<<Struct: 93.68 - 93.69: bedding>> good ori mark, measured at contact with black phyllite, the black phyllite is heavily intruded/replaced by QVs
93.69	**104.43**	**SIS Interbedded silt Sandstone/Siltstone**
		laminated to thinly bedded calcareous, pyritic silt/mudstone and fg sandstone, dark grey to black, ~0.25% dissem-blebby py overprints the primary structures, ragged py-po are associated with qz-carb veinlets. Lith minor: QVV
		<<Min: 93.69 - 94.5 1% Pyrrhotite>>
		<<Min: 93.69 - 94.5 2% Pyrite>> ~10cm thick QV located at the upper contact of a silt/sandstone interval. Brecciated clusters of ankerite with strong sericite halos +/- py-po are common feature of the QV, blebby py within the white qz
		<<Min: 94.5 - 104.43 0.5% Pyrite>> disseminated euhedral blebs of py are sparsely scattered evenly throughout interval, overprinting the primary textures, veins of po-py+(qz-carb) are semi conformable to S0, veins are typically <1cm thick
		<<Min: 94.5 - 104.43 0.25% Pyrrhotite>>
		<<Alt: 93.69 - 94.5 strong Graphite>> Upper contact region of the interbedded silt/sandstone is infiltrated with QV ~10cm thick intersected at a low angle to the core axis. Intense graphite alteration surrounding the qz-vein
		<<Alt: 94.5 - 104.43 weak Quartz-Clay-Pyrite>>
		<<Alt: 94.5 - 104.43 moderate Carbonate>> pervasive and layer selective weak to strong carbonate alteration, some layers are more calcareous than others, sericite and graphite alteration is moderately developed and pervasive
		<<Vein: 93.69 - 94.5 80% Quartz-Carbonate-Pyrite>> this interval is the upper contact region of silt/mudstone, coarse white quartz veins conformable to the contact (S0), brecciated clusters of ankerite with sericite-py-po halos and breccia matrix infill
		<<Vein: 94.5 - 104.43 0.25% Quartz-Carbonate-Pyrite>> spaced, sulphide poor quartz veins hosted in calcareous fg sand/siltstone, typically <1m thick, wiggly morphology constrasts to the planar morphology of the host rock bedding
		<<Struct: 96.6 - 96.61: bedding>> good ori mark, measured from laminated planar and continuous bedding, this measurement marks a change in the S0 attitude, its also a change in lithology.
		<<Struct: 96.62 - 96.63: primary foliation>> good ori mark, moderate tight foliation defined by micaceous alignment

		well foliated knotted phyllite, up to 2% dissem pervasive py-po along S1 in the upper 2m of interval. Strong tight sericitic-graphitic foliation is intersected near parallel to core axis. Boudinaged qz-carb veins 1-5cm thick are semi-conformable to S1. St Lith minor:									
		<<Min: 117.38 - 118.5 1% Pyrrhotite>>									
		<<Min: 117.38 - 118.5 2% Pyrite>> disseminated and veinlet sulphides py-po are pervasive, sulphides are foliation controlled, sulphide content decreases gradually toward lower part of interval									
		<<Min: 118.5 - 124.5 0.5% Pyrite>> disseminated py-po along S1 plane, occassional concentration to veinlets and blebs									
		<<Min: 118.5 - 124.5 0.25% Pyrrhotite>>									
		<<Min: 124.5 - 130.36 0.5% Pyrite>> foliation controlled py-po, occassional concentration to veinlets and blebs, sulphide-poor veinlets with moderately developed sericite margins									
		<<Min: 124.5 - 130.36 0.5% Pyrrhotite>>									
		<<Alt: 118.5 - 124.5 moderate Clay>> porphyroblasts replaced by graphite-sericite have carboante filled strain-shadows									
		<<Alt: 118.5 - 124.5 moderate Graphite>>									
		<<Alt: 124.5 - 130.36 moderate Clay>> described as above interval with addition: ~2% QV with patchy brecciated ankerite-sericite pockets, ~.5% py-po disseminated along S1									
		<<Alt: 124.5 - 130.36 moderate Graphite>>									
		<<Vein: 124.5 - 130.36 3% Quartz-Carbonate-Pyrite>> boudinaged and wiggly qz-carb (sulphide-poor) veins 0.5 -2cm thick, pinching and swelling, intersected at low angle to core axis, hosted in bedded knotted phyllite trending towards black phyllite									
		<<Struct: 117.38 - 118: primary foliation>> good ori mark, S1 is wavy and along the core axis									
		<<Struct: 119 - 119.01: primary foliation>> good ori mark, S1 is wavy and along the core axis									
		<<Struct: 121.45 - 121.46: primary foliation>> good ori mark, S1 and S0 are near parallel to one another									
		<<Struct: 122.5 - 122.51: vein>> good ori mark, measured from planar (extensional?) qz-carb vein with similar composition to boundinaged veins. This vein <1cm thick. The planar structure is interesting - later phase maybe?									
		<<Struct: 124.5 - 124.51: primary foliation>> good ori mark, measured from well developed foliation, parallel to S0

From (m)	To (m)	Rock Type & Description
		<<Struct: 193.51 - 193.51: bedding>> good ori mark, well defined bedding
194.17	**209.40**	**MKP Knotted Phyllite f-sand**
		laminated, graphitic knotted phyllite interbedded with lesser calcareous fg sandstone(schist). QV content and distribution similar to interval above. Foliation and vein controlled carbonate alteration appears to be directly associated with the sulphide mi Lith minor: SIS
		<<Min: 194.17 - 209.4 0.5% Pyrite>> sulphide content is correlated with carbonate (ankerite) alteration along S1 and within veins. Higher carbonate alteration typically coincides with higher dissem sulphide content
		<<Min: 194.17 - 209.4 0.5% Pyrrhotite>>
		<<Alt: 194.17 - 209.4 moderate Graphite>>
		<<Alt: 194.17 - 209.4 moderate Carbonate>> carbonate (ankerite) appears to part of the mineralization assemblage. Observed replacing matrix along S1 and 'bleeding' into qz veins as clusters which are later brecciated and infilled with sulphide-sericite phase. Ankerite destabilizes the gold?
		<<Vein: 194.17 - 209.4 5% Quartz-Carbonate-Pyrite>> pod-like and boundinaged qz-ank-(py-po-gn-sp-cp) veins ~5% of interval. QVs are 5 - 30+ cm thick are semi-conformable to S0.
		<<Struct: 196.12 - 196.13: primary foliation>> good ori mark, moderately defined bedding with knotted phyllite
		<<Struct: 199.5 - 199.51: bedding>> good ori mark, well defined bedding within knotted phyllite
		<<Struct: 203 - 203.01: bedding>> good ori mark, wavy thinly bedded knotted phyllite
		<<Struct: 203.02 - 203.03: primary foliation>> good ori mark, moderately defined foliation within knotted phyllite
		<<Struct: 206.55 - 206.56: bedding>> good ori mark, measured from well defined wavy bedding within a knotted phyllite section of the interval
		<<Struct: 206.57 - 206.58: primary foliation>> good ori mark, measured from moderate-well defined foliation within the knotted phyllite
		<<Struct: 209.01 - 209.02: bedding>> good ori mark, measured from well defined bedding just above a quartz interval with vg
		<<Struct: 209.03 - 209.4: primary foliation>> good ori mark, moderately defined foliation, better developed in phyllitic layers but clearly a penetrative fabric that transposes through rigid sandstone layers

Hole: FG-20-377

From (m)	To (m)	Rock Type & Description
209.40	**218.95**	**SIS** **Interbedded Sandstone/Siltstone** **f-sand**

bedded, well sorted arkosic sandstone(schist), interbedded with lesser knotted phyllite, black phyllite and calcareous (limestone) beds. Lith minor: QVV

<<Min: 209.4 - 218.95 0.25% Pyrrhotite>>

<<Min: 209.4 - 218.95 0.25% Pyrite>> vein and S1 controlled disseminated po-py. VG noted at 210m occupying matrix/cement zone of a brecciated cluster of sericite-ankerite, hosted within a QV

<<Min: 210 - 210.1 0.01% Gold>>

<<Alt: 209.4 - 218.95 moderate Graphite>>

<<Alt: 209.4 - 218.95 moderate Clay>> pervasive sericite replacement of matrix, graphitic alteration is strong in phyllitic layers, quartz veins have tightly developed (<10mm) serpentine halos and strong sericite-serp breccia clusters caught up in the QVs. Wewak carbonate alteration overall.

<<Vein: 209.4 - 218.95 5% Quartz-Visible Gold>> sparely spaced, 5-80cm thick boudinaged pod-like QVs are broadly distributed along S0. Visible gold noted at 210m occupying matrix/cement of brecciated ankerite clusters within QVs, associated with intense fibrous (greenish) sericite development

<<Struct: 210.85 - 210.86: bedding>> good ori mark, measured from well defined wavy bedding contact

<<Struct: 212 - 212.01: primary foliation>> good ori mark, measured from moderately defined foliation in knotted phyllite, intersected near parallel to core axis

<<Struct: 213.5 - 213.51: bedding>> good ori mark, measured from well defined bedding layers within a sandstone interval

From (m)	To (m)	Rock Type & Description
		<<Min: 265.5 - 279 0.1% Pyrrhotite>>
		<<Alt: 265.5 - 279 strong Graphite>> strong graphitic alteration, porphyroblasts have weakly developed strain shadows infilled with qz-carb-ser-(sulphides).
		<<Alt: 265.5 - 279 weak Carbonate>>
		<<Vein: 265.5 - 279 0.1% Quartz-Carbonate-Pyrite>> sparsely spaced, discontinuous qz-carb veinlets and boudinaged pods <1cm thick.
		<<Struct: 269.25 - 269.26: bedding>> good ori mark, well defined bedding layers within knotted phyllite
		<<Struct: 269.27 - 269.28: primary foliation>> good ori mark, moderately defined penetrative foliation fabric, best developed in phyllitic beds and less so within sandstone beds
		<<Struct: 271.42 - 271.43: bedding>> good ori mark, well defined between thin sandstone beds and the knotted phyllite.
		<<Struct: 271.44 - 271.45: primary foliation>> good ori mark, well developed folitation
		<<Struct: 273.8 - 273.81: bedding>> good ori mark, well defined bedding in knotted phyllite
		<<Struct: 273.82 - 273.83: primary foliation>> good ori mark, well defined foliation in knotted phyllite
		<<Struct: 277.95 - 277.96: bedding>> good ori mark, well defined bedding in knotted phyllite
		<<Struct: 277.97 - 277.98: primary foliation>> good ori mark, well defined foliation in knotted phyllite
279.00	**284.10**	**SIS Interbedded Sandstone/Siltstone f-sand** thinly bedded knotted phyllite, black phyllite, sericite schist, calcareous mica schist and minor mudstone. Dissem py-po up to 0.5%. Lith minor:
		<<Min: 279 - 284.1 0.5% Pyrrhotite>>
		<<Min: 279 - 284.1 0.5% Pyrite>> pervasive dissem py-po has a positive correlation with carbonate alteration intensity.
		<<Alt: 279 - 284.1 moderate Graphite>> layer selective alteration. Graphitic phyllite. Sericitic schist. Pervasive disseminated py-po except in strongly calcareous (limestone) beds. Porphyroblasts are replaced by graphite
		<<Alt: 279 - 284.1 moderate Sericite-Carbonate-Pyrite>>
		<<Vein: 279 - 284.1 7% Quartz-Carbonate-Pyrite>> QVs 2-30cm thick hosted in SIS. Composed of: qz(95)-ank(4)-(sericite-chlorite-graphite)-(po-py-cpy-gal)
		<<Struct: 280 - 280.01: bedding>> good ori mark, well defined bedding in interbedded sericite schist and graphitic phyllite

From (m)	To (m)	Rock Type & Description
		<<Struct: 280.02 - 280.03: primary foliation>> good ori mark, moderately defined foliation in interbedded sericite schist and graphitic phyllite
		<<Struct: 281.25 - 281.26: bedding>> good ori mark, well defined bedding, weakly stretch-brecciated layers
		<<Struct: 281.27 - 281.28: primary foliation>> good ori mark, moderately defined foliation through sandstone(schist)
284.10	**294.00**	**MKP Knotted Phyllite silt**
		well foliated graphitic knotted phyllite. Weak pervasive foliation controlled carbonate alteration. Lith minor:
		<<Min: 284.1 - 294 0.25% Pyrite>> sulphides + trace trace base metals disseminated along with carbonate alteration assemblage phase. Porphyroblasts are nearly 100% replaced by graphite
		<<Min: 284.1 - 294 0.25% Pyrrhotite>>
		<<Alt: 284.1 - 294 moderate Graphite>> blebby and disseminated carbonate alteration is pervasive, often concentrating in strain sdaows of porphyroblasts. Dissem py-po+/- cpy appears to be associated with the carbonate phase in that it occupies similar positions
		<<Alt: 284.1 - 294 weak Carbonate>>
		<<Vein: 284.1 - 294 0.1% Quartz-Carbonate-Pyrite>> Sparsely spaced, weakly deformed wiggle qz veinlets semi-conformable to S0
		<<Struct: 287 - 287.01: primary foliation>> good ori mark, well developed foliation in the knotted phyllite
		<<Struct: 291.4 - 291.41: bedding>> decent ori mark; thin sandstone beds alt blk phyllite
		<<Struct: 291.42 - 291.43: primary foliation>> decent ori mark; foliation is parallel to core (gently folded)
294.00	**313.03**	**BP Black Phyllite silt**
		well folated, black (graphitic) phyllite. Interbedded with calcareous sandstone, knotted phyllite. High strain zone. Lith minor: MKP
		<<Min: 294 - 313.03 0.5% Pyrite>>
		<<Min: 294 - 313.03 0.5% Pyrrhotite>> sulphides in (<1cm) blebs and stringers, and veinlets parallel to primary fabric; occurs with graphite and carbonate in phyllite; trace cpy & pale green in qvn
		<<Alt: 294 - 313.03 moderate Carbonate>>
		<<Alt: 294 - 313.03 strong Graphite>> intense graphite replacement of primary rock. Patchy, brecciated carbonate bands, also ankerite clusters within QVs. Sericite defined along foliation.

From (m)	To (m)	Rock Type & Description	From (m)	To (m)	Length	Sample #	Au Best ppm	Ag Best ppm	Cu ppm	Pb ppm	Zn ppm
		<<Min: 343.65 - 362.14 Chalcopyrite>>									
		<<Min: 343.65 - 362.14 0.3% Pyrite>> pyrite and pyrrhotite in disseminated, 3mm strings and blebs within MKP; occurs as stretched strings and in blebs pressure strain shadows (augen), both on S1 foliation, usually in close proximity to ank porphyroblasts or veinlets; trace cpy, sph									
		<<Min: 343.65 - 362.14 0.2% Pyrrhotite>>									
		<<Alt: 343.65 - 362.14 moderate Graphite>> Graphite and Sericite dominant alt; minor carb (ank) alt in same S1 as GR and SER, but <5%									
		<<Alt: 343.65 - 362.14 weak Sericite>>									
		<<Vein: 343.65 - 362.14 2.5% Quartz-Carbonate-Pyrite>> Sparsely spaced, 2 to 25cm QV, ± ank clusters, thin ones significantly deformed; sulphides present as isolated strings within qv, or as <1cm clots and veinlets on fringes									
		<<Struct: 343.76 - 343.77: bedding (s0)>> good ori; convolute repetition of 2-3mm carb/sericite laminations									
		<<Struct: 345.96 - 345.97: primary foliation>> good ori mark; graphitic/sericitic foliation									
		<<Struct: 348.08 - 348.09: bedding>> good ori; 8cm beds of alt slt/sst/carb									
		<<Struct: 348.68 - 349.69: primary foliation>> good ori mark; pervasive gr/ser foliation									
		<<Struct: 351.78 - 351.79: primary foliation>> good ori mark; pervasive graphitic/sericitic foliation									
		<<Struct: 352.29 - 352.3: angular relationship between s0 and s1 (0 - 90)>> good ori mark; moderately clear graphitic/sericitic foliation									
		<<Struct: 355.26 - 355.27: bedding>> good ori mark; finely laminated, uniform (not convolute) interbedded slt/blk shl/carb (near to fold hinge)									
		<<Struct: 356.16 - 356.17: primary foliation>> good ori mark; graphitic/sericitic foliation; could be interferred with by S0									
		<<Struct: 357.78 - 357.79: primary foliation>> good ori; graphite/serite foliation; ank porphyroblasts elongated in same orientation									
		<<Struct: 357.82 - 357.83: bedding (s0)>> good ori; carbonate-cemented v.fine sst bed									
		<<Struct: 359.57 - 359.58: primary foliation>> good ori; ser/gr foliation; gr augen on ank porphyroblasts elongate on same									
		<<Struct: 361.24 - 361.25: bedding (s0)>> good ori; thin (<2mm) carbonate interlaminated with siltsone and graphitic shale; beds contorted: tight, small-amplitude (6mm) folds; noted multiple porphyroblasts in contact en-echelon in same plane: forming at sediment interface

Hole: FG-20-377

From (m)	To (m)	Rock Type & Description
		<<Struct: 362.42 - 362.43: bedding (s0)>> good ori; 7mm sericitized, ank.-cem'd f.sst; new lithological package, sub-parallel orientation
		<<Struct: 364.41 - 364.42: bedding (s0)>> good ori; <2mm laminated SIS sediments (bedding)
		<<Struct: 364.95 - 364.96: primary foliation>> good ori; graphitic/sercitic low angle to porphyroblastic laminated sediments
		<<Struct: 366.82 - 366.83: primary foliation>> good ori; strong alternating sercite/graphite/carb foliation
		<<Struct: 367.42 - 367.43: bedding (s0)>> good ori; alternating carb/sericite foliated (s0-parallel) slt; close to core of fold; alt'd min'd porphyroblasts
		<<Struct: 371.45 - 371.46: primary foliation>> good ori mark; strong, convolute sericitic/carb/graphitic foliation, disrupts carb interbed in knotted phyllite; rotated porphyroblasts
		<<Struct: 371.52 - 371.53: bedding (s0)>> good ori mark; laminated carb/ser-replaced interbed in sericitic/carb/graphitic foliated, pbs-rotated knotted phyllite
372.90	**400.35**	**SIS Interbedded Sandstone/Siltstone f-sand**
		carbonaceous (graphitic), interbedded turbiditic(?) sequence; grain sizes range fully from m.sst to blk shl; foliations present in more competent layers as sharp ptygmatic folds and disruptions, in shls/slts as well-developed graphitic/ sercitic/carbonate througgh-going fabrics; rare porphyroblasts are highly strained (in blk shls only); sands are arkose (now altered) and qtz rich, usually carb-cem'd, beds are arranged in cm-scale pulses up to 35cm thick total, with varible % of carbon; Lith minor: BP
		<<Min: 372.9 - 400.35 0.75% Pyrite>> VG in graphitic/carbonate foliation of blk shl/slt at 395.95m, also in qv-ank-blkslt intersection at 386.95m, 387.04m; pyrite and pyrrhotite in stringers and blebs elongate parallel to S1 fabrics and in S0 parallel as veinlets (replacement?); trace (0.3%)
		<<Min: 372.9 - 400.35 Chalcopyrite>>
		<<Min: 372.9 - 400.35 0.5% Pyrrhotite>>
		<<Alt: 372.9 - 400.35 moderate Carbonate>> Carbonate (ank) cements f-m sst; sercite present as S0-parallel replacement fabric; ank also sometimes present in S1 foliations; weakly developed graphitic S1 foliation obesreved to clearly X-cut and disrupt sst/carb strata at 381.85
		<<Alt: 372.9 - 400.35 weak Graphite>>
		<<Vein: 372.9 - 400.35 28% Quartz-Carbonate-Pyrite>> Vein styles as section above, except that thick veins to 1.6m; py & po commonly from trace (0.2%) to 3% (of veins); some veins parallel to S1 foliations (syngenetic?); associated with ank bx, qv, and boundaries with org rich shl/slt; gal, sph, cpy noted

From (m)	To (m)	Rock Type & Description
		<<Struct: 372.95 - 372.96: bedding (s0)>> good ori mark; just above contact with previous unit; f.sst/slt alt lamination seds; bed through next section are highly def'd locally: TM speculates soft-sediment def'm
		<<Struct: 375.79 - 375.8: bedding (s0)>> Good ori mark; 8cm ank-cem'd m.sst bed, well defined
		<<Struct: 376.17 - 376.18: bedding (s0)>> good ori mark; 1cm limestone (very fizzy) bed, well defined
		<<Struct: 377.96 - 377.97: bedding (s0)>> good ori mark; 2mm carbonate bed in laminated, graphitic-sercitic seds (S1parS0?)
		<<Struct: 379.25 - 379.26: primary foliation>> good ori mark; graphitic/ankeritic foliation in heavily-alt'd (rounded) knotted phyllite (rare in this unit); fold hinge (synform) at 379.4
		<<Struct: 379.96 - 379.97: vein>> good ori mark; boundary of qv (ank clusters, Po/Py) with graphitic/ankeritic foliation
		<<Struct: 380.85 - 380.86: bedding (s0)>> good ori mark; laminated (<0.5mm) interbeds of slt/graphitic-shl;
		<<Struct: 381.63 - 381.64: bedding (s0)>> good ori mark; thick lam'd (1mm) carb/slt interbedsl;
		<<Struct: 381.9 - 381.91: primary foliation>> good ori mark; weakly developed, bed disrupting graphitic/sericitic foliation in carb-cem'd f.-m.sst
		<<Struct: 386.51 - 386.52: vein>> good ori mark; sharp continuous boundary of qv (ank clusters, Po/Py) with graphitic mudstone, foliated (gr) parallel to this ori
		<<Struct: 390.67 - 390.68: primary foliation>> good ori mark; graphitic axial plane through verging, ptygmatic folds, looks like S1 parallel; lots of min'n in local rock
		<<Struct: 391.79 - 391.8: bedding (s0)>> good ori mark; 0.5cm carb beds interbedded with sericite/graphite SLT and F.SST.; convolute, ptygmatically folded disruptions to bedding (this one pretty continuous)
		<<Struct: 396.47 - 396.48: primary foliation>> not good ori mark; Fe-carbonate foliation (with graphitic and sericitic in parallel)
		<<Struct: 396.52 - 396.53: bedding (s0)>> not good ori mark; sercitized slt bedding in f.sst
		<<Struct: 397.15 - 397.16: bedding (s0)>> not good ori mark; carb-cem'd f.sst interbed
		<<Struct: 397.23 - 397.24: primary foliation>> not good ori mark; strong graphitic foliation

From (m)	To (m)	Rock Type & Description
71.68	**107.85**	**SST Sandstone f-sand**
Interbedded grey-grey/green homogenous fine SST beds with MKP. Interbedded on the 10cm-2m scale. MKP beds seem to be taking up most of the strain, often yielding tectonic breccia/sheared look to them Lith minor: MKP		
<<Min: 71.68 - 107.85 0.2% Pyrite>> trace pyrite disseminations and stringers, primarily in MKP sections (rare py stringers in sst)		
<<Alt: 71.68 - 107.85 weak Graphite>> Sandstone beds recrystalized, mkp beds with ankerite knots, dissem py and carbonaceous/graphitic frac surfaces and internal foliae		
<<Alt: 71.68 - 107.85 weak Quartz-Clay-Pyrite>> Sandstone beds recrystalized, mkp beds with ankerite knots, dissem py and carbonaceous/graphitic frac surfaces and internal foliae		
<<Vein: 71.68 - 86.45 1% Quartz>> Rare qz veins, cm-10cm with trace ank clts and py whisps, sporadic calcite fracture fill		
<<Vein: 86.45 - 89.48 10% Quartz>> Clean, frosty looking quartz veins, cm-5cm scale in sandstone, ultra rare cm scale ankerite grains, ultra trace sulphides		
<<Vein: 89.48 - 95.19 1% Quartz-Ankerite>> cm-3cm quartz veins with rare ankerite clots and trace pyrite whisps		
<<Vein: 95.19 - 96.2 90% Quartz-Ankerite>> Thick quartz veins seperated by 10cm wallrock clast, minor ankerite clots and wrc's, trace pyrite whisps

107.85	**210.00**	**MKP Knotted Phyllite f-sand**									
		Typical mkp (90%), ank knots, carbonaceous foliae with minor silty-sandy cm-few cm interbeds (9%), SST interbeds up to 30cm wide (1%) as previous unit present to a depth of 130.65m, beyond that just the cm-few cm scale SIS interbeds. Several sections of thick quartz veining, visible gold present in vein corridor around 175m (see mineralization for description). Lith minor: SIS									
		<<Min: 107.85 - 162.36 0.1% Pyrite>> ultra trace pyrite dissem and stringers in veins and wallrock									
		<<Min: 162.36 - 171.73 0.2% Pyrite>> minor pyrite replacement of ank knots, and discrete stringers within wallrock, trace pyrite stringers and disseminations as interstitial btw ank clots in veins, trace po blebs/str in veins									
		<<Min: 171.73 - 174.08 1% Pyrite>> pyrite stringers, disseminations and clots in veins, stringers and dissem in wallrock, po stringers and blebs in veins, trace sphalerite blebs									
		<<Min: 171.73 - 174.08 0.5% Pyrrhotite>> pyrite stringers, disseminations and clots in veins, stringers and dissem in wallrock, po stringers and blebs in veins, trace sphalerite blebs									
		<<Min: 174.08 - 175.31 0.01% Gold>> Au as three discrete occurrences. At 194.96m, four mm scale accicular needles of yellow gold/electrum within/along boundary of silicified wallrock clast, on opposite side of core at same depth are another three smeared submm-mm accicular grains are obser									
		<<Min: 174.08 - 175.31 1% Pyrite>> Au as three discrete occurrences. At 194.96m, four mm scale accicular needles of yellow gold/electrum within/along boundary of silicified wallrock clast, on opposite side of core at same depth are another three smeared submm-mm accicular grains are obser									
		<<Min: 175.31 - 178.35 1% Pyrite>> pyrite stringers, disseminations and clots in veins, stringers and dissem in wallrock, po stringers and blebs in veins, trace sphalerite blebs									
		<<Min: 175.31 - 178.35 0.5% Pyrrhotite>> pyrite stringers, disseminations and clots in veins, stringers and dissem in wallrock, po stringers and blebs in veins, trace sphalerite blebs									
		<<Min: 178.35 - 210 0.2% Pyrite>> trace pyrite stringers and coarse dissem in mkp, at 196.5m . At 198.5m three submm specks of bright yellow visble electrum are observed along vein margin adjacent to wrc									
		<<Alt: 107.85 - 210 weak Porphyroblast (knots)>> Ankerite knots/porph, weakly graphitic/carbonaceous foliations and frac surfaces									
		<<Alt: 107.85 - 210 weak Graphite>> Ankerite knots/porph, weakly graphitic/carbonaceous foliations and frac surfaces									
		<<Vein: 140.57 - 146.67 22% Quartz-Ankerite>> Vein zone initates as cm scale bedding parallel qz veins/veinlets, transitions to massive qz veins (with only trace ank and py, mainly carbonaceous wallrock clasts) and weak breccias from 142.68-144.31m, back to minor cm veins/veinlets and weak breccias+c									
		<<Vein: 146.67 - 160.78 2% Quartz-Ankerite>> sporadic cm-20cm wide quartz veins with rare ankerite clots and trace disseminated pyrite and wallrock slivers

280.30	**296.02**	**SIS Interbedded Sandstone/Siltstone Silt**
		Interbedded silts, sands and shales. Rare grey granular limestone beds. Deformation increases downhole from planar beds with minor slump/displacement features to distoreted, folded, boudinaged and tectonically brecciated, especially strong between 29--294m before decreasing again to end of unit. Increased deformation yields increased quartz+calcite foliation/bedding parallel veining that is as distorted and boudinaged as bedding. Ankerite or sulphides are not seen as part of this influx of veins. Lith minor: BP
		<<Min: 280.3 - 286.4 2% Pyrite>> Pyrite and po stringers and sub-euhedral clots. Higher concentration in wallrock as whispy fol parallel str, also clots in subcm veinlets than within larger veins
		<<Min: 280.3 - 286.4 3% Pyrrhotite>> Pyrite and po stringers and sub-euhedral clots. Higher concentration in wallrock as whispy fol parallel str, also clots in subcm veinlets than within larger veins
		<<Min: 286.4 - 301 1% Pyrrhotite>> mm scale pyrite+/-pyrrhotite stringers and disseminations in wallrock, bedding/foliation parallel. Rare pyrite stringers/dissem within larger (<1cm) quartz calcite veins

Hole: FG-20-378

From (m)	To (m)	Rock Type & Description
296.02	**314.93**	**SIS** **Interbedded Sandstone/Siltstone** **f-sand**

Section seems to be a combination of lithologies. Interbedded silts and sands present with carbonaceous and pyritic phyllite, with knotty ank texture present throughout as well. Moderately foliated with rare disjointed anastomosing fol parallel quartz veins. Beds often have ragged edges with very weak shear fabric, parallel to foliation. Lith minor: MKP

<<Min: 301 - 316.31 0.5% Pyrite>> Minor pyrite+/- pyrhhotite stringers and disseminations/clots within qz+ank veins, decrease in pyrite disseminations in wallrock (occuring with shift from shales to more mkp style lithology)

<<Min: 301 - 316.31 0.2% Pyrrhotite>> Minor pyrite+/- pyrhhotite stringers and disseminations/clots within qz+ank veins, decrease in pyrite disseminations in wallrock (occuring with shift from shales to more mkp style lithology)

<<Vein: 301 - 316.31 1% Quartz-Ankerite>> Return to vein character more similar to main zone, although sparse dm-30cm wide quartz veins with 1% ank clots, and minor py+po stringers (0.5%)

<<Struct: 314.07 - 314.08: bedding>> bedding in SIS

314.93 316.31 QVV >60% quartz veins f-sand

Quartz vein zone, massive milky white quartz vein with trace ankerite and sulphide stringers, wallrock clasts. Veining subparallel to and cross cutting core length, with SIS being moderately mineralized, with fairly planar bedding. Lith minor: SIS

<<Alt: 314.93 - 331.5 weak Graphite>> Graphitic fracture surfaces and internal foliae, carbonate granular replacement and bedding parallel discontinuous veins/alteration patches

<<Alt: 314.93 - 331.5 weak Sericite-Carbonate-Pyrite>> Graphitic fracture surfaces and internal foliae, carbonate granular replacement and bedding parallel discontinuous veins/alteration patches

316.31 320.00 SIS Interbedded Sandstone/Siltstone Silt

Generally planar to weakly distorted laminated/bedded silts (70%) and pyritic shales (30%), increasing shale content downhole. Rare foliation quartz veins, graphitic fracture surfaces wavy to mirror polished Lith minor: SPH

From (m)	To (m)	Rock Type & Description
118.63	120.42	MKP Knotted Phyllite Mud

stil fine grained (mudstone, minor interbeds of SLT/SST); less qtz; pbs are smeared (very elongate) and ank replaced; ank augen are common, fold hinges within; Lith minor: MPH

<<Min: 118.63 - 120.42 0.1% Pyrite>> pyrite in disseminated clusters to 1mm; possible partial replacement of PBS

<<Alt: 118.63 - 120.42 strong Graphite>> very dark grey grahpitic shales/slts; minor foliation control on gr, minor sericite in foliations; rotated and "smeared" (approaching connectivity) pbs

Hole: FG-20-379

From (m)	To (m)	Rock Type & Description
		<<Vein: 252.39 - 256.42 70% Quartz-Carbonate-Pyrite>> massive QV with blebby and fracture controlled py-po +/- cpy, accessory sphalerite is locally abundant occuring within convolute domains of the black phyllite
256.42	**275.00**	**MKP Knotted Phyllite Silt**
		graphitic siltstone, 4-7 modal % graphitic porphyroblasts 3-9mm long (3:5 aspect ratio), well foliated, dense, blebbly py up to 1.5 modal %, rare relict bedding textures, strongly deformed, extensional-type faulting around 264.5m, Lith minor:
		<<Min: 256.42 - 275 Chalcopyrite>>
		<<Min: 256.42 - 275 1% Pyrite>> disseminated and blebby po-py controlled along foliation form wispy discontinuous veinlets and veins with a composition equivalent to larger QVs. This interval has noteably more consistent/pervasive sulphide mineraliztion than typical knotted phyllite
		<<Alt: 256.42 - 275 weak Sericite>> strong graphitic replacement of micaceous minerals in phyllite, wispy and blebby foliation controlled carbonate-quartz-sulphide veinlets and ptygmatic veinlets.
		<<Alt: 256.42 - 275 strong Graphite>> strong graphitic replacement of micaceous minerals in phyllite, wispy and blebby foliation controlled carbonate-quartz-sulphide veinlets and ptygmatic veinlets.
		<<Vein: 256.42 - 275 7% Quartz-Carbonate-Pyrite>> 5-50cm thick QVs with composition qz-ank-(py-po-cpy)-(ser-graphite+/-ep?).
		<<Struct: 258 - 258.01: bedding (s0)>> good ori mark, measured from stretched thin beds within knotted phyllite
		<<Struct: 258.5 - 258.51: primary foliation>> good ori mark, foliation is conformable to bedding
		<<Struct: 259.75 - 260: vein>> good ori mark, boudinaged qv vein, pinching and swelling between
		<<Struct: 263 - 263.01: primary foliation>> good ori mark, convoluted S1, difficult to measure in this high strain zone
		<<Struct: 263.26 - 265.05: fault>> good ori mark, gouge zone ~5cm true thickness, extensional step-like fault morphology, conformable to S1 plane, slippage along S1 plane
		<<Struct: 265.17 - 265.27: vein>> decent ori mark, QV ~9cm true thickness located at base of faulted zone.
		<<Struct: 267.1 - 267.11: vein>> good ori mark, measured from lower contact of a ~25cm true thickness QV. Difficult to measure deformed margin, measurement is an approximation through the small variations.

		<<Min: 458.85 - 467.5 0.3% Pyrrhotite>> py-po dissem along S1 and controlled in fractures in QVs
		<<Min: 458.85 - 467.5 0.4% Pyrite>> py-po dissem along S1 and controlled in fractures in QVs
		<<Alt: 458.85 - 467.5 strong Sericite-Carbonate-Pyrite>> >90% sericite replacement of matrix. Leached porphyroblasts. Strong sericite-chlorite? development with ankerite in QVs.
		<<Alt: 458.85 - 467.5 moderate Sericite>> >90% sericite replacement of matrix. Leached porphyroblasts. Strong sericite-chlorite? development with ankerite in QVs.
		<<Vein: 458.85 - 467.5 30% Quartz-Carbonate-Pyrite>> ragged QVs 3-50cm thick semi-conformable to S0, leached carbonates cause vuggy texture. Medium grained sericite is the dominant alteration mineral within the veins
		<<Struct: 461.5 - 461.51: bedding (s0)>> good ori mark, thin bedding insericite schist
		<<Struct: 463.15 - 463.16: vein>> good ori mark, sheeted QVs, regular attitude.
		<<Struct: 464 - 464.01: bedding (s0)>> good ori mark, thin beds in MKS
		<<Struct: 464.03 - 464.04: primary foliation>> good ori mark, well developed foliation
		<<Struct: 467.2 - 467.21: vein>> good ori mark, QV conformable S0
467.50	**473.65**	**MKP Knotted Phyllite Silt**
		thinly bedded sericite-schist and phyllite, strong sericite altered matrix, minor 1-10mm thick silicified siltstone beds. Sheeted qz-carb-sulphide veinlets are conformable to S0. pervasive trace dissem py and less po. Lith minor:
		<<Min: 467.5 - 473.65 0.1% Pyrrhotite>> py-po dissem along S1 and controlled in fractures in QVs
		<<Min: 467.5 - 473.65 0.2% Pyrite>> py-po dissem along S1 and controlled in fractures in QVs
		<<Alt: 467.5 - 473.65 moderate Sericite-Carbonate-Pyrite>> sericitic knotted phyllite as described. ~0.2% dissem py
		<<Vein: 467.5 - 473.65 2% Quartz-Carbonate-Pyrite>> QVs as described 0.5 - 2cm thick sparsely distributed.
		<<Struct: 468 - 468.01: bedding (s0)>> good ori mark, thin beds in MKP
		<<Struct: 470.8 - 470.81: bedding (s0)>> good ori mark, thin bedding in MKP

122.60	**131.33**	**QVV >60% quartz veins silt**									
		Interbedded MKP and BP. BP horizons are >80% replaced by massive, fractured QVs. VG noted in veins proximal to very thick qz sections, but not directly in the very think qz. High strain zone. Abundant QV breccia. Lith minor: MKP									
		<<Min: 122.6 - 131.33 2% Pyrrhotite>> pervasive dissem po blebs up to 8mm long and forming veinlets. Partial po-py replacement of marginal ankerite in QVs. VG noted at two locations 127.35 and 129.9m hosted in fractured qz and sericite alteration around ankerite respectively. High strain zone									
		<<Min: 122.6 - 131.33 1.5% Pyrite>>									
		<<Min: 127.3 - 127.4 0.01% Gold>> cleanly hosted in the qz with no apparent close association with other minerals									
		<<Min: 129.85 - 129.95 0.01% Gold>> hosted along a strongly sericite alteration pathway at the margin of a QV									
		<<Alt: 122.6 - 131.33 moderate Graphite>>									
		<<Alt: 122.6 - 131.33 strong Quartz-Clay-Pyrite>> patchy silicification of matrix, weak patchy carbonate overprint. Sulphides po-py have partially replaced ank veins. Sericite and chlorite as main accessory alteration minerals within QVs.

From (m)	To (m)	Rock Type & Description
		<<Vein: 122.6 - 124.38 25% Quartz-Ankerite>> Deformed and irregular QV bxa through phyllitici beds within the SIS. QVs occupying contact margins bwn SSL-SST-MKP-BP which are medium bedded
		<<Vein: 124.38 - 127.05 95% Quartz-Ankerite>> Massive QV with sparsely scatterd bxa clusters of ank-(po-py-sericite). Hosted in black phyllite horizon (near complete replacement)
		<<Vein: 127.05 - 131.33 Quartz-Ankerite>>
		<<Vein: 127.05 - 131.33 50% Quartz-Visible Gold>> High strain zone, irregular shaped QV bxa. VG (visible gold) noted at 127.35m and 129.9m. The upper VG is cleanly hosted in the qz with no apparent close association with other minerals. The lower VG is hosted along a strongly sericite alteration pathway
131.33	**142.92**	**SIS Interbedded Sandstone/Siltstone f-sand**
		interbedded graphitic SST and phyllitic siltstone. Very thinly bedded to laminatd. Wiggly qz-carb-sulphide alteration is semi-conformable to S0. QVs through this section are consistently spaced 80-120cm apart and selectively replace phyllitic siltstone beds in areas with notable folded rock. QVs are largest in fold hinge zones . Lith minor:
		<<Min: 131.33 - 142.92 0.5% Pyrite>>
		<<Min: 131.33 - 142.92 1% Pyrrhotite>> pervasive S1 controlled po with lesser py. Relateively low ankerite-sulphide content in QVs through this SIS interval
		<<Alt: 131.33 - 142.92 moderate Quartz-Clay-Pyrite>>
		<<Alt: 131.33 - 142.92 moderate Graphite>> pervasive graphitic replacement of select vfg SST beds. Serpentine replacement of silty beds. Patchy domainal and vein controlled carbonate alteration is weak.
		<<Vein: 131.33 - 142.92 5% Quartz-Ankerite>> Boundinaged qz-ank-sulphide veins 1-10cm thick selectively replacing graphitic and siltstone beds throughout the SIS

From (m)	To (m)	Rock Type & Description
195.70	**198.82**	**SSL Siltstone silt**
Unit grades from moderate foliated with crenulations to a crackle breccia. Beds of silt are fractured with graphitic matrix. Unit is highly broken up from 195.45-196.5m. At 195.9-196.1m is a highly siliceous bleach sandstone? Tension fracture filled with quartz throughout at <1% to interval. Fault at 197.45m. Lower contact is sharp marked by highly strained QV in BP Lith minor: MKP		
<<Alt: 195.9 - 196.1 fresh rock Porphyroblast (knots)>>		
<<Alt: 195.9 - 196.1 moderate Silica>> pervasive bleaching, interval highly fractured and broken up.		
<<Alt: 196.1 - 198.82 weak Porphyroblast (knots)>> moderate to strong porphyoblasts of Carb in phyllite, QCP in lesser percent.		
<<Alt: 196.1 - 198.82 weak Quartz-Clay-Pyrite>>		
<<Struct: 197.45 - 197.46: fault>> Fault measure without ori line. Graphitic with minor gouge.		
198.82	**200.80**	**BP Black Phyllite silt**
Unit is ~50% QV, with coarse ankerite at 8% to vein. Veining is discontinous and highly contorted. Veinbing ranges from a few cm to 20cm in thickness. Po blebs at 5% with sphalerite and galena noted. Lith minor: SSL		
<<Min: 198.82 - 200.8 Galena>>		
<<Min: 198.82 - 200.8 8% Pyrrhotite>> blebs of Po+py in veining, trace sphalerite possible trace galena		
<<Min: 198.82 - 200.8 1% Pyrite>>		
<<Min: 198.82 - 200.8 Sphalerite>>		
<<Alt: 198.82 - 200.8 fresh rock Porphyroblast (knots)>>		
<<Alt: 198.82 - 200.8 weak Sericite-Carbonate-Pyrite>> high strain zone. QV ~50% of interval along with BP>SST. QV contains ankeite bx with Po.		
<<Vein: 198.82 - 200.8 50% Quartz-Ankerite>> coarse ankerite breccia clusters, coarse py+po at 3%, trace spl+ possible galena.		
<<Struct: 199.4 - 199.41: vein>> Massive 20cm quartz vein

From (m)	To (m)	Rock Type & Description
226.55	**238.00**	**SIS** **Interbedded Sandstone/Siltstone** **silt** MKP interbedded with porphyroblastic conglomerate and . Black porphyroblastic conglomerate unit consists of beds of flaser bedded sandstone, black mudstone, siltstone and quartz sub rounded black clasts that are weak to mod deformed, clasts up to 3cm. Unit contains beds of carbonate. Unit contains weak pervasive foliation. Py anhedral medium grained with lesser Po blebs. Min is diss along fol planes with bulk at 3% locally in selvages to carbonate rich band. Black porphyroblasts have an en echleon texture of ankerite in trace amount. See photos in hole folder, unit litho code PCH. Lith minor: SIS <<Struct: 227.38 - 227.39: bedding>> thick bed of sandstone <<Struct: 233.48 - 233.49: bedding>> thin bed of silt <<Struct: 237.31 - 237.32: vein>> sharp vein contact, minor undulating contact.
238.00	**243.00**	**SST** **Sandstone** **silt** Interbedded sandstone with minor calcareous sandstone and lesser knotted phyllite, thin trace beds of graphite. Interval contains strong sericite, pyrite and lesser po disseminated and in veins. Extensive veining ribboned to boudin with trace fuchsite. Lith minor: SCA <<Min: 238 - 242.7 1% Pyrite>> interval has trace py+/-po throughout with medium to coarse blebby anhedral Py up to 1% and 0.5% Po in vein selvages, lesser percent in vein. <<Min: 238 - 242.7 0.5% Pyrrhotite>> <<Min: 242.7 - 245.9 3% Pyrite>> diss 3% py in MKP. <<Alt: 238 - 242.7 fresh rock Porphyroblast (knots)>> <<Alt: 238 - 242.7 moderate Sericite-Carbonate-Pyrite>> Interval is zone of storng quartz veining with intense sericite selvages <<Alt: 242.7 - 259.5 moderate Porphyroblast (knots)>> dominately knotted phyllite with 1-2% qtz veinlets. Diss pytrace-1%. <<Alt: 242.7 - 259.5 fresh rock Quartz-Clay-Pyrite>> <<Vein: 238 - 242.7 40% Quartz-Ankerite>> wiggly to contorted qtz veining, strong sericite selvages, strong white mica selvages, Minor ankerite breccia clusters. Py+po perdominately in wallrock to vein with lesser in veins.

111.60	162.35	SIS **Interbedded silt Sandstone/Siltstone**

Intense defromed interbedded SSL SST and MPH range from mm to 8cm lamina. Well foliated to folded with angles changing over 30cm. Carbonate diss throughout at 10% up to 30% locally as braccia clusters. Graphite intense along vein margins, diss sericite and clay. Veining at 15% throughout with 5% forming along foliation and 10% a massive dialation veins. Dialiation veins contain up to 50% ankerite breccia clusters and 8% po+py and cut at high angle to core axis. Lith minor: MPH

<<Min: 111.6 - 118.2 3% Pyrrhotite>> blebs of Po+py forming in vein selvages with intense clay alt.

<<Min: 111.6 - 118.2 1% Pyrite>>

<<Min: 125.5 - 130.5 3% Pyrrhotite>> blebs of Po+py forming in vein selvages with intense clay alt.

<<Min: 125.5 - 130.5 1% Pyrite>>

<<Min: 151 - 151.3 3% Pyrrhotite>>

<<Min: 151 - 151.3 0.1% Gold>> Vg at 151.10m in qtz vein proximal to ankerite clusters. Coarse po at 5% blebs in vein

<<Min: 152 - 152.6 0.1% Pyrite>>

<<Min: 152 - 152.6 8% Pyrrhotite>> Coarse blbs of po with trace py in vein.

<<Min: 152.6 - 163 0.1% Pyrite>> trace diss blebs of py

<<Alt: 118.1 - 125.6 weak Sericite-Carbonate-Pyrite>> same as previous interval but less intense carbonate

<<Alt: 118.1 - 125.6 fresh rock Clay>>

<<Alt: 125.6 - 130.5 fresh rock Clay>>

<<Alt: 125.6 - 130.5 weak Sericite-Carbonate-Pyrite>> highly deformed with dialation veining. Unit is black phyllite strongly sheared to brecciated with ankerite infilling stockwork. Sericite graphitie forming along fol/shr planes

229.60	**242.70**	**SCA Calcareous Sandstone m-sand**
		Light to dark grey with black interbedded dom calcareous sandstone (>1m thick) with siltstone and thin beds of black phyllite. Perdominately low angle beds with minor S0/S1 at 80°. Qtz carbonate veinlets (contorted and boudined) forming along S1 planes in BP beds up to 20% to unit. Low angle fractures surface are intense graphitic. Lower contact is gradational from 241.5-242.7m. Lith minor: SIS
		<<Vein: 230.2 - 230.95 30% Quartz-Ankerite>> foliation parallel veining up to 30% of interval. Trace py+po.
		<<Vein: 231.8 - 232.3 90% Quartz-Ankerite>> massive qtz vein with ankerite and 1% po+py
		<<Vein: 232.3 - 243.3 5% Quartz-Carbonate>> thin whisps of qtz+/-carbonate forming along S1 in SIS.
		<<Struct: 229.82 - 229.83: fold axis>> fold axis in SIS
		<<Struct: 230.19 - 230.2: bedding (s0)>> bedding in SIS
		<<Struct: 232.45 - 232.46: bedding (s0)>> bedding in SIS

From (m)	To (m)	Rock Type & Description
272.10	**292.00**	**MPH Phyllite silt**
		Black to dark grey with minor dark sheen coloured phyllite, units consist of beds of mkp, ssl and sca. Unit is moderate o strongly foliated with minor crenulation intervals. Minor beds of mottled phyllite with fine grained quartz/feldspar? and trace carbonate coupled with py. From 283.7-286.5m interval is a highly sheared mkp with whispy veinlets of quartz at 5% to unit, intense clay alteration. Quartz ankerite milky white veining from 277.4-281.5m at 35% to interval, veining contains up to 5% po+py and up to 20% coarse blebs of Po in vein selvages. Smokey grey qtz vein noted at 283.68m with 10% py+po infilling as coarse blebs. Unit contains disseminated to stinger like blebs of py+po at 1-3% throughout unit. Lith minor: MKP
		<<Min: 279.45 - 280.5 2% Pyrite>>
		<<Min: 279.45 - 280.5 8% Pyrrhotite>> coarse blebs of po with lesser py in vein selvages
		<<Min: 280.5 - 290 5% Pyrite>> diss veinlets as whisps.
		<<Min: 280.5 - 290 0.1% Pyrrhotite>>
		<<Alt: 277.4 - 281.5 strong Quartz-Clay-Pyrite>> massive qtz veining with intense clay selvages, Po+py up to 8% in selvages.
		<<Alt: 281.5 - 292 weak Quartz-Clay-Pyrite>> pervasive clay weak to mod locally strong, trace pbl.
		<<Alt: 281.5 - 292 weak Carbonate>>
		<<Vein: 277.4 - 281.45 50% Quartz-Ankerite>> massive dialation veining contorted tca. Milky white with minor smokey grey. Ankerite at 1-5% in milky white veins. Po up to 8% coarse blebs in vein selvages.
		<<Vein: 281.45 - 290.3 Quartz-Carbonate>> mm scale veinlets forming along S1 planes, minor crenulated. One 3cm (283.61-283.64m) milky white vein with 10% po+/-py. Smokey grey veinlet 1-2cm at 283.67-283.69m with 5% po.
		<<Vein: 290.3 - 301.2 24% Quartz-Ankerite>> massive veins up to 80cm in length at 24% to interval. Ankerite and coarse po up to 10% to vein.
		<<Struct: 273.25 - 273.26: vein>> stringer of py in mkp
		<<Struct: 277.09 - 277.1: bedding (s0)>> Bedding contact of siltstone

From (m)	To (m)	Rock Type & Description
		<<Struct: 288.24 - 288.25: primary foliation (s1)>> mod fol in SIS
292.00	**301.20**	**MKP Knotted Phyllite f-sand**
		Black to dark grey with silvery sheen clay altered mkp. Strong qtz ankerite veining throuhgout unit. Locally strong deformation beds and veinlets. Lower contact is sharp at 40° tca. Lith minor: MKP
		<<Alt: 292 - 301.2 weak Carbonate>>
		<<Alt: 292 - 301.2 moderate Porphyroblast (knots)>> por at 30% to interval, local qtz veinlet sheared. Pervasive trace sericite.
		<<Struct: 292.48 - 292.49: primary foliation (s1)>> strong fol in sheared mkp
		<<Struct: 294.64 - 294.65: primary foliation (s1)>> strong fol in sheared mkp
		<<Struct: 297.46 - 297.47: primary foliation (s1)>> weak fol in mkp.
301.20	**357.50**	**SPH Pyritic Black Shale f-sand**
		Unit is dominately pyritic black shale, highly graphitic, interbedded with calcareous sandstone and lesser meta-siltstone. Structure consists of well laminated to contorted and then highly strained brecciated. Veining perdominately consists of qtz+carb forming along fol planes and is contorted locally. From 322.7-326.3m is an interval of massive quartz veining at ~50% to interval, milky white with trace pyrite blebs along selvages. Disseminated trace pyrite throughout unit with up to 5% coarse blebs, mineralization is primarily hosted in SPH. Lith minor: SIS
		<<Min: 301.2 - 322.7 1% Pyrite>> Diss blebs of py trace up to 5% in SPH.
		<<Min: 322.7 - 357.5 3% Pyrite>> blebs and whisps of py disseminated throughout forming up to 10% coarse blebs in graphitic SIS
		<<Alt: 301.2 - 357.2 strong Graphite>> Black phyllite with pyrite diss, intense graphite and carbonate rich beds of sandstone/possible limestone.
		<<Alt: 301.2 - 357.2 moderate Carbonate>>
		<<Alt: 357.2 - 363.5 weak Silica>>
		<<Alt: 357.2 - 363.5 strong Sericite-Carbonate-Pyrite>> strong to intense pervaisve sercite alteration, moderate to strong silicifcation, trace carbonate and 1-5% upt to 10% py disseminated throughout.
		<<Vein: 301.2 - 322.7 5% Quartz-Carbonate>> S0/S1 parallel veining with carbonate.

From (m)	To (m)	Rock Type & Description
357.50	**363.50**	**SIS** **Interbedded Sandstone/Siltstone** **silt**
Unit is a grey to beige coloured, fine grained interbedded siltstone and sandstone unit with pervasive sericite alteration. Well laminated to well bedded with minor crenulations. Disseminated 1-5% py with up to 15% coarse blebs. Veining is strong with milky white to smokey grey with intense sericite selvages. LC is sharp at ~15° tca. Lith minor: SST		
<<Min: 357.5 - 363.5 5% Pyrite>> fine to medium grained euhedral prite forming diss throughout sericite altered SIS		
<<Vein: 360 - 363.5 5% Quartz>> sheeted parallel to S1/S0 to boudined to breccia like veining up to 40% of interval. Breccia like qtz are mediumg grained sub rounded clusters with muscovite and feldspar matrix. Strong pyrite throghout interval in sericite SIS.		
<<Struct: 357.71 - 357.72: bedding>> bedding of sst, ssl. On edhe of fax, no measurement of FAX.		
<<Struct: 357.9 - 357.91: vein>> foliated vein on downhole side of FAX.		
<<Struct: 359.72 - 359.73: bedding>> bed of mudstone		
363.50	**367.50**	**MKP** **Knotted Phyllite** **silt**
knotted phyllite with ~30% pbl, well foliated. LC is sharp at 35° tca. Lith minor:		
<<Alt: 363.5 - 367.5 moderate Porphyroblast (knots)>> typical knotted phyllite.		
<<Struct: 366.19 - 366.2: primary foliation>> strong fol in MKP		
367.50	**375.60**	**SIS** **Interbedded Sandstone/Siltstone** **silt**
low angle graphitic laminated siltstone with minor sandstone and lesser mudstone. Core is really broken up. Small interval of S0/S1 parallel boudinaged veining. Lith minor: BP		
<<Alt: 367.5 - 375.6 weak Graphite>> graphitic SIS.		
<<Vein: 371.5 - 373.25 5% Quartz>> milky white boudined veining forming in highly sheared clay rich SIS, strongly crenulated.

From (m)	To (m)	Rock Type & Description
151.93	156.06	MKP Knotted Phyllite silt

dark-grey black siltstone, lesser sandstone and knotted phyllite, speckelled with 3 modal % (fe-carb + po + py) forming blebs and stringers locally. Evident minor kink fold hinges ~50cm thick intersected between 154 - 155m. Thinly bedded and locally boudined. Lith minor: SPT

<<Min: 151.93 - 156.06 1% Pyrrhotite>>

<<Min: 151.93 - 156.06 Chalcopyrite>>

<<Min: 151.93 - 156.06 2% Pyrite>> disseminated and discontinuous veinlets, blebs and pbl replacement po-py. Veins in kink hinges between 154 - 155m have composition as described with clots of intergrown po-py up to 2 modal % of the veins, trace cpy.

<<Alt: 151.93 - 156.06 strong Quartz-Clay-Pyrite>> Quartz veining, spotty and patchy network-style fe-carb replacement is strong around quartz veins, py-po are components of the alteration assemblage (i.e. same distribution). Local porphyroblast replacement by alteration assemblage

From (m)	To (m)	Rock Type & Description	From (m)	To (m)	Length	Sample #	Au Best ppm	Ag Best ppm	Cu ppm	Pb ppm	Zn ppm
0.00	**9.00**	**OVB Overburden**									
Casing											
9.00	**96.00**	**MKP Knotted Phyllite f-sand**	9.00	10.50	1.50	3781363	-0.0025				
Knotted phylite, within the first ~15m porphyoblasts are mod - strongly oxidized w/ select few weathered out; knotts are relatively consistent and frequent to end of interval. Qz veins prominent at top of hole until 33m, where they drop off a return in intervaled bursts (details within vein tab); surrounding the veins the "knotted" texture disapears and beds become a dark black silt. @ 59 - 62m there is a slight appearance of bedding occuring w/ small light grey sand beds, but they are infrequent within this sub-interval and so are not delineated into their own unit Lith minor: SIS											
<<Min: 45.3 - 50.5 1% Pyrite>> Pyrite replacing Ank, <2% Py and observed in aggregates along vein margins			10.50	12.00	1.50	3781364	-0.0025				
<<Min: 56.6 - 63.3 2% Pyrite>> Py aggs clustered along deformed vein margins; Coarse Py aggs in wall rock near Vn margins and in select silt bedding			12.00	13.50	1.50	3781365	-0.0025				
<<Min: 69 - 78 2% Pyrite>> Dissemenated Py aggregates in groundmass (1 - 2%)			13.50	15.00	1.50	3781366	-0.0025				
<<Min: 78 - 82.3 4% Pyrite>> Dissemenated cubi Py in groundmass and observed in elongated forms along bedding planes			15.00	16.60	1.60	3781368	-0.0025				
<<Min: 82.3 - 86.9 2% Pyrite>> Pyrite replacing Ank, <2% Py and observed in aggregates along vein margins			16.60	18.31	1.71	3781369	-0.0025				
<<Min: 86.9 - 90.7 0.4% Pyrite>> <1% Py + Po along foliation (from replacing prorphyblast ank pressure shadows?), and near vein margins			18.31	19.50	1.19	3781370	-0.0025				
<<Min: 86.9 - 90.7 0.4% Pyrrhotite>> <1% Py + Po along foliation (from replacing prorphyblast ank pressure shadows?), and near vein margins			19.50	21.00	1.50	3781371	-0.0025				
<<Min: 90.7 - 95.5 2% Pyrite>> Py>Po>Cpy; aggs along vein margins + replacing ank; Py also observed along deformed foliation			21.00	21.35	0.35	3781372	-0.0025				
<<Min: 90.7 - 95.5 2% Pyrrhotite>> Py>Po>Cpy; aggs along vein margins + replacing ank; Py also observed along deformed foliation			21.35	23.50	2.15	3781373	-0.0025				
<<Min: 90.7 - 95.5 0.1% Chalcopyrite>> Py>Po>Cpy; aggs along vein margins + replacing ank; Py also observed along deformed foliation			23.50	25.12	1.62	3781374	-0.0025				
<<Min: 95.5 - 113.1 2.5% Pyrrhotite>> Entering interbedded interval w/ cubic Py hosted win beds (1 - 2%), Py+Po observed along margins replacing ank (1-2%) and replacing porphs further downhole (<1%)			25.12	26.20	1.08	3781375	-0.0025				
<<Min: 95.5 - 113.1 2.5% Pyrite>> Entering interbedded interval w/ cubic Py hosted win beds (1 - 2%), Py+Po observed along margins replacing ank (1-2%) and replacing porphs further downhole (<1%)			26.20	27.50	1.30	3781377	-0.0025				
<<Alt: 9 - 18.51 strong Carbonate>> FeC alteration w/ moderate to strong oxidation focused within porphyoblasts, weak to moderate in veins; weak graphitic alt			27.50	29.00	1.50	3781378	0.008

PHONE (604) 253-3158

Client: **Kore Mining Ltd.**
Suite 1601 - 277 Thurlow St.
Vancouver British Columbia V6C 0C1 Canada

Submitted By:	James Hynes
Receiving Lab:	Canada-Vancouver
Received:	August 17, 2020
Analysis Start:	September 15, 2020
Report Date:	September 21, 2020
Page:	1 of 4

CERTIFICATE OF ANALYSIS VAN20001663.1

CLIENT JOB INFORMATION

Project:	FG
Shipment ID:	K20-011
P.O. Number	
Number of Samples:	78

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
SS80	78	Dry at 60C sieve 100g to -80 mesh			VAN
AQ252	77	1:1:1 Aqua Regia digestion Ultratrace ICP-MS analysis	30	Completed	VAN

SAMPLE DISPOSAL

PICKUP-PLP	Client to Pickup Pulps
DISP-RJT-SOIL	Immediate Disposal of Soil Reject

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

ADDITIONAL COMMENTS

Invoice To: Kore Mining Ltd.
Suite 1601 - 277 Thurlow St.
Vancouver British Columbia V6C 0C1
Canada

CC:

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CLIENT JOB INFORMATION

Project:	FG
Shipment ID:	K20-002
P.O. Number	
Number of Samples:	100

SAMPLE DISPOSAL

PICKUP-PLP	Client to Pickup Pulps
PICKUP-RJT	Client to Pickup Rejects

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PUL85	100	Pulverize to 85% passing 200 mesh			VAN
SPTRF	100	Split samples by riffle splitter			VAN
M150 1kg	100	Metallic Sieve 1 kg to 150 mesh - save + and - fraction			VAN
FS552	100	Metallics Fire Assay for Au and/or Ag	50	Completed	VAN

ADDITIONAL COMMENTS

Version 2 : Reweigh minus fractions and recalculate the total value for samples B0175434-B0175435, B0175597-B0175598, B0175600.

CERTIFICATE OF ANALYSIS VAN20002084M.1

CLIENT JOB INFORMATION

Project:	FG
Shipment ID:	K20-017B
P.O. Number	
Number of Samples:	98

SAMPLE DISPOSAL

PICKUP-PLP	Client to Pickup Pulps
PICKUP-RJT	Client to Pickup Rejects

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
SPTRF	98	Split samples by riffle splitter			VAN
PUL85	98	Pulverize to 85% passing 200 mesh			VAN
FS652	98	Metallic Sieve 1 kg to 150 mesh - save + and - fraction			VAN
FS652	98	Metallic Fire Assay - duplicate minus fraction analysis	50	Completed	VAN
FA550	3	Lead collection fire assay 50G fusion - Grav finish	50	Completed	VAN
FA550	3	Lead collection fire assay 50G fusion - Grav finish	50	Completed	VAN

ADDITIONAL COMMENTS

Invoice To: Kore Mining Ltd.
Suite 1601 - 277 Thurlow St.

CERTIFICATE OF ANALYSIS VAN20002375A.1

CLIENT JOB INFORMATION

Project:	FG
Shipment ID:	K20-020
P.O. Number	
Number of Samples:	98

SAMPLE DISPOSAL

PICKUP-PLP	Client to Pickup Pulps
PICKUP-RJT	Client to Pickup Rejects

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PRP70-250	88	Crush, split and pulverize 250 g rock to 200 mesh			VAN
SLBHP	10	Sort, label and box pulps			VAN
FA450	98	50g Lead Collection Fire Assay Fusion - AAS Finish	50	Completed	HMS
FA550	1	Lead collection fire assay 50G fusion - Grav finish	50	Completed	HMS

ADDITIONAL COMMENTS

Invoice To: Kore Mining Ltd.

CERTIFICATE OF ANALYSIS VAN20002376M.1

CLIENT JOB INFORMATION

Project:	FG
Shipment ID:	K20-021
P.O. Number	
Number of Samples:	102

SAMPLE DISPOSAL

PICKUP-PLP	Client to Pickup Pulps
PICKUP-RJT	Client to Pickup Rejects

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
SPTRF	102	Split samples by riffle splitter			VAN
PUL85	102	Pulverize to 85% passing 200 mesh			VAN
FS652	102	Metallic Sieve 1 kg to 150 mesh - save + and - fraction			VAN
FS652	102	Metallic Fire Assay - duplicate minus fraction analysis	50	Completed	VAN

CERTIFICATE VA20087087

Project: Frasergold

P.O. No.: K20-004

This report is for 187 samples of Drill Core submitted to our lab in Vancouver, BC, Canada on 21-APR-2020.

The following have access to data associated with this certificate:

JAMES HYNES	MICHAEL TUCKER	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize up to 250g 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
Au-GRA22	Au 50 g FA-GRAV finish	WST-SIM

This is the Final Report and supersedes any preliminary report with this certificate number.Results apply to samples as submitted.All pages of this report have been checked and approved for release.

CERTIFICATE VA20087090

Project: Frasergold

P.O. No.: K20-005

This report is for 219 samples of Drill Core submitted to our lab in Vancouver, BC, Canada on 21-APR-2020.

The following have access to data associated with this certificate:

JAMES HYNES	MICHAEL TUCKER	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize up to 250g 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
Au-GRA22	Au 50 g FA-GRAV finish	WST-SIM

This is the Final Report and supersedes any preliminary report with this certificate number.Results apply to samples as submitted.All pages of this report have been checked and approved for release.

CERTIFICATE VA20089287

Project: Frasergold

P.O. No.: K20-007

This report is for 160 samples of Drill Core submitted to our lab in Vancouver, BC, Canada on 24-APR-2020.

The following have access to data associated with this certificate:

JAMES HYNES	MICHAEL TUCKER	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize up to 250g 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS

This is the Final Report and supersedes any preliminary report with this certificate number.Results apply to samples as submitted.All pages of this report have been checked and approved for release.

CERTIFICATE VA20092099

Project: Frasergold

P.O. No.: K20-005

This report is for 3 samples of Reject submitted to our lab in Vancouver, BC, Canada on 21-APR-2020.

The following have access to data associated with this certificate:

JAMES HYNES	MICHAEL TUCKER	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
FND-03	Find Reject for Addn Analysis
SCR-21	Dry Screen1kg to 106um
PUL-32	Pulverize 1000g to 85% < 75 um
SPL-21	Split sample - riffle splitter
BAG-01	Bulk Master for Storage

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-SCR24	Au Screen FA Double Minus 50g	WST-SIM
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
Au-AA26D	Ore Grade Au 50g FA AA Dup	AAS

This is the Final Report and supersedes any preliminary report with this certificate number.Results apply to samples as submitted.All pages of this report have been checked and approved for release.

Appendix E: Statement of Qualifications

Statement of Qualifications

I, Michael Tucker of 2153 Victoria Dr. Vancouver, BC, Canada hereby certify that:

1. I graduated from Laurentian University with a Bachelor of Science in Geology in 2010 and from The University of British Columbia with a Master's degree in Geological Science in 2015.

2. From 2010 to present, I have been actively engaged in mineral exploration work in Ontario, Quebec, Yukon, and British Columbia).

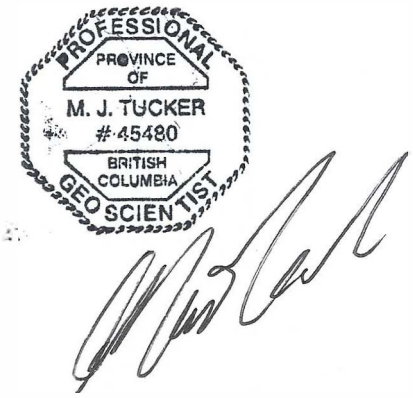

3. I have personally participated in the field work and exploration activities related to the Frasergold property on behalf of Kore Mining (now Karus Gold) overseeing the exploration program from September 20 - October 16, 2020.

Dated at Vancouver, BC on October 23, 2021

Respectfully submitted,

Michael Tucker

Michael J. Tucker

Statement of Qualifications

I, Rachel Kim of 166A West 19th Avenue, Vancouver, British Columbia, Canada, hereby certify that:

1. I graduated from Queen's University with a B.Sc. in Geological Engineering in 2014, and from the University of British Columbia with an M.Sc. in Geological Sciences in 2020.

2. From 2017 to present, I have been actively engaged in mineral exploration work in British Columbia, Alaska, and Ontario.

3. I have personally participated in the field work and exploration activities related to the Frasergold property on behalf of Kore Mining (now Karus Gold) including overseeing core cutting and sampling of drill core from the Frasergold property, owned and operated under the aforementioned company.

Dated at Vancouver, British Columbia, this 2nd day of June, 2021.

Respectfully submitted,

"Rachel S.Y. Kim"

Rachel S.Y. Kim, M.Sc.

Appendix F: Detailed Cost Statement

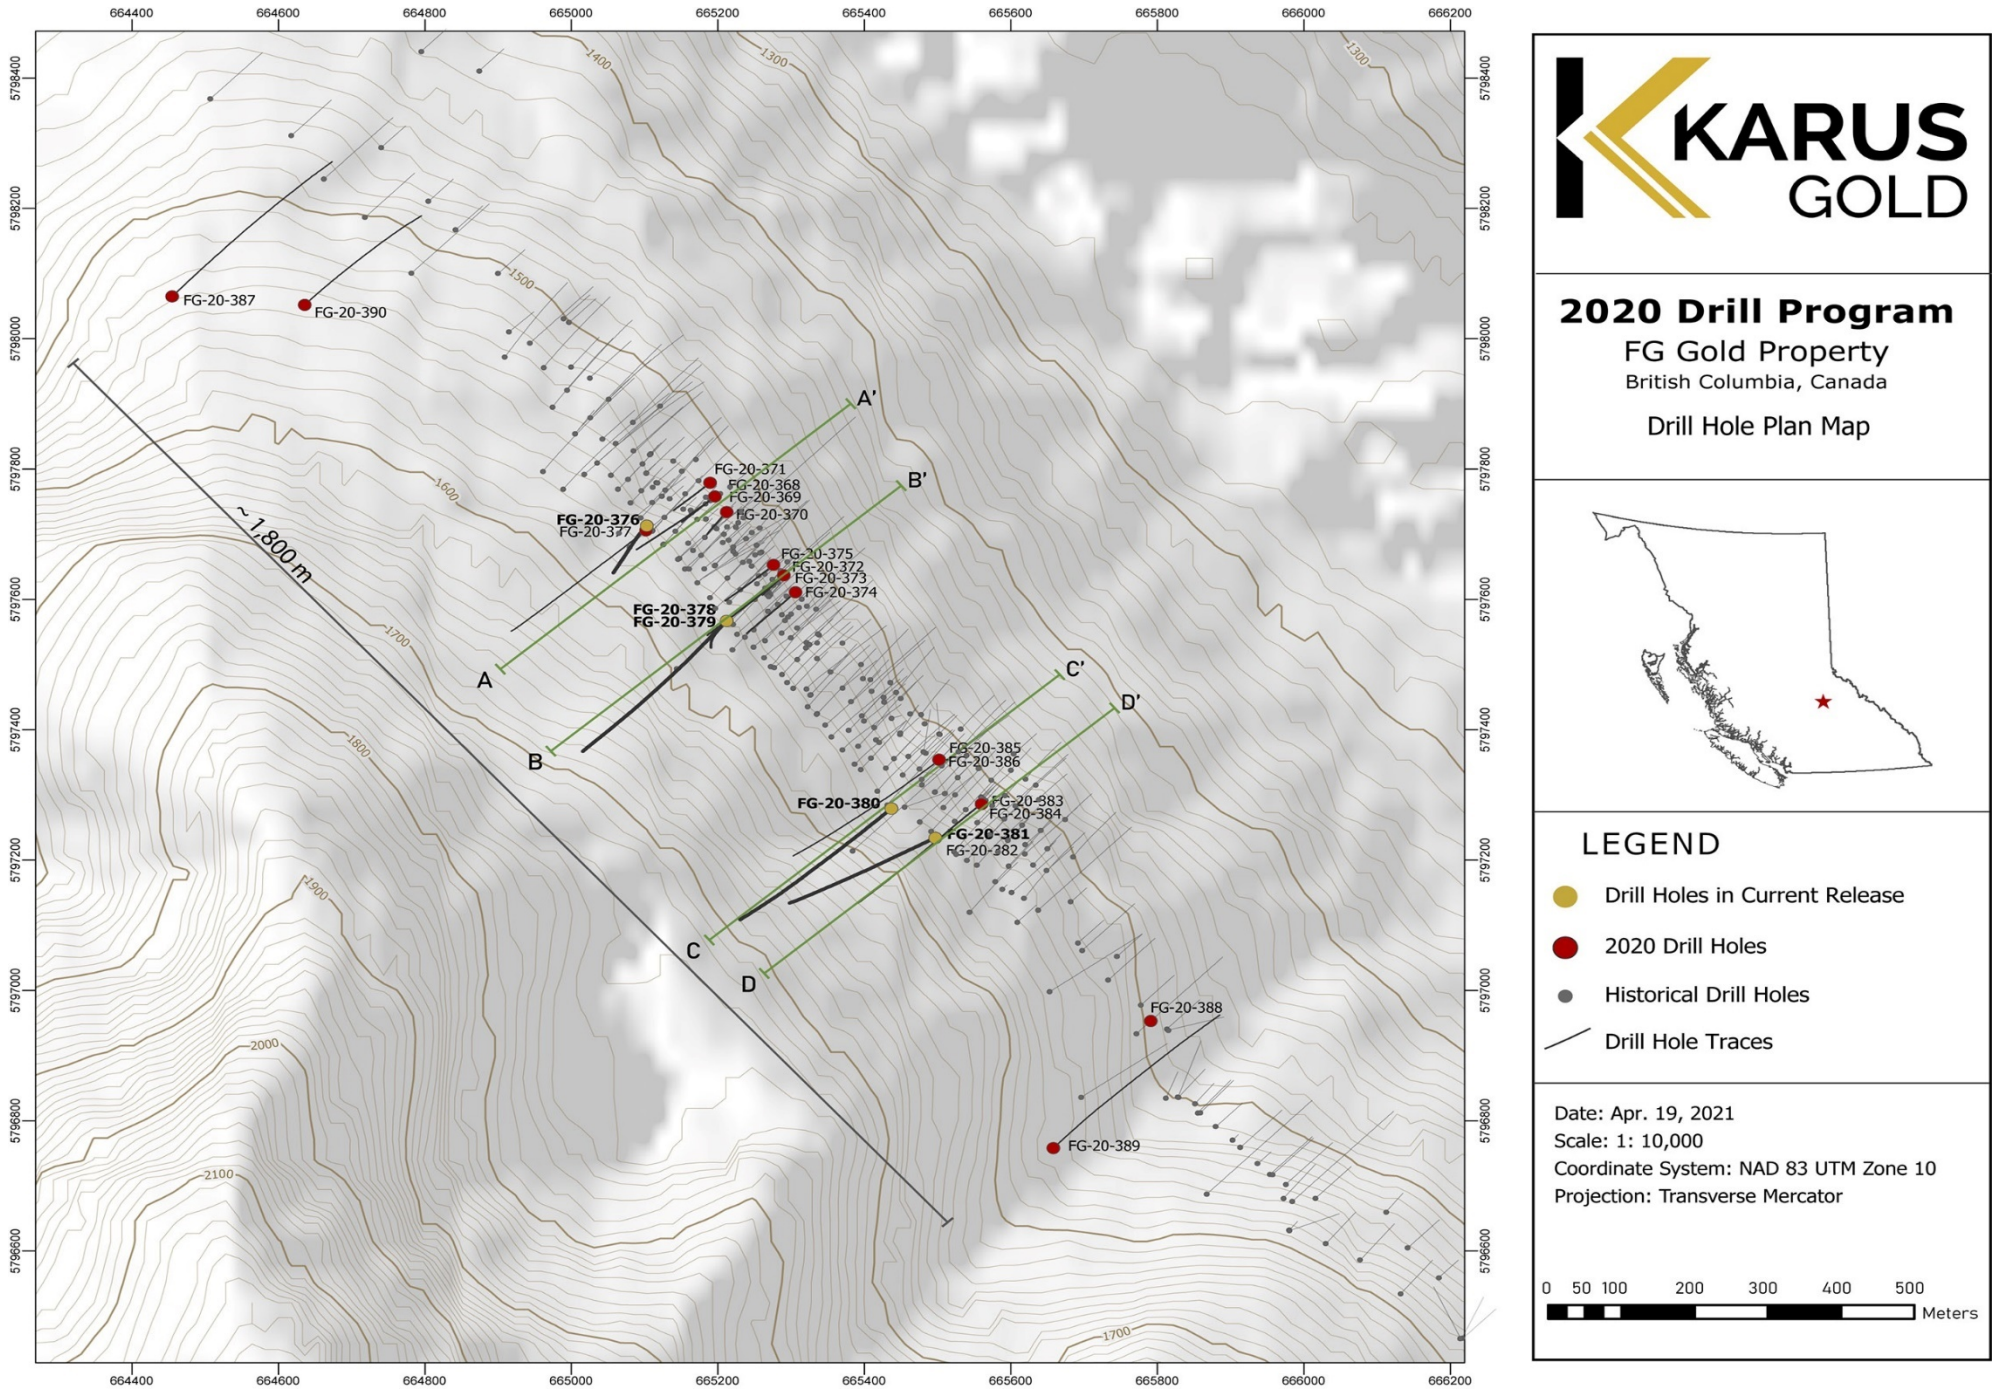

Exploration Work type	Comment	Days			Totals
Personnel (Name)* / Position	**Field Days (list actual days)**	**Days**	**Rate**	**Subtotal***	
Graham Leroux (geologist) / Project Manager	26/02/2020 - 29/02/2020	49	$750.00	$36,750.00	
	01/03/2020 - 11/03/2020				
	26/06/2020 - 10/07/2020				
	25/07/2020 - 31/07/2020				
	01/08/2020 - 07/08/2020				
	28/08/2020 - 31/08/2020				
	Monthly Sep, Oct, 1/2 November 2020	76	$0.00	$31,250.00	
Emanuel Herrerias /	26/02/2020 - 29/02/2020	56	$425.00	$23,800.00	
Core Cutter and Sampler	01/03/2020 - 11/03/2020				
	15/03/2020 - 31/03/2020				
	01/04/2020 - 09/04/2020				
	24/06/2020 - 31/07/2020				
	01/08/2020 - 31/08/2020	61	$450.00	$27,450.00	
	01/09/2020 - 30/09/2020				
	01/10/2020 - 15/10/2020				
Katherine Rempel /	27/02/2020 - 28/02/2020	90.3	$400.00	$36,120.00	
Geotech	02/03/2020 - 04/03/2020, 10/03/2020				
	15/03/2020 - 31/03/2020				
	01/04/2020 - 05/04/2020				
	08/04/2020 - 15/04/2020				
	01/07/2020 - 31/07/2020				
	01/08/2020 - 31/08/2020				
	01/09/2020 - 15/09/2020				
	01/10/2020 - 17/10/2020				
Victor Gendron /	10/04/2020 - 13/04/2020	3.5	$400.00	$1,400.00	
Core-cutter and Sampler					
Jelle De Bruyckere / Logging Geologist	09/03/2020 - 31/03/2020	25	$750.00	$18,750.00	
	01/04/2020 - 02/04/2020				
Adam Fage / Logging Geologist	09/03/2020 - 31/03/2020	55	$750.00	$41,250.00	
	01/04/2020 - 15/04/2020				
Christian Brugger /	31/07/2020 - 15/08/2020	48.5	$385.00	$18,672.50	
Core Cutter and Sampler	01/09/2020 - 31/09/2020				
	01/10/2020 - 31/10/2020				
Melissa Vaughan /	19/10/2020 - 22/10/2020, 28/10/2020	6	$300.00	$1,800.00	
Core Cutter and Sampler	02/11/2020 - 04/11/2020				
Kevin Peterson / Logging Geologist	20/09/2020 - 07/10/2020	18	$700.00	$12,600.00	
Kaitlyn Gibson / Logging Geologist	10/10/2020-10/19/2020	10	$450.00	$4,500.00	
	10/28/2020-10/31/2020	4	$450.00	$1,800.00	
	11/01/2020-11/10/2020	10	$450.00	$4,500.00	
Michele Veseika /	05/10/2020 - 23/10/2020	18.5	$500.00	$9,250.00	
Geotech					
Nickolas Dudek / Geotech	11/10/2020 - 16/10/2020	6	$550.00	$3,300.00	
Nickolas Dudek / Sampler	01/10/2020 - 10/10/2020	6.5	$550.00	$3,575.00	
Andrew Mitchel / Geotech	14/10/2020 - 15/10/2020	2	$81.25	$162.50	
Taighe Selwood / Logging Geologist	16/10/2020 - 24/10/2020	9	$475.00	$4,275.00	
Taylor Quinn / Sampler	05/10/2020	1	$275.00	$275.00	
Tyler Ford / Geotech	16/10/2020 - 24/10/2020	9	$475.00	$4,275.00	
M. Husslage / Logging Geologist	08/05/2020 - 08/28/2020	24	$600.00	$14,400.00	
	09/15/2020 - 09/29/2020	15	$600.00	$9,000.00	
Micheal Tucker (geologist) / Project Manager	30/08/2020 - 07/09/2020	9	$750.00	$6,750.00	

	13/09/2020 - 18/09/2020	6	$750.00	$4,500.00	
	13/10/2020 - 20/10/2020	8	$750.00	$6,000.00	
Rosie Tempest / Geotech	30/08/2020 - 07/09/2020	9	$550.00	$4,950.00
